### ABSTRACT

Semantic prosody, which is a brand new concept in the field of linguistics, describes the way in which certain seemingly neutral words can be perceived with positive or negative associations through frequent occurrences with particular collocations. This concept was introduced to the discipline by Bill Louw in 1993. This paper explored the semantic prosody behavior of close Persian equivalents of two near synonym groups “*cause* and *bring about*” and “*result*, *outcome*, *aftermath* and *consequence*” from a cross-linguistic perspective. These search-words were separately compared with their close translation equivalents to identify how similar or different they are in their semantic prosodies. To realize the semantic prosody behavior of Persian words, a specialized monolingual corpus was compiled. The results showed that Persian exhibits features of semantic prosody as English does. The comparative analysis presented that *cause* and its near Persian equivalent, *baes shodan*, display a very similar semantic prosody behavior. This analysis also showed that semantic prosodies of the *result*-words are quite similar in English and Persian.

**KEYWORDS:** Semantic Prosody, Collocation, Denotative Meaning, Connotative meaning, Corpus-based Study

### INTRODUCTION

Corpus linguists analyze discourses or texts for finding what people intend to mean by the texts they produce, and what they are interpreted as meaning. When texts are analyzed, many language patterns and concepts such as collocations, phrasal verbs, denotations and connotation concepts are extracted. One of the brand new concepts is semantic prosody.

Have you ever noticed why a *problem* is *caused* but a *solution* is *brought about*? A glance at a concordance, which displays all the occurrences of a particular word in the lines of a text so one can see where co-textual combinations recur, will show that the verb *cause* collocates with unfavorable things such as *pain*, *disease*, *distress*, *disruption* while its synonym, the phrasal verb *bring about* collocates with favorable words like *improvement*, *cure*, *solution* and *success*. Therefore, it can be said that *cause* has a negative semantic prosody and its near synonym *bring about* has a positive semantic prosody (Widdowson, 2007, p. 81).

According to Louw (2000), “A semantic prosody refers to a form of meaning which is established through the proximity of a consistent series of collocates, often characterisable as positive or negative...” (p. 50). Sinclair and Stubbs mentioned that semantic prosody is affective meaning of a given node or collocation’s key word with its typical collocates (as cited in Xiao & McEnry, 2006, p. 105). In other words, they observed that there are always semantic relations between node and collocates, and among collocates themselves.

This research studied the concept of semantic prosody cross-linguistically. In fact, it investigated the collocations of Persian equivalents of English search-words and identified their semantic prosody behavior. These search-words were separately compared with their close translation equivalents to identify how similar or different they are in their semantic prosodies.

## LITERATURE REVIEW

This part intends to present definition of semantic prosody and concepts related to this phenomenon such as collocation, connotation and denotation. Corpus definitions and types will be also reviewed in the following.

### *Collocation*

Collocation has been studied for at least around five decades. Firth was the first person to use the word collocation as a technical term in 1957. He said “I propose to bring forward as a technical term, meaning by collocation, and apply the test of collocability” (Firth, 1957, p.194). According to him, collocations of a given word are statements of the habitual or customary places of that word (Xiao & McEnery, 2006, p.105). Firth’s notion of collocation is essentially quantitative. It can be noted that there is a connection among certain patterns of co-occurrence which recur quite regularly. On the other hand, certain items tend to keep company, or collocate, with others. In fact there is a kind of mutual attraction that draws them together. For example, the word *unforeseen* will attract the word *circumstances* and *foregone, crying* and *pious* will attract *conclusion, shame* and *hope* in sequence (Widdowson, 2007, p. 79).

### *Denotative and Connotative Meanings*

Lexicographers fill dictionaries with words and their meanings. Most dictionaries include the referential meaning of a word or expression which is called denotative meaning (Fromkin et al, 2003, p.481). The basic meaning of senses can be favorable or unfavorable which traditionally is labeled as complimentary or pejorative words in sequence (Ping-fang & Jing-chun, 2009, p.21).

A word has not only a linguistic denotative meaning but also a connotative meaning that reflects the evocative or affective meaning associated with a word. Synonyms may have the same denotative meaning but different connotations (Fromkin et al, 2003, p.578). Lexicographers attempt to mark connotations by usage labels such as informal, derogatory, offensive and ironic in dictionaries.

Semantic prosody is similar to denotative meaning in that, there appears to be parallelism between favorable prosody and complimentary words and also unfavorable prosody and pejorative ones. But the difference is that denotative meaning is overt and static while semantic prosody can’t be found without a linear combination; therefore, it is covert and dynamic (Ping-fang & Jing-chun, 2009, p.21).

Leech (1974) defined connotation as “the communicative value that an expression has by virtue of what it refers to, over and above its conceptual content” (p.12). Based on this definition, there is a relation between connotation and semantic prosody. They both endow an evaluation by collocates in a linear micro-context.

Different opinions are in existence, regarding whether or not semantic prosody is a type of connotative meaning. Partington (1998, p. 68), Stubbs (2001a, p. 449) and Hunston (2002, p. 142) appear to take it for granted that semantic prosody is connotational, while Louw (2000, pp. 49–50) clearly argues that ‘semantic prosodies are not merely connotational’ as ‘the force behind SPs [semantic prosodies] is more strongly collocational than the schematic aspects of connotation’ (as cited in Xiao & McEnry, 2006, p.107). It can be concluded that connotation can be collocational or noncollocational whereas semantic prosody can only be collocational

### *Semantic Prosody*

Stewart (2009) defined the most common interpretation of semantic prosody as “the way in which a word such as *cause* co-occurs regularly with words that share a given meaning(s) and then acquires a positive or negative meaning of these words, this acquired meaning called semantic prosody” (p. 1).

The aforementioned definition is explained through the well-known example of this concept. *Cause*, studied by Stubbs is mostly used with negative words like *accident, catastrophe, disease, distress* and so on which denote disagreeable things. It is therefore said, to have a negative semantic prosody. While its synonym, the phrasal verb *bring about* has positive semantic prosody. It usually collocates with *cure, success, solution*, etc. which denote agreeable things. Thus it can be said that a *problem* is *caused* but a *solution* is *brought about* (Widdowson, 2007, p.81). Whitsitt (2005) mentioned three distinctly different definitions of semantic prosody in his article. One is Bill Louw’s, contributed in 1993, as follows: if several different words all sharing the same semantic trait are frequently used with another word, meaning will be passed, over time, from that group of words to the other word. Then there is that of Sinclair’s (1996) which is:

Semantic prosody . . . is attitudinal, and on the pragmatic side of the semantics/ pragmatics continuum. It is thus capable of a wide range of realization, because in pragmatic expressions the normal semantic values of the words are not necessarily relevant. But once noticed among the variety of expression, it is immediately clear that the semantic prosody has a leading role to play in the integration of an item with its surroundings.

And the third definition which has no definite author, treats semantic prosody as if it were a synonym of connotation. About this definition, Janet Cotterill writes that semantic prosody is involved in “revealing ‘words [which] occur in characteristic collocations, showing the associations and connotations they have and therefore the assumptions which they embody” (pp. 283-85).

### ***Corpus***

To be defined roughly, a corpus is a collection of naturally occurring examples of language. Corpora, in Sinclair (1996) terms, are parts of language, chosen and organized based on explicit language criteria, so that they can be criticized and as Johnson (1998) contended, help to choose and set together the texts "in a principled way" (as cited in Estaki 2012, p.8). The intended use of the corpus determines the criteria used to compile a corpus. In fact, depending on the purpose and the form, different types of corpora may be distinguished such as General Corpus, Specialized Corpus, Monitor Corpus, Comparable Corpus, Parallel Corpus, Pedagogic Corpus, Learner Corpus, Historic or Diachronic Corpus, Spoken Corpus and Evaluation Corpus.

### **THE STUDY**

The subject of this article revolves around exploring the semantic prosody behavior of Persian equivalents of some English words. A specialized monolingual corpus was made for this purpose.

### ***Specialized Monolingual Corpus and Data Collocation***

English words, which are used in this article, are *cause*-words and *result*-words. These words were chosen because scholars had conducted in-depth examinations on them and realized their semantic prosodic features.

The researcher compiled a specialized monolingual (Persian) corpus for analyzing the semantic prosody behavior of Persian equivalents of these search-words. The texts of this corpus were selected from “Parseek”, “Tabnak” and “Magiran” which all are Persian news websites. Since the texts of this corpus were collected from Persian news websites, it is named a specialized monolingual corpus. There is, in addition, one further point that, the selection of texts is based on the Persian equivalents of search words, identifying by using two bilingual dictionaries. These words were typed on the search icon and all texts including them were extracted. This corpus contains approximately 2,000,000 words. For finding all occurrences of the search words under each other, as a concordance<sup>3</sup>, sentences including the words were extracted from the corpus and pasted on a new Microsoft word file. In this way, sentences are shown below the other and words are displayed with a span of co-text to the left and right, as in figure 1.

---

<sup>3</sup> A concordance provides lines of text one below the other, with the search word along the central axis.

Figure 1: Displaying of a word along the sentence

This is the first stage. In the next stage, the researcher should identify the collocations and semantic preferences and then translate these into semantic prosody. On the other hand, it is time to change the data into evidence.

### Data Analysis

In this research, the researcher tried to identify semantic prosody behavior of Persian equivalents of search-words by investigating their collocations. Then according to collocates of the node word, semantic prosody was classified into positive, negative or neutral. If the collocates that a neutral word, i.e. node word, attracts are mostly negative semantic characteristic, the node word bears a negative prosody. If the collocates are mainly positive words, then the node word is endowed with a positive prosody. And finally if both positive and negative collocates exist, it can be said to bears a neutral prosody. This classification of semantic prosody was proposed by Stubbs (1996); that is some words have a predominantly negative prosody, a few have a positive prosody, and many words are neutral in this respect.

## RESULTS AND DISCUSSION

The semantic prosodic features of English words are presented in table 1.

Table 1: The semantic prosody of search-words

Search-words	Scholars	Semantic prosody behavior
<i>Cause</i>	Stubbs, Sinclair, Bublitz	negative
<i>bring about</i>	Xiao and McEnry	positive
<i>Result</i>	Xiao and McEnry	Positive
<i>Outcome</i>	Xiao and McEnry	positive
<i>aftermath</i>	Xiao and McEnry	negative
<i>consequence</i>	Xiao and McEnry	negative

### CAUSE-words

#### English Data

English speakers use *cause* and *bring about* in their speech to mean “make something happen”. These near synonyms have a very similar denotative meaning but they are different in their collocational behavior and semantic prosody. In contrast to *cause* having negative semantic prosody, *bring about* has positive semantic prosody. It should be mentioned that these verbs are seemingly neutral words but their frequent occurring with negative and positive words produces negative and positive semantic prosodic feature for them. These two word forms and their Persian equivalents are subtly discussed below.

Stubbs (1995) analyzed the semantic prosody of the word *cause*. He observed that this verb was almost always followed by something negative such as *problems*, *pain*, *disease*, *distress*, *trouble* etc. Figure 2 shows a random selection of instances of the verb *cause* (as cited in Hunston, 2007, p. 251). In each line, the words indicating what is caused are highlighted in bold.

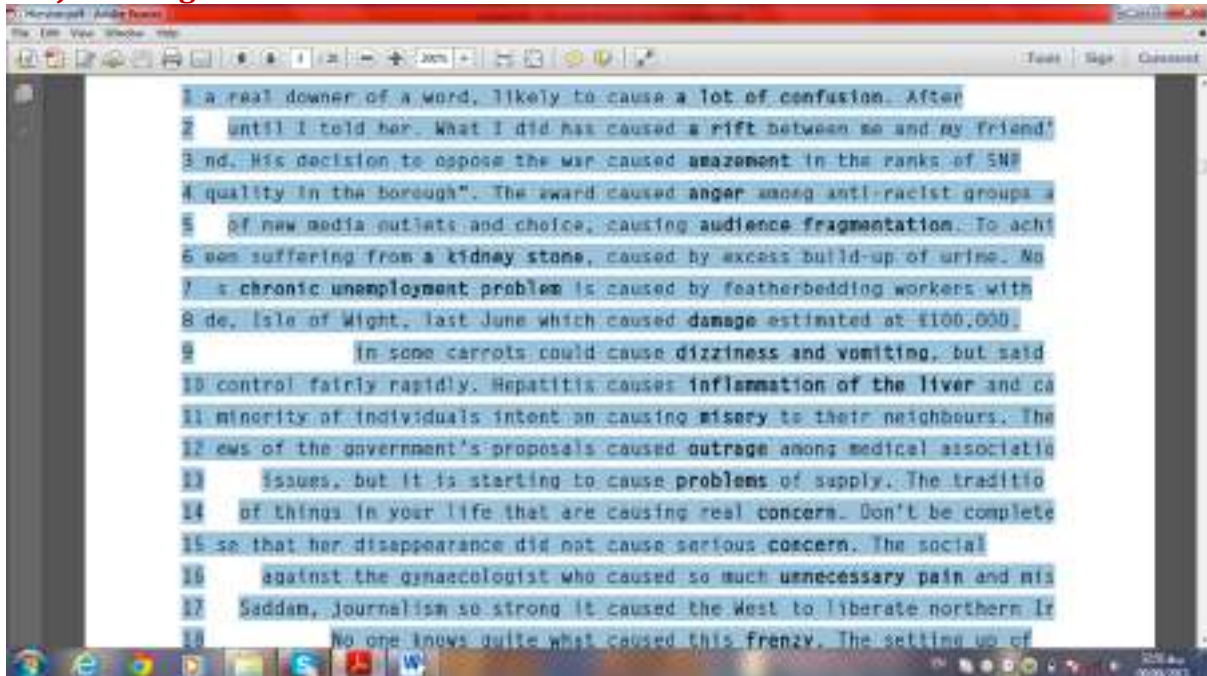

Figure 2: Examples of cause

Xiao and McEnry (2006) utilized the FLOB and Frown corpora to study the semantic prosody of near synonyms, *cause* and *bring about*. In these corpora, there are 287 examples of *cause* of which 223 occurrences have an unfavorable prosody, 56 are neutral while 8 cases are positive. This corpus search shows that this verb has an overwhelmingly negative prosody (p.114). Some of its nominal collocates are:

*serious illness, death, damage, blood, concern, degradation, events, harm, land, number, people, pollution, suffering, anxiety, condition, decision, fear, heart, human, stress, surprise, symptoms, time, water, women, years, cancer, crisis, accident, delay, pleasure, some easing of the confusion, some tumors to shrink or disappear*

The last three underlined expressions show that the typical and central negative prosody of *cause* doesn't prevent it from co-occurring with words indicating positive results (Xiao & McEnry, 2006, p. 115). Related to this issue Stubbs (1995) wrote;

CAUSE is near the stage where the word itself, out of context, has negative connotations. The selection restrictions on CAUSE are not (yet?) categorical: it is not (yet?) ungrammatical to collocate CAUSE with explicitly positive words. But it is easy to see how an increase in frequency of use can tip the balance and change the system (p.50).

His last sentence indicates that more than 90% of collocates of this verb are negative. Thus it could be said something can *cause* death and *bring about* happiness.

Contrary to this verb with strongly negative semantic prosody, its phrasal verb synonym *bring about* mostly collocates with desirable objects such as *improvements, revolution, happiness, and growth*. According to Xiao and McEnry's study (2006), in FLOB and Frown corpora, there are 37 occurrences of this phrasal verb, of which 17 are positive and 14 are negative, with the remaining six being neutral (p.115). Some other collocations of this phrasal verb are:

*increase, order, government, situation, action, policy, reduction, result, state, death, downfall, war*

Of these collocates, the three underlined words are negative, others are positive or neutral. Therefore a *problem* is *caused* but a *solution* is *brought about*.

There are a number of other phrasal verbs in English which share similar meaning but vary in semantic prosody. Xiao and McEnry (2006) studied the semantic behavior of *result in/from*, *lead to*, *arouse* and *give rise to*. *Result in* and *result from* are different in frequency and syntax but are quite similar in affective meanings. They are used less frequently than *cause* to show a negative affective meaning and less frequently than *bring about*, to show a positive evaluation. *Lead to* is strikingly similar to *result in/from* in affective meanings. *Arouse* and *give rise to* are relatively infrequent. They draw a table for the semantic prosody of the *cause* words.

Table 2: Distribution of CAUSE-words in English (Xiao &amp; McEnry, 2006, p. 117)

Synonyms	Negative	Positive	Neutral	Total
<i>Cause</i>	223 (78%)	8 (3%)	56 (19%)	287
<i>Arouse</i>	45 (65%)	10 (15%)	14 (20%)	69
<i>lead to</i>	141 (49%)	65 (22%)	85 (29%)	291
<i>result in/from</i>	84 (47%)	49 (27%)	47 (26%)	180
<i>give rise to</i>	27 (46%)	8 (13%)	24 (41%)	59
<i>bring about</i>	14 (38%)	17 (46%)	6 (16%)	37

#### Persian Data

By considering the results of scholars' analyses on semantic behavior of *cause* and its near synonym *bring about* in English, we tried to analyze the semantic prosody of their Persian equivalents. The Persian equivalents of these near synonyms are extracted from three bilingual dictionaries. Among them, those which appeared the most common were selected to be studied including, باعث شدن, موجب شدن, and سبب شدن. Table 3 shows these entries and their Persian equivalents.

Table 3: Persian equivalents of Cause and Bring about

English synonyms	Persian equivalents	Dictionaries
<i>cause something</i>	علت...بودن، باعث...شدن، موجب...شدن، برانگیختن، پدیدآوردن، به وجودآوردن	هزاره Millennium
	سبب شدن، موجب شدن، باعث شدن، فراهم آوردن، واداشتن، وادارکردن	حییم Haim
	علت(چیزی)بودن، موجب شدن، باعث شدن، ایجاد کردن، به وجود آوردن	پویا Living
<i>bring something about</i>	باعث شدن، موجب شدن، پدیدآوردن	هزاره Millennium
	فراهم آوردن، بوقوع رساندن	حییم Haim
	به وجودآوردن، ایجادکردن، باعث(چیزی)شدن، موجب(چیزی)شدن	پویا Living

#### A. باعث شدن

The words or phrases collocating with this verb are adjectives, nouns or noun phrases. The collocations of this verb are listed below (in descending order of frequency of co-occurrences). Following is a table including some sample sentences of this verb. In each line, the words collocating with this verb are in bold.

**منفی:** ازدست دادن هویت، حاشیه رفتن اولویت‌ها، التهاب جامعه، باخت، تکدرو تالم خاطر، وسوسه، پسرفت، تخریب، طلاق، حمله قلبی، بی‌انگیزگی و بی‌اعتمادی، وخیم شدن، سرشکستگی، بحرانی شدن اوضاع، اخراج، تلف شدن، هتک حرمت، ضعیف شدن، کشته و زخمی شدن، نفرت از دین، وحشت مردم، سوختگی، سرطان، نابینایی و فلج شدن، غفلت، تشنج و درگیری، مزاحمت، پیری زودرس، افسردگی، فلج عضلانی، ناراحتی و نگرانی، دلخوری، ائتلاف، آبروریزی، چالش، تهی شدن از هویت

**مثبت:** افزایش خدمت‌رسانی، توسعه فناوری اطلاعات و ارتباطات، خوشحالی مردم، فخر، پیشرفت، ایجاد دوستی، افزایش امید، اعتبار، کارآمدی و رشد، سلامتی، موفقیت، خودباوری در تولید، صرفه‌جویی در زمان، عاقبت بخیری، پیروزی، عزت و سربلندی، غرور و افتخار

**خنثی:** تصمیم‌گیری، معطوف شدن نگاه، وابستگی، نگهداری افراد، شناسایی، نقل داستان، بازی کردن، تغییرنگاه، اتفاق، تشکیل دادگاه، انتقال

Table 4: Examples of شدن...باعث

No	Examples
1	محقق نشدن وعده ها باعث بی انگیزگی و بی اعتمادی پرستاران شده است.
2	ورزش نکردن باعث تقویت نشدن عضلات و ابتلا به بیماری های استخوانی می شود.
3	مشروبات الکلی باعث طولانی تر شدن اثر خاطرات دردناک می شود.
4	نزدیک شدن بیش از حد به تلویزیون باعث ایجاد اختلالات بینایی می شود.
5	بازی های کامپیوتری باعث چاق شدن کودکان می شود.
6	کاهش کیفیت آب رودخانه کارون باعث تلف شدن ماهی های گرمابی شده است.
7	تحقق حماسه اقتصادی باعث شکوفا شدن ظرفیت ها و رشد اقتصادی می شود.
8	رائش زمین باعث مدفون شدن 83 معدنچی در تبت شد.
9	ملی پوشان با ارائه بازی های ضعیف و دور از انتظار باعث سرشکستگی فوتبال ملی شدند.
10	سازمان ملل متحد: نیروهای آمریکایی باعث تخریب باغ های معلق بابل شدند.
11	تعامل میان معاونان فرهنگی و دانشجویی، باعث پرشور تر شدن فضای انتخابات در دانشگاه ها می شود.
12	مجسمه های خیابانی که باعث وحشت مردم شدند.
13	ایجاد پل ارتباطی بین نخبگان و مدیران باعث متحول شدن استان می شود.
14	عواملی که باعث زرد شدن دندان ها می شوند.
15	لنزهای آلوده باعث سوراخ شدن قرنیه می شوند.
16	یکی از معجزات قرآن باعث مسلمان شدن یک تیم تحقیقاتی ژاپنی می شود.
17	حمایت از صنعت و معدن استان باعث کاهش بیکاری شده است.
18	عدم حضور شرکت های خارجی باعث دیده شدن شرکت های داخلی می شود.
19	ثبات، باعث موفقیت کشتی می شود.
20	دود قلیان باعث پیری زودرس پوست می شود.

In our specialized monolingual corpus, there are 220 instances of collocations of شدن باعث used as a verb. Of these, 130 occurrences have unfavorable prosody, 59 favorable while 31 cases have neutral meaning. As the number of occurrences of this verb shows, it tends to collocate with words denoting unfavorable things such as

as  
 مدفون شدن، پیری، زودرس، وحشت انگیزگی و بی اعتمادی، پیری، مدفون شدن  
 therefore, this verb can acquire a negative semantic prosody.

#### A. موجب شدن

A random selection of instances of this verb is shown in table 5. Highlighted words or expressions indicate collocations of this verb imbuing their meaning to it. Significant collocates of this verb include:

**مثبت:** عملکرد مناسب بازار، قوی تر شدن سپاه، متحول شدن رفتار، رشد شکوفایی، همدلی، صنعتی شدن استان، درخشندگی، زنده شدن نام، تقرب به خالق، شادابی و پویایی، سلامتی، استقلال و آزادی، سرزندگی و قدرت، بهبود بیماری روانی، پایداری در تولید، پیشرفت، خوشبختی، ارتقای دانش، رشد اقتصاد ملی، توفیق، نفع و سود، خرسندی، عزت و افتخار، دلگرمی، تقویت اعتماد، آرامش، خنده و شادی

**منفی:** بسته شدن عروق، بدرنگ شدن دندانها، تنبل شدن ذهن، پوکی استخوان، شیوع بیماری، خدشه دار شدن دین، زخمی شدن، سردرگمی، سلب اعتماد، تلف شدن، خشم مردم، مجروح شدن، افسردگی، ناباروری، کمبود مواد غذایی، بدطعم شدن ماهی، صدمه و آسیب، بروز مشکلات، تغییرات خلقی، کشته شدن، التهاب، سوراخ شدن آپاندیس، سکنه قلبی، افزایش تورم، هلاک، بحران مالی، تباهی، تجاوز، هتک حیثیت، آزار و اذیت، تسمخه همگان، اختلاف، متزلزل شدن، سوءاستفاده، ترس و ناامیدی، نارضایتی، عزل، ازکارافتادن

**خنثی:** توزیع شیر، معرفی، آشنایی، شکل گیری، انتقال، تولید افکار، کوچ،

Table 5: Examples of شدن...موجب

No	Examples
1	سرما موجب فعال شدن ویروس های بیماری را در بینی می شود.
2	تزییق بوتاکس در مواردی موجب نامتوازن شدن چهره بیمار می شود.
3	ضربه و مصرف بیش از حد فلوراید موجب بدرنگ شدن دندان می شود.
4	واقعی شدن قیمت ها موجب افزایش کیفیت خدمات پستی می شود.
5	بازی های یارانه ای موجب تنبیل شدن ذهن می شوند.
6	گرم شدن جهان و پدیده های آب و هوایی شدید موجب شیوع وسیع بیماری ها می شود.
7	رئیس شورای عالی حوزه علمیه: اقدامات افراطی موجب خدشه دار شدن دین اسلام می شود.
8	جرايم اينترنتی موجب از هم پاشیده شدن خانواده ها می شود.
9	فعالیت های فرهنگی موجب متحول شدن رفتار مددجویان زندان می شود.
10	توجه به ورزش موجب برطرف شدن ناهنجاری های اجتماعی و اخلاقی می شود.
11	حضور مردم در انتخابات موجب همبستگی و خنثی شدن اهداف شوم دشمنان می شود.
12	حمله شهرک نشینان صهیونیست موجب زخمی شدن هشت دانش آموز دختر فلسطینی شد.
13	وزیر نفت: اجرایی شدن انتقال گاز موجب رشد و شکوفایی ایران و پاکستان میشود.
14	امام جمعه بیله سوار: نهادینه شدن عطف در جامعه موجب افزایش همدلی می شود.
15	بی بی سی: کشته شدن اسیر فلسطینی در زندان رژیم صهیونیستی موجب خشم گسترده مردم شده است.
16	پیروزی انقلاب موجب برچیده شدن بساط ظلم و زور از کشور شد.
17	افسردگی موجب سکنه ی قلبی می شود.
18	توسعه کشت های گلخانه ای موجب صرفه جویی در مصرف آب کشاورزی می شود.
19	اجرایی کشاورزی حفاظتی، موجب پایداری در تولید و امنیت غذایی می شود.
20	آیا درست است که از دواج موجب بهبود بیماری روانی می شود؟

There are 210 instances of collocations of شدن موجب in our corpus, which are distributed as follow: positive 77, neutral 30 and negative 103. Some sentences include words or expressions which refer to undesirable things such as زخمی شدن، تنبیل شدن etc.

همدلی، پیشرفت، etc. Some other collocations of this verb refer to desirable things for example شیوع بیماری، خشم etc. خوشبختی

## B. سبب شدن

Some collocations of سبب شدن are listed below and its table, including examples, is followed.

**مثبت:** غرور هواداران، بازگشت آرامش، تحول و توسعه، خیر، رشد تعالی، تحول بزرگ، خشنودی، امنیت، افتخار، نشاط و پویایی، افزایش خودباوری و عزت نفس، رونق اقتصادی، تنوع حضور، گرایش به قرآن، کرامت، زوده شدن گناه، خوب شدن خلق و خوی، براق شدن موها، موفقیت، انگیزش جوانان، خلق حماسه، بهرهمندی، وحدت، اقدام موثر، زندگی آرام و راحت، خوداتکایی، برتری

**منفی:** تشدید تنش، افزایش نگرانی، اعتراض خشونت آمیز، لغو تمرین، جان باختن، انحرافات جنسی، ناآرامی، نقض حریم، سقوط، حمله، ترافیک، صدمه زدن، فاجعه، ریزش، خونریزی، تخریب، طغیان رودخانه، کشته شدن، خودکشی، ابتلا به بیماری، جاری شدن سیل، نقض رشد، ترس مردم، انفجار، به هم خوردن وحدت، مشکوک شدن، سلب اعتماد، حاشیه رفتن نیروی کار، به زندان افتادن

**خنثی:** گرایش، افزایش اقامت، خوردن غذا، خرید، نامیده شدن، شناسایی، رویداد، مطرح کردن

Table 6: Examples of سبب شدن...

Examples	No
تصمیمات بانکی قبرس سبب افزایش نگرانی مردم شده است.	1
صدور حکم دیوان عالی کنیا سبب بازگشت نسبی آرامش شد.	2
احداث شهرک پتروشیمی در چابهار سبب ایجاد تحول و توسعه اشتغال میشود.	3
بحران بودجه آمریکا، سبب لغو یک تمرین نظامی ارتش این کشور شد.	4
استاندار اصفهان: پیام نروزی رهبر فرزانه انقلاب سبب رشد و تعالی کشور می شود.	5
بحران مالی قبرس، سبب شکل گیری چالش بانکی در این کشور شده است.	6
مصرف مواد غذایی پرچرب در زنان باردار سبب ایجاد نفخ و اختلال در خواب شبانه می شود.	7
تمرینات ورزشی منظم سبب بهبود عملکرد مغز در میانسالی می شود.	8
اختلاف و تفرقه میان اصولگرایان سبب خشنودی جریان فتنه می شود.	9
کاهش بودجه دولت آمریکا سبب تاخیر گسترده پروازها شد.	10
حضور حداکثری در انتخابات سبب خلق حماسه سیاسی می شود.	11
بمب گذاری بوستن آمریکا سبب امنیتی شدن مارتن لندن شده است.	12
لاوروف: اقدام اتحادیه عرب ممکن است سبب استعفای ابراهیمی شود.	13
گودیداری غیراصولی در تهران سبب ریزش یک ساختمان مسکونی شد.	14
باران شدید سبب طغیان رودخانه ها و آب گرفتگی معابر درکنگان بوشهر شد.	15
معاون فرماندار بوکان: سفرهای استانی سبب نزدیک شدن مردم و دولت شده است.	16
غنی کردن اوقات فراغت گردشگران سبب افزایش اقامت در آذربایجان شرقی شده است.	17
اختلال در شبکه رایانه ای سبب اختلال در حرکت قطارها در تایوان شد.	18
با درمان موش ها بواسطه پادتنی که سبب توقف و خنثی نمودن این آنزیم می شود، کاهش در اثرات بیماری در مغز و نخاع مانند میلین زدایی، مشاهده شد.	19
خوردن شکلات سبب لاغر شدن افراد می شود.	20

In our specialized monolingual corpus, 187 occurrences of collocations of this verb are found. Of these, 90 instances are negative, 80 positive and 9 neutral. The number of instances of this verb, including negative and positive collocations is very close.

#### Discussion about the Persian Equivalents of Cause-Words

The Persian equivalents of the English words which mean “make something happen” such as *cause* and *bring about* are سبب شدن، باعث شدن، موجب شدن. They have 210, 220 and 187 instances in our corpus, respectively. Table 7 and figure 3 present these near synonyms’ semantic prosody behavior.

Table 7: Distribution of CAUSE- words across meaning categories in Persian

Synonyms	Negative	Positive	Neutral	Total
باعث ..شدن	130(59%)	59 (26%)	31(14%)	220
سبب...شدن	94 (50%)	60 (32%)	33(17%)	187
موجب...شدن	103(49%)	77 (36%)	33(17%)	213

Figure 3: Semantic prosody of synonymous cause-words in Persian

This chart reveals some columns indicating the semantic prosody behavior of three near Persian synonyms meaning “make something happen”. As it can be clearly seen, باعث...شدن has the highest percentage of the negativity and the lowest of positivity. Therefore, it can be said that it has overwhelmingly a negative semantic prosody as its co-occurrences are unfavorable words or expressions. Regarding the chart, the synonyms of باعث شدن, سبب شدن and موجب شدن have also more tendencies toward collocating with negative words. It can be proved by their high negative percentage. In general, although باعث شدن has the highest negative percentage, the result of the Chi-square (a) test demonstrated that statistically there is no significant difference among the negative percentages of these three close synonyms. The result of the test is presented in the table below.

Table 8: Test Statistics

	percent
Chi-Square(a)	1.152
Df	2
Asymp. Sig.	.562

$$(\chi^2(2, 0/05) = 1/15, p=0/56)$$

Overall, in contrast to English synonyms *cause* and *bring about* which differ in semantic prosody, their Persian equivalents are not so different while باعث شدن strongly tends to collocates with words with unfavorable meanings. It is considered that it has a negative semantic prosody.

### RESULT-words

#### English Data

Some words in English which mean “anything that is due to something already done” are *result*, *outcome*, *consequence* and *aftermath*. Most dictionaries only focus on the denotative meaning of these near synonyms and some of them such as Longman Synonym Dictionary simply list them as the synonym. They don’t distinguish the differences between these near synonyms in their affective meaning. Studies show that these four near synonyms can be arranged from positive to negative, on a semantic continuum as follows: *outcome/result*; *consequence*, and *aftermath* (Zhang, 2007, p.5).

Examples of *consequence* in the FLOB/Frown corpora show that fixed expressions such as “as a consequence” and “in consequence of” can be negative, positive or neutral, depending on their context while *consequence* and its plural form *consequences* strongly tend towards a negative semantic prosody. When *consequence* means *result*, its typical collocates refer to something unpleasant such as *serious*, *disastrous*, *adverse*, *demanding*, *negative*, *unfortunate*, *tragic* and *fatal* (Xiao & McEnry, 2006, p.109).

Fourteen occurrences of *aftermath* which are mostly in the expression “in the aftermath of”, in the FLOB/Frown corpora show that the tendency of this word is strongly toward negative prosody. The significant collocate of this word is *war/wars* (Xiao & McEnry, 2006, p.110).

*Result* and *outcome* are the other two synonyms. *Result* is more common than *outcome*. It appears that these words collocate with pleasant or favorable affective meaning words, e.g. *an excellent result*, *a brilliant result*, *a successful outcome*, *a great result* and etc. Their significant collocates, ranking by co-occurrence frequency are;

Result: *better*, *different*, *early*, *end*, *final*, *similar*, *direct*, *empirical*, *likely*, *experimental*, *good*, *negative*, *desired*  
 Outcome: *likely*, *positive*, *successful*

A close attention to the collocations show that negative also appears on the collocation list of *result*.

#### Persian Data

As for the semantic prosody behavior of Persian equivalents of these near synonyms, their Persian equivalents were extracted from Millennium and Living English to Persian dictionaries, presented in the table 9.

Table 9: Persian equivalents of result-words

Synonyms	Persian equivalents from Millennium	Persian equivalents from Living
<i>Result</i>	نتیجه، اثر، حاصل، ثمره، فایده، بارویر	نتیجه، ثمره، حاصل
<i>Outcome</i>	نتیجه، حاصل، پیامد، بازده	نتیجه، حاصل، پیامد
<i>Consequence</i>	نتیجه، پیامد، اثر، حاصل، عواقب	نتیجه، پیامد
<i>Aftermath</i>	نتیجه، عواقب، پیامد	نتیجه، پیامد، عواقب

Among the Persian equivalents of these synonyms, *natijeh* is seen as an equivalent of all these words. In addition to this, another equivalent for *result* is *hasel*. *Payamad* and *hasel* are equivalents of *outcome* beside *natijeh*. Equivalents of *consequence* are these all words plus *avagheb*. *Natijeh*, *avagheb* and *payamad* are mentioned as *aftermath* equivalents. This part explored the collocational behavior and semantic prosody of these near Persian synonyms. These near synonyms differ in their semantic prosody behavior.

#### A. حاصل

Significant collocates of this word are:

حاصل: فعالیت، کار، تولید، زحمات، وحدت و همدلی، تلاش، عملکرد خوب، عدالت، وجود نظام اسلامی، شهامت، خودباوری، آزادسازی، تجربه، مبانی دینی، مقاومت، علمگرایی، اعتماد، ازدواج، نیات صادقانه، تجلی تفکر، پیوند، استقامت، مطالعات، رقابت، آزمایش، بررسی، روابط، قرارداد، مسابقه، زلزله، اشتباهات، تملق، درگیری، حوادث، دوری از ادبیات، تعارض

Of all these nominal collocates, with the exception of the underlined items which are neutral and negative, the other ones show the tendency of this word toward a positive semantic prosody. Some sentences including positive collocates of this word were selected and came in table below.

Table 10: Examples of حاصل

Examples	No
هنرمندان حاصل ۳ سال فعالیتشان را به موزه هنرهای معاصر می‌برند.	1
پیروزی و 10 شکست حاصل کار نمایندگان ایران در تنیس روی میز قهرمانی جهان است.	2
درآمدهای حاصل از هدفمندی یارانه‌ها امروز در مجلس بررسی می‌شود.	3
تاجری: افتخارات و لاسکو حاصل زحمات مربیان قبلی است.	4
یک طلا و یک برنز حاصل تلاش دوومیدانی کاران در مرحله اول جایزه بزرگ آسیا است.	5
خوشحالم که عیدی اول را ما به مردم دادیم، این تیم حاصل شهامت مربیان لیگ برتری است.	6
جماران حاصل خودباوری است.	7
رشد 2 برابری درآمدهای حاصل از آزادسازی حامل‌های انرژی در اجرای هدفمندی...	8
اسلامی کردن دانشگاه حاصل هزار سال مبانی دینی است.	9
عقب نشینی غرب در مذاکرات آلمانی حاصل مقاومت ملت و رهبری بود.	10

In our specialized monolingual corpus, there are 106 instances of the word *hasel* which 40 contain positive collocations of this word, 34 neutral and 32 negative.

#### B. نتیجه

Some collocates of this word are:

نتیجه: ارتباط مطلوب، صلاحیت، پیروزی، تفکر، میانجیگری، موافقت، تحقیق و تفحص، خدمت رسانی، رایزنی، دانش، آزادسازی، حمایت و مدیریت، بی احتیاطی، تبانی، هتک حرمت، بی‌تفاوتی، بمب اتمی، تحریم علمی، معکوس، بی‌توجهی، انحراف، قهر، رسوایی، سوء استفاده، ناامیدی، سهل‌انگاری، دخالت، واگذاری، تداوم بحران، استرس، ممنوعیت واردات، وقوع خشکسالی، مساوی، بررسی، بازی، درمان

Except the underlined words which are neutral, other items have neither positive nor negative meaning. The Following table includes some instances of both negative and positive collocates of this word.

Table 11: Examples of نتیجه

Examples	N0
محصول محوری، نتیجه ارتباط مطلوب صنعت و دانشگاه می‌باشد.	1
نتیجه صلاحیت نامزدهای انتخاباتی شهر و روستا، 28 اردیبهشت ماه ابلاغ می‌شود.	2
دمشق: پیشرفت در مذاکرات سیاسی بین‌المللی نتیجه پیروزی‌های ارتش سوریه است.	3
استاد هندی: انتخابات آزاد در ایران، نتیجه نظام مردمسالار است.	4
نتیجه موافقت قطعی قطب‌های علمی تا اوایل شهریور اعلام می‌شود.	5
سردار نقدی: علم بدون معنویت نتیجه‌اش پمپ اتمی است.	6
تاج: لیگ سیزدهم قطعاً 16 تیمی است، نتیجه تبانی تایپان هفته اعلام می‌شود.	7
باهنر: از تشکلهای حامی کاندیداتوری عذرخواهی می‌کنم، به نتیجه ائتلاف پایبندم.	8
اتحاد مسلمانان نتیجه هتک حرمت به ساحت مقدس صحابه پیامبر (ص) است.	9
فغانی: ناهنجاری و بداخلاقی در فوتبال نتیجه بی‌تفاوتی مسئولان است.	10

Ninety occurrences of this word were found in our specialized monolingual corpus, including 35 negative collocations, 33 positive and 22 neutral.

### C. پیامد

The collocations of this word are:

پیامد: عدم حمایت، تجاوز، برخورد کشتی با صخره، مصرف خودسرانه، خطرناک، منفی، مداخله، جبران ناپذیر، فاجعه‌بار، بحران، گردوغبار، درگیری، سقوط، استعفا، تهدید، تحریم، پیش‌بینی نشده، جنگ، ورشکستگی، محدودیت، مخرب، اشغالگری، غفلت، ناگوار، بیکاری، تشدید تنش، شوک، وخیم، بدرفتاری، تلخ، مصرف مواد مخدر، ناامنی، ترور، بازداشت، اهانت، حوادث، اعتراض، تورم، بیماری، مخاطره‌آمیز، تشنج، ناخوابسته، مناقشه، توافق، تکنولوژی، فعالیت، اتخاذ تدابیر فوق العاده

Most of collocates of this word are negative. Some of them are adjectives such as خطرناک، جبران‌ناپذیر، فاجعه‌بار، مخاطره‌آمیز and some others are nouns or noun phrases except the underlined items indicating that it still collocates with positive words. In our corpus, there are a number of obviously negative collocates of this word. Some instances existed in table below.

Table 12: Examples of پیامد

Examples	No
انگلیس درباره پیامدهای <u>عدم حمایت</u> از بازسازی سومالی هشدار داد.	1
مجلس شورای مصر پیامدهای <u>تجاوز</u> اسرائیل به سوریه را بررسی می‌کند.	2
دمپسی: ایجاد منطقه ممنوع پرواز در سوریه پیامدهای <u>منفی</u> زیادی برای منافع امریکا دارد.	3
استفاده ابزاری از آژانس پیامدهای <u>جدی همچون یأس</u> و خروج از معاهده را در پی دارد.	4
امیر عبداللهیان: حمله به سوریه پیامدهای <u>خطرناکی</u> دارد.	5
دخالت احتمالی و اشنگتن در سوریه با پیامدهای <u>جبران ناپذیری</u> همراه خواهد بود.	6
نماینده روسیه در ناتو: توسل به زور در سوریه پیامدهای <u>فاجعه باری</u> خواهد داشت.	7
یک تشکل سیاسی مخالف نظام سوریه نسبت به پیامدهای <u>استعفای</u> اخضر ابراهیمی هشدار داد.	8
پوتین درباره پیامدهای <u>بحران</u> اقتصادی جهانی برای اقتصاد روسیه هشدار داد.	9
شکست مادورو، پیامدهای <u>پیش بینی نشده</u> ای متوجه ونزوئلا خواهد کرد.	10

Of the 98 instances containing پیامد in our corpus, 54 occurrences have negative collocations of this word, 26 neutral and 17 positive, being the least instances.

### D. عاقبت

Significant collocations of this word are:

عاقبت: غرور، دزدی، ورود اشتباه، مظنونان، تلخ بدحجابی، شوم توجیه گناه، زورگیری، چاقوکش، فرار از مالیات، پناهجویان غیرقانونی، تشخیص اشتباه، بیکاری، خیانت، دروغگو، نزاع، بی‌فکری، سیم‌کارت‌های بلاتکلیف، وزرای برکنار شده، جوگیر شدن، اخراج، متجاوزان، مزاحمت، فرو ریختن، جدال، درگیری، خودنمایی، مستی، جلد، قاتلان، لاجبت، اسراف، گران‌فروشی، شخص متخلف، لشکرکشی، جنایت سیاه، بازجویی، آتش‌زدن، دوستی در زندان، حقه بازی، حرص و طمع، پرحرفی، هکرها، فرار از مکتب، فرقه انحرافی، حرف دروغ، تندروی، ناراستی، طاغوت، عشق، ایمان، ایستادگی، تلاش، مهربانی و انصاف، خوش

This word rarely collocates with words with favorable meaning such as the underlined words. Words or phrases which come with this word mostly have unfavorable meaning as the listed and following table show.

Table 13: Examples of عاقبت

Examples	No
عاقبت وحشتناک مردی که اتوبوس دولتی را دزدید!	1
عاقبت وزیری که از مالیات فرار می‌کرد.	2
رئیس اداره پناهندگان وزارت خارجه: عاقبت پناهجویان غیرقانونی، زیان مالی و جانی برای آن‌هاست.	3
افروغ: کسانی که از اهرم تهمت و افترا استفاده کردند امروز روز خوشی ندارند و عاقبت بدتری هم سراغشان خواهد آمد.	4
عاقبت اکثر روابط اینترنتی داستان‌های تلخ اما واقعی است.	5
شکایت از رئیس جمهور به قوه قضاییه و استیضاح؛ عاقبت پاسخهای غیراقتناعی رئیس جمهور خواهد شد.	6
عاقبت مستی، فراموشی است.	7
... "نسبه نمی‌دهیم، حتی به شما" و هیچ کاسبی نقاشی عاقبت گران فروشی و عاقبت نسبه فروشی را به پیشانی مغازه‌اش نصب نمی‌کرد.	8
قصاص، اعدام در ملاء عام، 3 سال حبس و 74 ضربه شلاق عاقبت متهمی است که پس از تجاوز به منشی مطب دندانپزشکی او را با روسری خفه کرد.	9
اگر کارکرد بمب هسته‌ای آنطور که ابرقدرت‌ها مدعی هستند بازدارندگی است یعنی ترساندن نیروی بیگانه از عاقبت تجاوز به کشور و می‌خواهند دشمن را بترسانند تا آنها حمله نکنند.	10

There are 118 instances of this word in the corpus which 66 are negative, 31 neutral and 21 positive.

As mentioned before, these Persian synonyms are different in their semantic prosody behavior. For making this statement more clarified, these synonyms' occurrences are presented in percentage in the table 14 and figure 4 in next part.

#### Discussion about the Persian Equivalents of Result-Words

Table 14: Distribution of RESULT-words across meaning categories in Persian

Synonyms	Negative	Positive	Neutral	Total
عاقبت	66 (56%)	21 (17%)	31 (26%)	118
پیامد	54 (55%)	17 (17%)	27 (27%)	98
نتیجه	35 (38%)	33 (36%)	22 (24%)	90
حاصل	32 (30%)	40 (37%)	34 (32%)	106

Figure 4: Semantic prosody of synonymous result-words in Persian

In conclusion, like the synonyms of *result* in English, the three near synonyms of نتیجه in Persian can be arranged on a semantic continuum, from positive to negative as follows: حاصل، نتیجه، پیامد، عاقبت. There are both similarities and differences in the distribution of RESULT - words and their Persian equivalents across meaning categories. Like its English equivalents aftermath and consequence, عاقبت typically does not express a positive affective meaning. This word co-occurs with unfavorable words transferring their negative meaning to it, it is therefore said this word has negative semantic prosody. This analysis is the same about پیامد. The semantic prosody of نتیجه depends on its

collocates. It can be concluded that نتیجه as the same equivalent for all English RESULT- words, collocates with both negative and positive words. It can get a neutral semantic prosody. حاصل which is the Persian equivalent of *result* and *outcome*, like them has a positive semantic prosody because it co-occurs with favorable words. It has overwhelmingly positive semantic prosody. For further proof, a Chi-square (a) test was taken. It comes to appear in table below.

Table 15: Test Statistics

	Percent
Chi-Square(a)	9.448
Df	3
Asymp. Sig.	.024

$$(x^2 (3,0/05)= 9/44, P=0.024)$$

This test supports the hypothesis that عاقبت and پیامد have negative semantic prosodies but حاصل a positive semantic prosody.

## CONCLUSION

This paper has explored semantic prosody behavior of some Persian words which are close translation equivalents of search-words, “*cause* and *bring about*” and “*consequence, result, outcome* and *aftermath*”. The researcher tried to realize the semantic prosody of Persian equivalents of the search-words by means of a specialized monolingual corpus and corpus investigation methodology. Then a contrastive analysis between English and Persian words on their semantic prosody behavior has done. According to our contrastive analysis, it could be concluded that, semantic prosody is as observable in Persian as it is in English.

While the semantic prosody of near synonyms, *cause* and *bring about* are different, the semantic prosody of their Persian close translation equivalents, *baes shodan*, *sabab shodan* and *mojeb shodan* (موجب شدن) are not. Among them باعث شدن has overwhelmingly a strong semantic prosody. In English these near synonyms are not interchangeable; even though, it is not ungrammatical to use them interchangeably. But in Persian, they can be used interchangeably and it is not ungrammatical.

While English and Persian are quite unrelated, the semantic prosody of the RESULT-words are quite similar in either language. Among these near synonyms, *result* and *outcome* have a positive semantic prosody *consequence* and *aftermath* a negative semantic prosody. This classification of semantic prosody behavior of these near synonyms happens to their close Persian equivalents which are *hasel*, *natijeh*, *payamad*, and *aghebat*. Of these near Persian synonyms *hasel* has strongly positive semantic prosody, *natijeh* may get a neutral semantic prosody and *payamad* and *aghebat* have overwhelmingly a negative semantic prosody. By studying Persian sentences including these near synonyms in English and their translations, it can be said that they are normally not interchangeable in both languages as they show different semantic prosody.

The discussion of these search-words and their close Persian equivalents suggest that Persian exhibits features of semantic prosody as English does.

**ABSTRACT**

The present study is an attempt to investigate the comparative effects of "concept mapping" and "lexical inferencing" strategies on English as Foreign Language (EFL) learners' retention of phrasal verbs. For this purpose, 90 intermediate female learners, between 17 and 31 years old, attending the Iran-Mehr Language School in Tehran took a piloted sample Preliminary English Test (PET), 60 of whom were selected as homogenous learners. They were randomly divided into two experimental groups -one learning phrasal verbs through "concept mapping" strategy and the other with the "lexical inferencing" strategy. They were given a piloted researchers-made pretest on phrasal verbs to ensure that the participants had no prior knowledge of the target phrasal verbs. Then all participants in both groups were taught using the same material and received the same amount of instruction. The only difference was that one experimental group was taught through the concept mapping strategy while the other one through the lexical inferencing strategy. After conducting the treatment, a piloted researchers-made post-test was administered to both groups, in order to measure the students' ability on the retention of the phrasal verbs taught through concept mapping and lexical inferencing strategies. The post-test was conducted after a two-week interval. The analysis of the test scores using *t*-test revealed that both strategies had significant effects on retention of the phrasal verbs. It was also concluded that there was no significant difference between the performances of both groups on retention of the phrasal verbs.

**KEYWORDS:** CONCEPT MAP, LEXICAL INFERENCE, VOCABULARY RETENTION, PHRASAL VERBS

**INTRODUCTION**

Language learners are likely to come up with new words and vocabulary items when learning a second language. Many argue that vocabulary is one of the most important components of any language to teach and learn (Gess & Selinker, 1994, p. 270). According to Nation (2001) acquiring vocabulary of a language affects the process of learning that language and highly enhances communication in that language.

Vocabulary has different types and subcategories such as nouns, verbs, adjectives, adverbs and also multiword expressions like idioms, fixed expressions and phrasal verbs (Moon, 1997; Wray, 2002). Phrasal verbs are usually found in vocabulary textbooks and grammar courses in the EFL curriculum. A phrasal verb is a type of verb, which consists of a sequence of a lexical element in combination with a particle, the meaning of which is different from the meanings of its separate parts (Koprowski, 2005). Since they are composed of the content word (verb) and the function word (particle), they can be dealt with either in vocabulary as multiword expressions, or in grammar, with regard to the transitivity and the separability. The nature of phrasal verbs can be difficult at best to comprehend and memorize, because their meaning is uninterpretable due to the idiomaticity, which makes phrasal verbs a particular

problem (Schmitt, 2000). One of the practical factors in facilitating retention and comprehension of phrasal verbs is the use of learning strategies. Strategies are those specific attacks that individuals make on a given problem, and that vary considerably within each individual. Park (1995) defines learning strategies as "the mental activities that people use when they study to help themselves acquire, organize, or remember incoming knowledge more efficiently" (p. 35).

O'Malley, Chamot, Stewner-Manzanares, Kupper, and Russo (1985, p. 285-296) categorized learning strategies under three main groups: metacognitive strategies, cognitive strategies, and socio-affective strategies. Among these strategies, metacognitive strategies are considered as the most essential ones in developing learners' skills (Anderson, 1991). There are a number of metacognitive learning strategies that can help students to become more sophisticated learners such as concept mapping and making lexical inference.

### ***Concept mapping***

The quest for exploring the relationship between knowledge and graphic representation of concepts has become an interesting field of investigation in the study of skill acquisition (Dormer, 2005). In fact, when knowledge is organized and represented through graphical means we are on the voyage to concept maps (Novak, 1977). A concept map, as a learning strategy, is defined as a visual representation of an individual's knowledge structure on a particular topic as constructed by the individual (Zimmaro & Cawley, 1998). With the visual representation of key words, students can identify main issues of a text and organize these key issues in a meaningful way.

The process of creating and modifying a concept map involves making decisions about the different ways concepts are related to one another, leading the individual to reflect on prior knowledge as it relates to new material (McAleese, 1998), as well as engaging in "control" processes of planning, monitoring progress, and evaluating goal attainment as the map is constructed (Brown, 1987). Although the literature on concept mapping has been primarily concerned with its application in L1 context, its benefits in L2 context has been recently explored (Ghanizadeh, 2007). Concept mapping is used in different areas of L2 research covering language skills. As a proper alternative to pre and post reading activities, the technique was used by Carrell, Pharis and Liberto (1989) in enhancing L2 reading. Examining its impact on L2 listening comprehension, Fahim and Hiedari (2006) reported a positive influence of concept mapping on the learners' listening comprehension. Moreover, in a study by Pishghadam and Ghanizadeh (2006) on the effect of concept mapping on EFL writing ability of a group of Iranian students, it was found that the technique resulted in quantitative and qualitative improvement of students' writing ability. As an assessment device, concept mapping has already been employed in L1 research (e.g., Kinchin, 2000; Reese, 2004). As of recent, the technique was used by Ghanizadeh (2007) as an assessment tool in L2 reading comprehension. Liu and Chen (2008) examined the effect of computer-based concept mapping on reading strategies of a group of Taiwanese students learning English as a foreign language. The analysis of variance showed that this effect has more reading benefit on the high-level group than on the low-level one. Recently, Marriott and Torres (2008) examined the use of concept mapping in developing a student's reading, writing and oral skills.

### ***Lexical Inference***

Inference refers to "the process, in language learning, of arriving at a hypothesis, idea, or judgment on the basis of other knowledge, ideas, or judgments, that is, the process of making inference or inferring" (Richards & Platt and Platt, 2000). In foreign language learning, inference is intended to refer to a process of identifying unfamiliar stimuli, concerned with the acquisition of new morphemes and vocabularies in natural context. In inferring, attributes and contexts that are familiar are utilized in recognizing what is unfamiliar.

Language learners are likely to come up with new words and vocabulary items in their interaction with a text. Not knowing the meaning of the new words, they are advised to employ some compensation strategies and utilize familiar contexts and attributes to tackle the problem.

As evident from the definition, to generate inference, one has to rely on certain knowledge sources. Various researchers have put forth different sources of knowledge one may resort to in constructing lexical inference. Haastrup (as cited in Soria, 2001) suggested three sources, namely, contextual, intralingual, and interlingual, that readers may use in making lexical inference.

Making inferences can be used in many subjects, particularly reading and encourages learners to construct meaning by reading between the lines. It is a skill that all learners need in order to comprehend texts.

Thus, based on the above-mentioned points, concept mapping and making lexical inference may both be powerful strategies in teaching and learning vocabulary. Hence, this study investigated the comparative impact of lexical

inference and use of concept map strategy on retention of phrasal verbs. The results of this study may shed light on problems of learning phrasal verbs.

### **RESEARCH QUESTION**

To fulfill the purpose of this study, the following research question was posed:

Is there any statistically significant difference between the impact of using concept map and making lexical inference on EFL learners' retention of phrasal verbs?

### **METHODOLOGY**

#### ***Participants***

The participants of this study included 60 students, majoring at English language literature and English language translation. Prior to the study, 90 candidates took Preliminary English Test (PET). In order to choose a homogeneous sample from among them 60 students whose scores fell between one standard deviation below or above the mean were selected and randomly assigned to two groups. Experimental group 1 consisted of 30 students, practicing concept mapping, and experimental group 2, practicing word inference.

#### ***Instruments***

To fulfill the purpose of the study the following instruments were used:

*PET Language Proficiency Test:* The first testing instrument was PET (2004) consisted of 67 items including three sections of reading (35 items), writing (7 items), and listening (25 items). The allotted time for this test was an hour and thirty minutes. The test includes skills of grammar and structure, reading and vocabulary, and writing. The Cronbach alpha formula was employed to estimate the reliability of PET and an acceptable reliability of .91 was obtained.

*American English File 2:* The learners' course book was "American English File 2", by Olive Oxenden, Chridtina Latham-Koenig, and Paul Seligson; Oxford publication (2008). Six units should have been covered during 8 weeks, and also some tasks of work book regarding the units including multiple-choice, fill-in-the-blanks, matching, and true- false have been used for both groups.

*Two Researchers-made Tests of Phrasal Verbs:* A researchers-made test of phrasal verbs was administered to the participants as the pretest. Also, at the end of the treatment, a parallel researchers-made test with the same nature and characteristics as the phrasal verb post-test was administered to the participants. Before the administration, these two tests were piloted with 30 subjects with almost similar characteristics to the target sample. The two tests were composed of 25 items each in multiple-choice format. The time allocated for each test was 20 minutes.

#### ***Procedure***

To accomplish the purpose of the study the following procedure was pursued: The PET, phrasal verbs pre and post-tests were standardized by piloting them among a group of 30 students with almost similar characteristics of the representative sample.

Then the three characteristics of individual items (Item Facility, Item Discrimination, and Choice Distribution) were calculated in order to omit the malfunctioning items. The writing part of PET was rated, according to the rating scale provided by Cambridge for PET, by two of the researchers. In order to make sure that the researchers had the same understanding of it a few papers were rated by them. Since it was shown that there was consistency between the papers they rated, the researchers moved to the actual practice. Later on, the inter-rater reliability was calculated on the basis of the ratings done by the researchers for the pilot test of PET. Since there was an acceptable consistency between them, the researchers went through the same procedure for the main participants. It should be mentioned that the speaking part of PET was not administered because of not having permission from institute officials to perform this part.

An already piloted PET was given to 90 intermediate level students of Iran-Mehr Language School (in Tehran, Iran) who were selected non-randomly and 60 students whose score fall between one standard deviation above and below the mean were chosen.

The 60 subjects were divided randomly into two experimental groups, one class of 30 as the concept mapping group and one class of 30 as the lexical inferencing group.

Then, all of the students in two groups participated in the phrasal verb pretest in order to make sure that there was no significant difference between the two groups regarding this variable before the treatment and to make sure that participants are not familiar with these phrasal verbs. All the participants were taught using the same material and they received the same amount of instruction. The only difference lay in the teaching of concept mapping strategy, which was included in one experimental group and lexical inferencing strategy in another experimental group.

Both classes were instructed by the same teacher (one of the researchers). The course consisted of 20 sessions of 90 minutes spanning over a period of approximately two month. In this study only six files out of nine files of the text book (American English File 2) were taught.

#### *Concept Mapping Group*

The students in this experimental group received the instruction for concept mapping strategy. The strategy being taught was based on Harris and Graham procedure of strategy instruction (1996). The procedure consists of five stages as follows:

- (1) Strategy description;
- (2) Discussion of goals and purposes;
- (3) Modeling of the strategy;
- (4) Student mastery of strategy; &
- (5) Guided practice and feedback.

The descriptions of the above-mentioned stages are as follows:

*1. Strategy description.* As an introduction, students were told that they were going to learn about the strategy of concept mapping. Concept mapping was described as a strategy that could be used to categorize information in a graphic form through drawing.

*2. Discussion of goals and purpose of strategy.* Concept mapping was described as a strategy that could help learners with vocabulary development and reading comprehension.

For the purpose of this study, the teacher discussed the students about the significance and benefits of using the concept mapping strategy in learning and retention of vocabulary especially phrasal verbs. Students were asked two questions:

- (a) How do you think the strategy of concept mapping might help you to learn and retain vocabulary better?
- (b) How could this strategy help you with different types of vocabulary especially phrasal verbs?

To reinforce students' participation as collaborators in the learning process, goals and Purposes that students generated were written on the white board.

*3. Modeling the strategy.* In this stage the step-by-step instruction for creating a concept map was described, as follow:

#### ***Step 1:***

The teacher introduces a concept (a verb, from the reading passage) that was familiar to all students, such as "call". Then, the teacher draws a square in the center of the board and writes the verb (Call) on it.

#### ***Step 2:***

The students had to say different prepositions which could be associated with that verb, such as "up", "off", "in", "back", "on". The teacher drew lines from the square for each of the prepositions involved. After that, she drew a circle at the end of each of the lines, and wrote each preposition in one circle.

#### ***Step 3:***

The teacher chose one of the prepositions associated with that verb (such as call up) and explained the meaning of it in one word verb (to telephone) and wrote it in the other circle in the same line.

#### ***Step 4:***

The teacher gave some examples to show "separability" and "inseparability" status of the phrasal verbs and wrote them in the board:

"Call up" as an example for "separability":

"Call up" means "To telephone" and is "separable", for example:

I called up Mary last night.

I called Mary up last night.

I called her up last night.

Or

"Call on" as an example for "inseparability":

"Call on" means, "To visit" and is "inseparable":

I called on Mary in the hospital.

I called Mary on in the hospital.

**Step 5:**

The teacher gave students enough time to say other examples and wrote them in the proper circles in the same manner.

4. *Student mastery of strategy.* During this stage, the teacher encouraged students to draw another parts of the concept map using the remaining prepositions such as "off", "in", "back", "on". The teacher selected several students to show their maps to their classmates.

5. *Guided practice and Feedback.* In this stage, the teacher collected the students' concept maps and after reviewing them and correcting mistakes, returned the corrected concept maps to the students.

It should be mentioned that, due to the students' unfamiliarity with the strategy of concept mapping, in the three first sessions the teacher using the approach of "expert-constructed concept maps", explained some complete forms of concept maps. Next she provided students with uncompleted forms of concept mapping while the learners had to complete them using "Fill in the Map Model". Finally the learners were required to construct concept maps based on the "Hierarchy Model of Concept Mapping" and the above-mentioned procedures.

All of the concept maps were based on the phrasal verbs of the texts in "American English File 2" (six files). It should be mentioned that, from 50 phrasal verbs used in this study twenty of them were taken from reading passages of "American English File 2", and as for the remained phrasal verbs, the researchers selected one word verbs through the reading passages of the book and used their corresponding phrasal verbs.

***Lexical Inferencing Group***

The teacher started the first session of instruction by defining the concept of lexical inferencing as follows:

Lexical inferencing is making "informed guesses" about the meaning of unknown words based on the available cues in the text. Guessing is a compensation strategy, which involves using a wide variety of clues to guess the meaning when the learner does not know the meaning of a word. Good language learners, when confronted with unknown words, make educated guesses. On the other hand, less adapted language learners try to look up every unfamiliar word, which impedes progress toward proficiency.

To make the above-mentioned points more tangible, the teacher gave the picture of a tent falling down to each of the participants and asked them to think about the reason of falling down the tent. She explained that each person has different experiences and different background knowledge that makes her/his has different inferences from the same matter. Each student comes with a variety of personal experiences. These personal experiences and cultural differences can affect one's ability to infer. As Immanuel Kant stated (cited in Carrell and Eisterhold 1988, p. 81) "new information, new concepts, and new ideas can have meaning only when they can be related to something the individual already knows."

Then, she asked them to tell their reasons. All of the reasons for different types of inferences can be categorized into fifteen categories according to Haastrup's (1991) taxonomy of knowledge sources for lexical inferencing (Table 1).

Table 1: Taxonomy of Knowledge Sources for Lexical Inferencing  
Based on Haastrup (1991)

Level 1	Level 2	Level 3	Level 4
Textual knowledge	Co-text	Local co-text	Semantics 1
			Paralinguistics
		Global co-text	Semantics 2 (specific words)
			Semantics 3 (overall co-text)
	Target word	Phonology	
		Word class	
		Morphology	
Extra-textual knowledge			

In this taxonomy for the distinctions among the different types of inferences, three conditions are established in terms of contextual clues:

- Condition 1: Words with local co-text clues.
- Condition 2: Words with global co-text clues.
- Condition 3: Words with extra-textual clues.

All of the above conditions were explained to the students with examples as follows:

**Local co-text clues:** are clues found in the sentence in which the target word occurs. The clues may be realized through cohesive ties, coherence relations, or both. For the purpose of this study, cohesive ties refer to synonyms, antonyms, super-ordinates, and collocations (Halliday and Hasan, 1976), whereas coherence relation is the relationship between propositions, such as causal relation, consequential relation, contrastive relation and others (Sanders, Spoorena and Noordman, 1992).

**Global co-text:** refers to the case where successful understanding of the target word calls for an overall understanding of the text by means of integrating information throughout the text. No specific part of the text provides direct clues for the word.

The use of an **extra-textual clue** refers to the case where the text does not provide direct clues for the word meaning and one has to fall back on background knowledge or experience to infer its meaning.

To gather data about learners' lexical inferencing strategies each session the students were presented with a handout containing five reading passage in which 5 targeted phrasal verbs were included. The reading passages selected were developed by Haastrup (1991) in a study on lexical inferencing with Danish learners of English or extracted from the course book (American English File 2).

Following the suggestion of Haastrup (1991), each text contained a local co-text clues, global co-text clues, or words with extra-textual clues, which helps learners to identify the meaning of targeted phrasal verbs. Then the students had time to guess the meanings of phrasal verbs.

Different researches show that successful inferencing depends heavily on the ability to comprehend the text as a whole and most of the words in it (Hirsh & Nation, 1992; Laufer, 1988; Liu & Nation, 1985). So, before being used in the present study, the reading passages were piloted with a group of students having almost similar characteristics to the participants in the study. The pilot study revealed that the students had a good overall comprehension of the text (mean of comprehension: 6.6/10). It also showed that the percentage of unknown words in the passage ranged from 4.27% to 2.67%, derived by dividing the total number of the words reported as unknown by the total number of words in the passage and multiplying the results by 100 (based on Haastrup, 1991).

The students were asked to read the text for comprehension and to try to infer the meanings of the unknown phrasal verbs. The students had 30 minutes to guess the meanings of those five phrasal verbs within the 5 texts. The participants were allowed to work in pairs and share ideas with their peers since Nation (2001, p. 261) claimed that when teaching students the strategy of lexical inferencing, it is better for students to work together, with the teacher, in groups, in pairs and then individually. Then, the instructor checked their guesses and wrote the meaning of each phrasal verb on the board with the help of the students.

As homework for the next session, the students besides of working out the text book exercises were supposed to write five sentences with those phrasal verbs that had been presented at that session.

At the beginning of each session the teacher checked their assignment of the previous session. After teaching different parts of the specified unit the teacher gave them a new handout including five new phrasal verbs and the participants had enough time to share their guesses and ideas. Finally they should share their guesses with the teacher and she wrote the meaning of each phrasal verb on the board with the help of the students. Then again as homework the participants were asked to write five extra sentences with those phrasal verbs taught at that session. This procedure was followed up to the end of the 20<sup>th</sup> session.

Two weeks after the end of the instruction, a piloted researcher-made post-test consisted of 30 multiple-choice item based on those 50 phrasal verbs presented during the instruction was administered to investigate the participants' retention of phrasal verbs. The time allocated to this test was 15 minutes and the range of scores was from 0 to 30.

The data obtained from the post-test were analyzed in order to study the impact of two strategies -concept mapping and lexical inferencing- on retention of phrasal verbs.

## RESULTS

### *Descriptive Statistics of the PET Proficiency Test Piloting*

The PET consisted of 67 items including three sections of reading (35 items), writing (7 items), and listening (25 items). The test was administered to a group of 30 intermediate-level EFL learners at the Iran-Mehr Language School bearing almost the same characteristics as the target sample. All items went through an item analysis procedure and two items were discarded due to their malfunctioning characteristics.

Following the piloting of the test, the mean and standard deviation of the raw scores and the reliability were calculated. The mean and the standard deviation of this administration were found to be 70.22 and 8.16 respectively. Table 2 shows the descriptive statistics of the PET in the pilot phase.

*Table 2: Descriptive Statistics of the PET Piloting Descriptive Statistics*

	N	Minimum	Maximum	Mean	Std. Deviation	Variance
VAR00006	30	35.00	60.00	70.2200	8.16899	83.288
Valid N (listwise)	30					

Table 3 shows the reliability of the test scores gained from the participants in the PET piloting phase. The Cronbach alpha formula was employed for this purpose and an acceptable reliability of .91 was obtained.

Table 3: Reliability of the PET Piloting before Deletion of Malfunctioning Items

Cronbach's Alpha	Number of Items
.915	67

After deletion of the 2 malfunctioning items, the reliability of the test shifted to .95. Table 4 shows the reliability of the test scores gained after the deletion.

Table 4: Reliability of the PET Piloting after Deletion of 2 Items

Cronbach's Alpha	Number of Items
.954	65

There were two writing tasks in the test rated by two qualified raters (Two of the researchers) using the predetermined PET rating scale. The rating scale used in this study was the official Cambridge General Mark Schemes for Writing. The rating was done on the basis of the criteria stated in the rating scale including the range of scores from 0 to 5.

In order to calculate the inter-rater reliability between the raters, the researcher used the Pearson correlation coefficient. The results showed that there was a significant correlation between the two raters. Therefore, this gave assurance to the researcher that the same raters can be used for the actual administration of the test (the results are shown in Table 5 and Table 6).

Table 5: Inter-rater Reliability of the Two Raters in the Piloting of Writing Part 2

Correlations		VAR00001	VAR00002
VAR00001	Pearson Correlation	1	.834**
	Sig. (2-tailed)		.000
	N	30	30
VAR00002	Pearson Correlation	.877**	1
	Sig. (2-tailed)	.000	
	N	30	30

\*\*. Correlation is significant at the 0.01 level (2-tailed).

Table 6: Inter-rater Reliability of the Two Raters in the Piloting of Writing Part 3

		VAR00003	VAR00004
VAR00003	Pearson Correlation	1	.813**
	Sig. (2-tailed)		.000
	N	30	30
VAR00004	Pearson Correlation	.723**	1
	Sig. (2-tailed)	.000	
	N	30	30

\*\*. Correlation is significant at the 0.01 level (2-tailed).

#### ***Descriptive Statistics of the PET Proficiency Test Administration***

After the procedure of piloting the PET test, it became an instrument to homogenize the students for this study. On the whole, 90 students participated in the test administration. After the administration of the test, descriptive statistics

were conducted just as was done in the piloting phase. Table 7 shows these statistics with the mean of 73.32 and the standard deviation of 8.22.

*Table 7: Descriptive Statistics of the PET Administration*

	N	Minimum	Maximum	Mean	Std. Deviation
VAR00005	90	59.00	89.00	73.3281	8.22463
Valid N (listwise)	90				

The reliability of the PET in this actual administration for homogenization of the subjects was calculated too (Table 8). An index of .91 reassured the researcher of the reliability of this test.

*Table 8: Reliability of the PET Administration*

Cronbach's Alpha	Number of Items
.912	65

### ***Descriptive Statistics of the Phrasal Verbs Tests Piloting***

#### ***Phrasal Verb Pretest***

As it was already stated, the pretest was administered in order to make sure that the participant had no prior knowledge of the target phrasal verbs. The test was already piloted with a group of 30 subjects with almost the same characteristics as the target group of the main study. According to the results, there were no malfunctioning items. The results of the pretest revealed that the participants were unfamiliar with 50 phrasal verbs that were taught to them through these strategies (Table 9).

#### ***Phrasal Verb Post-test***

After conducting the treatment sessions, in order to measure the students' ability on the retention of the phrasal verbs taught a post-test was conducted at the interval of two weeks.

Before administration, the test piloted with a group of 30 subjects with almost the same characteristics as the target group. According to the results, there were no malfunctioning items. The results are shown in table 9.

*Table 9: Descriptive Statistics of the Phrasal Verb Tests Piloting*

Phrasal verb Tests	Participants	N	Mean	Std. Deviation	Minimum	Maximum
Pretest	30	30	4.66	5.33	4	30
Post-test	30	30	4.73	5.49	5	30

### ***Descriptive Statistics of the Phrasal Verbs Tests Administration***

#### ***Phrasal Verb Pre-test***

Before starting the treatment, a pretest which was a phrasal verbs pretest, was administered by the researchers in order to make sure that the participants in both groups had no prior knowledge of the target phrasal verbs.

As displayed in Table 10 and 11 the mean scores for lexical inferencing and concept mapping groups on Pretest of Phrasal Verbs are 4.38 and 4.86 respectively.

Table 10: Descriptive Statistics of the Pretest of Phrasal Verbs,  
Lexical Inferencing Group

	N	Minimum	Maximum	Mean		Std. Deviation	Variance	Skewness	
	Statistic	Statistic	Statistic	Statistic	Std. Error	Statistic	Statistic	Statistic	Std. Error
V1 Valid N (listwise)	30 30	2	7	4.38	.701	2.060	4.2436	.898	.383

Table 11: Descriptive Statistics of the Pretest of Phrasal Verbs Concept Mapping Group

	N	Minimum	Maximum	Mean		Std. Deviation	Variance	Skewness	
	Statistic	Statistic	Statistic	Statistic	Std. Error	Statistic	Statistic	Statistic	Std. Error
V1 Valid N (listwise)	30 30	1	6	4.86	.701	2.263	5.1211	.898	.420

#### Phrasal Verb Post-test

The target phrasal verbs were taught to the two experimental groups during a 20 session treatment. At the end of the treatment a post-test was administered to both groups with an interval of two weeks in order to test the retention of the phrasal verbs by two experimental groups. As displayed in Tables 12 and 13 the mean scores for lexical inferencing and concept mapping groups on Pretest of Phrasal Verbs are 23.93 and 25.97 respectively.

Table 12: Descriptive Statistics of the Lexical Inferencing group Post-test Administration

	N	Minimum	Maximum	Mean		Std. Deviation	Variance
	Statistic	Statistic	Statistic	Statistic	Std. Error	Statistic	Statistic
V1 Valid (listwise)	30 30	17	30	23.93	.616	3.373	11.375

Table 13: Descriptive Statistics of The Concept Mapping Group Post-test Administration

	N	Minimum	Maximum	Mean		Std. Deviation	Variance
		Statistic	Statistic	Statistic	Std. Error	Statistic	Statistic
V1 Valid (listwise)	30 30	20	30	25.97	.526	2.883	8.309

The reliability of the tests was calculated afterwards using Cronbach Alpha formula (Table 14).

Table 14: Reliability of the Lexical Inference and Concept Map Phrasal Verb Post-test Administration  
Reliability Statistics

Cronbach Alpha		Number of Items
Lexical Inferencing post-test	0.79	30
Concept Mapping Post-test	0.81	30

Figures 1 and 2 also show the results.

Figure 1: Phrasal verb post-test Scores of the Lexical Inference Group

Figure 2: Phrasal verb Post-test Scores of the Concept Mapping Group

### Checking the Normality

Four assumptions should be met before one decides to run parametric tests;

- 1) The data should be measured on an interval scale;

- 2) The subjects should be independent that is to say none of them participates in more than one group;
- 3) The data should enjoy normal distribution; and
- 4) The groups should have homogeneous variances (Field; 2009).

The present data are measured on an interval scale and none of the subjects participate in more than one group. The assumption of normality is also met. As displayed in Table 15 the ratios of skewness and kurtosis over their respective standard errors are within the ranges of +/- 2.

Table 15: Normality Table

GROUP		N	Skewness			Kurtosis		
		Statistic	Statistic	Std. Error	Normality	Statistic	Std. Error	Normality
Lexical INFERENCING	PET	29	-0.35	0.43	-0.80	-1.25	0.85	-1.48
	PRETEST	29	0.13	0.43	0.31	-1.17	0.85	-1.39
	POSTTEST	29	-0.18	0.43	-0.41	-1.01	0.85	-1.20
CONCEPT MAPPING	PET	29	0.08	0.43	0.19	-1.32	0.85	-1.56
	PRETEST	29	-0.06	0.43	-0.13	-1.05	0.85	-1.24
	POST-TEST	29	-0.58	0.43	-1.33	-0.57	0.85	-0.67

The assumption of homogeneity of variances will be discussed when reporting the results of the independent *t*-test.

#### Pretest of Phrasal Verbs

##### Comparing Lexical Inferencing and Concept Mapping Groups' Mean scores on Phrasal Verbs Pretest

An independent *t*-test is run to compare the lexical inferencing and concept mapping groups' mean scores on phrasal verbs pretest in order to prove that the two groups enjoyed the same level of knowledge on phrasal verbs prior to the main study. As displayed in Table 16 the mean scores for lexical inference and concept mapping groups on phrasal verbs pretest are 4.38 and 4.86 respectively.

Table 16: Descriptive Statistics of Phrasal Verbs Pretest  
(Lexical Inferencing and Concept Mapping Groups)

Group	N	Mean	Std. Deviation	Std. Error Mean
INFERENCE	29	4.38	2.060	.383
CONCEPT MAPPING	29	4.86	2.263	.420

The results of the independent *t*-test ( $t(56) = .84, P = .39 > .05, r = .11$ ) it represents a weak effect size) indicate that there was not any significant difference between lexical inferencing and concept mapping groups on the pretest of phrasal verbs. Thus, it can be concluded that the two groups enjoyed the same level of knowledge on phrasal verbs prior to the study. The results are shown in table 17.

Table 17: Independent *t*-test of Phrasal Verbs Pretest  
(Lexical Inferencing and Concept Mapping Groups)

	Levene's Test for Equality of Variances		t-test for Equality of Means						
	F	Sig.	T	Df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
								Lower	Upper
Equal variances assumed	.398	.531	.849	56	.399	.483	.568	-.656	1.621
Equal variances not assumed			.849	55.511	.399	.483	.568	-.656	1.621

It should be noted that the assumption of homogeneity of variances is met (Levene's  $F = .39, P = .53 > .05$ ). That is why the first row of Table 17, i.e. "Equal variances assumed" is reported.

Figure 3 also shows the results.

Figure 3: Phrasal Verbs Pretest of Lexical Inferencing and Concept Mapping Groups

#### Post-test of Phrasal Verbs

#### Comparing Lexical Inferencing and Concept Mapping Groups' mean scores on Phrasal verbs Post-test

An independent *t*-test is run to compare the lexical inference and concept mapping groups' mean scores on phrasal verbs post-test in order to probe any significant difference between the impact of using concept mapping and lexical inference on EFL learners' retention of phrasal verbs. As displayed in Table 18 the mean scores for lexical inference and concept mapping groups on Phrasal Verbs Post-test are 25.34 and 26 respectively.

Table 18: Descriptive Statistics of Phrasal Verbs Post-test  
(Lexical Inferencing and Concept Mapping Groups)

Group	N	Mean	Std. Deviation	Std. Error Mean
INFERENCE	29	25.34	2.755	.512
CONCEPT MAPPING	29	26.00	2.928	.544

The results of the independent *t*-test ( $t(56) = .87, P = .38 > .05, r = .11$  it represents a weak effect size) indicate that there is not any significant difference between lexical inferencing and concept mapping groups on the phrasal verbs Post-test (Table 19).

Table 19: Independent *t*-test Post-test of Phrasal Verbs Inference and Concept Groups

	Levene's Test for Equality of Variances		t-test for Equality of Means						
	F	Sig.	T	Df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
								Lower	Upper
Equal variances assumed	.022	.884	.878	56	.384	.655	.747	-.840	2.151
Equal variances not assumed			.878	55.795	.384	.655	.747	-.840	2.151

It should be noted that the assumption of homogeneity of variances is met (Levene's  $F = .02, P = .88 > .05$ ). That is why the first row of Table 19, i.e. "Equal variances assumed" is reported.

Figure 4 also shows the results.

Figure 4: Comparing Lexical Inferencing and Concept Mapping Groups' Mean Scores on Phrasal Verbs Post-test

### Construct Validity

A factor analysis through varimax rotation is carried out to underlying construct of the PET, pretest and post-test. The SPSS extracted two factors as the underlying construct of the three tests employed in this study. This two-factor solution accounts for 90.68 percent of the total variance (Table 20).

Table 20: Total Variance Explained

Component	Initial Eigenvalues			Extraction Sums of Squared Loadings			Rotation Sums of Squared Loadings		
	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %
1	1.655	55.154	55.154	1.655	55.154	55.154	1.652	55.070	55.070
2	1.066	35.532	90.686	1.066	35.532	90.686	1.068	35.617	90.686
3	.279	9.314	100.000						

As displayed in Table 20 the pretest and post-test of phrasal verbs load on the first factor indicating that they are tapping on the same underlying construct. In other words, they are measuring the same underlying construct. These results indicate that the tests developed to measure the phrasal verbs enjoy construct validity.

The PET general language proficiency test loads on the second factor which due to the nature of the PET test can be labeled as general language proficiency factor.

### DISCUSSION AND CONCLUSION

According to the results it has been revealed that lexical inferencing and concept-mapping strategies help the learners to retain the target phrasal verbs. The results of the post-tests of both groups indicated that these two strategies can significantly enhance the retention of phrasal verbs.

Furthermore, based on the statistical analysis, which has been done in order to compare the results of the two post-tests, there was no significant difference between the effects of these two strategies on retention of the target phrasal verbs. This outcome is in line with the findings of Kalaa (2012). She studied the effects of the "word association" and the "lexical inferencing" strategies on EFL learners' phrasal verbs learning and retention. The findings indicated that both of the word association and lexical inferencing strategies helped the learners to learn and recall the target phrasal verbs. The results of the phrasal verb post-tests strongly indicated that learning the phrasal verbs through these strategies was effective and efficient. Furthermore, the participants who were exposed to these strategies exhibited enhanced retention of the phrasal verbs.

Similarly, regarding the results of statistical analysis, it can be concluded that there was not any significant difference between two groups on learning and retention of the target phrasal verbs. This result also corroborates the findings of Cooper (1999). His study showed that successful learners use lexical inferencing strategies to learn idioms.

Hence, applying suitable strategies such as concept mapping or lexical inference (guessing meaning of words in their natural context) involves learners in learning process, which can be more helpful than presenting them long lists of words and their meanings to memorize. Also, incorporation of strategies in course books and curriculum may result in intellectual analytical learners that through using strategies can overcome their learning difficulties.

At the end, it is worth mentioning that like any study, this research faced a limitation, which has to be taken into consideration while attempting to generalize its findings. The researcher did not have any control over the age of the participants and they were only adults with age range of 17 to 31. Therefore, the findings of the study may not be generalizable to other age groups.

### **SUGGESTIONS FOR FURTHER RESEARCH**

The following are suggested for further studies:

1. In this study, the whole procedure from the test of homogeneity to the post-test lasted about two months. The results of the study might have been influenced by the lack of time to more practice. Besides, teachers may need to spend more time in teaching students to take risks in guessing phrasal verbs from the context or practicing concept mapping in their learning. Therefore, future research can be carried out by lengthening the training time.
2. In this study only hand-made concept maps were used while nowadays there is a growing interest in using computer-assisted concept maps which seems be less time-consuming. So, further research can be conducted using computer-assisted concept maps to investigate the results.
3. The focus of the present study was exclusively on the effect of concept mapping and lexical inferencing strategies on retention of phrasal verbs. So, further research can be conducted on the result of teaching other types of vocabularies through these two strategies.

## **ABSTRACT**

Corrective move has been considered the most vital element in the instructed second language learning process (Panova & Lyster, 2002). This study investigated teachers' corrective moves (CMs) on learners' oral errors and its effects on their uptake in terms of repair in English as foreign language (EFL) classrooms at the Payam Noor University (PNU) in Iran. To meet this end, four conversation classrooms were selected. The data were drawn from the transcripts of audio recorded classroom activities and discussions. Then the errors were coded as grammatical, lexical, or phonological using the coding categories identified by Lyster and Ranta's (1997) model of CMs in response to the students' three types of erroneous utterances. During a whole semester, EFL learners' listening and speaking classrooms discussions were analyzed. The statistical analysis used included frequency of occurrence of students' errors. Second, teachers' six types of CMs follow students' errors were listed in frequency and percentage for each session. Third, a series of general Loglinear analyses of multi-way frequency tables were performed to examine the existence of relationship between more than two categorical variables. The results indicated certain CMs had significant impact on the level of learners' uptake. Regarding the type of errors, certain CM was more effective for correcting students' errors. The findings of the current study offer certain implications for EFL teachers, learners, teacher training programs, syllabus designers and material developers.

**KEYWORDS:** Corrective Moves, EFL Classrooms, Error Types, Learners' Uptake, Repair, Need Repair

## **INTRODUCTION**

The purpose of the present study is to test the prediction whether EFL students will improve their uptake, if provided with helpful opportunities to notice their errors during the classroom interaction through the provision of different types of teachers' CM. Most of studies on the different CM types and learner uptake (Lyster & Ranta, 1997; Panova & Lyster, 2002) have been conducted in immersion settings or adult ESL contexts, and not many studies have focused on EFL classrooms.

It seems that there is a gap in learners' performance in EFL classes that makes language learning unsuccessful in terms of learners' uptake, typically, when the learners make linguistic errors and teachers' CM are needed to correct learners' errors. There have been few studies, if any, that have directly investigated CM in relation to learners' uptake, repair in immediate, or rarely over a long period for the purpose of students' uptake in different communicative EFL classroom settings especially in PNU context.

### ***Corrective Moves in L2/FL Classrooms***

One of the areas studied inside SLA is corrective feedback, which has been defined by Ellis (2008) as teacher's response to learner's erroneous utterances. CM occurs when a student produces an oral error, or an incorrect utterance of some sort. This erroneous response or answer usually follows a teacher's CM type. Furthermore, after the CM from the teacher, the student may show signs of learning or understanding which might imply that the student has reacted to the teacher's feedback. However, this uptake move is not always visible in the exchange, since it is a complex and difficult matter to investigate and determine.

In addition to the numerous studies investigating CF moves efficacy, many descriptive studies have taken place in the L2 classroom and have investigated the types of feedback that occur (e.g., Ammar, 2008; Lyster & Mori, 2006; Sheen, 2004). Overall, these studies have found recasts to be the most popular type of feedback used in L2

classrooms (e.g., Lyster & Mori, 2006; Sheen, 2004; Yoshida, 2008), although recasts have also often been found to be the least effective type of feedback in the classroom when compared with more explicit techniques (Ammar, 2008; Ammar & Spada, 2006; Ellis, 2007; Ellis, Loewen, & Erlam, 2006; Havranek, 2002; Lyster, 2004; Panova & Lyster, 2002; Sheen, 2006), at least when measured by uptake. However, as the studies took place in a range of instructional (communicative and grammar-focused) as well as linguistic contexts (both L2 and EFL contexts), with minimal attention to additional external and internal factors, more research is needed to isolate and understand how feedback type mediates SLA.

Corrective moves in EFL settings have also been found to be more beneficial than feedback in L2 settings (Li, 2010; Mackey & Goo, 2007). This is believed to be the case for several reasons: studies have shown that learners in FL settings have a more positive view of error correction (Loewen & Philp 2006), perhaps playing a role in the efficacy of feedback. Some have found that more feedback (in the form of recasts) is provided and used by learners in EFL settings when compared to L2 classes (Liu, 2007; Sheen, 2004, as cited in Li, 2010). More research is needed to investigate if and how the amount of feedback or student views of error correction relate to feedback efficacy, especially considering that Lyster and Saito (2010) found no significant differences between feedback in FL and second language (SL) classrooms.

The growing interest in CM was indicated by the publication of several meta-analysis studies between 2006 and 2010 (Russell & Spada, 2006; Mackey & Goo, 2007; Li, 2010; Lyster & Saito, 2010). These studies together provide strong support for the effectiveness of CM. One of the factors found to mediate the effectiveness of feedback is the length of the treatment or intervention. In Lyster and Saito (2010) meta-analysis of oral feedback in classroom studies, the finding showed that longer treatment was significantly more effective than short-to-medium treatments.

### ***Theoretical Perspectives to the Benefits of CM***

In the field of SLA, there are many theories about the most valuable way for language learners to acquire new language forms during their classroom interactions. Long (1996, 2006) *Interaction Hypothesis* states providing negative evidence is of utmost importance in SLA particularly for young adults and adult learners. He asserts that L2 learners may get negative feedback during the course of their interaction with peers and teachers. Negative evidence (feedback) is information about ungrammaticality. Learners need negative evidence in the form of either feedback on error or explicit instruction when they are not able to discover through exposure alone.

Following a series of research on CM in ESL situations, Lyster and Mori (2006) presented the *Counterbalance Hypothesis*. It refers to class activities that are distinct from teaching routine and CM that usually dominate the communicative language classroom. Compared to *interaction hypothesis* which relies on students' active involvement of L2 learners in class activities with the necessary attention shift in focus, the *Counterbalance Hypothesis* is based on the role of attention in learning. This shift in focus is supposed to enhance links between changes in long-term memory and real use of language.

According to the sociocultural theory, CM provides learners with dialogically negotiated support as they move from other-regulation towards self-regulation (e.g., Nassaji & Swain, 2000; Sato & Ballinger, 2012, as cited in Lyster, Saito, & Sato, 2013). In this relation, Vygotsky's (1978) notion of Zone of Proximal Development (ZPD) suggests that learning occurs with support from those more competent, in the zone of proximal developments. So the crucial role of teacher, her/his interaction with learners provides a scaffold to allow for communication to proceed while giving the students access to linguistic data. Lyster, Saito, and Sato (2013) stated that scaffolding is a process through which a teacher or more knowledgeable person helps the student in his or her ZPD as necessary.

### ***Types of CMs in the Classes***

Lyster (2002) categorizes feedback moves as one of three groups including prompts, explicit correction, and recasts. explicit correction, recasts, and prompts. The first two types provide the learners with a kind of L2 rephrasing of their incorrect form. In these cases the instructor provides the correct language and clearly shows that the language learners' uptake was wrong. A brief survey of each CMs studies is shown below:

#### ***Prompts***

According to Lyster and Mori (2006), prompts "include a variety of signals—other than alternative reformulations that push learners to self-repair" (p. 271). They maintained that by using the prompts, the learners are encouraged to self-repair. In some other cases these moves are called negotiation of form (Lyster, 1998b, Lyster & Ranta, 1997) and sometimes form negotiation (Lyster, 2002). Prompts consist of a range of feedback sub-categories that include:

(a) Elicitation, in which a rephrasing from the learner is elicited by the teacher;

(b) Metalinguistic clues, in which some comments or questions are provided by the instructor which are related to the correctness of the learner's sentences;

(c) Clarification requests, in which the instructor uses certain phrases like "Excuse me?" and "I didn't get it" after the problematic sentences by the learners to show them that something needs to be modified or corrected; and

(d) Repetition, in which the faulty sentence is repeated by the teacher having a certain intonation to mark the error.

All these CMs which can be used individually or in combination with other moves cover a wide range of CM. They give a chance to the students to self-correct by producing their own modified sentence.

#### *Explicit Correction*

It refers to the feedback that provides the learner with the correct form while at the same time demonstrating that an error was committed (Ellis, 2008). The degree of explicitness of feedback move needed to promote noticing without detracting from the communicative focus of instruction has been and remains a core theme of corrective feedback research (Russell & Spada, 2006). Different types of feedback are most often described theoretically on a continuum of explicitness, rather than as a dichotomy of implicit/explicit (Ellis, 2008; Mackey & Goo, 2007), though they are most often discussed and empirically tested as dichotomous variables. The most explicit types of feedback are overt corrections, metalinguistic information, and elicitations (Ellis, 2008). On the less explicit end of the feedback continuum (most often referred to as "implicit feedback") are recasts, confirmation and comprehension checks, clarification requests, elaborations, simplifications, repetitions, and negotiations (Gass & Mackey, 2007).

One recent meta-analysis found that explicit feedback tends to be more effective than implicit feedback (Li, 2010), at least immediately and shortly after feedback provision, and others reported inconclusive results comparing explicit and implicit feedback (Lyster & Saito, 2010; Mackey & Goo, 2007; Russell & Spada, 2006). The effects of implicit feedback are believed to increase after treatment, at times even bypassing the beneficial effects of explicit feedback (Li, 2010).

#### *Recast*

As Lyster and Mori (2006) state, the teacher "implicitly reformulates all or part of the student's utterance" (p. 271). Long (1996, 2006) posits that when communication in a meaning focused classroom breaks down, negotiation for meaning and recasts can facilitate L2 development precisely at the moment when learners notice the gap (Schmidt & Frota, 1986) between their erroneous production and the correct target language form. Lyster (1998a) discusses the pedagogical implications of his research on CM, and he suggests that recasts do not lead to learner-generated repair because students perceive them as a confirmation of meaning rather than as a correction. Critics of Lyster point out that his studies only take place in immersion classrooms, and that his results have not been obtained in other instructional settings.

Leeman (2003) describes recasts are complex discourse structures that can serve as both implicit positive and negative evidence. Leeman suggests that the negative evidence component of recasts may not be a critical factor. Further, she asserts that the beneficial effect of recasts is at least partially derived from the increased salience of positive evidence they provide to learners. Several research studies found that recasts facilitate language learning (Han, 2002; Havranek, 2002; Iwashita, 2003; Leeman, 2003; Philp, 2003); however, these studies have only been able to demonstrate a positive effect on short-term learning.

Philp (2003) concludes that learners may effectively use recasts when developmental level and feedback correspond. Further, she found that learners did not always notice recasts. Philp suggests that learners' noticing of recasts may have been constrained by the following factors: limitations in working memory, unfamiliar input, multiple corrections, complex changes in the recast, learner level, and grammatical forms in the recast that were beyond the learner's interlanguage grammar. Despite these differing viewpoints, there is general agreement among SLA researchers that recasts are the most common form of oral CM employed by teachers in EFL and L2 classrooms.

#### ***Relationship between Teachers' CMs and Students' Error Type***

Lyster (1998a) examined for the relationship among error types, feedback types, and repair. He found lexical errors were responded to the negotiation moves: elicitation, metalinguistic clues, clarification requests, and repetition without the provision of the target form, while grammatical and phonological errors were recast. As far as repair was concerned, negotiation was generally more effective than correction, particularly for lexical and grammatical errors. In contrast, recasts resulted in phonological repairs.

In his 1998b study, Lyster used the data from Lyster and Ranta (1997) to examine the relationship between error type and feedback type. He found that teachers preferred to use the negotiation of form to correct lexical errors, and recasts to correct phonological and grammatical errors. The researcher also found that the negotiation of form led to greater learner repair for grammatical and lexical errors while recasts led to greater learner repair for phonological errors. Lyster's study also revealed that, in general, teachers had a low tolerance for lexical and phonological errors. Additionally, he found that teachers tended not to correct as many grammatical errors, but when they did, they usually opted to correct them with a recast rather than through the negotiation of form. However, Lyster (1998a, 1998b) asserts that teachers should use the negotiation of form rather than recasts to correct learners' grammatical errors because the negotiation of form pushes learners to produce output (Swain, 1985), which serves as an internal priming device that may encourage learners to notice the gap (Schmidt & Frota, 1986) between their non-target utterances and the correct TL forms.

Following Lyster and Ranta (1997) and Lyster (1998b), research by Panova and Lyster (2002) and Lyster (2004) appear to support the claim that recasts are ambiguous to L2 learners. In his 2004 study, Lyster compared recasts to prompts for the acquisition of grammatical gender in French. Prompts, which were formerly known as the negotiation of form (Lyster, 1998a, 1998b), were defined as instances where students were prompted to use more correct grammatical forms. Lyster found that when combined with form-focused instruction, prompts were more useful than recasts for learners' acquisition of rule-based representations of grammatical gender. Similarly, Panova and Lyster (2002) found that students who received prompts achieved greater accuracy in following language processing than those who received recasts. The researchers concluded that the students who received recasts did not reveal subsequent gains in their L2 accuracy because they had difficulty noticing their own morphosyntactic errors and because they were uncertain about how to interpret recasts.

Studies have investigated if feedback is more facilitative in alerting learners to certain types of errors (such as morphosyntax) compared to others (such as lexis). Researchers have found evidence that learners' perceive implicit feedback (recasts) when phonological and lexical errors are targeted more than morphosyntax (Carpenter, Jeon, MacGregor, & Mackey, 2006; Han, 2008; Sheen, 2006). However, while some studies have found immediate significant differences for feedback targeting lexis, they also reveal that the benefits of feedback targeting morphosyntax (grammar) increase over time (Mackey & Goo, 2007). Thus, as with the delayed benefits of implicit feedback, perhaps learners need to process feedback targeting more complex grammatical features for a longer period of time, rather than benefiting from it immediately as they do from explicit feedback or feedback targeting lexis.

### ***Learner Uptake and Repair***

Uptake was defined by Lyster and Ranta (1997) as a student's immediate response to the teacher's feedback that "constitutes a reaction in some way to the teacher's intention to draw attention to some aspect of the student's initial utterance" (p. 49). The notion of uptake in classroom studies provides an effective tool for identifying patterns in teacher-student interaction that include a wide range of learner responses following teacher feedback, thus allowing for an operationalization of pushed output in classroom settings (Swain, 1988). Lyster and Ranta (1997) distinguished two types of uptake: 'repair' and 'need repair'. "Repair refers to uptake that leads to a correction of the error that the teacher has treated, while 'needs repair' consists of uptake where the error is not corrected (p. 49). According to Lyster (1997, 2002, 2004), though uptake is an important and clear resource for understanding the effect of the feedback (e.g., the feedback is noticed as correction), it does not indicate that long-term learning has occurred.

In the context of adult EFL, McDonough (2005) found that self-repair moves that followed prompts in the form of clarification requests were significant predictors of L2 development. Similarly, Havranek and Cesnik (2001) found repair that followed prompts to be the most effective feedback combination in a range of EFL classrooms. In contrast to self-repair that follows prompts, uptake that involves repetition of a recast does not engage learners in a similarly deep level of processing, nor does it necessitate any reanalysis. Panova and Lyster (2002) suggested that uptake that consists of a repetition might not have much to contribute to L2 development because of its redundancy in an error treatment sequence in which the repair is both initiated and completed by the teacher within a single move. Although an increasing agreement that uptake "may create the conditions for language acquisition to occur" and "may be *facilitative* of acquisition" (Ellis, 2001, p. 287), there is an equally strong consensus that uptake alone does not represent an instance of learning. Instead, the effect of CM and learner repair on longer term L2 development needs to be investigated in carefully designed quasi-experimental studies.

Studies by Oliver and Mackey (2003) and Sheen (2004) confirm Lyster and Ranta's (1997) findings that recasts are the most common form of error correction employed by language teachers. However, these researchers found that the discourse situation of the FL classroom plays an important role in whether or not a recast results in the learner's uptake of the correction. Sheen (2004) claims that the instructional setting is also a factor that contributes to whether or not recasts result in learner uptake. The researcher found that the rates for uptake and repair were greater in some contexts than others. For example, she found that EFL learners in Korea and L2 learners in New Zealand confirmed greater uptake of recasts than French immersion and ESL learners in Canada even though all four settings ascribed to communicative approaches. Long (2006) asserts that EFL and L2 teachers should not reject the use of recasts in their classrooms simply because they have been found to be ambiguous in some immersion class-room settings. Further, he points out that the immediate uptake of recasts cannot be equated with L2 learning. Therefore, there are different results obtained for the effectiveness of CM in the learners' uptake, specially, when it relates to the effectiveness of prompts or explicit correction.

There have been few studies, if any, that have systematically investigated CM in relation to learners' error types and uptake, repair over a long period in EFL classroom settings especially in PNU context. It seems that there is a gap in learners' performance in EFL classes that makes language learning unsuccessful during classroom activities in terms of learners' uptake.

### **RESEARCH QUESTIONS**

This study aimed to answer the following two research questions and in order to find answer to the research questions, the following hypotheses were tested.

1. Does CM have any significant effect on students' uptake in terms of repair in EFL classrooms?
2. Is there any significant relationship between the teachers' CMs and learners' error types?

### **METHODOLOGY**

#### ***Participants***

The students who took part in the research project were members of four intact classes, originally 79 English Translation freshmen in PNU Tehran and Varamin Branches during the first semester of 2011- 2012 academic year. Despite the fact that in general PNU is a distance education system that reduces the necessity of the subjects' attendance in classrooms; students in this project were informed to participate in all classes due to the obligatory nature of such courses in PNU speaking and listening courses. They were both male and female students but gender was not a variable in the present study. The students were asked to give some information about their age level and their English background and experiences. Their age range was from 20 to 38 ( $M = 24.77$ ,  $SD = 1.66$ ), with 49 female and 15 male.

#### ***Materials***

Materials for this research were composed of two textbooks and 4 tests in the form of a pretest and three question worksheets. They will be elaborated on respectively below.

*Textbooks.* The course materials for both experimental and control groups were the students' regular curriculum textbooks including the second and third volumes of the EFL series, *Interchange* Third Edition for the students of EFL Speaking and Listening courses 2. The textbooks were updated versions of the popular series by Richards, Hull, and Proctor (2005), student's books 2 and 3. For such courses, students study the book for the purposes of improving their listening and speaking skills, vocabulary, and grammatical structure and to a lesser extent reading and writing skills. The instructional materials of students' textbooks represent a more communicative orientation.

*Tests.* The researcher used an adapted test as a pretest and developed some tests during the course of this study which are described below.

*Pretest.* At the beginning of the course, a test of homogeneity was administered in both experimental and control groups. It was chosen from Nelson's Proficiency Test intermediate level (level 3), written by Fowler and Coe (1993). It consisted of 50 multiple choice items on structure, reading comprehension, vocabulary, and pronunciation items and the estimated time for answering the questions was 45 minutes. The readability of the homogeneous test was

measured with respect to the students' Reading Comprehension course I, using the Readability formula of Fog. The reliability of the Nelson Proficiency Test was ( $r = .80$ ) expressive of a relatively high reliability index. Regarding the validity of the Nelson Proficiency Test, it has already been validated for testing learners' intermediate level of language ability.

*Progress Test.* There were also some progress tests which were developed by the researcher during the academic term. These included 3 tests. They had subsections on structure, and vocabulary, and pronunciation. Each had 30 items in multiple choice format. They were basically developed based on the written transcriptions of the students' audio-recorded frequent erroneous utterances in the classes throughout the sessions. These tests were edited by two researcher assistants who held Master degrees in EFL with a range of 7 to 10 teaching experiences.

In order to have reliable progress tests scores, the selected sentences of students' errors were edited and rechecked by the same researcher's assistants. The researcher and three trained raters analyzed the data examined in the study and consistency in assigned scores within and between raters examined too. Interraters' agreement was further statistically established via a Pearson's correlation coefficient test of inter-rater reliability. The findings indicated that the consistency was appropriate enough to take the next steps. Regarding the validity, the current study was limited in terms of external validity. The reason was that the current study just focused on two intact classes in two EFL educational centers at Payam Noor University (PNU), and the result of this study may affect the generalizability of the findings to other EFL contexts outside the PNU classes. With regard to the practical limitation, the researcher pretested students' proficiency level through Nelson's Proficiency Test to check EFL students' homogeneity prior to the onset of the project. Although the purpose of the current study was to study the students' oral uptake in terms of repair, the pretest was limited to multiple test items. The reason was due to some constraints regarding selection of three interviewers, availability and willingness of PNU students to participate in at least three interviews and the subjectivity of the interviewer's scoring rubric. This might have led to some damage to internal validity of the whole work, but the main purpose of the test was finding about the homogeneity of the groups involved.

#### **Coding scheme**

For analysis teachers' CMs in classrooms settings, Lyster and Ranta (1997) developed an analytic model to code error treatment sequences in terms of CM types and learner's uptake. Specifically, they identified six types of CM. Example of each type of CM is shown below.

##### **1. Explicit correction**

- |                           |                                  |
|---------------------------|----------------------------------|
| T: OK. Did you study it?  | [Elicitation]                    |
| St: Yes, yes, I study it. | [Need-repair- Grammatical error] |
| St: Yes, I studied it.    | [Uptake -Self-repair]            |

##### **2. Recast:**

- |   |                         |
|---|-------------------------|
| T: Well, you want to tell us something? | [Feedback- elicitation] |
| St: Eh..... Japan tradition.            | [Grammatical error]     |
| T: Japanese tradition.                  | [Uptake-Self- repair]   |

##### **3. Clarification requests:**

- |                                      |                                   |
|--------------------------------------|-----------------------------------|
| St: I want practice today.....today. | [Grammatical error]               |
| T: I'm sorry? (Clarification)        | [Feedback- clarification request] |

##### **4. Metalinguistic feedback:**

- |   |                                  |
|---|----------------------------------|
| St: There are influence person who.....       | [Grammatical error]              |
| T: influential is an adjective.               | [Feedback- Metalinguistic clues] |
| St: Influential person- because of his power. | [Uptake-Self-repair]             |

##### **5. Elicitation:**

- |  |                         |
|--|-------------------------|
| T: "When do you bring excuses?               | [Feedback- Elicitation] |
| St: "When I do something....."               | [Lexical error]         |
| St: "No, when I do something wrong, I accept | [Uptake- Self-repair]   |

##### **6. Repetition:**

- |  |                       |
|--|-----------------------|
| St: "It is good to be neat/net/, clean, and dress up." | [Phonological error]  |
| T: "It is good to be neat/net/?"                       | [Feedback-Repetition] |
| St: "So your appearance is important."                 | [Topic continuation]  |

Based on the Lyster and Ranta's (1997) descriptions of the error types are presented briefly.

#### **Grammatical errors:**

Errors in the use of wrong determiners, prepositions, pronouns, grammatical genders in

tense, verbs, auxiliaries, negations, and etc...

*Lexical errors:*

Errors in the use of wrong lexical items, prefixes and suffixes.

*Phonological errors:*

Errors in the use of mispronunciations, pronunciations of silent letters, etc....

***Data collection procedures***

This study implemented in four intact classrooms during the first semester in 2011. During the time, verbal data were collected. The steps taken in the current study will follow in the following subsections.

*Holding Workshops:* Prior to the study a workshop was held for participating teachers in the experimental groups. Teachers were provided with a teachers' guide, explaining what the CMs are and how they would be used during classroom interaction and discussion in response to the learners' errors, approximately a few days prior to the onset of the instructional treatment. During this time, the researcher provided some examples to illustrate each type of CM from previous classroom observation studies. This consciousness-raising was continued after each three sessions for the purpose of refreshing the experimental group teachers' mind of becoming aware to take more benefit of using CM in their classes for the correction of students' erroneous utterances. After each session, experimental groups' teachers were required to write one or two examples of different types of CMs she used during their classes on a teachers' checklist developed by the researcher (Appendix A).

The teachers in this study were four EFL teachers working in PNU as guest instructors. They had masters degree in TEFL with a teaching experience of five to nine years. In order to minimize the Hawthorne effect, the workshop was only held for the teachers in the experimental groups' classrooms.

*Choosing the Sample, Pretesting and Recording Teaching Sessions:* In order to find the homogeneity of the subjects of this study regarding their general language proficiency, they were pretested through an intermediate level of Nelson's Proficiency Test. The test contained 50 multiple choice items on structure, reading comprehension, vocabulary, and pronunciation items. Though the test is an already valid test, the reliability of the Nelson Proficiency Test was tested by a pilot study. It was carried out on 25 students in Varamin PNU. The internal consistency of the test was calculated by Kuder- Richardson Formula ( $KR-21$ ), the result turned out to be ( $r = .76$ ) representing a relatively high reliability index. After the administration of the Nelson proficiency test, 64 subjects were selected by the researcher. The criterion for the selection of the subjects was the mean and the standard deviation of the subjects' pretest scores ( $M = 65.01$ ,  $SD = .44$ ). The scores between one standard deviation above and below the mean score of Nelson Proficiency Test were selected.

Subsequently, the researcher randomly assigned the subjects into four intact classes, 32 of whom was in the experimental groups, the other 32 in the control groups. These students were attending a 4 credit 12 session course entitled Conversation 2 during the implementation of this research. The experimental groups were received teacher's systematic CMs in response to their errors, while the control groups continued with their regular curriculum without receiving any systematic CMs treatment.

Due to the nature of this research, it was required to choose certain courses in which oral feedback was provided for the learners. Ultimately, Conversation 2 was opted since it met both criteria of verbal feedback and sample size. Altogether, the subjects for the study were selected based on the availability principle. A pretest was administered at this stage to balance the both groups in terms of their language proficiency. As mentioned before, it was found that the difference between the means of students' performance in two groups were not significant. The performance of student's oral interaction was audio- recorded during regular class time over a period of one semester. Each class was held once a week for four hours, but with a 30 minutes break interval. The length of session ranged from 100 to 110 minutes.

*Preparing Transcriptions and Coding the Data:* All the audio-recorded classroom interaction and discussion data along with the teachers' error treatment were fully identified and transcribed by the researcher. To determine the frequency of students' uptake along with their types of errors and teachers' different CMs, Lyster and Ranta's (1997) coding scheme was used. Then the data were coded in terms of teachers' CM types, learners' uptake, and subsequent

'repair'. The transcription of error treatment sequences were reexamined by two researcher's assistants who held Master degree in EFL. A third assistant re-analyzed 20% of the coded data.

### Data Analysis

*The Design of the Study:* This is a quasi-experimental study based on the observational classroom interaction data which utilizes a combination of both descriptive and quantitative methods. A kind of institutional randomization naturally happens in PNU setting since students just register for courses and they are assigned to different classes with different teachers through mere chance.

*Initial Data Analysis in Descriptive Form:* The statistical analysis used included frequency of occurrence of students' errors in terms of phonological, lexical, grammatical erroneous utterances. Then teacher's CMs following students' errors were listed in frequency and percentage. Regarding the descriptive statistical analyses, there were comparisons between both groups for detecting the similarities and differences; the sources of significance; the correlation between the teachers' CF and learners' errors; the students' uptake which led to repair and need-repair in their immediate uptake.

*Quantitative Analyses:* The quantitative statistical analysis took benefit of certain methods which are elaborated next. First, a Pearson Correlation Coefficient was computed to find the inter-rater reliability of the three raters' six CMs, learners' uptake (repairs and need repair), and three error types. Second, a series of general log- linear analyses of multi-way frequency tables were performed. Loglinear analysis is a statistical procedure used to examine the existence of relationship between more than two categorical variables.

## RESULTS AND DISCUSSIONS

### Calculating Inter-Rater Reliabilities

Since there might be possible subjectivity associated with the raters scores, the consistency in assigned scores (scorer reliability) within and between raters were examined. In order to assure consistency within inter-rater reliability, each rater scored each six CM, learners' uptake, repaired, need-repair, and types of errors in terms of grammatical, lexical, and phonological errors and decided on the final score. All the final scores assigned by the three raters were calculated using Pearson product moment correlation ( $r$ ) formula.

The computed Pearson correlation coefficient for coding the six CMs, *elicitation*, *metalinguistic clues*, *clarification requests*, *repetition*, *recast*, and *explicit correction* were .80, .82, .79, .78, .75, and .77 respectively, and inter-rater reliabilities for coding the students' *uptake*, *repaired*, *need-repair* were .83, .84, and .81, respectively. As the results show, there is a high positive relationship among the scores rated by the three raters.

### Descriptive Data

*Frequency of CMs:* The frequency of CM in both groups is presented in Table 1.

Table 1: Frequency of CM in both Experimental and Control Groups

	Elicitation	Metalinguistic feedback	Explicit Correction	Clarification Requests	Repetition	Recast	Total
Experimental Group	1668 49%	803 24%	84 2%	486 14%	134 4%	215 6%	3390 99%
Control Group	1622 50%	425 13%	308 9%	168 5%	111 3%	640 20%	3274 100%

The results of Table 1 showed the frequency, distribution, and percentages of the CM, used by teacher in response to errors committed by learners in both groups. The most frequent CMs are elicitation, metalinguistic clues, clarification requests, and recast and the least frequent CMs are repetition and explicit correction.

*The Distribution of Errors in the Experimental Group:* Of the 887 students' turns with errors, 829 were followed by students' error types, coded as grammatical (444), lexical (226), or phonological (159). The remaining 58 students' turns with error were immediately followed by topic continuation. Table 2 is shown this distribution.

Table 2: Number of Errors (N=829) by Error Type in Experimental Group

Grammar	444
Lexical	226
Lexical	156

Table 2 show that the most frequent errors are grammatical and the least ones are phonological. The 829 CMs following initial errors were distributed across the six CMs and they are shown in Table 3.

*Table 3: Distribution of Errors Receiving CMs in the Experimental Group*

Types of Feedback:	Grammatical (N=444)	Lexical (N=226)	Phonological (N=159)
Elicitation	143	68	39
Metalinguistic Feedback	115	61	46
Clarification Requests	82	45	24
Recasts	55	27	32
Explicit Correction	14	9	10
Repetition	35	16	8

Of the 444 students' turns with grammatical errors, 143 were followed by a teachers' turn containing the most frequent CMs, 143 were elicitation, then metalinguistic clues with 115 frequencies, and the least interactional moves were explicit correction 14 and repetition 35. With regard to the lexical errors, the most frequent errors were 68 elicitations, 61 metalinguistic clues, and the least ones were explicit correction and repetition. Of the 159 students' turns with phonological errors, 46 were followed by a teachers' turn containing metalinguistic clues, 39 were followed by a teachers' turn containing elicitation and the least CMs were explicit correction 10 and repetition 8.

*The Distribution of Errors in the Control Group:* Of the 1220 turns with errors, 336 were followed by a teacher's CMs, coded as elicitation, metalinguistic clues, explicit correction, clarification request, repetition and recast. The remaining 884 students' errors were immediately followed by topic continuation. These distributions are shown in Table 4.

*Table 4: Number of Errors (N=336) by Error Type in Control Group*

Grammar	173
Lexical	111
Phonological	52

Of the 336 errors receiving teacher's CMs in the entire database, 173 were grammatical, 111 were lexical and 52 were phonological. The 336 CMs following initial errors were distributed across the six CMs are shown in Table 5.

*Table 5: Distribution of Errors Receiving CMs in the Control Group*

	Grammatical	Lexical	Phonological
Types of CM:			
Elicitation	37	10	2
Metalinguistic clues	18	10	3
Clarification request	16	8	5
Recast	48	41	29
Explicit Correction	44	37	10
Repetition	10	5	3

Of the 336 students' turns in control group, the grammatical errors were 173 followed by a teacher's turn containing the most frequent CMs, 48 were recast, then explicit correction with 44 frequencies, and the least CMs were clarification requests 16 and repetition 10. With regard to the lexical errors in the control group, the most frequent CMs were 41 recast, 37 explicit corrections, and the least ones were 8 clarifications and 5 repetitions. Of the 52

students' turns with phonological errors, 29 were followed by a teachers' turn containing recast, 10 were followed by a teachers' turn containing explicit corrections and the least CMs were 2 elicitations, 3 metalinguistic clues, and 2 repetitions.

*Research Question 1: Teacher's CMs and Learners' Uptake:* To investigate if the CM had any significant effect on the students' uptake in terms of repair and need- repair in EFL classrooms, four general Loglinear analyses were run. Loglinear analysis is a statistical procedure used to examine the existence of relationship between more than two categorical variables. These analyses were based on a 2 x 6 x 2 contingency table which includes two levels for group (experimental and control), 6 levels for the six CMs and 2 levels for uptake, repaired and need-repair (NR). The results are reported in Tables 6 to 9.

*Table 6: Loglinear Analysis for the Effect of CMs on the Repair (Experimental Group)*

Effect	Sig. Level	Parameter Estimation
Elicitation	.01	.771
Metalinguistic F.	.02	.91
Elicitation* Metalinguistic F.	.03	.63

\* Interaction Effect

Based on the results in Table 6, it turned out that in the case of repaired errors for experimental group elicitation (.771), and metalinguistic clues (.91) as individual factors and the interaction of these two(.63) had the most significant effect on the frequency of uptake as NR. It is notable that the level of significance was in all cases well below .05 which is the usual acceptable alpha level in the field. They were respectively .01, .02, and .03. Due to the effects of some of the CMS on the learners' uptake in terms of repair and NR, the null hypothesis was rejected partially.

*Table 7: Loglinear Analysis for the Effect of CMs on the Level of Repair (Control Group)*

Effect	Sig. Level	Parameter Estimation
Elicitation	.00	.91
Metalinguistic feedback	.00	.77
Recast	.005	.68
Elicitation*Metalinguistic	.04	.14
Elicitation*Recast	.03	.17

\*CM Effect

As for the repaired errors in control group, a number of CMs and their interactions had significant effects on the uptake level. They included elicitation (.91), metalinguistic clues (.77), recast (.68), as well as the interactions of elicitation/metalinguistic clues, and elicitation/recast (Table 7). Due to the effects of some of the CF on students' uptake, the null- hypothesis was partially rejected.

*Table 8: Loglinear Analysis for the Effect of CM on the Level of NR (Experimental Group)*

Effect	Sig. Level	Parameter Estimation
Elicitation	.003	.321
Metalinguistic clues	.001	.064
Repetition	.004	.053
Elicitation*Metalinguisticclues	.000	.039
Elicitation*Repetition	.01	.028

\* Interaction Effect

In the case of need-repair errors in experimental group (Table 4.8), the CMs with most significant impact consisted of elicitation (.321), metalinguistic clues (.064), repetition (.053), and the interactions of elicitation/metalinguistic clues (.039) and elicitation/repetition(.028). Due to the effects of some of the CMs on students' uptake, the null hypothesis was partially rejected.

*Table 9: Loglinear Analysis for the Effect of CM on the Level of NR (Control Group)*

Effect	Sig. Level	Parameter Estimation
--------	------------	----------------------

Elicitation	.000	.62
Metalinguistic feedback	.020	.29
Repetition	.021	.063
Recast	.030	.058
Elicitation*Recast	.042	.076
Elicitation*Repetition	.031	.054

\* Interaction Effect

The results of Loglinear analysis for the NR errors in control group (Table 9) showed a number of CMs with significant effects including elicitation (.62), metalinguistic clues (.29), repetition (.063), recast (.058), along with the interactions of elicitation/recast (.076) and metalinguistic clues/recast (.054). Due to the effects of some of the CMs on students' uptake, the first null hypothesis was partially rejected.

*Research Question 2: Teacher's CM and Students' Error Types:* The second research question investigated the relationship between teacher's six CM and students' error types committed by EFL students. A series of linear regressions exploring the potential relationship between these two sets of variables CM and error types yielded the results which are demonstrated in Tables 10 to 15.

*Table 10: Regression Analysis for the Effect of CMs on Grammatical Errors (Model Summary)*

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
	.781 <sup>b</sup>	.610	.583	4.61783

a. Predictors: (Constant), clarification - b. Predictors: (Constant), clarification, repetition

The regression analysis for grammatical errors indicated that CM can describe the effect of the correction of grammatical errors quite significantly (.61). Table 10 has shown that the obtained value of Adjusted R Square (linear regression) is .58. It means that 58% of changes of grammatical error are determined by two predictors including clarification requests and repetition. The CMs with significant coefficients are demonstrated in Table 11.

*Table 11: CM with Significant Coefficients*

Model 1	Unstandardized Coefficients		Standardized Coefficients		Sig.
	B	Std. Error	Beta	T	
(Constant)	39.626	2.350		16.859	.000
Clarification	-.368	.077	-.618	-4.807	.000
Repetition	.177	.081	.279	2.171	.038

a. Dependent Variable: grammar

The results of CM with significant coefficients have shown that clarification and repetition have the significant coefficients out of all the other CMs. The magnitude of Beta coefficient which indicates the degree of the impact of CF on the grammatical errors correction was mainly shared with coefficients of clarification and repetition, respectively .618 and .279. The Linear Regression Model 1 and its equation derived from the above results are shown in the following

Model 1:

Grammatical Error = -.618(Clarification requests) + .279 (Repetition)

Grammatical Error = 39.62-.368 (Clarification request) +.177(Repetition)

*Table 12: Regression Analysis for the Effect of CF on Lexical Errors (Model Summary)*

Model 2	R	R Square	Adjusted R. Square	Std. Error of the Estimate
	.960 <sup>a</sup>	.921	.910	1.57213

- a. Predictors: (Constant), explicit, recast, metalinguistic clues, repetition

The regression analysis for lexical errors indicated that CM can describe the effect of the correction of lexical errors quite significantly (.92). Table 4.12 has shown the obtained value of Adjusted R Square (linear regression) is .91. It means that 91% of changes of lexical errors are determined by four predictors including explicit correction, recast, metalinguistic clues, and repetition. The CMs with significant coefficients are shown in Table 13.

Table 13: CF with Significant Coefficients

Model 2	Unstandardized Coefficients		Standardized Coefficients	T	Sig.
	B	Std. Error	Beta		
(Constant)	3.2962	.7041		.219	.233
Explicit	.549	.101	.707	5.422	.000
Recast	.207	.045	.8324	.590	.000
Metalinguistic	.151	.044	.397	3.446	.002
Repetition	-.173	.067	-.373	-2.597	.015

- a. Dependent Variable: vocabulary

The results showed that in Linear Regression Model 2, the CM such as explicit correction, recast, metalinguistic clues, and repetition have meaningful relation with lexical errors. The CMs with significant coefficients have shown that the correction of a major chunk of lexical errors (.921) can be described by CF moves. The Beta magnitude in this case was mainly due to significant coefficients of explicit correction (.707), recast (.832), metalinguistic clues (.397), and repetition (-.373). The Linear Regression Model 2 and its equation derived from the above results are shown in the following Model:

Model 2:

Lexical Error = .71(Explicit C.) + .83 (Recast) +4 (Metalinguistic F. -.37(Repetition)

Lexical Error= 3.296 + .549 (Explicit C.) +.207 (Recast) +.151 (Metalinguistic F.) +.173

(Repetition)

Table 14: Regression Analysis for the Effect of CMs on Phonological Errors (Model Summary)

Model 3	R	R Square	Adjusted R Square	Std. Error of the Estimate
	.856 <sup>a</sup>	.733	.715	1.17251

- a. Predictors: (Constant), explicit, recast

Finally, the results of regression analysis indicate that phonological errors regressed quite significantly (.733) on CMs. Table 14 has shown the obtained value of Adjusted R Square (linear regression) is .71. It means that 71% of changes of phonological errors are determined by two predictors including explicit correction and recast. The CMs with significant coefficients are shown in Table 15.

Table 15: CM with Significant Coefficient

Model 3	Unstandardized Coefficients		Standardized Coefficients	T	Sig.
	B	Std. Error	Beta.		
(Constant)	9.791	.427		22.919	.000
Explicit Correction	.326	.038	.999	8.673	.000
Recast	-.037	.012	-.350	-3.041	.005

Dependent Variable: Pronunciation

The results have shown that explicit correction and recast have the significant coefficients out of all the other CMs. The magnitude of Beta coefficient indicates the degree of the impact of CMs on the phonological errors correction. The CMs with significant effect include explicit correction and recast with 0.999 and 0.350 Beta index. The Linear Regression Model 3 and its equation derived from the above results are shown in the following Model:

Model 3:

Phonological Errors = .999 (Explicit) -.350 (Recast)

Phonological Errors = 9.791 + 326 (Explicit) - 0.37 (Recast)

The results of the above tables showed that the second null hypothesis was rejected. Therefore, there is significant relation between the teacher's CMs and the learners' error types.

### **Discussion**

A closer look at the results of this study as they pertain to the first hypothesis reveals a general pattern. It seems that in both groups the CM which was singled out in terms of impact was metalinguistic clues (explicit feedback). It was followed by elicitation, recast, repetition (all three cases are types of (implicit feedback), or an interaction impact. Lyster and Saito (2010) attempted to group along CMs a continuum that ranges from implicit to explicit and according to the dichotomous distinction between reformulations and prompts. Although recasts are placed toward the implicit end of the continuum, it is done so in relation to explicit correction for the purpose of distinguishing these two types of reformulation while acknowledging that recasts themselves range from more implicit to more explicit (Loewen & Philp, 2006; Sheen, 2006).

To classify prompts as implicit or explicit, the researcher followed suggestion by Lyster, (2002) state that clarification requests and repetition are more implicit than elicitation and metalinguistic clues. It is remarkable that one single CM had a great contribution in terms of impact on uptake level in both groups. The fact that the learners in this study were all adults may be linked to the major impact of one single CM or its interactions with other CM types.

As Panova and Lyster (2002) point out via a number of studies, learners may require negative evidence (i.e., information about ungrammaticality) in the form of either feedback on error or explicit instruction in order to improve their interlanguage. They further state that CM can empower learners to notice the gap between their interlanguage forms and target language forms.

Finally, due to the Vygotsky (1978) sociocultural perspective, as learners are assisted by others in the social environment, they learn what they are developmentally prepared for and this 'development involves movement from other to self-regulation' (Ellis, 2007). Ellis (2007) adds, quite correctly, that a teacher needs considerable skill to determine the appropriate feedback needed as the acquisition process develops. Scaffolding then, in terms of L2 acquisition, could be seen as CM (in total) in the zone of proximal development.

With regards to the second hypothesis, the results of some successive regression analyses displayed that systematic CM can significantly describe different types of errors made by the EFL learners in this study. The null hypothesis is, therefore, rejected. It is true that all of the regression analyses output were significant. Nevertheless, in terms of magnitude, the order was as follows: lexical errors, phonological errors, and grammatical errors. The fact that CM could largely describe lexical errors may be largely due to the nature of such errors. At the intermediate level, EFL learners do not have a very substantial array of lexical resources at their disposal. Therefore, they may tend to rely heavily on instructor's feedback once they commit such errors. The instructors also seem to be aware of this regular scenario. That may be one of the reasons behind the large share for direct CM of explicit correction and metalinguistic clues. In other words, the teachers frequently use these direct CMs for setting the vocabulary errors straight knowing by experience that other moves may not produce desirable outcomes. The use of recast for correcting errors, based on the researcher's observations, was mostly in the case of vocabulary items or combinations which were manageable for the learners based on context or topic of the discussion issue or listening extract.

As for the phonological errors, a similar explanation may apply. For one thing, phonological errors are not as straightforward to deal with as lexical, or grammatical. It seems that in reaction to students' phonological errors, the teachers provided some metalinguistic clues, usually addressed to the whole class. In other words, for basic issues

the teacher preferred less explicit feedback, but for the new aspect or less common ones which were important in that situation they preferred more explicit moves such as metalinguistic clues.

Grammatical errors were the ones that regressed the least on CMs. Nonetheless, its coefficient was significant. The distinctive feature here, however, is that in the case of grammatical errors, less explicit moves had the major contribution to regression magnitude. The reason behind this may lie in the fact that basically in Iranian educational system, students are no stranger to grammatical issues, and often times even the exceptions to the rules are fully explained.

## CONCLUSION AND IMPLICATIONS

This study established that a strong positive relationship existed between the teacher's CM and learners' uptake in terms of repair and need repair within the framework provided by Lyster and Ranta's (1997) analytic model. In other words, in the case of this study, the process of correcting and re-correcting led to a fixed learning attainment model. Perhaps the most important factor was the comprehensive workshop and the follow-up sessions that helped the formation of a stable teaching program for teachers in the treatment group. The results show that the frequency of learners' repair increased gradually and continued by the provision of teacher's CM in response to the students' diverse types of errors over time.

Another factor found to mediate the effectiveness of feedback was the duration of the treatment for intervention. Lyster and Saito's (2010) meta-analysis of oral feedback in educational studies revealed that longer treatments were significantly more effective than short-to-medium treatments. The findings of the current study confirmed the Lyster and Saito's (2010) meta-analysis of oral feedback in classroom studies. Therefore, the length of treatment certainly affects additional factors surrounding the value of feedback provision, including the explicitness of the feedback provided.

The results of this study compared with many previously mentioned studies resulting feedback in FL settings has also been found to be more valuable than feedback in L2 settings (Li, 2010; Mackey & Goo, 2007). This is believed to be the case for several reasons: studies have shown that learners in EFL settings have a more positive view of error correction, perhaps playing a role in the effectiveness of feedback. Some have found that more feedback (in the form of recasts) is provided and used by teachers in FL settings when compared to L2 classes (Liu, 2007; Sheen, 2004, as cited in Li, 2010).

From a logical point of view, students of EFL settings, as the case is for Iran, only receive feedback from teachers in schools and institutes. As a result, it is natural that EFL teachers and students are more careful about errors and feedbacks and sometimes they ask for feedback willingly. In addition, what are needed are different types of research design that will each provide a missing piece of the puzzle. Researchers need designs that address different issues and control as many variables as possible.

It seems obligatory that EFL teachers should provide feedback for the students. But it should be kept in mind that there is no fixed recipe for feedback. The success or failure of CM will depend on the classroom context, the type of errors students make, their proficiency level, the type of oral task they are asked to do, and a collection of other variables that may be context specific.

The findings of this study offer certain implication for the field. Before the teachers plan CM practices for their classrooms, they need to reflect on the context in which student language use and errors take place. As EFL teachers are well responsive, students in the early stages of cognitive development and language acquisition need to be encouraged to produce language that communicates meaning; error correction techniques that require students' reflection on language structures or vocabulary are not suitable for learners in those early stages. The types of CM techniques that elicit student-generated repairs are clearly more appropriate for the more cognitively grown-up and proficient learners. It is important to let the learner self-correct. If they allow time and provide appropriate cues for the learner to self-repair, more often than not the student will come through. The least effective technique for correcting a student's incorrect language use is to simply give them the answer.

The results of this study can be of some benefit for TTC courses. Teacher trainees can gain awareness about language learner's interlanguage episodes and the type of errors they commit. They can further discuss how to deal with these errors through alternative CM. Course book developers and teachers can develop course books that include tasks and exercises to encourage a variety of activities that are drawn from the results of CM studies. Such

materials are especially important for local situations that have their own points of strength and weakness. These can be compared with international textbooks that do not always reflect the local needs of EFL learners.

In addition to the impact of length of study, proficiency as a relevant variable affecting CM is reflected in individual differences. A closer look at teacher CM behavior seems to be required, taking into consideration teachers' perspectives on how to best utilize CM in their overall instructional scheme and what they hope to accomplish by it. Further research could be done with a higher number of subjects. With a mainly quantitative research study, the results become more valid with more data to analyze. A more focused approach which is perhaps more manageable and at the same time can provide richer data with a larger number of variables to investigate the effect of different types of CM in written or oral context.

### ***Limitations of the study***

This study was limited in some ways. First, the subjects to whom the researcher had access during the research period were limited to some EFL classes of speaking and listening courses at Varamin and Tehran educational centers of Payam Noor University (PNU) in Iran. Because when this study was conducted during the first semester of 2011, the researcher had not any other access to more classes of speaking and listening courses due to the unwillingness of the instructors to participate in their study. The researcher tried her best to handle the first limitation by including the maximum possible number of classes available to her in PNU.

Time span of the study was another factor that restrained the project. As for the second limitation, the researcher made sure that all the sessions were held fully. In the case of cancellation of some sessions, make-up sessions were arranged which was not difficult to manage due to the part-time nature of education in PNU. Practical limitation regarding the administration of pre-test was another factor that limited the current study. The researcher pretested students' proficiency through Nelson's Proficiency Test to check EFL students' homogeneity prior to the onset of the project. Although the purpose of the current dissertation was to study the students' oral output, the pretest was limited to multiple choice items. The reason was due to some constraints regarding selection of three interviewers; availability and willingness of PNU students to participate in at least three interviews, and the subjectivity of the interviewer's scoring rubric. Based on the assumption that all four language skills are somehow related to each other, and scores in one language skill show more or less the ability of students in other skills, the selection of Nelson's proficiency test may be justified. This might have led to some damage to internal validity of the whole work, but the main purpose of the test was finding about the homogeneity of the groups involved

This study was limited in terms of external validity. The reason was that this dissertation just focused on four intact group classes in two PNU EFL contexts at Payam Noor University (PNU) educational centers in Iran, and the result of this study may affect the generalizability of the findings to other EFL contexts outside the PNU EFL classes.

### ***Acknowledgements***

I am grateful to the following people who helped me with this study: my advisor, Dr. Hassan Iravani, and my two readers, Dr. Gholam Reza Hessamy and Dr. Fatemeh Hemmati for their insightful comments and supports. I also appreciate teachers and students who made possible this study from the beginning, especially the teacher in the experimental group who patiently follow the instruction for using CMs accurately in their classes during a whole semester.

## Appendix A

### Classroom Checklist for Teachers' Use of CF Moves

**Teacher: S      Session: Eleven      Study Center: Varamin**

**Instruction:** Please write one or two example for the types of corrective feedback you used in response to your students' types of errors.

#### 1. Explicit correction:

- T: What the land field is? [Feedback—Elicitation]  
 St: It is a place where garbage drown there. [Lexical Error]  
 T: It is an open area where the garbage is taken. [Feedback- Explicit correction]

#### 2. Recast:

- St: There are a lot of people wait for you to serve. [Grammatical Error]  
 T: There are a lot of people waiting for you to serve. [Feedback-Recast]

#### 3. Clarification request:

- T: Can you say some of the activities a producer usually does? [Feedback-Clarification]  
 St: He has to be ready to make quick decision, to control the budget. [Uptake- Repair]

#### 4. Metalinguistic clues:

- T: what can we do to learn new vocabularies? [Feedback- Elicitation]  
 St: ...by looking it up in dictionary. [Grammatical Error]  
 T: By looking up the meaning of the new words in a dictionary. [Feedback- Metalinguistic.F]

#### 5. Elicitation:

- T: Asia ,Africa, America,.... are.....? [Feedback- elicitation]  
 St: Yeah.....continents [Uptake- Repair]

#### 6. Repetition

- St: One of their friends forgot the party last night. [Grammatical Error]  
 T: ....forgot the party! [Feedback- Repetition]

## AIMS AND SCOPE

The international journal of language learning and applied linguistics world performs as a platform for the new scholars to share their insights with other scholars in the form of original papers.

The international journal of language learning and applied linguistics world is a double-blind peer-reviewed international journal dedicated to promoting scholarly exchange among teachers and researchers in the field of language teaching and applied linguistics. Papers submitted to the journal will immediately be sent to two related reviewers who are responsible to provide feedback on the content and the language use.

The journal is published monthly in online and print versions. The scope of the journal includes, but not limited to, the following fields:

*Theory and practice in English*  
*Language teaching & learning*  
*Teaching English as a second or foreign language*  
*Applied linguistics*  
*Discourse studies*  
*Syllabus design*  
*Language learning problems*  
*Computer assisted language learning*  
*English for specific purpose*  
*English for academic purpose*  
*Language teaching & testing*  
*Translation studie*

*maliakbari@hotmail.com, Jaber.haghighi@gmail.com*

## **ABSTRACT**

The present study investigated how people may evaluate others' personality by noticing their names in an Iranian community. Before initiating the study, the effective facets based on which names are chosen in Iran including religious belief, historical tendencies and newly fashionable names, were sought. Two hundred students in Ilam University filled out the questionnaire in which 30 names, and 30 attributes, from the three above-mentioned groups were represented. Having analyzed the data, the researchers found out that the participants' attitudes towards each category were so close to each other. They proposed approximately the same attributes to each group in general and each name in particular. Analysis of the data suggests that people in the given context often shape mental attitudes towards one's personality by considering his/her name. It was also revealed that stereotypical characters significantly affect the participants' attitude toward others names.

**KEY WORDS:** Personal Names, Religious Names, Historical Names, Newly Fashionable Names, Iranian Names.

## **INTRODUCTION**

Personal names have always been important means for human being to be known and introduced, and are vehicles for establishing and maintaining communications (Ansu-Kyermeh, 2000). Moreover, it is important in a way that each person usually lives with his/her name for a long life. Thus, choosing a name bears significant consequence for parents.

Various facets play roles in choosing names in different cultures. Among the influential facets on choosing names in Iran, one can refer to religious belief, social status, the place of residence, parents' personality, special events, historical tendencies, literal stories, poems, nationality, fashionably new fads and the like. Closer examination of Iranian names calls for special attention to be paid to the powerful role of *religion, history, and novelty*.

Iran is a religious country and the majority of its people are Muslims. Therefore, lots of Iranian names have roots in their religious belief. Ten top names in the recent decade that are registered at National Organization for Civil Registration fervently support this claim. The statistics are available at [www.sabteahval.ir](http://www.sabteahval.ir) and show that the most frequent names in Iran, at least in the last decade, are religious names like Mohammad, Ali, Abolfazl and the like. For instance, 33084 parents chose Amir Ali, the most frequent male name, for their son, and 52049 parents chose Fatemeh, the most frequent female name, for their daughter in the Iranian calendar year, starting in March 20, 2010 to March 19, 2011. The ten top names for boys are Amir Ali, Abolfazl, Amir Hossein, Ali, Mohammad, Amir Mohammad, Mahdi, Hossein, Mohammad Mehdi and Mohammad Reza. The ten top girls' names are Fatemeh, Zahra, Setayesh, Hasti, Zeinab, Nazanin Zahra, Reihaneh, Maryam, Mobina and Narges. Iran is also a historical country carrying extensive and voluminous literature in background. Historical inclinations as well as tendencies toward historical characters affect peoples' choice of names. Kourosh, Darioush and such other personal names gotten from Iranian kings names that are very common nowadays, reveal people's tendency toward history as well. Furthermore, the influence that Persian literature has on people's belief is undeniable in Iran. Names of popular national heroes, figures of art, scholars, and literary figures (e.g. Sohrab, Ramin, Soudabeh, and Arash), are common these days. National names (e.g. Mitra and Sarah) are also among popular names today. This group of names, including all mentioned above, are called historical group henceforth.

The third group consists of newly fashionable names. This group of names includes ones that have just been used in recent decades like Atena, Elina or Arian. They are either recently revived or totally novel. The former refers to those names that root in religion or history, like Mobina and Arian respectively, but they have just recently become fad. The latter are those that have recently come into existence, like Atena, Pedram or Helia. Atena that is originally a Greek name (central intelligence agency, 2007) has recently become popular among Iranians. Helia is also another popular Greek name, that is, as is mentioned in [www.sootak.ir](http://www.sootak.ir), the daughter of the sun. The newly fashionable names may be used because they are up-to-date and in fashion and accordingly, some parents prefer choosing novel names to religious or historical ones. Parents' tendency toward one or the other option motivated the authors to investigate if personal name affect people attitudes toward ones' personality.

## **REVIEW OF THE RELATED STUDIES**

The psychological impact of one's name on shaping personality has been a domain for previous studies. In an early study the relationship between names and mental illness was probed by Ellis and Beechley (1954). They found that kids with unusual and uncommon first names suffered illness more than kids with more usual names. They further reported that this tendency was weaker among girls and women than boys and men. The researchers concluded that others' attitudes might have affected their personality. This could be traced back to the parents since it is plausible that they behave differently and strangely with strange-name kids. Another justification might go to the society; people may have bothered them because of their unusual names.

Figlio (2007) also suggested that boys with names traditionally given to girls are more likely to misbehave than boys with masculine names. In elementary school, boys named Ashley and Shannon, for instance, behaved just like their more masculine-named classmates named Brian and other boyish names. "But, as they enter middle school...boys with names associated with girls may begin to misbehave in school at a disproportionate rate" (Figlio, 2007, p. 3). Attitudes towards personal names motivated the researchers and economists to investigate the relationship between personal names and one's earning during years. Bertrand and Mullainathan (2004) found that employers with African-American names were paid significantly lower than those with "White" names. Figlio (2005) found that "children with names associated with low socio-economic status" achieve lower scores in reading and mathematics exams comparing with their brothers or sisters with "less race or class-identifiable names" (p. 22). The researcher continued that these students are less likely to be considered as gifted and talented learners. Moreover, Arai and Thoursie (2007) investigated the impact of immigrants' surname change to "Swedish-sounding or neutrals" on their earnings. They concluded "that changing a foreign name of Slavic, Asian or African origin to a Swedish-sounding or neutral name is associated with a substantial increase in labor earnings" (p. 15). In another study, Aura and Hess (2010) reported that individual names "have a great deal of predictive power about their lifetime outcomes such as income and social status, educational, and attainment" (p. 16). In contrast to all these findings, Fryer and Levitt (2004) found that one's personal name does not affect his/her outcome.

Influential facets in choosing names, in different cultures, have also been discussed in previous qualitative studies (e.g. Jayaraman, 2005; Guma, 2001). Lyons (1977, p. 222) and Ryme (1996, p. 231) claimed that personal names are both synchronically and diachronically motivated. Katakami (1997) reported the customs of a tribe in Kenya, namely Mbeere, on choosing personal names. The researcher noted that a personal name reflect its sex, place, and generation-sets. However, the basic principle of naming a newborn is to name him or her after another, e.g. grandparents. Following these principles, one may have up to five names as he/she grows up. Agyekum (2006) investigated influential factors in choosing personal names among Akans in Ghana. The researcher found day names, family names, circumstance names, and kinship and so forth, as important facets on personal naming. This is because of adding to or dropping from original names. Mandende (2009) asserted that Vhavenḡa people choose different names for a person in different stages of life. That is, they diachronically change the child name. These naming include names given by birth, school/Christian names, initial school names, marriage names, traditional leaders' names, and Teknonymy.

Exploring the influential facets on naming newborns has been a call for studies. Finch and Mason (2000) referred to using the name of people in naming newborns as a regular custom in the UK. They believe that this usually occurs to keep the memory of lovely late people alive (pp. 145-61). Hanks and Hodges (2003) contended that lots of people in southern India have their father's names beside their personal names. They also use their village names after them (p. 30). Finch (2007) also posited that personal names can be thought of as a means to display "family-like" relationship. However, Finch (2008) maintained that this is to appreciate the value of kinship, and to develop "kin network...in a way which focuses on particular relationship" (p. 13). As mentioned before some research has been conducted to investigate the relationship between name and personality, name and earnings, strange name and mental illness, and important facets on choosing personal names. However, by the best knowledge of the researchers, no research has investigated the extent to which personal names really direct others attitudes in the Iranian context. In other words, it remained unclear whether people evaluate names stereotypically or not. Such an issue, thus, created a relatively strong motivation for research in this social aspect of life in Iran. More specifically, the major intent in conducting the present study is to explore how they affected others' attitudes.

## RESEARCH QUESTION

The present study seeks answer for the following research question:

Does one's name affect attitudes toward his/her personality?

## METHODOLOGY

### ***Design***

This study was conducted quantitatively through survey research. To collecting necessary information regarding the content of the questionnaire for the survey, two pilot studies were conducted. The first pilot study was conducted in order to select frequent and representative names from the three above-mentioned groups, namely religious, historical, and fashionably new ones. The aim of the second pilot was to find the appropriate and frequent attributes for the suggested names to be presented in the actual questionnaire.

### ***Participants***

The participants were students in Ilam State University. Two hundred students randomly filled in the questionnaires. They were majoring in Teaching English as a Foreign Language, English Literature, Persian Literature, Agriculture, Marketing Management and so forth. It should be noted that the Master of Art (MA)/Master of Science (MS) as well as the Bachelor of Art (BA)/Bachelor of Science (BS) students participated in the study. The major reason for selecting university students as participants of the study was their representativeness. They were from different cities, races and tribes in Iran with different backgrounds and cultures. Furthermore, as educated people, university students are more likely to be familiar with the meanings of personal names and were expected to be more sensitive to the issue. Yet, another reason for their selection was their availability and convenience of administration.

### ***Instrument***

A questionnaire including 30 names, written in rows, and 30 attributes, written in columns, was prepared, and 200 copies of which were distributed through Ilam University. Special care was taken so as to maintaining a balance between the categories of names so far attended. Every 10 names belong to one of the three above-mentioned groups: religious, historical and newly fashionable names. The 30 attributes were selected from the most frequently suggested attributes during the pilot studies. Then the names were written in rows, b.1 to b.30, and the attributes were written in the columns, a.1 to a.30. Finally, the participants were asked to select 10 of the most probable attributes each name invoked in their minds. It must be noted that the names and attributes were randomly written in the questionnaire in order not to direct participant's answers.

### ***Procedure***

Having recognized the most important factors in choosing a name, the researchers conducted two pilot studies to find names from the three above-mentioned groups of names, and to determine attributes for them. In the first pilot study, the researchers asked the participants to write contemporary common names that they considered as religious, historical and newly fashionable in an open-ended questionnaire (see appendix 1). The most frequently suggested names were used as the representatives of the names of each group. After the first pilot study, thirty six frequently suggested names were written in an open-ended questionnaire (see appendix 2). The suggested religious names including male and female were Mohammad, Fatemeh, Ali, Hossein, Mahdi, Zahra, Zeinab, Mostafa, Reza, Abolfazl, Mahdieh, Ahmad and Rasoul. It is noted that these names are highly frequent among Iranians.

The most frequently suggested historical names, used in the questionnaire, were Kourosh, Dariush, Jamshid, Ramin, Arash, Soudabeh, Sohrab, Sara, and Mitra. It is worth noting that the three first names were the names of three of the most powerful and famous Iranian kings. The fourth to the seventh names are from Persian literature, and the last two are Iranian national names. All of these names are frequent names in Iran. The last group included newly fashionable names. Sepideh, Pedram, Mobina, Elina, Atena, Matin, Arian, Shayan, Arman, Helia, and Radmehr were the suggested names by participants. In order not to direct the participants' answers, the selected names were randomly written in the questionnaire. In the second pilot study, these open-ended questionnaires were, again, passed to some students to suggest attributes for them. The researcher asked the participants to write whatever each name invoked in their minds. The most frequent proposed attributes were used in the final questionnaire. To check the reliability of the questionnaire, the researchers asked the participants to propose attributes for the suggested names two weeks later. Having ensured of the reliability of the researchers-made questionnaire, the researchers decided to distribute it among university students in Ilam, Iran.

Two hundred copies of the final questionnaire, in which 30 names were written in columns and 30 attributes in rows, were distributed among students in Ilam University. The researchers asked the participants to check the probable attributes that each name invoked in their minds. Having the data collected, the researchers transferred them into

Microsoft Office Excel sheet to record the frequency of attributes for each name. The most frequently suggested attributes for each name were considered of as the attributes of the name.

## RESULTS

Table.1 reveals the number of times each attribute has been marked for names. The number of times each attribute was marked for each name is written in the related rows and under the related column. For instance, number 18 in a.1, b.1 shows that 18 participants marked Mohammad (name b.1) as trustee (a.1). It should be added that only highly frequent attributes that were considered as representatives were presented in Table 1. Furthermore, the number of times each attribute has been marked for names is presented in the last row of the table. The analysis of the data is presented in the following sections.

Table 1: The number of times each name was marked by the participants

## DISCUSSIONS AND CONCLUSIONS

The ultimate goal of the present study was to see to what extent one's name affects others' attitudes toward him/her. Very wonderful results were found from data analysis. It was revealed that some attributes were used to describe only one or two groups and not the others. In the following paragraphs these group-specific attitudes are discussed thoroughly. Moreover, the respondents' suggested attributes for each one of the selected names is presented.

Seven attributes, i.e. *trustee*, *trustful*, *faithful*, *innocent*, *religious*, *submissive*, and *patient* have been selected by participants only for religious names. Put it another way, neither historical nor fashionably new names were thought of as possessors of these attributes, from the participants perspective. *Trustee*, column a.1, was chosen 36 times to introduce religious names; Mohammad, row b.1, was selected by 18, Mostafa, row b.23, by 13, and Abolfazl, row b.29, by 5 participants as the possessors of this attribute. *Trustful*, column a.11, is another attribute that was suggested solely for religious names. Mohammad, Mahdi, and Hossein, rows b.1, b.17, and b. 14, are three religious male names that were thought of as being *trustful*. They were chosen by 9, 7, and 6 participants respectively. The attribute in column a.14, *noble*, was marked 17 times for Fatemeh, row b.7, 9 times for Zeinab, row b. 20, and 5 times for Hossein, written in the row b.14.

*Faithful*, column a.15, was another religious-specific attribute merely suggested for religious names. Thirteen participants considered Mostafa, 10 Hossein, 9 Zahra, 8 Mahdi, 8 Abolfazl, and 3 Mohammad as *faithful* people. Column a.18 asked for the attribute *innocent*. Nine participants marked this column for Zahra and 8 for Fatemeh. These two names are religious female names. The next attribute suggested, just, for religious names was *religious*. The number of attributes for each name is as follows: 13 for Abolfazl, 14 for Mahdi, 8 for Reza, 4 for Zahra, 3 for Ali, and 2 for Mohammad. Column a. 27 asked participants to mark the names that they considered *submissive*. Hossein, Zeinab, and Fatemeh are the names who were thought of as the possessors of this attribute. They were marked 17, 14, and 11 times respectively. Fatemeh, Hossein, Zeinab, and Reza, four male and female religious names, were the names that were considered *patient*, column a.27.

*Traditional* and *attractive* were two attributes that had been chosen, just, for historical names. *Traditional* was marked, by 14 participants, for Kourosh, row b.2, by 14 for Darioush, row b. 9, and by 4 for Sara, row b.18. The first two names are historical male names, and the last one is a national female name. Therefore, participants think of this attribute as a historical one. Besides, neither religious nor new names are anticipated to carry traditional ideas. Only 8 participants expected Soudabeh, row b.11, and 6 expected Darioush as *attractive*, column a.13. This is an attribute that the least of participants marked for names.

The third group of names includes newly fashionable names. Four attributes, *spoiled*, *naughty*, *lovely*, and *elegant* were attributed only to these names. One interpretation that can be offered is that the majority of people with these names are kids and probably no more than 20 years old. Therefore hearing such names reflect a baby in the mind, who might be *spoiled*, *naughty*, *lovely*, and *elegant*. *Spoiled*, column a.6 was selected 141 times, merely, for newly fashionable names. Almost all the fashionable names in the questionnaire had been marked in this column. Column a. 12 asked for the attribute of *naughty*. Fourteen participants considered Mobina, row b.6, 14 Radmehr, row b.16, 8 Arman, row b.19, and 7 Shayan, row b. 13, as *naughty*. All of these names are fashionable male names. Another attribute that was only selected for fashionable names was *lovely*, column a.19. Mobina was selected by 12, and Arian by 8 participants as a lovely person. These two names are fashionable for female and male individuals respectively. Column a.28 asked for the attribute of *elegant*. The expressed ideas for this attribute are as follows: Helia, row b.30, was selected by 15 participants, Atena, row b.27, by 8, Elina, row b.25, by 8, Pedram, row b.3, by 6, Shayan, row b.13, by 4 respondents. All of these names are newly fashionable ones. These names are minorities compared to the religious and historical names and are to some extent universal and less respected by the majority.

Three attributes, *kind*, *calm*, and *proud*, were selected for all the names in all three groups. *Kind* was selected 156 times, *calm* 56 times and *proud* 44 times by participants. *Kind*, column a.4, has been marked the most among all columns. Mostafa, Mohammad, Ali, Fatemeh, Zahra, Hossein, Mahdi, Reza, Jamshid, Soudabeh, Sara, Mitra, Mobina, Arian, Radmehr, Elina, and Helia were the names that were considered as *kind*. The first eight names are religious, the ninth to the twelfth names are historical and the others are new names. Column a.8 asked for *calmness*. Mohammad, Zahra, Hossein, Mostafa, Matin, Helia and Sara are expected to be calm. The first four names are religious names. The fifth and the sixth names are fashionable, and the last one is a historical female name. Religious names are considered as *calm* more than the other two groups. *Proud*, column a.26 was suggested for Ramin, Sara, Sepideh, Mostafa, Reza, and Atena. It indicates that these attributes are generally used and would not differentiate between names in different groups. In other words people with different names could be thought of as *proud*, *calm*, and *kind*.

Three attributes of *courageous*, *strong*, and *powerful*, were selected for two groups. *Courageous*, column a.20, for example, is used to describe two religious names, Ali, row b.4, and Abolfazl, row b.29, and one historical name, Arash, row b.28. The former names are the names of two religious characters in Islam who are known for their courage among Muslims. Ali was chosen by 19 and Abolfazl by 12 participants. Furthermore, there is one character in Iranian folklores, called Arash, who is famous for his courage among Iranians. This name was selected by 8 participants. These three characters directed the participants to mark the attribute *courage* on the related rows. It reveals that neither female names nor newly fashionable names were attributed as courageous people.

Two other attributes, *strong*, column a.10, and *powerful*, column a.2, were also common among these two groups to wit religious and historical names. *Powerful* was chosen by 96 participants, 14 times for Abolfazl, a religious name, and 82 times for historical male names. Historical male characters are known for their power in ancient Iran; moreover, a person called Abolfazl is known as a *powerful* person among Shia, Muslims. This is also true about the attribute of *strong*. It was chosen 62 times, 12 of which went to Abolfazl, and 50 times to four historical names, Kourosh, Jamshid, Darioush, and Sohrab. It reveals that these attributes are used to describe historical male names. However, there is also a religious character that is known as a *powerful* and *strong* person.

The only attribute which was common between religious and fashionable names was *serene* which is the meaning of the name Matin (Hamira (2001, p.416). It has been selected 96 times, 32 times for Matin and the rest for other religious names: 21 participants marked Zahra, 16 for Fatemeh, 11 for Mostafa, and 9 for Ali, and 9 for Mohammad. All these names, except Matin, are religious names. Thus, it can be interpreted as a religious attribute. Perhaps the literal meaning of the name “Matin” accounts for why 32 participants marked this column for the same name.

*Sissy*, *prestigious* and *chick* were three attributes that were common between historical and fashionable names. Seven names were attributed as *sissies*, column a.3, six of them are fashionable and only one, Mitra, is a historical female name. It was marked, by 12 participants as an attribute to describe a person called Pedram. The number of times the same attribute was marked by participants for other names is as follows: 12 times for Radmahe, 10 for Elina, 5 for Helia, 3 for Matin 8 for Ramin, and 4 times for Mitra. The first six names are newly fashionable, but the last two are historical. Thus, participants, mostly, considered people with new names as *sissy*. Perhaps the reason for selecting the last two names is that they are totally common among newborns. Four of these names are male and three of them are female names, thus there is no difference between boys and girls in this attribute.

*Prestigious*, column a.16 was selected for 6 names, 4 of them are new and only 2 are historical names. Eleven participants considered Pedram as a prestigious person; 15 considered Sara, 12 Elina, 6 Arian, 4 Atena, and 3 Radmehr, as prestigious people. Except Sara, all these names are fashionable names. No religious name was regarded as *prestigious*. Fashionable male names were not thought to be *prestigious*, either. The last common attribute between these two groups was *chick*, column a.22. It was determined for two fashionable names, Helia 11 times, and Elina 10 times, and two historical names, Sara 5 times and Arash 4 times. No name from the religious group was checked for the attribute *chick*.

A very eye-catching finding is that each one of the 4 of the attributes of *magnanimous*, *warrior*, *poetic*, and *justice* were selected only for one particular name. *Magnanimous* was attributed, 25 times, only to a historical male name, Kourosh. This name, row b.2, is gotten from the name of “the Cyrus the Great” who was the first person who presented human rights cylinder. It should be noted that this name is the name of well-known kings in ancient Iran (Rastgar Fassai (2000, p. 801); Mo'in (1992, p. 1622). *Warrior*, column a.17, has been selected for Arash, row b.28. This name is taken from the name of an Iranian national hero, “Arash the Archer” also known as “Arash the warrior” (Dehkhoda (1993, p. 67); Rastgar Fassai (2000, p. 9); Hamida (2001, p.27)). It is highly plausible that this character directed the participants’ thought. Moreover, *poetic*, column a.25, was selected just for Sohrab, row b.24. Sohrab is the name of a famous contemporary poet. It is likely that participants considered Sohrab as a *poetic* person because of him. Ali, row b.4, was attributed 12 times as being *justice*. It is noted that Imam Ali is known for his fairness among Shia; perhaps the same character led the participants’ ideas in marking this attribute for Ali.

Furthermore, 8 attributes have only been chosen for either male or female names. Three attributes i.e. *courageous*, *strong* and *good tempered* have been selected just for male names. It shows that these attributes represented male characteristics, in participants’ perspective. On the other hand, 5 attributes of *kind*, *beautiful* and *pretty*, *attractive* as well as *innocent* have been thought to represent female attributes only. Put it another way, these attributes reflected a female in the participants’ minds.

Generally speaking, it can be concluded from the findings that to Iranians, names are more than a common means of identification. They account for a whole variety of family, social, religious, political and ideological values at work

in the society. Iranians are aware of and pay particular attention to these values the names invoke. The findings also revealed that Iranian names are thought to mirror and reflect social and cultural attitudes and this is why parents are so concerned about choosing a name for their newborn child.

Furthermore, the present investigation verified that people have pre-determined opinions and evaluation about each of the above-mentioned group of names which confirms Hagström (2012) claim that “based on our preconceived notions about other people’s names we draw conclusions about their gender, age, ethnicity, nationality, social positions, and maybe even religious beliefs.” (p. 83).

Although exploring the reasons behind such stereotype is not the major purpose of this paper, some plausible reasons are presented below. An explanation for such stereotyping may refer to the impact of the media including press, TV, radio, Islamic books, Islamic belief and so on. Religious names are used with positive attributes on television or radio. Newspapers and magazines’ headlines and titles address the prophet and Imams’ names using attributes like *trustee*, *courageous*, *serene*, and *kind*. For instance, Mohammad, the holy prophet of Islam, is introduced as a *trustful* and *trustee* person; Zeinab as a *patient* person, and Imam Hossein, the third Imam in Shia, as *submissive* in media. Lots of movie actors and actresses with religious names are shown as good and respectful characters. Historical and literary books try to show historical characters as *powerful*, *strong*, and *great*, having *traditional* ideas. Exploring the probable reasons of stereotypical attitudes can be a rich ground for new studies. Findings of the study thus suggest parents to devote particular attention to choosing name for a newborn hence this is a means by which people are evaluated.

#### **SUGGESTIONS FOR FURTHER STUDY**

Relevant to the purpose started earlier, the evaluation of participants’ answers was investigated in this research and the probable reason or reasons behind their evaluation were beyond the scope of the current study. They can, thus, be investigated in new research works. People’s tendency toward each one of these names or the reason of this kind of evaluation can be a call for further studies. Furthermore, factors that affect people’s attitudes and tendency can be studied in the future. Moreover, investigating how much social planning can direct or restrict one’s tendency can be topics of further research. Still, as noted earlier, study of the factors which are at work in parents decision on choosing one name or another is an additional avenue open to further research.

Zahra.....	24. Shayan.....	36. Negar.....

## LEXICAL ANALYSIS OF GENERAL ENGLISH TEXTBOOKS IN IRANIAN UNIVERSITIES

**Mehdi DehGhaedi**

*MA., Department Of General English ,Dashtestan Branch, Islamic Azad University,Dashtestan, Iran. Email: ghaedideh@gmail.com*

### ABSTRACT

Currently, immediate and academic needs of the learners have gained much importance in the evaluation of learning materials. In so doing, this study aimed at comparing a number of General English (GE) reading textbooks used in universities in Iran in terms of their vocabulary size, vocabulary levels and text coverage. Coxhead's (2000) Academic Word List (AWL) containing 570 word families, the BNC 14,000 high-frequency English word lists, and the 2000 English words required by Iran's Ministry of Education were chosen as the base word lists. The results showed that a General English textbook can contribute to learning 47–407 interdisciplinary academic words. Beyond the 2,000-word level, a GE textbook can supply students with 158–2001 new word families. Syllabus designers and materials producers can take advantage of the findings of the study through needs analysis for the specification and sequencing of the lexical items in general English textbooks.

**KEY WORDS:** General English Textbooks, Vocabulary Level

### INTRODUCTION

English education in Iran starts officially in the first year of guidance school, though some private schools may begin English programs as early as in the first grade. During primary and secondary education (Grades 1–12), English courses aim to familiarize learners with basic English sentence structures and the most commonly used words. The content of English texts is broadly humanities-based and teaching is geared towards the general interest of students rather than to specific purposes.

The 2,000 basic English word list published by West's (1953) General Service List (GSL) of English has served as a curricular standard for the English course design for elementary and high schools. By and large, the 2,000 lexical items are presumed to be the minimum vocabulary of EFL high school graduates entering university.

At the university level, English is a required language subject. English courses for general purposes are offered to non-English majors two to three hours per week in the freshman and sophomore years respectively. The curriculum design of General English is expected to broaden students' horizon so that they can meaningfully relate their academic study to other realms of understanding. Crucial to this goal is providing students with versatile academic content covering topics such as culture, nature, business, medicine, science and technology to achieve an all-encompassing development of knowledge.

In Iran, English is not an official language. After taking required English courses in the first two years of college, one may learn new English words at a decreasing rate and may even almost stop learning. As far as non-English majors are concerned, GE courses may be regarded as a transition between senior high school and college English proficiency benchmarks. As students continue to take English for Specific Purposes (ESP) courses in the third or fourth years, then GE courses may also be viewed as a launch pad for further English programs. GE textbooks and materials used in the freshman and sophomore years may therefore play an important role in enhancing English abilities.

In light of the potential role of English for General Purposes courses in the current EFL context, vocabulary goals should be considered first in choosing and preparing teaching materials. Breadth of vocabulary has been identified as one of the most important indicators of reading proficiency and language abilities (Hu & Nation, 2000; Qian, 2002), since a rich vocabulary makes the skills of listening, speaking, reading and writing easier to perform. The limited vocabulary of EFL learners is a major source of difficulty in reading an English text.

West (1926) considered "one unknown word in every fifty words" to be the minimum threshold necessary for the adequate comprehension of a text (cited in Chujo, 2004, p. 231). Some other researchers (Read, 2000; Schmitt &

McCarthy, 1997) believe that if more than one word is unknown in every twenty words (95%), learners would need to look up new words on and off, which means as the density of unknown words increases, reading comprehension drops. So, it can be inferred that, learners depend on vocabulary as their first resource and if 95–98% coverage of a text is needed for unassisted comprehension, vocabulary size may be one of the predictors of test scores and this assumption should be applied to English language testing, since learners cannot resort to dictionaries or consult teachers while doing a test. As such, what is the optimum vocabulary needed for a graduating college EFL student?

## **LITERATURE REVIEW**

The majority of research carried out in L2 vocabulary studies has focused on developing measures to assess proficiency or the size of a learner's vocabulary. For example, Laufer and Nation (1995) analyzed students' written texts by comparing them to three frequency lists: one containing the 1000 most frequent word families in the English language, one containing the 2000 most frequent word families in the English language, and a third list containing 500 academic words used at university. Word family within the authors' study is represented by a "head word" and all "derived forms" as in the example: push: pushed, pushes, pushing. The authors argued that their results indicate that the use of frequently occurring words reflects a smaller vocabulary while the use of low-frequency words is an indicator of vocabulary richness. This measure does not identify whether a learner can produce a certain word when prompted to do so, but rather how much lexical variety he uses in his writing (Laufer, 2005).

Past studies have shown that the minimal vocabulary size needed for reading authentic texts starts at a low of 5,000 words and ranges up to 10,000 words for reading university textbooks (Hirsh & Nation, 1992; Laufer, 1989, 1997).

According to Nation (2001), words in non-fiction texts can be divided into four categories:

1. High-frequency or general service vocabulary: those basic general service English words which constitute the majority of all the running words in all types of writing. The most well-known general service vocabulary is West's (1953) General Service List of English Words (GSL).
2. Academic vocabulary (also called sub-technical or semi-technical vocabulary): vocabulary with medium-frequency of occurrence across texts of various disciplines that have some rhetorical functions and communicative purposes. Acquiring these words seems to be essential when learners are preparing for EAP or ESP.
3. Technical vocabulary: are the ones used in a specialized field and are considerably different from subject to subject. In an academic setting, ESP students do not see technical terms as a problem because these terms are usually the focus of discussion in class or in the specialist textbooks.
4. Low-frequency vocabulary: words that are rarely used.

Coxhead (2000) compiled a corpus of around 3.5 million running words from university textbooks and materials from four different academic areas (law, arts, commerce as well as science), and identified 570 academic word families, which were claimed to cover almost 10% of the total words in a general academic text. Her research suggested that for learners with academic goals, the academic word list contains the next set of vocabulary to learn after the top 2,000-word level. To put it concretely, after the top 2,000 word families on a frequency list, greater text coverage is gained by moving on to the 570 academic words (10% coverage) than by continuing to learn the next 1,000 words ("3–5%" coverage for the 3rd 1,000; Nation, 2006, p. 79).

## **RESEARCH QUESTIONS**

The present study was undertaken to examine the vocabulary of General English textbooks used in universities in Iran. How can the goal of increasing vocabulary size to a particular target level be achieved in the classroom under real class conditions? What interdisciplinary academic vocabulary can freshman and sophomore English courses for general purposes provide through diverse and versatile content? What additional vocabulary is required for students under the assumption that 95% text comprehension is the threshold for passing an English proficiency

test? If college GE textbooks fall short of the targets above, English instructors must then provide supplementary materials to bridge the gap. By lexically comparing textbooks, this research sought to answer the following questions:

R.Q.1. What percentage of the words in a General English reading textbook does Coxhead's (2000) Academic Word List cover? How many interdisciplinary academic words may one learn from a GE textbook?

R.Q.2. how many new words may a university student learn from a GE textbook?

R.Q.3. What is the vocabulary level of a GE textbook?

## METHODOLOGY

### *Textbook selection criteria*

The criteria for the selection of the GE reading textbooks widely used in universities in Iran were based on the popularity of GE textbooks frequency of use in 10 Azad universities in Iran. In total, six textbooks were chosen, two low-intermediate, two intermediate, and two upper intermediate. Excluding exercises the main articles in each book chosen were scanned into six separate computer files. As proper nouns are not in the list of the most frequent 2,000 words and various types of text may contain different percentages of proper nouns, they were separated from the counting of normal words. After removing proper nouns, the resulting corpus contained in total 74,912 tokens (running words), as Table 1 shows.

*Table 1: The corpus of General English Reading textbooks*

GE Textbook 2	Book Level	Number of Texts	Tokens
Reading Challenge	Low-intermediate	20	6,709
Access Reading 3	Low-intermediate	20	8,541
Active Skills for Reading 3	intermediate	32	18,798
Concepts & Comments-reading 4	high-intermediate	20	15,383
Select Readings-intermediate	intermediate	14	10,204
Select Readings upper-intermediate	high-intermediate	12	15,277
			74,912

### *Instrumentation*

Developed by Paul Nation for research purposes, the Range software can be used to compare a text against certain base word lists to see what words in the text are and are not in the lists, how many words from a word list are in a text, create word lists based on frequency and range, and discover shared and unique vocabulary in different pieces of writing. In particular, it can also be used to compare the vocabulary of many text files at a time to see how much of the same vocabulary they use (i.e. range) and the frequency of occurrence of the words in total and in each file.

To compare GE textbooks, the following three categories of word lists were used:

1. The BNC 14,000 high-frequency English word lists.
2. Coxhead's (2000) Academic Word List (AWL) containing 570 word families.
3. The 2,000 basic English words announced by the Ministry of Education.

The 14,000 high-frequency word families were divided into fourteen base word lists, each containing exactly 1,000 word families. Apart from the BNC 1<sup>st</sup>–14<sup>th</sup> 1,000 word lists, some proper nouns and Roman numerals as well as spoken interjections and exclamations were also incorporated in the RANGE program, however, they were beyond the research focus and were hence not factored in.

Coxhead's (2000) 570 academic word-family list has also been included in the RANGE program. This list was adopted for the present study to measure how frequently the academic words across disciplinary domains occur in

a GE textbook and to compare the extent to which a GE textbook can prepare a learner for reading professional texts.

Word families are regarded as an important counting unit because comprehending regularly inflected or derived members of a word family does not require much effort, if learners know the base word and basic word building processes (Bauer & Nation, 1993). The notion is useful when we are concerned with vocabulary size in a reading textbook. The 2,000 most frequent words on the BNC HFWL include 2,000 base forms, their inflected forms and derivatives, thereby making a total of 11,941 different words (types). Finally, to assess the vocabulary levels of the six GE textbooks, the RANGE computing program was run each time against one of the following three base word lists, using the same counting units, word types and word families: (1) AWL 570, (2) BNC HFWL 1<sup>st</sup>–14<sup>th</sup> 1000, and (3) the basic words by the Ministry of Education.

## RESULTS AND DISCUSSION

According to Coxhead (2000), the 570 academic word families account for approximately 10% of the tokens in academic texts. The middle column in Table 2, which shows the AWL occurrence in tokens and in percentage, addresses the first research question, “What percentage of the words in a General English reading textbook does Coxhead’s (2000) Academic Word List cover?”

The top textbooks of higher AWL coverage were Active Skills for Reading 3 (5.32% in tokens; 12.47 % in types), and Select Readings high-intermediate (4.63% in tokens; 12.29% in types). These two books were labeled by the publishers as suitable for high-intermediate and advanced EFL learners. Access Reading 3 for low-intermediate learners had the lowest AWL coverage, with 2.32% coverage counted in tokens and 4.82% in types. It was observed that the higher AWL coverage and the higher-level GE textbooks bore some relationship to each other, which can be justified as advanced textbooks are meant to teach advanced vocabulary and to expand students’ vocabulary breadth. Similarly, it is not disappointing to find that basic GE textbook contained little academic vocabulary since lower-level books serve other purposes in language learning.

*Table 2: The AWL coverage of GE textbooks*

General English Textbooks	Number of words	AWL occurrence in tokens/ %	AWL occurrence in types/ %	AWL occurrence in families
Active Skills for Reading 3	18,798	1000/ 5.32%	444/ 12.47%	270
Select Reading high intermediate	15,277	472/4.63%	280/ 12.29%	266
Select Readings-intermediate	10,204	609/ 3.99%	371/ 11.00%	211
Concepts & Comments- reading 4	15,383	607/ 3.95%	303/ 10.85%	202
Reading Challenge 2	8,541	298/ 3.69%	118/ 7.20%	91
Access Reading 3	6,209	237/ 2.32%	102/ 4.82%	69

Given the assumption that the 570 interdisciplinary academic words are all new to college freshmen, Table 3 demonstrates that the academic lexical items that can be learnt by using one of the six GE textbooks range from as little as 49 to as much as 415 word families. This result produces an overall picture of the amount of academic vocabulary a student will be equipped with after taking a GE course for one year.

Coxhead (2000) suggested that the Academic Word List containing 570 word families could be used to set vocabulary learning goals for GE courses as a launch pad for further English for academic purposes programs. For instance, if 50% of the headwords in the AWL are expected to be taught within an academic year, then a GE

textbook should ideally include at least 285 predominantly academic words. If properly selected or managed, a GE textbook can contribute to the goal of academic vocabulary learning.

To answer Research Question 2 it was decided that the 2000 word list can serve as the computing basis for analysis, since it represents the average level of a college freshman's vocabulary capacity in accordance to the requirement of Iran's Ministry of Education.

*Table 3: Text coverage by the 2000 word list*

Level	GE Textbooks	2000 word list %coverage (in tokens)
high intermediate	Active Skills for Reading 3	85.70 %
high intermediate	Select Readings-high intermediate	85.54 %
intermediate	Select Readings-intermediate	89.10 %
intermediate	Concepts & Comments 4	90.18 %
low-intermediate	Reading Challenge 2	88.67 %
low-intermediate	Access Reading 3	91.21 %

The table shows that how much of the vocabulary in a GE textbook will be familiar to the learner and how many words the learner may not know.

*Table 4: Text coverage by TBEWL 2000 across GE textbooks*

GE Textbook	2000 word list		Not in the 2000 word list		Total	
	tokens/ %	types/ %	tokens/ %	types/ %	tokens	types
Active Skills for Reading 3	16110/ 85.70	1999/ 56.15	2688/ 14.30	1561/ 43.85	18798	3560
Select Readings high intermediate	13068/ 85.54	1848/ 54.77	2209/ 14.46	1526/ 45.23	15277	3374
Concepts & Comments4	13059/ 84.89	1671/ 59.83	2324/ 15.11	1122/ 40.17	15383	2793
Select Readings intermediate	9092/ 89.10	1487/ 65.28	1112/ 10.90	791/ 34.72	10204	2278
Access Reading 3	7790/ 91.21	1172/ 78.34	751/ 8.97	324/ 21.66	8541	1496
Reading Challenge 2	5949/ 88.67	1226/ 74.85	760/ 11.33	412/ 25.15	6709	1638

For example, 7,790 of the running words in Access Reading 3 were in the 2000 word list, while 751 tokens were not. These 751 occurrences involving 324 different words (types) could possibly be college freshmen's new words. By and large, if a college student reads all the texts of a GE course book within an academic year, he/she would come across 324-4,003 new words beyond the 2,000-word level, appearing in different types. This implies that the vocabulary learning goals subject to the selection of a GE textbook are quite wide-ranging. By learning vocabulary at the rate of 162 new headwords (and hence their family members) per academic year over the college course of four years, it does not seem likely that students can achieve the 5,000-word threshold level as proposed by Laufer (1997).

If Nation's (2001) estimate that native speakers read about 10-12 books per year to acquire 1,000 words is correct, then setting the vocabulary goal 2001 new words for one GE textbook, to be learnt within one year, would be akin to 'building castles in the air'. In view of this, the vocabulary size of a textbook cannot be ignored and should be taken into account from the start, at the onset of syllabus design.

#### ***The vocabulary level of a GE textbook***

Vocabulary levels were defined as the number of words counted from the top of BNC HFWL accounting for 95% of the running words in that textbook if we accept the assumption of 95% text coverage as the minimum for successfully guessing meanings from context and gaining reasonable comprehension. As mentioned previously, there are fourteen 1,000-word bands created from the British National Corpus in the RANGE program. Thus, the

BNC HFWL was used to identify the division among the diverse vocabulary levels contained within the GE textbooks. The text coverage of each 1,000-word band in the target textbook was calculated by counting the number of 1,000-word bands needed until the total coverage reached 95%.

*Table 5: Vocabulary levels of the GE Textbooks measured by the BNC HFWL 1<sup>st</sup>-14<sup>th</sup> 1000 at the accumulated text coverage reaching 95%*

GE Textbook	Book Level	Vocabulary Level
Active Skills for Reading 3	high-intermediate	3,000-3,500
Select Readings high intermediate	high-intermediate	4,000-4,500
Select Readings-intermediate	Intermediate	2,500-3,000
Concepts & Comments 4	Intermediate	4,000
Reading Challenge 2	low-intermediate	3,000-3,500
Access Reading 3	low-intermediate	2,500-3,000

There are two apparent exceptions in Table 5 with regard to the book level claimed by the publishers and the vocabulary level measured by the BNC HFWL 1<sup>st</sup>-14<sup>th</sup> 1,000. The intermediate GE textbook, Select Readings-intermediate, had a vocabulary level of 2500-3000 words which is counter to the general expectations on the range of the number of words in intermediate books and so low. This book at the intermediate level actually had more middle- and low-frequency English words. By contrast, the advanced Active Skills for Reading 3 had a denser distribution of words, 3,000-3,500. This shows that it is possible to select an advanced-level GE textbook with a lower vocabulary level. The discrepancies in vocabulary levels among GE textbooks imply that textbook authors may not apply the same standard in their selection of words while writing their teaching materials for the publishers. It can also be ascribed to the fact that articles in textbooks for different reading purposes may involve different levels of difficulty. Some low-frequency words appear more frequently in a certain genre or subject matter and can function as technical words in certain fields. This echoes Nation's (2001) remark that "one person's technical vocabulary is another person's low-frequency word" (p. 20). By the same token, some vocabulary presumed difficult by some authors may be considered easy by others.

## CONCLUSION

General English textbooks are supposed to play roles in vocabulary learning in a number of ways. The present corpus-based study is a try to discuss the roles in question. To sum up, Coxhead's (2000) 570 academic word families account for 1.3% – 6.54% of the total words in a General English textbook, and up to 407 interdisciplinary academic words can be learnt from a GE reading textbook. GE textbook containing more readings for academic purposes are suggested in cases that academic vocabulary learning is the goal.. The other very important factor to consider, when choosing college GE textbooks, is the appropriateness of book levels. If a learner's vocabulary is small, s/he may not enjoy reading due to the enormous vocabulary load. The opposite case is also true, in that, if a learner has large vocabulary knowledge, as learning gains may be small due to the few number of new words available in the text, the task of reading would become so boring to them. As a consequence, more thought should be given to the selection of a GE textbook. Not knowing students' vocabulary capacity in advance, a college professor may choose GE textbooks based on their intuition or publishers' claims, which might lead to the above mentioned problems. So, it seems necessary that the students be placed in the proper class level by an appropriate proficiency placement test so that it would become possible for the teachers to select an English textbook for general purposes with an appropriate level of reading difficulty. In relation to the topics and articles they contain, GE textbooks offer texts of varying vocabulary levels. In the present research, the book levels claimed by the publishers did not seem to coincide with their vocabulary levels in a few instances. This finding may be helpful in raising teachers' awareness of the importance of considering the vocabulary level when choosing an English textbook. They should treat the book level claimed by the publishers with caution. Apart from this awareness, it is also crucial to set vocabulary goals at a reasonable size and level for the course of study.

## LIMITATIONS OF THE STUDY

Although this research focused on the vocabulary component of the General English textbooks, by no means does it imply that vocabulary size, levels and lexical coverage are exclusive factors in selecting a GE book for class use and vocabulary is not the only component of an English course. Other parameters such as syntax and content area knowledge may be worth investigating but were beyond the focus of the current study. For the purpose of data triangulation, further research might achieve further findings through a qualitative analysis of students' perception toward language textbooks in relation to vocabulary load and reading difficulty. It would also be interesting to examine how a textbook can be used and how books within one series may provide a pathway for language development.

**ABSTRACT**

The present study aimed at examining the relationship between English Textbooks and the cultural attitudes of Iranian EFL (English as a foreign language) learners whose English proficiency was intermediate and above. To this end, Top Notch and Interchange series were selected as two of the widely used English textbooks in Iran as an EFL context. The afore- mentioned textbooks were analyzed to extract all the possible cultural issues embedded within the units. The questionnaire which was employed in this study was a test of cultural attitudes by Ashraf, Motallebzadeh and Kafi (2013) which checked the cultural attitudes of Iranian EFL learners. This test was validated by two experts in the field, also its reliability, using Cronbach's Alpha, was estimated to be (.870). The questionnaire was administered to 210 EFL learners of English. Afterwards the relation between these learners' English proficiency and the extent to which their cultural attitudes had changed was also investigated. For measuring the probable relation, Chi Square test as well as cross tabulation were run for analysis of the obtained data. The results exhibited a significant relation between English textbooks and the cultural attitudes of Iranian EFL learners.

**KEY WORDS:** Textbooks, Cultural Attitudes, EFL Learners

**INTRODUCTION**

Generally speaking, there seems to be a widespread attention and research done regarding textbooks including their contents and effects. Generally Speaking, nearly all students seem to refer to and use the ideas they come across in their course books within their daily lives. Actually, it sounds that learners are under the influence of the textbooks they study during each school year and as a matter of fact they learn many issues e.g. social, religious, and cultural as well as linguistic ones. Therefore, it is asserted that the totality of language learning comprises three integrated components: linguistic, cultural, and attitudinal (Wilkes, 1983).

There have also been interesting ideas and beliefs regarding the relevance of culture and cognitive ability by some scientists including Tylor (1874). He has made an assumption that has won general acceptance and that is the fact that there is an intimate connection between socio-cultural progress and mental progress.

**LITERATURE REVIEW**

***The Role of Culture in Intercultural Competence***

This section discusses some of the arguments posited in support of developing second language learners' intercultural competence. This is in line with globalization where second language learners are increasingly exposed to the global community in which English plays a role as an international bridge.

Puente (1997) asserts that "language reflects and affects culture" forming a "dynamic relation" or intrinsic link. In relation to this, Iranian English language learners need to learn about the target language culture together with

Persian culture in order to communicate effectively, achieving communicative competence. Communicative competence is not possibly achieved without cultural understanding, as it is the core of language acquisition. A learner then avoids all the pitfalls of cultural misunderstanding or ignorance which leads to the breakdown of communication. In addition to communication, learners who are said to have acquired a language are those who are able to align themselves with the culture of the target language. They can also think in the target language thus enabling them to identify with the language by capturing the essence of the language (Tang, 1999).

### ***Culture and ELT***

As Prodromou (1992; as cited in Sardi, 2002) states, the learner's attitude toward the target culture has an impact upon the acquisition of the language. A positive attitude toward the target language culture, i.e. respecting other people and their way of life, is a factor in language learning that leads to cross cultural understanding. Before students can learn about culture they must be receptive to the concept of learning about cultures other than their own. According to Karimpour (2000), negative attitude, i.e. viewing everything through the eyes of our own culture and its values, usually emerges either through false stereotyping or undue ethnocentrism. English as a foreign language (EFL) learners' negative attitudes toward second language (L2) culture may lead to decreased motivation and interaction, and because of decreased L2 input and interaction it may lead to unsuccessful attainment of L2 proficiency.

Lado (1988) has divided unhealthy attitudes into two groups: 1) "pedantic cultural attitude" 2) "quaint nativism attitude" (Tsai Yu-Hsin, 2001, p.7). He believes that these two phenomena are commonly found among students encountering a foreign culture. According to this author, those who have pedantic culture attitudes consider the second or foreign language as the only correct or prestigious way to view the world and differences between this culture (L2 culture), and another language and culture are indicators that the other is incorrect or inferior. On the other hand, those who have adopted a "quaint nativism attitude" consider everything in native culture as more beautiful, interesting, desirable and correct than in second or foreign culture. Both of these attitudes are neither proper nor healthy and can result in cultural misunderstanding (Tsai Yu-Hsin, 2001).

Consequently, what seems to be of great importance is the fact that the study of different cultures aids students in getting to know different people. This knowledge is necessary for understanding and respecting other nations and their ways of life. Kincheloe and Staley (1985) highlight the significance of cultural awareness: first, cultural awareness makes students less fearful and prepares them to deal with different people and places. Second, it allows for the possibility of increased tolerance. Third, as students see themselves and their own cultures more objectively, feelings of ethnocentrism and self-righteousness are decreased or avoided.

### ***Opposing Views on the Cultural Content of EFL Courses***

There are indications that some ELT course books focusing on the target culture have an alienating effect on students who do not want to be culturally assimilated and, as a consequence, give up learning the language (Gray, 2000). On the other hand, it is not uncommon for many students to become alienated from their own social and cultural settings as they become adjusted to the value system of the Anglo-American world. Many educators in Asian and African countries have expressed their concern for the status of their native culture and language in relation to the cultural content of ELT materials developed for global use (ibid.).

These problems with the cultural influence of English on other societies have led to the suggestion that an ideologically, politically and culturally neutral form of English should be promoted in ELT. It is argued that English, as an international language utilized for communication purposes would make it possible for nonnative speakers to retain their own cultural characteristics as much as possible (Jenkins, 2000). Another suggestion is that, instead of focusing entirely on the culture of the target language, it is more beneficial to take a cross-cultural approach to EFL teaching. According to Prodromou (1992), for example, the development of students' cross-cultural awareness is of vital importance because in this way they will become more sensitive to the world's many cultural systems and will care more about the world they live in.

### ***Textbooks and Culture***

A discussion on textbooks is inevitable in light of the arguments advocating the infusion of culture in EFL education. The significance of textbooks is seen in the many roles textbooks play in facilitating the second language teaching and learning process in the classroom. Textbooks across the world are of different cultural orientations; whether they are based on source cultures, target culture or international target cultures. Source cultures refer to learners' own culture, target culture is the culture in which the target language is used as a first language while international target

cultures refer to various cultures in English, or non-English-speaking countries which use English as an international language. (Cortazzi & Jin, 1999; as cited in Norhana & Sanda, 2011).

### ***Related Studies***

There have been similar studies carried out with regard to both or one of the variables. For example, Ashraf, Motallebzadeh, & Kafi (2013), investigated the EFL learners' attitudes through the analysis of Interchange and American file series. They also checked these EFL learners' attitudes towards using localized textbooks instead of the original ones. The results indicated that EFL learners prefer using original English textbooks instead of the localized ones. Moreover, all these learners' cultural attitudes have been affected by the mentioned textbooks. Rajabi and Ketabi (2012) investigated the aspects of cultural elements in prominent English textbooks for EFL setting. The results indicated that the pragmatic (sociolinguistic) occurrences are quite predominant probably because the forms and functions of language such as, to offer, to clarify and to request are included in almost all the chapters.

Abdollahzadeh and Baniasad (2010) also conducted a research on ideologies in the imported English textbooks: EFL learners and teachers' awareness and attitude. Studying the results and from the total frequencies, it can be concluded that *Spectrum VI* (total frequency: 58) has the most ideologies. Comparing frequencies, one can observe that the higher the level of a textbook, the more frequent the ideologies. Further consumerism and sexism were found to be the most common ideological prompts across all these imported textbook series.

Making a comparison between the students' native culture and foreign language culture is a new issue in the field of language teaching. Some writers (Kramersch, 1993; Baker, 2003; Valdes, 1986) consider both cultures to be closely related to each other. They state that mother language culture plays a role that promotes better understanding of the foreign culture. For instance, Kramersch (1993) argues that in a foreign culture, we construe events by contrast and analogy with our own culture, as well as by contrast and analogy with the foreign culture. She reveals that: "by constructing both their own and the foreign values, by organizing and extending the range of convenience of these constructs, students can find bridges to other culture, anticipate foreign events and discover alternatives to their own cultural patterns" (p.437). She also suggests that before we make L2 students understand the attitudes and values of a foreign culture, we have to make them aware of their own attitudes and values in interpreting a foreign event.

### **STATEMENT OF THE PROBLEM**

It seems that textbooks are at the heart of crucial innovations occurring within the educational systems, therefore, they need to be studied thoroughly in order to inform any further changes the stakeholders may deem useful and needed. Besides, their impact in the EFL context should be investigated through more researches because for the EFL learners, the textbook becomes the major source of contact they have with the language apart from the input provided by the teacher.

Consequently, it has repeatedly been emphasized by many researchers and scientists including Hutchinson and Torres (1994) that textbooks are universal elements of English language teaching and that it seems no teaching learning situation is complete unless the relevant textbook is provided. Moreover, it seems that there is an opposing view regarding the cultural content of EFL courses (Widdowson, 1990; as cited in Sardi, 2002). He stated that English teaching should be carried out independently of its cultural context. Instead, familiar contexts seem more suitable to be inserted within the textbooks. It is obvious that every language has a setting in which people who speak it belongs to a race or races and "language doesn't exist apart from culture" (Sapir, 1970).

### **RESEARCH QUESTIONS**

To address the above mentioned problem, the researchers tried to answer the following questions:

Q1. Is there any significant relationship between studying English textbooks and probable changes in cultural attitudes of Iranian EFL learners?

Q2. Is there any significant relationship between English Proficiency and the cultural attitudes of Iranian EFL learners?

## RESEARCH HYPOTHESES

To avoid subjectivity the researchers propose the following null hypothesis:

HO1. There is not any significant relationship between English textbooks and the cultural attitudes of Iranian EFL learners.

HO2. There is not any significant relationship between English proficiency and the cultural attitudes of Iranian EFL learners.

## SIGNIFICANCE OF THE STUDY

An important point motivating a work in this area is the status of English textbooks in Iran and particularly among English teachers and the vast community of students. In other words, so many budgets are allocated to buying and providing the useful English commercial textbooks in the market. Therefore, getting to know about the attitude and the outlook these teachers and students might have towards the English textbooks which are widely used in Iran, would be of great benefit for teachers in finding the appropriate teaching materials as well as textbook writers and curriculum developers.

Many teachers and school authorities believe that there are different factors involved in the Iranian students' achievement in English language (Azizifar, Koosha & Lotfi, 2010). One of these factors may refer to the culture which is directly mentioned or implied in the various exercises included in the textbooks which results in the probable change in the EFL learners' attitudes towards a foreign language. Moreover, if we look meaningfully at what culture means, we would come up with the fact that culture is an inseparable part of societal life that cannot be ignored easily (Alptekin, 1993; as cited in Sardi, 2002).

## METHODOLOGY

### *Participants*

In order to collect the required data, a sample of 210 intermediate and above intermediate male (89) and female (121) EFL students who had recently finished studying these levels at language schools in Iran participated in this study. The majority of the participants (106) had an age range of 21 to 30 years old and the rest were under 20 and half of the participants (50%) had B.A. degree. The majority of the participants had studied Interchange series or Top Notch series as the main required textbook at the institute. In order to control the probable effects of other factors on the learners' cultural attitudes, two control questions were included to the end of the first section of the questionnaire, to which 15 learners had answered positively and as a result they were excluded from the study at first place. All these intermediate learners had spent a minimum amount of two years studying English.

### *Instrumentation*

The elicited instrument used in this study was a researcher made questionnaire i.e. an Acculturation test by Ashraf, Motallebzadeh and Kafi (2013).

### *Acculturation Test*

The questionnaire which was employed in this study was a test of cultural attitudes by Ashraf, Motallebzadeh and Kafi (2013) which checked the cultural attitudes of Iranian EFL learners towards the cultural elements embedded within the English textbooks. In order to design the questionnaire, the researchers had analyzed some prominent English textbooks with regard to the cultural issues. The result was the exclusion of 65 cultural elements from the mentioned textbooks. In order to validate the questionnaire, two experts in the field were asked to check and give comments on the items included in the questionnaire, and as a result 15 items were excluded from the total amount of questions. As for the reliability of the questionnaire, Cronbach's Alpha was run through SPSS and the estimated reliability turned out to be 0.870. The questionnaire consisted of 44 items and was a five-point Likert scale, ranging from (1) "strongly agree" to (5) "no idea". The time allotted for answering the questionnaire was estimated to be 15 minutes. The questionnaire included items, which measured the cultural attitudes such as; I like western music more than Iranian ones, I enjoy it if some information about western celebrities be included in textbooks or In my free time, I prefer to do other kinds of entertainments including music, rather than reading books. The questionnaire is included in the appendix.

### *Procedure*

In this study, the researchers investigated the probable relationship between English textbooks and the cultural attitudes of EFL learners. To this end, the date and time were arranged with the institutes in order to be able to administer the questionnaire to intermediate or above intermediate EFL learners. Prior to administering the questionnaire in intermediate classes, the researchers made sure about the English background of participants and

their level of proficiency by checking the placement test they had taken when entering the institute. This placement test was a validated test designed and used by the institute in order to specify the learners' level of proficiency. The institute requires all the learners to take this test prior to registration and beginning the language course. Finally, an interview was run in order to check the EFL learners' attitudes towards studying English and its probable effects on their cultural attitudes.

Data collection started in March 2013 and finished in May 2013. When data collection was over, the results were analyzed using SPSS, Correlation, Cross tabulation and Chi square test, and then they were discussed in the teaching and learning context e.g. what is the probable effect of English textbooks and what could be its probable implications in the EFL context.

## DATA ANALYSIS

Considering the first research question i.e. is there any significant relationship between English textbooks and the cultural attitudes of Iranian EFL learners, Cross tabulation, and Chi square test were employed to check whether learners' cultural attitudes have changed or not. The results of the analysis are shown in table 1.

*Table 1: Books \* Sum Ranks Cross tabulation*

			Sum Ranks				Total
			Strongly Affected	Affected	Lees Affected	Not Affected	
books	Interchange	Count	24	79	20	0	123
		% within books	19.5%	64.2%	16.3%	.0%	100.0%
		% within Sum Ranks	60.0%	61.2%	50.0%	.0%	58.6%
		% of Total	11.4%	37.6%	9.5%	.0%	58.6%
	Top Notch	Count	16	50	20	1	87
		% within books	18.4%	57.5%	23.0%	1.1%	100.0%
		% within Sum	40.0%	38.8%	50.0%	100.0%	41.4%
		Ranks					
		% of Total	7.6%	23.8%	9.5%	.5%	41.4%
	Total	Count	40	129	40	1	210
		% within books	19.0%	61.4%	19.0%	.5%	100.0%
		% within Sum	100.0%	100.0%	100.0%	100.0%	100.0%
		Ranks					
		% of Total	19.0%	61.4%	19.0%	.5%	100.0%

The way data is explained according to the Cross tabulation table, is based on the differences in the scores participants have gained on the questionnaire, which put them under four different categories which moved from "Strongly Affected to Not Affected".

Table 1 exhibits that 123 (58.6 percent) of the total participants of this research had studied Interchange series in their process of language learning, out of which 24 (19.5%) were 'strongly affected' by Interchange books, 79 (64.2%) were 'affected', 20 (16.3%) were 'less affected' and there were no results found in the last group. This indicates that all and all, Interchange series 'affect' the EFL learners' cultural attitudes.

The second part of the table focuses on the results obtained from those participants (87 = 41.4 %) who had studied Top Notch series as their major English textbook. Out of the mentioned participants 16 (18.4%) were 'strongly affected' by Top Notch books, 50 (57.5%) were 'affected', 20 (23%) were 'less affected' and there was only one person who was not affected by the American File series (1.1%). Once again the results show that English textbooks affect learners' cultural attitudes. And it is also revealed that Interchange series had greater popularity as well as influence on the learners' cultural attitudes.

To check whether the results were significant or not Chi Square test was run and the results are exhibited in table 2.

Table 2: Chi-Square Tests

	Value	df	Asymp. Sig. (2-sided)
Pearson Chi-Square	3.037 <sup>a</sup>	3	.386
Likelihood Ratio	3.371	3	.338
Linear-by-Linear Association	1.306	1	.253
N of Valid Cases	210		

According to Chi-Square table, the Pearson Chi-Square value is 3.037. Its Asymp. Sig (two-sided) is .386 which is smaller than 0.05. Thus, there is a significant relationship between English textbooks and the cultural attitudes of EFL learners.

To sum up, as the analysis of the result exhibited, the null hypothesis i.e. there is not any significant relation between English textbooks and the cultural attitudes of EFL learners was rejected. And it was found that both these books have had a significant impact on EFL learners' cultural attitudes. In a similar study carried out by Csilla Sárdi (2002), the researcher came up with the idea that learners have got a positive view point towards learning English and also the fact that the cultural issues of English as foreign language is conveyed into its textbooks (Interchange series) were also previously proved by another study by Zarei and Khalessi (2011). To answer the second research question, i.e. whether there is a significant relation between English proficiency and the cultural attitudes of EFL learners, Chi square test as well as cross-tabulation were used. The results are shown in table 3.

Table 3: English Proficiency \* Sum Ranks Cross tabulation

			Sum Ranks				Total
			Strongly Affected	Affected	Lees Affected	Not Affected	
English Proficiency	excellent	Count	9	13	1	1	24
		% within English Proficiency	37.5%	54.2%	4.2%	4.2%	100.0%
		% within Sum Ranks	22.5%	10.1%	2.5%	100.0%	11.4%
		% of Total	4.3%	6.2%	.5%	.5%	11.4%
	very good	Count	15	32	8	0	55
		% within English Proficiency	27.3%	58.2%	14.5%	.0%	100.0%
		% within Sum Ranks	37.5%	24.8%	20.0%	.0%	26.2%
		% of Total	7.1%	15.2%	3.8%	.0%	26.2%
	good	Count	15	47	17	0	79
		% within English Proficiency	19.0%	59.5%	21.5%	.0%	100.0%
		% within Sum Ranks	37.5%	36.4%	42.5%	.0%	37.6%
		% of Total	7.1%	22.4%	8.1%	.0%	37.6%
	average	Count	0	33	11	0	44
		% within English Proficiency	.0%	75.0%	25.0%	.0%	100.0%
		% within Sum Ranks	.0%	25.6%	27.5%	.0%	21.0%
		% of Total	.0%	15.7%	5.2%	.0%	21.0%
	weak	Count	1	4	2	0	7
		% within English Proficiency	14.3%	57.1%	28.6%	.0%	100.0%
		% within Sum Ranks	2.5%	3.1%	5.0%	.0%	3.3%
		% of Total	.5%	1.9%	1.0%	.0%	3.3%
	too weak	Count	0	0	1	0	1
		% within English Proficiency	.0%	.0%	100.0%	.0%	100.0%
		% within Sum Ranks	.0%	.0%	2.5%	.0%	.5%
		% of Total	.0%	.0%	.5%	.0%	5%
Total			Count	40	129	40	210
			% within English Proficiency	19.0%	61.4%	19.0%	.5%
			% within Sum Ranks	100.0%	100.0%	100.0%	100.0%
			% of Total	19.0%	61.4%	19.0%	.5%

As the cross tabulation table exhibits, the EFL learners' English proficiency was categorized based on six groups ranging from "excellent to too weak". The researchers discussed three groups which contained the most number of participants. Based on table 6, 24 (11.4%) of the participants had an 'excellent' English proficiency out of which 13 (54.2%) were placed in the second group i.e. 'affected' by the afore-mentioned textbooks. Those whose English proficiency was 'very good' were about 55 (26.2%) out of which 32 participants (58.2%) were 'affected' by the cultural attitudes embedded in the textbooks. Finally, the group which included the most number of participants was the third 'good' which numbered around 79 (37.6%). Among these learners, 47 (59.5%) were 'affected' by the English textbooks. Finally, In order to check the significance of the results, Chi Square test was run and the results are depicted in table 4.

*Table 4: Chi-Square Tests*

	Value	df	Asymp. Sig. (2-sided)
Pearson Chi-Square	33.173 <sup>a</sup>	15	.004
Likelihood Ratio	37.185	15	.001
Linear-by-Linear Association	13.948	1	.000
N of Valid Cases	210		

As the results in table 4 depicts, the Chi Square value was 33.173 Which was bigger than the P. value (.004) , so there was a meaningful and significant relation between English proficiency and the change in cultural attitudes. To sum up, as the analysis of the results indicate, the second null hypothesis i.e. there is not any significant relation between English textbooks and the English proficiency of EFL learners is rejected. Finally we can assume that English textbooks bring about the change in the cultural attitudes of EFL learners in general and those who possess a good English proficiency in particular.

## **DISCUSSION AND CONCLUSION**

Based on what the researchers could shed light on during the data analysis phase of the study, it was proved that English textbooks, Interchange and Top Notch series, have had a significant impact on learners' cultural attitudes. Besides, it was also stated that EFL learners were more in favor of Interchange series rather than American File series.

Moreover, those who had a good English proficiency were more affected than those whose English proficiency was about average, weak or even too weak. This is an indicating factor that those EFL learners who have a good mastery over English and can go beyond the linguistic features of a foreign language i.e. the cultural elements, possessed a more significant change in attitudes compared to those who did not. Fairclough (1989; as cited in Zarei & Khalessi, 2011) believes that "language is not an independent construct but a social institution that creates and is created by certain forces and structures forming our functions in the society. Thus, learning a foreign language is a particular way of assimilating into a complex system of categorized experiences, thoughts, behaviors, and modes of interaction of certain people".

Above all, through the analysis of the Interchange and Top Notch series in this study, overall, the results indicate that textbooks are artifacts, which are strongly grounded in cultural assumptions and biases. This is partly because English language has gained a world-wide lingua franca status, whose non-native speakers already outnumber native speakers. Following this line of thought, McKay (2004) and Kachru (1986; as cited in Zarei & Khalessi, 2011) suggest that English as an International Language needs to describe one's own culture and concerns to others rather than being linked to the culture of those who speak it.

To sum up, exposing students to aspects of any foreign language is not as harmful as what Iranians believe in. The researchers came up with some cases in which the learners' cultural attitudes have changed for the better not for the worse. Moreover, this cultural awareness helps learners decide and grow a thorough outlook towards people in other communities and afterwards decide upon the best cultural features of each. All and all, the results of this study could

be of great benefit for ministry of education as well as all those who have a role in providing the foundation and basis for learning English as a foreign language. They can think of developing textbooks in which a mixture of both native and target culture are depicted so that a balance between the two are maintained. Moreover, textbook writers, practitioners as well as curriculum developers should bear in mind the crucial role textbooks play in an EFL teaching learning context. Careful attention and awareness is also deemed necessary on the part of those EFL teachers as the ones who have the responsibility of carrying over the linguistic as well as non-linguistic features of a textbook (in this context the cultural elements).

Other studies are also suggested to investigate the role of English teachers in an EFL context along with the textbooks. Besides, in this study, those who watched original English movies more than six hours per week and also the ones who chatted with a native speaker were excluded from the available data, thus another research can be done to compare the effects of media on cultural attitudes with the effect of textbooks.

#### (DE)LIMITATIONS OF THE STUDY

Like any other researches, some inevitable (De)limitations, which may raise new questions for further researches in the same field in the future, will be imposed on. First of all, variables such as age and personal variables are not taken into account. However, the most important restriction in this study is the fact that nearly all words, pictures and sentences that seemed to be against the cultural values of Iran were censored at first place. Consequently, we would doubt about the extent English textbooks may influence the cultural attitudes of Iranian learners in the absence of all those illustrations and wordings which seem to be related to western cultural issues.

### ABSTRACT

This paper aimed to scrutinize discourse layers in a written narrative. The narrative selected for the sake of discourse layers analysis was *The Rotten Fence* by PL, which was randomly selected from the database in Hatch and Hawkins (1991). Having been selected, the narrative was analyzed through the use of the proposed methods for classification of discourse layers including Mann and Thompson's (1989) rhetorical structure theory, Schank and Abelson's (1977) script theory, Labov's (1972) evaluation components, Tannen's (1985) and Chafe's (1982) involvement features, Schegloff and Sack's (1973) conversational analysis, Halliday and Hasan's (1976) cohesive devices, Goffman's (1976) universal system components as well as Labov and Waletzky's (1967) narrative structure components. In this analysis, the discourse was investigated by the application of such categories as linguistic and cognitive processes, social, linguistic, and cognitive processes, and linguistic and cognitive templates, respectively. The findings of the study revealed that in this discourse as well as many other discourses there are multilayers of discourse features superficially not evident. The findings also proved that some elements are absent in some discourses while some are clear and more colorful. Looking at the narrative analyzed, it would undoubtedly be apparent that language is a structured social, cognitive, and linguistic enterprise by the application of layered analysis.

**KEYWORDS:** Discourse Layers, Narrative, Ideational Functions, Interpersonal Functions, Textual Functions.

### INTRODUCTION

Generally speaking, Cameron (2001) defines discourse analysis as the study of language looked at communicatively and/or of communication looked at linguistically, involving reference to concepts of language in use, language above or beyond the sentence level, language as meaning in interaction, and finally language in situational and cultural context.

He argued that when one analyzes the layers of a given narrative, one particularly contributes to this activity consciously, systematically, deliberately, and, to some extent, objectively so as to generate descriptions, interpretations, and explanations of what his/her analysis has unraveled.

As far as discourse analysis is concerned, because of its diverse use in many disciplines and the work of different scholars, it can be assumed to be a multidisciplinary field with a wide range of interests. The reason why discourse analysis has such a vital role in applied linguistics and also the reason why the bulk of the work recently done on the development of theory and practice of discourse analysis may be traced back to this fact that the study of language in use is considered to be a goal and means of education and an instrument of social control and change, which, in turn, is the principal concern of applied linguists. In addition to applied linguists, some scholars of other fields such as sociology, psychology, and psychotherapy, have contributed to do research on this issue.

To scratch beneath the surface of discourse layers in any written or spoken narrative, linguists deploy three categories of methods which are, in turn, subdivided into smaller categories. These three main groups embrace: (a) The category which is demonstrative of structure as evolving from socially and cooperatively built communication, (b) The category that is a testimony to text structure to be the result of speakers' or writers' intents or goals, and finally (c) The category that clarifies the structure as properties of the text. The analysis of layers of discourse intends to make clear the connections between discourse practices and social practices and structures, connections abstruse to greenhorns. Some practitioners consider language in use as concurrently functioning ideational, interpersonal, and textual functions. While the first refers to the background knowledge of the speakers or writers about the surroundings and the phenomena happening there, the second epitomizes the speakers or writers' own attitudes and evaluations about the phenomena under investigation and, thus, creates a relationship between speakers and listeners or writers and readers. Textual function of language, influential to the two earlier functions, enables

speakers or writers to articulate spoken or written texts assimilable by listeners and readers. It empowers people to connect discourse to the co-text (linguistic text) and context (physical and social environment) in which it occurs.

## **LITERATURE REVIEW**

There is a considerable bulk of literature on system in discourse by which different aspects of discourse were triangulated by the application of various methods. Following one of the methods, adopting the units and processes illuminated by that method, would inevitably lead to one specific picture of what discourse is as well as what layers reside the discourse under investigation. Applying various methods would certainly call forth differing pictures since the units and processes had been changed in accordance with the implemented method, each of which adds a new layer to the total picture of discourse in such a way that language users may look at the methods by the eye of doing the same thing although from different perspectives. Neither the intended methods coincide exactly on the other methods, nor does the one seem to be more or less correct than the others. Each of the methods has their own purposes, merits, qualities, and limitations and focuses on different aspects of the discourse under investigation. Some focus on the writer's or speaker's goal of producing such discourse, others on more abstract notions of how discourse and language might be modeled or mapped as a cognitive system, and even others on template or component forms.

To illustrate that the case is true for any given discourse, the various methods were divided into three subcategories encompassing: (a) The first subcategory that would embrace such analyses as Mann and Thompson's (1989) rhetorical structure theory and Schank's (1975) and Schank and Abelson's (1977) script theory. These analyses would depict structures in which they are looked at as something arising out of what writers and speakers select when they write or utter a piece of discourse to meet their intended objectives, (b) The second subcategory would include methods such as Schegloff's (1968, 1979), Labov's (1972) evaluation components, Tannen's (1985) involvement features, Schegloff and Sack's (1973) conversational analysis. In this subcategory, the produced discourse is believed to be what is cooperatively built among and between participants of the interaction, and (c) In the third subcategory, the structures are seen as properties of the text itself. Halliday and Hasan's (1976) cohesive devices, Goffman's (1976) universal system components as well as Labov and Waletzky's (1967) narrative structure components would all fall into this last category. The following might best illustrate this three-way classification:

- A. Linguistic and cognitive processes (In which text structure results from selection/activation based on speakers and writers' goals and intents.)
  1. Mann and Thompson's (1989) rhetorical structure analysis
  2. Pragmatics of speech acts
  3. Celce-Murcia's (1980) contextual analysis
  4. Participant cohesion
  5. Schank and Abelson's (1977) script analysis
- B. Social, linguistic, and cognitive processes (In which text structure evolves from socially built communication.)
  1. Labov's (1972) evaluation components
  2. Schegloff and Sack's (1973) conversational analysis
  3. Goffman's (1981) ritual constraints; the playing of 'self'
  4. Speech event analysis
  5. Tannen's (1985) and Chafe's (1982) involvement features
- C. Linguistic and cognitive templates (text characteristics)
  1. Labov and Waletzky's (1967) narrative structure components versus Mandler's (1978) and Rumelhart's (1975) narrative structure components
  2. Analysis of differences in features across modes
  3. Goffman's (1976) universal system components
  4. Levinson's (1983) deictic expressions and Halliday and Hasan's (1976) cohesive ties
  5. Speech act analysis

## **METHODOLOGY**

### ***Material***

To do a layered discourse analysis, a written narrative had been randomly selected from the database in

Hatch and Hawkin's (1991), a study of 64 spoken and written narratives, which is by chance the one offered as a practice in the book *Discourse and Language Education* written by Hatch (1992). This story is directly taken from the written stories that are the final, edited versions appearing in a book of short stories produced by the children's Writing Laboratory. The only change to the story was assigning sentence number to the sentences orderly from the first (1) to the last (21). Each sentence starts with a capital letter and ends in a period, exclamation mark, or question mark. It should be reminded that the letter 'e' was added to the word 'bite' to correct the grammatical or typographic mistake (See Appendix A).

### ***Procedure***

Through any analysis of discourse layers, each type of analyses has its own goals and can be used for reaching various intents. Throughout this study, different theoretical frameworks had been applied to analyze the narrative under investigation while considering the implications for teaching, cross-cultural understanding, and research. Although, all the theoretical frameworks had not been applied in sequence to the narrative, in this analysis, you might think of what alternative methods of analysis is applicable.

In this study, the researchers used various methods to do the analysis of the written narrative with respect to its layers. In some cases, three PhD candidates expert in discourse analysis were recruited to review and scrutinize the selected narrative. The experts individually analyzed and decided what is/are the function(s) of every specific intended word or stretch of words. Then, cases on which the three experts reached a consensus were considered to be the correct function for the word or stretch of words. While, cases in which the function(s) of every specific intended word or stretch of words could not attract a unanimous agreement were discarded or ignored. But in other cases, the 'word count' facility of Microsoft Office word processor software was used to count exactly how many times one specific word with the intended meaning and/or function occurred.

## **RESULTS AND DISCUSSIONS**

The following analyses are not complete but simply brief lists of findings relevant to the points raised by each method of discourse analysis. Since the data is from a monologue, some of the analyses will be less revealing than others and each gives valuable information about the data. Let us begin with analyses that fit into the first category – those that describe linguistic and cognitive processes (text structure results from selection/activation based on speakers and writers' goals and intents):

### ***Linguistic and Cognitive Processes***

In this group of analysis, text structure results from selection and/or activation of forms based on the speakers or writers' goals and intents.

#### ***Rhetorical Structure Analysis***

Rhetorical structure analysis as a primarily cognitive processing model, attempts to show what the speaker may reasonably be expected to have had in mind in relating spans of the text. Doing a partial analysis, just looking at this story using Mann and Thompson's (1989) rhetorical structure theory analysis, offers some interesting results. Let us look at how sentences numbered 8 to 10 and their relation to sentence number 7, which briefly discussed the reason why the fence on which the storyteller and his brother sat collapsed. In the first part of the sentence number 7 and second part of the sentence number 17, the reason why *dogs started barking* was stated. There is a relationship between sentence number 11 and 13, the latter is the cause of what happened in the former. Finally the cause of what stated in the sentence number 20 was traced back in sentences number 11 and 12.

#### ***Process Cohesion – Participant Tracking***

Here, such cohesive ties as pronouns will be looked at in a slightly different way. To answer the question, "*Who is this story about?*", the reference will be traced back. To do this, the ways the storyteller places focus on the major and minor protagonists necessarily should be scrutinized. One way is in the series of temporally ordered clauses. The major protagonist (hero) of the story is usually conceived of as a person who carries out the actions in the foreground; also supposed to have *high agency*. By a brief look at the clauses that occur in the foreground, you will easily find those that have highest transitivity (Hopper & Thompson, 1980), belong to the storyteller (*I*, in this story). In this story, the first person singular (*italic* in the text) is the storyteller and also the story is about the person. *I* want to tell this story; *I* felt when something scary happened to *me*; *I* was five years old; *I* was very scared; then something happened that changed *my* fear to happiness; *I* was mad at him because he left *me* sitting there crying and wouldn't

help *me*; *I* got scared because the dogs were coming across the fence toward *me*; They had their mouths open as if they were going to bite *me*; *I* was really scared now; *I* relaxed and became happy; The dogs didn't want to bite *me*; *I* felt good because *I* knew everything would be all right and that *I* had two new friends; *my* brother came outside and started laughing at *me*; *I* hit him because *I* was still mad at him for not helping *me*; *I* was mad, scared, and happy.

A quick glance at the first and second sentences would inevitably unravel the fact that the hero here, *I*, has the high agency. Also the fact that the storyteller started the story about himself by first mentioning that *I want to tell this story because this is how I felt when something scary happened to me when I was five years old*. And nowhere in the story, Julian's actions were emphasized. Another way of establishing agency is to count the number of times the major and minor protagonists are mentioned and whether they have agent or patient status (i.e., whether they are the more powerful actors in subject slots or whether they are relatively weak receivers of actions in object slots). In this story, *I* was mentioned as an agent 12 times and as patient 8 times; and *Julian* appeared 2 times as agent along with the pronoun *I* and *He* came 2 times as agent and *him* appeared 3 times in the second half of the story, the appearance of *He* in the second half of the story shows some degree of low agency. Finally it should be mentioned that the pronoun *we* occurred 5 times in the story.

Look at the starting sentences of the story in which the storyteller focused on his role and stated that the story is about his feeling and what happened to him as he was 5 years old and what happened and how his feelings had changed putting himself in the subject slot and Julian in the object slot in the remaining parts of the story.

#### *Script Analysis*

The communication that arises from speaker goals and intents was to be modeled by the script analysis. The script form can be clarified by the text that results as the speaker develops plans to meet goals. What scripts would be needed for understanding the storyteller's story, here, *I*? What scripts would we need to program if we wanted a computer to be able to display understanding of the story? At least five scripts would be needed: the home script, the store script, the brotherhood script, neighbor script, dogs' attack script. Some of the components for each are outlined very roughly as follows:

**Home script:** home has qualities and parts (neighbors, wall, fence, buildings, door, etc.) and also has living things inside (brother, dogs, etc.).

**Store script:** store sell goods, people buy needed things from the stores, etc.

**Brotherhood script:** has an emotional relationship, brothers should be loyal to each other, brother should not leave his brother alone in emergency, etc.

**Neighbor script:** neighbor home has an owner, neighbor has 2 dogs, neighbor's home has a fence, fence should be firm to impede interference to the other side of the fence, etc.

**Dogs' attack script:** dogs attack to bite or injure people, dogs never lick ice cream, dogs attacked and Julian left the scene, etc.

The cohesive and deictic devices that appear in the text can best be accounted for by the application of these scripts. The ties are seen as arising from the speaker's goals and intents as the storyteller, here *I*, tells the story, rather than as characteristics of the text itself. For example, once the storyteller, *I*, activates and uses the five scripts, his choice of definite and indefinite articles comes from the script. We are not surprised to see definite articles used, for example, 16 times in sentences number 3, 4, 5, 6, 7, 8, 9, 11, 13, and 17. Since some neighbors have dogs, their home has fences and yard, and houses also have doors, a definite article can be used before such words as *fence* in sentences number 5 to 9 and also in sentence number 13; *yard* twice in sentence number 5 once with the possessive adjective *our*; *dogs* in sentences number 7, 13, 17; and *house* and *door* once in sentence number 11. The script of neighbors were also such familiar to the listeners that the storyteller used the noun phrases such as the next door neighbor's yard, the neighbors' side of the fence, the dogs, the house, the fence, and the door. Although everyone expects the attacking dogs to bite or injure people, the dogs did not hurt the storyteller and they did something unusual, licking the ice creams that the storyteller and Julian had bought.

In this script analysis, the storyteller's reason or goal for selecting and telling the story is somewhat apparent. The first goal, maybe, was to complete a task set by the teacher and to show himself as a competent storyteller. A more important goal is for the storyteller to establish himself within his social group by telling a story that involves him in the role of a miserable and the lucky person who first fell into the trap of two dogs attacking him and then finding the two dogs as new friends. *The fence fell down* in line 9 presupposes that the fence was heavy, decayed, and badly-located in the ground. In the sentence number 11, *locked the door*, it was presupposed that the door had lock and key to lock and unlock it.

### ***Social, Linguistic, and Cognitive Processes***

In this group of analysis, text structure is described as evolving from socially built communication.

#### ***Conversational Analysis***

In addition to selecting a personal topic, the storyteller used the intonation and the power of the dogs' attack scene rather than evaluation to involve his listeners. The text is amazingly free of repetition, sound effects, direct quotations, stress, and direct evaluation comments. Why the storyteller did not use such devices to entertain and involve his audience is not clear at this point. Given their volubility in responses to many of the other stories, the audience seemed a bit stunned.

In this story, neither general characteristics such as turn-taking or sequence structure nor specific qualities such as asking questions or delivering and receiving news, assessments, or complaints was present. This case of conversational analysis is the institutional encounter where the participants accomplish their institutional tasks through their interaction. This story includes openings and closings of conversations and the general ways in which sequences of action are built, but does not include such features as agreement, disagreement, assessments, storytelling, complaints, questioning and answering practices in cross-examinations, news interviews and press conferences, diagnosis and advice in medical and pedagogical settings, turn-taking, repair (i.e., the ways of dealing with problems of hearing, speaking, or understanding), and the ways in which the participants of interaction manage their relation to the utterances through gaze and body posture. There is not any example of adjacency pairs such as question-answer, greeting-greeting, request-grant/refusal, and invitation-acceptance/declination.

#### ***Ritual Constraints and Self***

In communication analysis, researchers examine the ways in which the system is manipulated to smooth social interaction and the ways in which deference and demeanor are handled. In narratives, the storyteller's major theme is that of portraying or establishing self in Goffman's (1981, p.573) definition of that term, that is, "not an entity half concealed behind events, but a changeable formula for managing oneself during them". Storytelling may be one of our favorite universal activities, because it allows us to pretend that there is a half-concealed self behind events that we narrate while it also allows us to display self as we manage ourselves in the telling of our thoughts and actions.

Goffman's (1981) ritual constraints as far as they relate to deference and demeanor were discussed. It might be concluded that the storyteller wants to show two half-concealed entities, successively characterizing himself as the helpless person who caught in trouble with the attacking dogs in the opposite side of the rotten and fallen fence and as a lucky person who found two friends when his brother left him in such a bad situation. The storyteller depicted the picture of himself as what narrated in the story. Simultaneously, the storyteller, tried to illustrate that every cloud has a silver lining and some good may come out of any gloomy situation. In the analysis of the storyteller's portrayal of himself as a half-hidden entity, we can see that there are many different storytellers, *I's*, that the storyteller wish to show:

The storyteller as a hapless boy

The storyteller as a lucky person

The storyteller as an angry boy

When you read this story for the first time, it seemed that fitting at least one of these portraits was the storyteller's goal or intent in telling this story. However, given our analysis to this point, none of these seem right. In terms of the storyteller, he chose a story, caught in trouble, which seems to be an unlikely source of entertainment for the audience.

#### ***Speech Event Analysis***

To determine its speech act function, if you concentrate on each utterance in the narrative, you will undoubtedly conclude that it primarily consists of representative speech acts. That is, each gives information that has truth value in the world the storyteller is telling you about. There were a few expressions that give *emotional values* information

(e.g., *I was mad at him because he left me sitting there crying and wouldn't help me* in sentence number 12, *Then I felt good because I knew everything would be all right and that I had two new friends* in sentence number 18, and *I hit him because I was still mad at him for not helping me* in sentence number 20). There are not any directives (commands) in the narrative. And pragmatics of many of speech acts is clear.

It is difficult to determine a speech event structure within the story. If we believe that the storyteller's goal is to complain, or gripe, or share his troubles and joys, it is difficult to see how his story fits the structure that usually results from such events. Complaints are addressed to the trouble source, to persons responsible for the trouble, and a remedy is negotiated. Gripes are brief complaints addressed to persons not responsible for the trouble and sympathetic to the complainer's point of view. The listener is expected to offer sympathy and encouragement or perhaps to reciprocate with similar stories of trouble. At this point, there is little in our analysis of the story that allows us to make a successful match with these three types of *complaint speech events*.

A second possibility is that this is a *dog's attack* speech event. We could look for similarities with *peoples' attack* on each other such as in sports, war, or animals' fight in wild life. The storyteller does indeed use metaphors from fight scripts, and he does show surprising indifferent behavior of his brother Julian. In fact, as the one involved in the trouble of attacking dogs, his intent to play the reporter role seems in doubt.

### ***Linguistic and Cognitive Templates***

In the third and last group of analysis, the main concern is clarifying the structure as a template that belongs to, or is the characteristic of the text.

#### ***Goffman's (1976) Universal System Components***

Goffman's (1976) universal system component analysis encompasses the signals of each of the components which he thinks of them to be universal in the communication, forming the overall template of the communication in total.

#### ***Opening and/or Closing Signals***

The two following sentences are the opening and closing signaling sentences respectively. "I want to tell this story because this is how I felt when something scary happened to me when I was five years old.", "So in one afternoon, I was mad, scared, and happy." Because in the former sentence, the storyteller signals what he would be going to do and in the latter sentence he concludes his story by using the word "so".

#### ***Backchannel, Preempt, and Turn-taking Signals***

There is not any case of backchannel, preempt, and turn-taking signals in the narrative cited above because in this story only one person narrated the story and the other participant of the story (Julian) was absent and anyone had interrupted the flow of the story.

#### ***Acoustically Adequate and Intelligible Messages***

The storyteller did not any repair work to make his message clearer. Also, any clarification questions were not asked by the teacher or students listening to the narrative. So, it can be concluded that the message was clear and assimilable enough for all.

#### ***Grice's Conversational (1975) Maxims***

The four Grice's (1975) conversational maxims were cleverly met through the flow of the story, from relevancy of the details narrated to quality, quantity, and manner. Since to the best of researchers' knowledge, the storyteller only mentioned details so as to convince listeners.

#### ***Cohesion Analysis – Deixis and Cohesive Ties***

In linguistics, deixis refers to the phenomenon wherein understanding the meaning of certain words and phrases in an utterance requires contextual information. In this analysis, to clarify how deictic terms and cohesive ties promote coherence, the written narrative by PL would be scrutinized. Deixis is closely related to anaphora, which refers back, and sometimes to cataphora, which refers forward. Although this article deals primarily with deixis in written language, the concept can apply to spoken language, gestures, and communication media as well. While this article

draws examples primarily from English, deixis is believed to be a feature of all natural languages (in a varying range). Possibly the most common categories of contextual information referred to by deixis are those of person, place, and time.

#### *Personal Deixis*

Person deixis concerns itself with the grammatical persons involved in an utterance: (a) those directly involved (e.g., the speaker, the addressee), (b) those not directly involved (e.g., over-hearers—those who hear the utterance but who are not being directly addressed), and (c) those mentioned in the utterance. In every written or spoken narration, words, phrases, or pronouns are always used to refer back (anaphoric phrases or words) and forward (cataphoric words). In this narrative story, pronouns as cohesive ties refer back and forward to the characters (I, this, me in sentence number 1; I and my in sentence number 2; my, Julian, and I in sentence number 3; we in sentence number 4; we and our in sentence number 5; two mean looking bulldogs no personal deixis in sentence number 6; we, the dogs, and us in sentence number 7; no personal deixis in sentence number 8; we and it in sentence number 9; Julian and I in sentence number 10; he in sentence number 11; I, him, he, and me in sentence number 12; I, the dogs, and me in sentence number 13; they, their, and me in sentence number 14; I in sentence number 15; I in sentence number 16; the dogs, me, they, and my in sentence number 17; I in sentence number 18; it, my, and me in sentence number 19; I, him, and me in sentence number 20; and finally I in sentence number 21). Throughout the narration there is no case of misunderstanding or reference problem because all the reference words had been used properly to refer their referent.

#### *Temporal Deixis*

Time, or temporal, deixis concerns itself with the various times involved in and referred to in an utterance. This includes time adverbs like soon, after, now, then, etc., and also different tenses. A good example is the word *tomorrow*, *today*, which denotes the consecutive next day before and after every day. It was found to be such cases of temporal deixis in the narrative under investigation as: Time clauses and phrases such as (*when* something scary happened to me) and (*when* I was five years old) in sentence number 1; (*then* something happened that ...) in sentence number 2; (*when* my brother, Julian, and I decided ...) in sentence number 3; (*After* we bought the ice cream sundaes, ...) in sentence number 4; (*When* we sat on the fence, ...) in sentence number 7; (*Before* we knew it, ...) in sentence number 9; (*Then* I got scared ...) in sentence number 13; (I was really scared *now*) in sentence number 15; (*Then* I felt good because ...) in sentence number 18; (*When* it was all over, ...) in sentence number 19; (... I was *still* mad at him ...) in sentence number 20; (So *in one afternoon*, ...) in sentence number 21 are all signs of time and the change of time through the narration process. In sentence number 12, the phrase *while I was* is omitted before the phrase (sitting there crying and wouldn't help me). *All of a sudden* meaning suddenly has a connotation of time in sentences number 8 and 16. It should be reminded that verb tense and aspect also depict the order of actions within which the narration happened with regard to the time when the story was narrated.

#### *Spatial Deixis*

Place deixis, also known as space deixis, concerns with the spatial locations relevant to an utterance. Like person deixis, the space deixis may be either those of the speaker and addressee or those of persons or objects being referred to. The most salient English examples are here, there, this, and that. In this narrative, the following are cases of place deixis: (... go to *Thrifty's* ...) meaning the place where ice cream was sold belonging to Thrifty in sentence number 3; (... we went *back home*.) in sentence number 4; (We sat *on the fence* that divided our yard *from the next door neighbor's yard*) in sentence number 5; (...*on the neighbors' side of the fence*.) in sentence number 6; (When we sat *on the fence*, ...) and the dogs started barking *at us* in sentence number 7; (... the fence fell *down*.) in sentence number 9; (Julian and I both fell *down* hard.) in sentence number 10; (He quickly got *up* and ran *into the house* ...) in sentence number 11; (... he left me sitting *there* crying and ...) in sentence number 12; (... the dogs were coming *across the fence*) and (*toward me*.) in sentence number 13; (... my brother came *outside*...) in sentence number 19. (All of a sudden the fence started *moving*.) in sentence number 8 has a connotation of direction, moving from one place to another. In phrases such as (When we sat on the fence, the dogs started barking *at us*.) in sentence number 7 and (When it was all over, my brother came outside and started laughing *at me*.) in sentence number 19 connote the word *at* connotes a slight meaning of up to down direction along with the action done by the main verbs, that is, bark and laugh respectively.

#### *Discourse Deixis*

Discourse deixis, also referred to as text deixis, refers to the use of expressions within an utterance to refer to parts of the discourse that contains the utterance — including the utterance itself. For example, in the sentence: *This* is a great story. The word *this* refers to an upcoming portion of the discourse, and in the sentence: *That* was an amazing day. The word *that* refers to a prior portion of the discourse. Here are some cases of discourse deixis used in the narrative:

(I want to tell this story *because* ...) in sentence number 1; (I was mad at him *because* ...) in sentence number 12; (Then I got scared *because* ...) in sentence number 13; (Then I felt good *because* ...) in sentence number 18; (I hit him *because* ...) in sentence number 20. But there are other signs of reasons which are implicit such as the reason why (... changed my fear to happiness.) in sentence number 2 implicit in sentence number 2; the reason why (Julian, and I decided to go to Thrifty's ...) in sentence number 3 implicit in sentence number 3; the reason why (... the dogs started barking at us.) in sentence number 7 implicit in sentence number 7; the reason why (Julian and I both fell down hard.) in sentence number 10 implicit in sentences number 8 and 9; the reason why (I was really scared now!) in sentence number 15 implicit in sentences number 13 and 14; the reason why (... I relaxed and became happy.) in sentence number 16 implicit in sentence number 17; (So in one afternoon, I was mad, scared, and happy.) in sentence number 21 implicit in sentences number 1 to 20.

#### *Social Deixis*

Social deixis concerns the social information that is encoded within various expressions, such as relative social status and familiarity. Two major forms of it are the so-called T-V distinctions and honorifics. Julian is referred to by the family relation with which holds to the storyteller. Although Julian is not the main character in this story, since their relation was not known by the audience, it was once told at the beginning of the story.

#### *Rhetorical Genre Analysis*

The first thing which might be called into question is the fact of distinguishing description from narrative. According to narrative category proposed by Shaughnessy (1977), this story can be considered to be an example of narrative which described what happened in a period of specified time and location to some people (here, storyteller and his brother Julian). In accordance with Shaughnessy's (1977) narrative category, this story is composed of the following four components:

**Abstract:** the abstract is identified to be the first sentence, that is, *I want to tell this story because this is how I felt when something scary happened to me when I was five years old.*

**Orientation:** The two protagonists, the storyteller as major and Julian as minor, were introduced in the first and third sentence, respectively.

**Resolution:** *The fence fell down; Julian and I both fell down hard; and The dogs didn't want to bit me; they only wanted to lick my ice cream sundae.* Based on what went through the preceding sentences, it can be assumed that the resolution was not brought about by the storyteller and his brother Julian but it happened by chance, what is not usual, at least in ordinary life.

**Coda:** This story lacks coda because nowhere in the story the storyteller brought the listeners including teacher and students out of the story time to here and present.

#### CONCLUSION

Language is considered to be a system of arbitrary symbols used for human communication and this study aimed at discovering the system in the ways people apply language for the sake of communication in social contexts. The system that comes out of the obtained data revealed that communication is an interlocking social, cognitive, and linguistic enterprise. Although it is common to discuss system in linguistic descriptions of semantics, syntax, and phonology, looking for such a system at the discourse, written or spoken, is still burgeoning. In this study, system in discourse is found to be at hierarchically arranged levels, higher levels including some smaller subcategories. The structures serve to be flexible templates that could be applied to accomplish communicative functions in any given social context.

#### LIMITATIONS OF THE STUDY

With respect to the analysis of the discourse layers, although this research would shed light on the issue, such limitations as lack of good sources available, time limit, and costs would affect the reliability of the data, so these limitations did not allow the researcher to make the ground level in providing a great deal of necessary quantitative and qualitative theoretical and experimental surveys. The data were collected only within a short period of time putting only one written discourse under the microscope, while investigating more written and/or oral discourse(s) might produce delicate results since in such cases especially in oral discourses the researcher(s) would be able to

critically dissect such suprasegmental features as stress, intonation, pauses and so forth. Additionally, it was impossible to conduct more repeated analysis by different experts, while repeated and different analyses would have certainly a more detailed picture of actual situation.

## Appendix A:

The Rotten Fence

By PL

- 1) I want to tell this story because this is how I felt when something scary happened to me when I was five years old.
- 2) Actually, I was very scared, but then something happened that changed my fear to happiness.
- 3) The story began when my brother, Julian, and I decided to go to Thrifty's and buy an ice cream sundae.
- 4) After we bought the ice cream sundaes, we went back home.
- 5) We sat on the fence that divided our yard from the next door neighbor's yard.
- 6) There were two mean looking bulldogs on the neighbors' side of the fence.
- 7) When we sat on the fence, the dogs started barking at us.
- 8) All of a sudden the fence started moving.
- 9) Before we knew it, the fence fell down.
- 10) Julian and I both fell down hard.
- 11) He quickly got up and ran into the house and locked the door.
- 12) I was mad at him because he left me sitting there crying and wouldn't help me.
- 13) Then I got scared because the dogs were coming across the fence toward me.
- 14) They had their mouths open as if they were going to bite me.
- 15) I was really scared now!
- 16) But all of a sudden, I relaxed and became happy.
- 17) The dogs didn't want to bite [the letter 'e' added here] me; they only wanted to lick my ice cream sundae.
- 18) Then I felt good because I knew everything would be all right and that I had two new friends.
- 19) When it was all over, my brother came outside and started laughing at me.
- 20) I hit him because I was still mad at him for not helping me.
- 21) So in one afternoon, I was mad, scared, and happy.

**THE EFFECT OF USING MALL ON IRANIAN EFL LEARNERS' VOCABULARY LEARNING**

**ABSTRACT**

This study focused on the impact of Mobile Assisted Language Learning (MALL) on Iranian English as a foreign language (EFL) learners' vocabulary learning. To carry out the research, 60 Iranian EFL learners, who participated in an international English language testing system (IELTS) preparation course, were selected as the participants of the study. Afterward they were randomly assigned into experimental and comparison groups. A vocabulary test was given to both groups as the pretest. The participants in the experimental group received 150 vocabularies of the General vocabulary for the IELTS book, their definitions and example sentences on a regular basis three times a week via SMS. The participants of the comparison group were provided with the same vocabularies and were asked to learn them with dictionary by themselves. After ten weeks, a vocabulary posttest was administered to both groups. The result indicated that the experimental group outperformed the comparison group leading to the conclusion that the use of MALL had a significantly more effective impact on learners' vocabulary learning.

**KEY WORDS:** MALL, vocabulary learning, vocabulary teaching

**INTRODUCTION**

Learning new vocabularies is an important part of learning a new language. According to Nation (2006) learners should know at least 5000 lexical items to understand non-technical English texts. Because of the limited class hours, students do not have the opportunity to speak and use all of the vocabularies in class. This leads to some problems for language teachers and learners. The problem faced a language teacher is how to teach this large number of vocabulary during the limited time of the class. Nation (2005) believed that teachers can teach individual words explicitly, but deliberately teaching vocabulary is one of the least efficient ways of developing learners' vocabulary knowledge. Also learners face a lot of difficulty in the language learning process. They should memorize and learn the large amount of words of the language they are learning. This urges language teachers and researchers to look for alternative ways to traditional classroom teaching of vocabulary and to change vocabulary learning into a lifelong learning which is not limited to the classroom and adapt it to the needs of learners. They should make learning interesting for students and make them responsible for their own learning. One of the ways that can help teachers in teaching vocabulary is using different technologies available to students. Cognitive and socio-cognitive approaches have implication of how to integrate technology in teaching in the communicative trend (Laufer, 1998).

One of the technologies that can be used to help learners in learning a foreign language is mobile phones which are dominant in most students' life. They are not just communication devices anymore. They are useful computers that fit into students' pockets, are always with them and nearly always on, and can be used in any kind of learning (Prensky, 2005). This technology has brought about a new type of language learning called Mobile Assisted Language Learning. As with other forms of technology, mobile assisted language learning (MALL) is a branch of technology-enhanced learning which can be implemented in numerous forms including face-to face, distant or on-line modes. However, different scholars in the field have underscored that MALL should be implemented in the classroom, taking the presence of learners as a paramount factor into consideration. As Colpaert (2004) has rightly argued, before using mobile technologies a learning environment should be fostered. Likewise, Salaberry (2001) has argued against "technology- driven pedagogy" emphasizing the fact that despite their considerable benefits nothing to date has proved that any type of technology can necessarily act better than traditional forms of teaching. Finally, as Beatty (2003) has asserted, "Teachers need to be concerned about investigating time and money in unproven

technology” (p.72). All in all, using any kind of technological device should be accompanied by developing an efficacious type of methodology because these devices are not instructors but rather instructional tools. In a study in Japan Thomson and Houser (2005) examined the use of cell phones in education. In this study students were surveyed regarding their use of mobile phones. English vocabulary lessons were sent to the learners' mobile phones using short text messages and a website was developed to explain the English idioms which students surfed using the 3G phones. The findings revealed that mobile phones are ubiquitous among students and learners were ready to read small texts on mobile screens. It was noted that mobile phones can effectively serve to educate a foreign language learner and short text messages is very useful in teaching vocabulary.

In a recent study, Sole, Calic, and Neijmann (2010) showed that mobiles can allow learners to express themselves in a variety of scenarios. This study included two case studies and was conducted over two years in one of the UK universities. Students were required to report on their work with mobile devices outside the classroom. It was shown that using mobile devices help learners have a better engagement with learning and to have a better interaction. The results also showed that mobile devices also facilitate contextual learning and they resultantly allow the information to be captured in learner's own location in a way as to be resonant with students' needs. Lu (2008) used a counter balanced design to investigate the usefulness of short message service (SMS) on 30 vocational high school students, vocabulary retention. In the first week of the experiment, one group received 14 target words via SMS and the other group received the same material on paper. In the second week the two groups changed their media; that is mobile group became paper group and the paper group became mobile group. At the end of each week, an immediate post test, and three weeks later a delayed post test was conducted. The results of the tests showed that both groups regardless of the medium had improved compared to the pretest. But generally mobile group scores were significantly better than the paper group. It's worth mentioning that their scores diminished in the delayed post test. This result underscores the effect of regular reading of vocabularies and it urges to find a way to investigate whether learners read frequently the lessons provided them via short messeging system (SMS). A comparison of students' scores on mobile phone and paper showed that there is a positive relation between reading frequency and vocabulary gain. Also at the end of the experiment the participants were interviewed to find their attitude towards mobile assisted language learning. The information gained by interview showed that generally students had positive attitudes towards mobile vocabulary learning and liked to continue learning vocabulary with the aid of mobile. Finally, at the University of Lancaster, Mitchell, Race, McCaffery, Bryson, and Cai's (2006) study involved using short text messages as a way to make communications between teachers and students possible. They found that text messaging is a cost effective mechanism to convey the personalized information to learners' mobile phones in a trendy fashion.

## RESEARCH QUESTION

Given the importance of the vocabulary learning in learning a new language and the opportunities that MALL provides, the present study addresses the following question:

“ Does using MALL have any significant effect on EFL students' vocabulary learning?”

## METHODOLOGY

### *Participants*

The subjects of this study were 60 male and female EFL learners who were studying English at the advance level in a language school in Mashhad, Iran. They were between 23 and 28 years old.

### *Instrumentation*

The following instruments were used to gather data at different stages of this study:

1. A language proficiency test, a modified version of IELTS, consisting of 25 listening questions, 50 reading questions. The time limit for answering the test was 75 minutes.
2. A vocabulary pretest, it was composed of 50 multiple choice items which were taken from Focus on Vocabulary 2: Mastering the Academic Word List (Schmitt & Schmitt, 2001).
3. A vocabulary posttest, which was similar to the pretest.

### *Material*

The General vocabulary for the IELTS book was the main material of this study. This book has been written for students who are planning to sit either the general training or the academic modules of the IELTS exam. It covers

some of the main vocabulary points that learners will need for, or come across in, the listening, reading, writing and speaking sections of the exam.

### ***Procedure***

The procedure will be reported in the following stages:

#### ***Participants Selection and Homogenization***

In order to homogenize the participants upon their level of proficiency, first an IELTS (described in full earlier) was administered to all the 60 available students. They were then randomly divided into experimental and comparison groups. The comparison group consisted of 30 students, 10 males and 20 females, and the experimental group consisted of 30 students, 15 males and 15 females.

#### ***Adminstrating the Vocabulary Pre-test***

As it was mentioned earlier, the experimental and comparison groups, were selected from among a population of students whose proficiency level was examined to be at the same. However, since the study concentrated on vocabulary, a vocabulary test, taken from Focus on Vocabulary 2 (described in full earlier), was administered to both groups to ensure that they were also homogenous in terms of vocabulary knowledge.

#### ***Intervention***

During the instruction, the participants in the experimental group received 150 vocabularies of the General vocabulary for the IELTS book, their definitions and example sentences on a regular basis three times a week via SMS. In addition, they were assessed each session by the instructor in class, to see how they learned the vocabularies. The participants of the comparison group were provided with the same vocabularies and were asked to learn them with dictionary by themselves. In addition, like the experimental group they were assessed by the instructor in class.

#### ***Adminstrating the vocabulary Posttest***

After ten weeks of teaching, a vocabulary posttest, similar to that of pretest was administered to both groups in their final examination. It is worth mentioning that the vocabulary posttest was different from the vocabulary pretest.

## **RESULTS**

After administrating the IELTS to 60 students, descriptive statistics was obtained. Table 1 demonstrates the descriptive statistics of the language proficiency test that was used for the homogenization of the participants. The mean and the standard deviation equaled 52.58 and 11.41, respectively. They were then randomly divided into experimental and comparison groups.

*Table 1: Descriptive Statistics of the Homogeneity Test*

	N	Range	Minimum	Maximum	Mean	Std. Deviation	Variance	Skewness	Kurtosis		
	Statistic	Statistic	Statistic	Statistic	Statistic	Statistic	Statistic	Statistic	Std. Error	Statistic	Std. Error
<b>Total</b>	<b>60</b>	<b>44</b>	<b>38</b>	<b>82</b>	<b>52.58</b>	<b>11.413</b>	<b>130.267</b>	<b>.912</b>	<b>.309</b>	<b>.103</b>	<b>.608</b>
<b>Valid</b>	<b>60</b>										
<b>N</b>											

Since the study concentrated on vocabulary learning, and to check the homogeneity of the experimental and comparison groups at the beginning of the experimentation, a vocabulary test was administered to both groups as a pre-test, and an independent *t*-test was performed on the two groups test scores. Table 2 summarizes the descriptive statistics.

Table 2: Descriptive Statistics of the Two Groups on the Vocabulary Pre-test

Group		N	Mean	Std. Deviation
Pre-test	Comparison	30	48.75	15.91
	Experimental	30	50.11	16.51

Regarding the mean scores of two groups there was no significance difference, but in order to be sure of close homogeneity of two groups, a *t*-test was run. It showed that there was no significant difference between the experimental and comparison groups in terms of their vocabulary knowledge. Table 3 manifests the results.

Table 3: Comparison between Variances and Means of the Two Groups on the Vocabulary Pre-test

			Levene's Test for Equality of Variances		t-test for Equality of Means					
			F	Sig.	t	df	t critical	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference
										Lower Upper
Pre-test	Equal variances assumed		11.39	.001	1.002	58	2.02	0.850	3.095	6.16 7.74

As it has been shown in table 3, the *t*-observed value for the comparison of the means of two groups was 1.002 at 58 degrees of freedom, which was lower than the *t*-critical of 2.02. Thus it could be claimed that the two groups were not significantly different in terms of vocabulary before undergoing the treatment.

After ten weeks of instruction, both groups were given a similar post-test. Table 4 summarizes the descriptive statistics:

Table 4: Descriptive Statistics of the two Groups on the Vocabulary Post-test

Group		N	Mean	Std. Deviation
Post-test	Comparison	30	52.97	10.63
	Experimental	30	68.45	9.25

To see whether the treatment was effective or not, the means of two groups were compared through a *t*-test. As it has been shown in table 5, the *t*-observed value was 5.56 at 58 degrees of freedom which was higher than the *t*-critical of 2.02. Thus, it was concluded that the students' performance in the experimental group was significantly greater than that of the comparison group.

Table 5: Comparison between variances and Means of the Two Groups on the Vocabulary Post-test

			Levene's Test for Equality of Variances		t-test for Equality of Means					
			F	sig	t	df	t critical	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference
										Lower Upper
Post-test	Equal variances assumed		15.36	0.000	5.56	58	2.02	0.230	5.430	-6.94 3.46

## DISCUSSION

Vocabulary has a central role in language learning, and Language learners should know a large number of words to be successful in their learning or to have a successful communication in it. Hence this study aimed to investigate the effect of using MALL on EFL students' vocabulary learning. The findings approved the usefulness of SMS in this regard. The participants in the experimental group improved significantly in the post test and outperformed the comparison group in the post test. This study indicated that using Mobile Assisted Language Learning (MALL) offered interesting advantages to the experimental group as compared with the comparison group. Learning vocabulary via SMS helped the participants in the experimental group to enhance their vocabulary knowledge in the post test. Studies analyzing the mobile technology's use in the different aspects of language learning have supported the idea that mobile technology can enhance learners' second and foreign language acquisition. Learners' attitudes towards technologies, their intention to use it, and the various actual uses of mobile technology integrated in their second and foreign language learning is a dominating research focus (Chang & Hsu, 2011). The result of this study was in line with Derakhshan and Kavianpanah (2011) who assessed the effectiveness of SMS on university students' vocabulary learning. They concluded that those who were exposed to SMS had more vocabulary gain and retention.

## CONCLUSION

This paper was generally an attempt to assess the effectiveness of using mobile phones in vocabulary learning of a group of Iranian EFL students. The first part of the article dealt with reviewing the related literature on using technology and mobile phones in the classroom. The second part was an attempt to elaborate on the experiment and the results. It was finally concluded that due to the significant difference between the mean scores of the two groups, the treatment had been a successful one in fostering the vocabulary knowledge of the students. Generally speaking, this study had a number of implications. First, this study showed that mobile phones can play a crucial part in learning vocabularies of a language. Another aspect worth mentioning is that this study was an attempt to help teachers, especially English teachers in developing countries who do not have enough opportunity to use sophisticated technologies in their classes. The technique offered in this study could be used by teachers in large classes. Finally, Like teachers, students can also take advantage of mobile learning. It can help them to learn and retain the large number of the foreign language vocabularies they are learning. Since the students are used to using their mobiles and sending and receiving SMS, they can use it as a complementary device to face to face instruction and assessment. In this way they can move toward a learner centered classroom and make students responsible for their own learning. Because the result of the present study confirmed the positive effect of SMS on learning of vocabularies. It goes without saying that every study faces a number of limitations which can not be avoided. Since the researchers used a modified version of IELTS as the proficiency test, it was not verified in terms of reliability, the same is true about the vocabulary pre and post- tests. Another limitation of this study refers to the term generalizability. Since the researchers had access to a limited number of participants, which may decrease the generalizability of the findings. The number of characters allowed in a short message was considered as a limitation. Due to this limitation, only a limited number of words could be sent in each attempt. Also the example sentences were chosen based on this limitation. Though many researches have been carried out towards MALL technology as a growing field of study in language learning and teaching, there are still so many works left to be done. Moreover, the methods with the help of which mobile device technology can be used to provide a more robust learning environment have to be further improved. More research is needed to explore that whether learning academic words via SMS can help learners to employ those words in extended discourse.

### ABSTRACT

In any foreign language setting, there are some variables that play an essential role in teachers' and consequently learners performances. Two of these important social psychological variables in teaching and educational context are self-Efficacy and burnout. This study has been conducted as a qualitative dominant mixed research design to explore the correlation between self-efficacy of Iranian English as a foreign language (EFL) teachers and their reports of burnout comparing two big provinces of Tehran and Khorasan Razavi. The data were gathered through the application of the Maslach Burnout Inventory (MBI; Maslach & Jackson 1981, 1986) and a researchers-made questionnaire of self-efficacy was designed by Motallebzadeh, Ashraf and Tabatabaee Yazdi (2013) which checked Iranian EFL teachers' self-efficacy. The participants were as 326 professional experienced teachers having university education. They were from both genders and different age groups. After obtaining the raw data, the SPSS software (version 16) was used to change the data into numerical interpretable form, using correlational analysis to determine any significant relationship between self-efficacy and teachers' burnout. The result showed that the participants' self-efficacy has a reverse relationship with their burnout. In addition, a significant relationship was observed between teachers' age, gender, years of experiences and reports of burnout.

**KEYWORDS:** Burnout, Self-Efficacy, ELT Teachers

### INTRODUCTION

The current decades seems to be known as the years of stress and intension. Studies revealed these two features as the most challenging and influential factors in human's life, for all contexts and work places. It is assumed that if people do not feel stressed for a few days or weeks; they suffer from a chronic stress condition that causes a feel of frustration and fatigue. They come across not only with emotional but also with physical problems. This condition has been called burnout by psychologists.

As cited in Skaalvik and Skaalvik, (2010) burnout is defined as a result of long-term occupational stress, especially among human service workers such as teachers (Jennett, Harris, Mesibov, 2003). Many teachers around the world may experience stress in their work (Jennett et al., 2003). Although most teachers cope successfully with such stress, burnout may be the endpoint of coping unsuccessfully with stress (Jennett et al., 2003).

As cited in Martin, Sass, and Schmitt, 2012, teacher intended-to-leave is very harmful to the profession. In the United States almost about one quarter of novice educators are not willing to continue their job after three years and by the fifth year this increases to 40%. (Milner & Woolfolk Hoy, 2003; National Center for Education Statistics, 2004; National Commission on Teaching and America's Future, 2003). Self-efficacy is known as an another influential factor in any job and life success, and defined as people beliefs about their own abilities to think, plan, monitor, organize, and perform activities needed in educational settings (Bandura, 1997, 2006).

This study was going to investigate the extent to which Iranian EFL teachers participating in their teaching classes leads to teacher burnout. Furthermore, the link between EFL teachers' self-efficacy and their burnout were examined with regard to demographics.

#### **LITERATURE REVIEW**

Understanding of teachers' perception of self-efficacy and the impressions of this knowledge play an essential role in teachers' decision-making and their action and methodologies that they use in the class (Pajares, 1992).

A question may be raised here why some teachers could tolerate the high level of stress and succeed in their job while some others cannot. This study aimed at investigating the role of teachers' self-efficacy and burnout as the two important reasons of this question.

#### ***Teachers' burnout***

Teaching is among those occupations with the highest levels of job stress (Chaplain, 2008; Stoeber & Rennert, 2008). Many studies have been done to investigate causes of stress and its consequences (e.g., Kokkinos, 2007; Kyriacou, 2001; Liu & Ramsey, 2008; Travers & Cooper, 1996). One of these consequences that is very important is teacher turnover (e.g., Harrison, Newman, & Roth, 2006; Perrachione, Rosser, & Petersen, 2008).

In any profession, turnover may lead to many straight costs (e.g., replacement costs, training costs). Turnover can be so influential because teacher turnover is related to many severe educational problems such as decreasing quality of education for the students (Levy, Fields, & Jablonski, 2006).

Teacher turnover refers to a teacher's readiness to leave the teaching profession. Researchers in field of education have recognized that work tension is positively related to turnover and negatively related to job satisfaction (e.g., Chen, 2007). For instance, Wright and Cropanzano (1998) noted that emotional exhaustion, which is a primary indicator of work stress and burnout, is a major predictor of voluntary turnover.

Decreasing of school effectiveness (Ingersoll, 2001; Shaw, Gupta, & Delery, 2005), productivity, and motivation (Tett & Meyer, 1993) can be the result of teachers' turn over. As cited in Devos, Dupriez & Paquay, 2012, the first years of teaching are a problematic era. Novice teachers come into a unique world; meet new things, unexpected condition and challenges. They are going to encounter dissimilar types of difficulties and problems, such as controlling classroom discipline, assessing learners' work, motivating learners (Britt, 1997; Ganser, 1999; Melnick & Meister, 2008; Veenman, 1984). Still, while this initial stage is frightening for some, it is a satisfying experience for others (Hebert & Worthy, 2001). How could this be clarified?

Besides the individual characteristics of the inexperienced teachers, the social working conditions (e.g. relationships with colleagues...) is a key for understanding how teachers cope with this era. Pyhältö, Pietarinen, and Salmela-Aro (2011) revealed the following:

"The teachers reported a range of different kinds of events and episodes causing destructive frictions and negative experiences in their work. The teachers perceived social interactions as being the most challenging and problematic part of their work in terms of burnout, on several different levels in their school community. Experienced burdening was situated in social interactions with the members of the school community." (p. 1105)

Recently, Akbari and Moradkhani (2010) explored relationship between teaching experience, and teacher efficacy among 447 Iranian EFL teachers. The results showed that experienced teachers experienced a significantly higher level efficacy.

As cited in Bruce 2009, "Strategies to avoid burnout include reducing stress, keeping personal health strong, building a strong social network, obtaining clear expectations in all facets of one's professional life, improving time management, participating in a mentoring program, and self-reflecting on personality characteristics that may be contributing to stress and burnout." (p. 57).

#### ***Teachers' self-efficacy***

Dewey (1903) claimed that all teachers should have "some regular and representative way in which he or she can register judgment upon matters of educational importance, with the assurance that this judgment will somehow affect the school system" (p. 199). Bandura's (1977) stated that one's self-efficacy beliefs are affected by two important

components: human agency and triadic reciprocal causation. The theory of human agency proposed that human beings are capable of shaping their lives (Bandura, 1982).

Still, this mechanism that through which human agency works is a multi-directional model that in which personal factors (e.g. cognition, and attitudes), and the external factors influence on each other (Bandura, 1997). In this mechanism, social setting, insight, and behavioral achievement influence on a teacher's judgment about his or her capabilities to positively affect student learning (self-efficacy).

Markley (2004, as cited in Ghasemi & Hashemi, 2011) indicated about the significant role of English language teachers in their academic success and learners' learning that highly depends on teachers and their methodologies in their classes. Strong self-efficacy makes teachers to be less critical about students' errors (Ashton & Webb, 1986), to work more with students who feel stress (Gibson & Dembo, 1984), and to be more patient with students' difficulty (Meijer & Foster, 1988; Podell & Soodak, 1993; Soodak & Podell, 1993). Moreover, teachers show greater enthusiasm for teaching (Allinder, 1994; Guskey, 1984; Hall, Burley, Villeme, & Brockmeier, 1992).

Self-efficacy could be related to a number of significant factors related to education, including student achievement (e.g., McLaughlin & Marsh, 1978; Muijs & Reynolds, 2002), student motivation (e.g., Midgley, Feldlaufer, & Eccles, 1989), educational innovations (e.g., Cousins & Walker, 2000), classroom management skills (Wool-folk, Rosoff, & Hoy, 1990), and teacher stress (Greenwood, Olejnik, & Parkay, 1990).

Moafian and Ghanizadeh (2009) investigated the relationship between self-efficacy and emotional intelligence among 89 EFL teachers from several private language institutes in Mashhad, Iran. Their findings showed that there was a significant relationship between teacher self-efficacy and emotional intelligence. Further, Vaezi and Fallah (2011) explored the connection between self-efficacy and anxiety in a sample of Iranian EFL teachers in private language institutes. The results showed an important negative correlation between self-efficacy and stress.

Akbari and Moradkhani (2010) studied relationship between teaching experience, academic degree and teacher efficacy among 447 Iranian EFL teachers. The results of data analysis revealed that experienced teachers (with more than three years of teaching experience) had a significantly higher level of efficacy, efficacy for classroom management, efficacy for student engagement, and efficacy for instructional strategies compared to their novice counterparts.

Rastegar and Memarpour (2009) explored teacher self-efficacy with respect to teacher emotion and demographic variables in an EFL context in Shiraz, Iran. The results showed a positive correlation between teacher emotional intelligence and self-efficacy.

## **SIGNIFICANCE OF THE STUDY**

Generally, researches point out to two main findings: 1) teachers are more in danger than other workers to burnout symptoms (see De Heus & Diekstra, 1999; Schaufeli & Enzmann, 1998), and 2) burnout affects teachers around the world (Byrne, 1999; Rudow, 1999).

In Iran, these days, most teachers are facing different social problems such as inflation that makes them feel social stressed and tension. Blasé (1982) has shown that stress and burnout affect teachers' job satisfaction, and reduce efficiency when working with students. Moreover, it seems that teachers with a high self-efficacy are happier, more creative, and more effective in their duties as teachers.

Teachers' methodologies and their actions in the class and the way they recognize and arrange instruction extremely depend on their ideologies of effective teaching and their ideas about teacher efficacy (Ghaith & Shaaban, 1999; Chacón, 2005). Then, the teachers' ideas of an effective teacher can highly affect their teaching and accordingly their learners' learning (Dembo & Gibson, 1985; Goddard, Hoy, & Hoy, 2000).

Understanding of teachers' perception of self-efficacy and the impressions of this knowledge play an essential role in teachers' decision-making and their action and methodologies that they use in the class (Pajares, 1992). Since language learning mostly takes place in formal language setting and as a foreign language, knowing these issues are very important in Iranian context (Kariminia & Salehizadeh, 2007).

Subsequently teachers have a key role in all societies and the success of learners' future depends on teachers' affective conditions, the most important significant of the present study is helping teachers enhance their self-

efficacy and reduce their burnout, by determining the relationship between burnout and self-efficacy. Consequently, the learners can make more benefit from their teachers and the whole class.

## RESEARCH QUESTIONS

Consequently, the study addresses the following research questions:

- 1) Is there any significant relationship between teachers' self-efficacy, and their feelings of burnout?
- 2) Is there any significant relationship between teachers' report of burnout to their age?
- 3) Is there any significant relationship between teachers' burnout with regard to their gender?
- 4) Is there any significant relationship between teachers' burnout and their years of the experiences?

## METHODOLOGY

### *Participants*

Participants of this study were 326 EFL teachers from two big provinces of Iran. Selection was done from all available professional experienced teachers having university education (Bachelor: 184; Master: 136 and PhD: 6). They were both males (102) and females (224) and aged between 20 and +40 years old with a range of between -1 and +10 years of teaching experience. Their field of study was Teaching of English as a foreign language (TEFL) (239), English Translation (57), and English literature (30). All of them were supposed to pass Teaching Training Courses (TTC) whether in University or Institute.

### *Instruments*

The needed data were gathered through the application of one standard and one researcher-made questionnaires. In addition, demographic form asked about the participants' demographic information including age, gender, and years of teaching experience.

#### *1. Teacher's burnout scale*

The Maslach Burnout Inventory (MBI; Maslach & Jackson 1981, 1986) that is one of the universal instruments used for assessing burnout was used in this study. The questionnaire consisted of three sub-dimensions; emotional exhaustion sub-dimension (EE, 9 items, maximum score – 54), desensitization sub-dimension (D, 5 items, maximum score – 30), and personal accomplishment sub dimension (PA, 8 items, maximum score – 48). Higher emotional exhaustion and desensitization sub-dimensions and lower personal accomplishment sub-dimensions cause high burnout status (Maslach & Jackson, 1981).

Prior research confirmed the validity, reliability of this questionnaire (Iwanicki & Schwab, 1981; Gold, 1985). Additionally, reliabilities for data gathered from each of the three scales ranged from .76 to .90 (Iwanicki & Schwab, 1981) and .72 to .88 (Gold, 1985). Reliabilities for data in the present study were similar and acceptable (EE: .89, DP: .71, PA: .71).

#### *2. Teacher's self-efficacy scale*

For measuring teachers' self-efficacy a researchers made questionnaire was designed, by Motallebzadeh, Ashraf and Tabatabaee Yazdi (2013) which checked Iranian EFL teachers' self-efficacy, based on the (Tschannen-Moran & Woolfolk-Hoy 2001) and (Bandura, 1997) Instrument Teacher Self-efficacy Scale, and (Murdoch, 1997) Good Teacher's questionnaire. This 30-item researcher-made questionnaire was conducted according to the following 5 subscales: efficacy to influence decision making (2 items, maximum scores \_ 10), instructional efficacy (15 items, maximum score – 45), disciplinary efficacy (2 items, maximum score – 10), efficacy to enlist parental and community involvement (3 items, maximum score – 15), and efficacy to create a positive school climate (8 items, maximum score – 40). Each item is measured on a 5-point scale: "nothing, very little, some influence, quite a bit, a great deal." The Self-Efficacy questionnaire used in this study was given to two linguists and specialists to judge its validity. Some items were modified and others were deleted until the researchers came up with a final draft of 30 items, and the reliability was estimated using Cronbach's Alpha .90.

### Procedure

In this study, 236 participants who are all Iranian ELT teachers in different language schools from two big provinces of Iran (Tehran and Khorasan Razavi) were selected. They were from both genders and from different ages with different years of experiences. In this study, for collecting the data, questionnaires in the form of papers and online (using Google drive) were spread up to different English Language teachers. These teachers were from different subfields of the study within English Language field. Collecting data started at April 2013 and lasted for about 2 weeks. The probable needed time for filling out both questionnaires was about 10 minutes.

Gathering data was summarized by the use of SPSS software (Version 16). Then, the correlation between these two variables was calculated. To analyze the data further, linear regression analysis was conducted to find out to what extent self-efficacy might have predictive power in teachers' overall burnout.

### RESULT

Table (1) presents categorization of sub-scales of burnout and self-efficacy scales and their related Cronbach Alpha reliability coefficients based on the data collected from the 616 participants of the study.

*Table 1: Classification of different items of burnout and self efficacy scales, cronbach alpha coefficient ( $\alpha$ )*

Scales/sub-scales	Items	( $\alpha$ )
<b>Burnout</b>		
Emotional Exhaustion	1, 4, 9, 10, 15, 16, 18, 20, 22	.89
Reduced Personal Accomplishment	3*, 6*, 7*, 12*, 13*, 17*, 19*, 21*	.71
Depersonalization	2, 5, 8, 11, 14	.71
<b>Self-efficacy</b>		
Efficacy to Influence Decision Making	1, 2	.82
Instructional Efficacy	3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17	.87
Disciplinary Efficacy	18, 19	.71
Efficacy to Enlist Parental and Community Involvement	20, 21, 22	.71
Efficacy to Create a Positive School Climate	23, 24, 25, 26, 27, 28, 29, 30	.74

\* Scored in reverse order

Pearson product-moment correlation was conducted to examine the role of teachers' self-efficacy in their burnout. The results indicated significant negative correlations between self-efficacy and burnout ( $r = -0.61$ ,  $p < 0.01$ ). This is in accordance with Vaezi and Fallah (2011) that discovered a significant negative correlation between self-efficacy and job stress among a sample of Iranian EFL teachers in private language institutes. In addition, as table 2 revealed all sub-scales of teacher self-efficacy were negatively correlated with teachers' burnout.

*Table 2: correlation between teachers' self efficacy and burnout*

Burnout	( $r$ )
Total Self-efficacy	- 0.58**
Efficacy to Influence Decision Making	- 0.24**
Instructional Efficacy	- 0.56**
Disciplinary Efficacy	- 0.45**
Efficacy to Enlist Parental and Community Involvement	- 0.40**
Efficacy to Create a Positive School Climate	- 0.50**

\*\* Correlation is significant at the 0.01 level (2-tailed).

Moreover, two components of teacher's burnout, namely Emotional Exhaustion, and Depersonalization were negatively associated with teachers' self-efficacy as follows: self-efficacy and (1) Emotional Exhaustion ( $r = -0.42$ ,  $p < 0.01$ ), and (2) Depersonalization ( $r = -0.49$ ,  $p < 0.01$ ), but the third component, namely (3) Reduced Personal Accomplishment, is positively correlated with teachers' self-efficacy ( $r = -0.45$ ,  $p < 0.01$ ).

These findings are in accordance and agreement with the study of Hakanen, Bakker and Schaufeli (2006) that revealed both emotional exhaustion and depersonalization correlated negatively with turnover and health among Finnish teachers. On the other hand, a positive relationship was found between personal achievement and self-efficacy ( $r = .45$ ,  $p < .001$ ).

To analyze the data further, linear regression analysis was conducted to find out to what extent self-efficacy might have predictive rule in teachers' overall burnout. The results indicated that teachers' total score of self-efficacy was negatively predictor of burnout. In this analysis, Total Self-efficacy and its constructs explained 38% of the variance in teachers' burnout. Of these variables Instructional self-efficacy and Efficacy to create a positive school climate made the largest unique contribution.

Considering different provinces, the results revealed significant negative correlations between self-efficacy and burnout in Tehran ( $r = -0.62$ ,  $p < 0.01$ ), and Khorasan-Razavi ( $r = -0.58$ ,  $p < 0.01$ ). These indicated that the higher significant negative correlation in case of province was for Tehran. To know any relationship between burnout and teachers' gender, independent sample T-test was used. According to mean differences between male and female teachers, result showed that burnout among female teachers is higher than among male teachers ( $\text{sig.} = 0.03 < 0.05$ ). This finding is in accordance with Anderson and Iwanicki's (1984) but in contrast with that of Borg and Riding (1991) result which revealed significantly higher levels of burnout among male teachers. In this regard, Schwab and Iwanicki (1982) found that male teachers reported more frequency and intense feeling of depersonalization towards their students compared to female teachers.

Moreover, the result revealed significant differences between male and female teachers regarding self-efficacy ( $\text{sig.} = 0.03 < 0.05$ ). In this case, male teachers seem to be more efficient than female that is in accordance with burnout results of this study. On the other hand, the more efficient teachers, the less sense of burnout was observed.

In addition Pearson product-moment correlation was conducted. The results revealed significant negative correlations between self-efficacy and burnout for both genders. Male ( $r = -0.62$ ,  $p < 0.01$ ), and Female ( $r = -0.60$ ,  $p < 0.01$ ). The result showed that correlation is higher in Male groups. To investigate the relationship between teachers' self-efficacy and burnout and their age, Pearson product-moment correlation was run again. The results revealed significant positive correlation between burnout and age ( $r = 0.90$ ,  $p < 0.01$ ).

More detailed analysis showed that there was a significant negative correlation between teachers' burnout and self-efficacy among male teachers of the age between 26-30 ( $r = -0.32$ ,  $p < 0.01$ ), but for the case of female teachers the correlation was significant in age groups of 20-25 ( $r = -0.31$ ,  $p < 0.01$ ), 26-30 ( $r = -0.37$ ,  $p < 0.01$ ), and 31-35 ( $r = -0.41$ ,  $p < 0.01$ ). Further, findings of the present study indicated a significant positive correlation between EFL teachers' age and their burnout ( $r = 0.9$ ,  $p < 0.01$ ). In other words, teachers' burnout tends to increase overtime. This is consistent with previous research that demonstrated that age is an important factor in predicting teacher burnout. Moreover, no significant correlation was seen between EFL teachers' self-efficacy and their age.

Moreover, the study revealed significant correlation at the level of B.A. ( $r = -0.51$ ,  $p < 0.01$ ) and higher in male teachers. Also the correlation is significant at the M.A. level ( $r = -0.73$ ,  $p < 0.01$ ), but higher in females. As a result, these findings revealed feeling of burnout was higher for M.A. teachers and no sign of burnout for PhD teachers.

Furthermore, qualitative data that gathered using two open-ended questions revealed that teachers perceived financial issues as being the most demanding and problematic element of their work in terms of burnout (27%), for example, one teacher stated that "payment principles don't appreciate your efforts." Additionally, many teachers stated lack of self-confidence and motivation as the reasons of burdening (12.8%). Several teachers believed that they had some trouble with the materials and books they taught (10%).

## **DISCUSSION**

The current study investigated the possible relationships of burnout, and self-efficacy with some socio-demographic and occupational characteristics of Iranian EFL teachers working at different institutes. The findings proposed that some EFL teachers, mainly younger feel more success in their profession, and they could be more successful at reducing the level of burnout. This may have suggestions for teachers' well-being, motivation and teaching efficiency and accordingly emphasize the value of setting up some courses for EFL teachers to increase efficacy.

To efficiently deal with teacher burnout, EFL teachers, should develop skills in controlling their stress levels. In addition, the role of language institute managers to provide assistance and support from others (e.g., colleagues, supervisors) are of utmost importance. Qualitative data, which was collected through open-ended questions to capture the things that promoted teacher burnout experiences, supported these findings in terms of self-efficacy gains. Many teachers indicated a desire to increase their effectiveness and specially recorded Iranian teachers' reports of burnout, mainly in fifteen aspects.

To summarize, the qualitative data analysis revealed that teachers consider different factors as the main cause of burnout among teachers. They have different priorities and this range of priorities leads to considering different factors as the underlying causes of burnout among teachers. It seems that different teachers get burned out differently and it makes the task more grueling. All the aforementioned factors have to be considered by all policy makers, managerial sectors and even syllabus designers in all processes of their decision making. To obliterate all these underlying causes, cooperation among different educational sections seems necessary. It means to reduce the amount of burnout among teachers the involvement of different groups is necessary.

Furthermore, teachers proposed different kinds of reasons for burdening and low level of self-efficacy. For example they indicated financial issues as the most demanding and problematic reasons of burdening. Moreover, several teachers believed that they had some trouble with the materials and books they taught. A lack of professional and qualified teachers, educational rules and policies, not positive and friendly atmosphere among colleagues/supervisors and managers, students with behavior problem and not qualified supervisors and managers were characteristic of the reasons that were considered as burdening by the teachers.

In addition, data revealed clearly that the majority of teachers reported that modernized work place and being up-to-date could be the best solution as one stating that "using internet for being updated on regular basis, taking part in teacher development courses like TESOL, exchange experiences with my fellow teachers". Twenty one percent of teachers complained about their low salaries. They compared their salaries to the cost of living.

## CONCLUSION

The results of this study illustrated that all five constructs of self-efficacy were reversely correlated with teacher burnout. Therefore, the results confirmed our hypotheses. In this study, burnout was at least moderately correlated to efficacy to influence decision making, instructional efficacy, disciplinary efficacy, efficacy to enlist parental and community involvement, and efficacy to create a positive school climate as sub-scales of self-efficacy. Further, findings of the present study indicated a significant positive correlation between EFL teachers' age and their burnout. In other words, teachers' burnout tends to increase overtime. This is consistent with previous research that demonstrated that age is an important factor in predicting teacher burnout.

The results also indicated a negative correlation between EFL teachers' self-efficacy and years of teaching experience, as well as age. In other words, teachers' self-efficacy tends to decrease over time and with every year of teaching. This is not in accordance with findings of Chester (1996) who revealed that beliefs are mediated by the teachers' age and prior experience. These results were also in contrast with those of Campbell (1993) who showed teachers with more experience were more efficacious.

It was also found that there was significant difference in the teachers' self-efficacy with respect to gender. In this case, male teachers seem to be more efficient than female that is in accordance with burnout results of this study. On the other hand, the more efficient teachers, the less sense of burnout was observed. Moreover, the results of the present study indicated that there were significant burnout differences among EFL teachers with respect to gender. In other words, male teachers' burnout level was significantly higher than that of the females. This finding is in contrast with Anderson and Iwanichi's (1984) but in accordance with that of Borg and Riding (1991) result which revealed significantly higher levels of burnout among male teachers. Moreover, in this regard, Schwab and Iwanicki (1982) found that male teachers showed more intense feeling of depersonalization towards their students compared to female teachers. This finding is consistent with the findings of Pierce and Molloy (1990). They mentioned that teachers with positive self-concept are more productive, happier and more effective in their job. Pierce and Molloy (1990) also reported that male teachers perceived themselves as less self-confident than female teachers.

## (De)LIMITATION OF THE STUDY

This study, like any other researches, suffers from some limitations that may raise some new questions for further research in the field. The most important limitation included in the study would be the working conditions under which all the teachers participating in the study are working including the commuting difficulties to work, the payment, or the physical condition of the working place and above all the colleagues and the manager. Furthermore, this study did not consider high school or university teachers due to the accessibility and availability of the teachers and the working places to the researcher. Consequently, it is going to merely focus on English teachers in language institutes. Therefore, it can be claimed that the findings of this research could be well fit with institutional EFL teachers.

We are particularly grateful to all EFL teachers of the private language institutes who participated in the research.

### ABSTRACT

The present study attempted to discover the impact of keeping portfolios on the improvement of the advanced English as a foreign language (EFL) learners' writing. In order to have homogeneous groups, a Test of English as a Foreign Language (TOEFL) proficiency test was given to 60 participants of the study and 48 of them were selected, and then they were randomly assigned to comparison and experimental groups. Since the study concentrated on writing ability a writing pretest was administered to both groups to make sure they were also homogeneous in terms of writing ability. The experimental group was exposed to portfolio assessment and instruction while the comparison group received the traditional writing instruction and assessment. After 10 sessions of treatment, a posttest similar to the pretest was administered. The result of the study indicated that there was a statistically significant difference between the groups. The conclusion was that keeping portfolios can contribute to progress of the students in terms of writing ability and it can be used as a promising testing and teaching tool in English language classes.

**KEY WORDS:** writing ability, portfolio instruction, portfolio assessment.

### INTRODUCTION

Based on Brown (2004), in the field of second or foreign language teaching and learning, writing is a unique skill with its own conventions and features. Writing effectively and clearly in a logical and well-developed organization is a main purpose of every writing treatment. Unlike the other skill, assessing writing is not a simple task. The traditional methods of assessing writing were not really successful in helping students in improving their writing ability. But, developing alternative assessments like portfolios have had high washback effect on writing classes. Chapelle and Brindley (2010), state that portfolio is purposeful collection of students' work over the time and contains their language performance at different stages of completion, as well as the students' own observations on his or her progress. Assessments may be focused on many purposes, but the most important role is always to improve instruction for each student. According to Gordon (2008), writing is an aid and support for other skills; it focuses on accuracy and communication of meaning. Morrison-Saunders, Bell and Retief (2012) point out that since most of university works are around writing, it is considered as a fundamental skill to the university students in academics experiences.

#### *Direct and indirect methods of gathering data for assessment*

Allen (2008) states that generally there is two basic ways to assess students' writing: first one is direct assessment which is based on an analysis of student products, in which they demonstrate how well they have mastered learning outcomes; next one is indirect assessment which is based on an analysis of reported views about students mastery of learning outcomes. Cooper (1984) also believes that direct assessment requires the examinees to write one or more essays, typically on preselected topics and indirect assessment requires them to answer multiple-choice items. He also states that direct assessment is sometimes referred to as a "production" measure and indirect assessment as a "recognition" measure. In Fraidan (2005) point of view, while direct approach of assessing writing has been criticized for its subjectivity, indirect approach is popular for being objective and producing the same result in the future.

#### *Formal approach to scoring writing*

To make plan for administering an approach to writing assessment there may be varieties of scoring methods and combination of methods like holistic, primary trait and analytic assessment for different purposes in different writing

tasks. Bacha (2001) believes that holistic and analytic scoring instruments or rating scales have been used to identify students' writing proficiency levels for different purposes in EFL/ESL programs.

*Table 1: A comparison of holistic and analytic scales in terms of qualities of test usefulness (Weigle, 2002)*

Quality	Holistic Scales	Analytic Scales
Reliability	lower than analytic, but still acceptable	higher than holistic
Construct Validity	assume that all relevant aspects of writing ability develop at the same rate and can thus be captured in a single score; correlate with superficial aspects such as length and handwriting	more appropriate for L2 writers as different aspects of writing ability develop at different rates
Practicality	relatively fast and easy	time-consuming; expensive

Breland (1983) quotes from Diederich (1974) that in analytic scoring, the writing samples scored by experts representing several different academic disciplines. Primary trait scoring is also known as focused holistic scoring, and it is resemble to holistic scoring. Brown (2004) states that this kind of scoring focus on task at hand and assigns a score based on the effectiveness of the text's achieving that goal, for example if the goal or content of writing is to write an persuasive essay, the score evaluation would rise or fall on the achievement of that function.

### ***Writing ability test***

While some scholars talk about intensive and extensive writing, some others have known them as controlled and free composition. Brown (2004) clarified intensive or controlled writing as a form-focused writing, grammar writing or simply guided writing and talks about extensive or free writing in which learners can exercise a number of options in choosing words, structure, and discourse that is freed from strict control of intensive writing. According to Farhady, Ja'farpour, and Birjandi (2009), controlled writing is utilized to recognize or complete grammatical sentences to assess the learner's ability to convey certain thoughts in writing; it consists of some type of written model with directions for conversations or language uses in rewriting the model. They also believe that free writing or composition writing includes a topic for the examinees to write a composition of a definite length. To Hyland (2003), in controlled writing fixed patterns from substitution table will be employed and in free writing patterns have developed by learners to write essay, letter, and so on.

### ***Portfolios***

khodadady and Khodabakhshzade (2012)note that portfolio is a collection of texts that writer has produced in a definite period of time. According to Davis and Ponnampuruma (2005), a portfolio is gathering various forms of evidence of achievement of learning outcomes; the student portfolio for assessment aims is a set of reports, papers, and other material, together with the student's consideration on his or her learning and on strengths and weaknesses. Based on Aydin (2010), students usually have positive reactions toward portfolio; it helps learners to analyze literary texts, write in different styles, demonstrate an awareness of the target language culture, improves proficiency skills, content knowledge, and grammatical competence; it also reduces writing anxiety, and promotes students' motivation to learn a foreign language.

Syafei (2012) believes that there are several types of portfolio: First, showcase portfolios which are usually used to show a student's best work to parents and school administrators. Next, collections portfolios which are student's work to present how students deal with day to day class assignments or *working folders* which may contain rough drafts, sketches, works-in-progress, and final products and finally, assessment portfolios which are presented as reflections of specific learning goals that consist of systematic collections of students' work, student self-assessment, and teacher assessment. According to Davis and Ponnampuruma (2005), Portfolio assessment has five stages:

1. Collection of evidence of learning outcomes achievement during day-to-day learning activities.
2. Reflection on learning to promote learning, personal and professional development, and improvement of practice.
3. Evaluation of evidence or quality of the evidence.
4. Defense of evidence of how well the portfolio has reflected the achievement of the learning outcomes.
5. Assessment decision or Pre-validated rating scales to assess the evidence.

Moya and O'Malley (1994) use both formal and informal assessment methods, emphasizes on both the processes and products of learning, try to understand student language progress in the linguistic, cognitive, metacognitive, and affective domains, it contains teacher, student, and objective input, and also stresses both academic and informal language development. These are the characteristics that make portfolios as a popular alternative assessment in the frame work of communicative language teaching.

However, testing and rating writing is a long process; it seems to be more delicate than other skills and needs more time and attention. In this way there are different kinds of writing assessment such as direct, indirect, formal, informal, and Portfolios assessments which are also direct method of writing assessment. This study attempted to investigate the impact of keeping portfolios on students' writing progress.

## RESEARCH QUESTION

Given the importance of the writing ability in learning a new language and the opportunities that portfolios provide, the present study addresses the following question:

“ Does keeping portfolios have any significant effect on EFL students' writing ability ?” To what extent?

## METHODOLOGY

### *Participants*

The participants of this study were 60 advanced students from 3 language institutes in Mashhad, Iran. After administering a TOEFL proficiency test, 48 of them were randomly assigned in two experimental and the comparison groups. Although both male and female had participated in this study but gender was not considered as a moderator. They were advanced EFL learners who were tested on the effect of portfolio assessment.

### *Instrumentation*

The instruments used in this study included a proficiency test which was the truncated version of TOEFL (TOEFL, published by ETS, 2010) proficiency, a pretest, and a posttest as well. At the beginning of the study since the researchers aimed to apply their treatment on advanced students, they were given a TOEFL proficiency test. After the participants had assigned in two groups, a writing pretest was also administered to both groups to make sure they were homogeneous in terms of writing ability. To explore the utility and efficiency of the treatment a writing posttest was conducted at the end of the research. In both pre/posttests the participants were asked to write a paper based on the same topics between two groups. Since the researchers used a modified version of TOEFL as the proficiency test, it was not verified in terms of reliability, the same is true about the vocabulary pre and post- tests.

### *Design and Procedure*

Since the purpose of this research was to investigate the impact of keeping portfolio on improvement of writing skill, an experimental method was selected. Through administering a language proficiency test between 60 advanced students who attended the TOEFL proficiency class in 3 language institutes in Mashhad, Iran. Those students whose scores fell between on standard deviation above and below the mean were included in the study. Out of the 60 students, 48 of them were selected and their close homogeneity was confirmed by utilizing the statistical technique of t-test. In order to fulfill the research the treatment applied in 10 sessions between two experimental and comparison groups. In comparison group students received traditional writing assessment; every session learners were given a topic to write about, the teacher read and scored the students' papers. But in experimental group, after choosing the topic, learners wrote up their first drafts, then, under each assignment teacher wrote his comments about the different aspects of students' written tasks. Therefore, the students gained information about their strengths and weaknesses of their essays. They also were asked to self-assess or reflect on their writing in the classroom and evaluate themselves. Then, at home, the students revised and redrafted their writings based on teacher's comments and their own reflection.

## RESULT

At the beginning of the research, a writing pretest was administered in order to determine the ability of the subjects in terms of writing skill. This would enable the researchers to investigate the possible impact of the treatment on the improvement of the writing ability of the experimental group. The descriptive statistics of the writing pretest are reported in Table 2.

*Table 2: Descriptive Statistics of the Two Groups on the Writing Pre-test*

Group				
		N	Mean	Std. Deviation
Post-test	Control	24	11.93	2.13
	Experimental	24	11.91	2.42

To guarantee the homogeneity of the subjects regarding their current writing ability, the researcher ran a t-test. As it has been shown in Table 3, the t- observed of 0.129 was lower than the t- critical of 2.02 at 0.05 level of significance for 46 degrees of freedom. Thus it could be claimed that the two groups were not significantly different in terms of writing before undergoing the treatment.

*Table 3: Comparison between Variances and Means of the Two Groups on the Writing Pre-test*

	Levene's Test for Equality of Variances		t-test for Equality of Means				
	F observed	F critical	t observed	df	Sig. (2-tailed)	Mean Difference	t critical
Pre-test Equal variances assumed	1.28	.001	-.129	46	0.86	0.02	2.02

After the instruction, the subjects in both groups sat for the post test. The descriptive statistics of the post test for both groups are presented in Table 4.

*Table 4: Descriptive Statistics of the two Groups on the Writing Post-test*

Group				
		N	Mean	Std. Deviation
Post-test	Control	24	12.56	2.31
	Experimental	24	15.31	2.28

The researchers ran an independent t-test (Table 5) to analyze the means of two groups on the posttest. Since the t observed value of 6.25 at 46 degrees of freedom was greater than the t critical of 2.02, the null hypothesis could be safely rejected at 0.05 level of significance leading to the conclusion that the treatment was effective enough to make a significant difference between the experimental and comparison groups. Consequently, it could be concluded that keeping portfolios would certainly improve students' writing ability.

Table 5: Comparison between variances and Means of the Two Groups on the Writing Post-test

	Levene's Test for Equality of Variances		t-test for Equality of Means				
	F observed	F critical	t observed	df	Sig. (2-tailed)	Mean Difference	t critical
Post-test Equal variances assumed	1.02	1.69	6.25	46	0.02	2.75	2.02

## DISCUSSION

Portfolio assessment and instruction could be used in writing classes on the one hand to resolve the teaching-testing incoherence (Walker & Perez Riu, 2008) prevalent in most EFL/ESL writing classes and on the other hand to boost students' achievement in writing ability. In sum, this study demonstrated the potential of portfolio assessment to help students foster their English writing ability. Both quantitative and qualitative methods were utilized to find out the impact of keeping portfolios on EFL learners' writing ability. The results showed that portfolio assessment and instruction as a process-oriented teaching and assessment tool improved the students' overall writing ability and the sub-skills of focus, elaboration, organization and vocabulary. The students also perceived the positive effects of portfolio assessment on the product as well as the process of English writing. The positive effects of portfolios on students' writing might be due to the "opportunities they afford students to become actively involved in assessment and learning" (Genesee & Upshur, 1996, p.99). In line with Murphy (2006), learning processes can be improved if formative assessment procedures are applied appropriately.

The students in the experimental group were actively involved in assessment and learning in the process-oriented portfolio program. They revisited, reflected on and revised their writing during the term and put their selected pieces of writing in their portfolios. In line with Hagstorn (2006), the constructivist approach in which formative assessment procedures are incorporated into teaching and learning, assessment should be viewed as a process designed for learning rather than a product separated from learning.

Keeping portfolios can be used in EFL classes as a mechanism whereby learning, teaching and assessment are linked. They can be used to boost the development of EFL/ESL students' writing ability. Students' genuine writing performances during the term should be the target of the evaluation. In fact, assessment should be seen as a collaborative formative process which helps students as they move toward their writing goals.

## CONCLUSION

As mentioned earlier, the main aim of this study was to find out the impact of keeping portfolio on students' writing. The results of quantitative data analysis indicated that portfolio assessment affected the students' achievement in their overall writing as well as their achievement in terms of focus, elaboration, organization, vocabulary, etc. To some extent, the results are also in accord with Fahed Al-Serhani 's (2007) findings that portfolio assessment significantly improves students' writing performance in general and the product skills of purpose, content, organization, vocabulary, sentence structure and mechanics in particular. Similarly, Khodashenas and Salehi (2012) find that portfolio-based writing instruction and assessment is an appropriate alternative in terms of writing. They conclude that, Portfolio assessment help students foster their English writing ability since they receive useful comments from teacher and actively involvement in process of assessment by themselves. It is also consistent with Elahinia's (2004) findings that portfolio assessment significantly improves students' overall writing ability.

There are several limitations to this study. First and foremost is that the portfolio score is considered to be the average of scores on the five selected pieces of writing. In other writing portfolio programs quantitative grades could be accompanied by a qualitative profile of students' efforts and achievements, hence reporting assessment results in both quantitative and qualitative terms. Second, age, gender and affective factors which are left untouched in the present study could be dealt with in further research to see if they moderate the effect of portfolio assessment on writing and its sub-skills. Third, the participants in this study were all in the advance level of proficiency which limits the generalizability of the result only to this proficiency level. Finally, the time span for this study is limited to only ten sessions of instruction, about five weeks which may affect the external validity or generalizability of the result.

Some suggestions could be generated from this study for future research on portfolio-based writing assessment and instruction. Firstly, since most EFL/ESL teachers in Iran are unfamiliar with portfolio-based assessment/instruction, and teachers play an essential role in this field, more research should be undertaken to explore the teachers' perception of this new approach to assessment. Secondly, due to the limit of time and space, the current study only lasted for ten sessions (five weeks). However, time might make a difference regarding learners' attitude, strategy and writing ability. To put it another way, some effects might not occur in such a short time. Therefore, further research needs to be carried out for a longer period of time, for instance, a semester or even longer.

### ABSTRACT

The world stepped into the era of online information and technologies that virtually have impact on all sides of human life including economics, education, social and cultural sides (Shojaei, Motamedi, & Nekoueizadeh, 2013). The idea of having our assessments computerized is obviously attractive and e-assessment is emerging as a major driver to e-learning for administrators, instructors and learners. E-Assessment (sometimes known as Online Assessment, Computer-based Assessment or Computer Assisted Assessment-CAA) certainly has advantages, disadvantages and associated problems. Expansion of virtual e-assessment is one of the most appropriate approaches to make higher education easier and more convenient for learners by accessing to self-assessment. The existence of maladministration assessment at any educational level has the greatest threat to the validity and reliability of any examination and consequently to the authenticity and recognition of issued diploma. Therefore, there are many debates over how e-assessment should be designed and administered, and this leads to curriculum design and policy. By considering that e-assessment systems must be stable in order to generate valid and reliable assessments results, this paper tries to replicate and discuss a conceptual framework for implementation of authentic e-assessment in web-based courses.

**KEY WORDS:** E-assessment, Authentic e-assessment, framework for implementation

### AUTHENTIC ASSESSMENT IN WEB-BASED COURSES

The two most important reasons for using authentic competency-based assessments are (a) their construct validity and (b) their impact on student learning, also called consequential validity (Gielen, Dochy, & Dierick, 2003). Construct validity of an assessment is related to whether an assessment measures what it is supposed to measure. With respect to competency assessment this means that (a) tasks must appropriately reflect the competency that needs to be assessed, (b) the content of an assessment involves authentic tasks that represent real-life problems of the knowledge domain assessed, and (c) the thinking processes that experts use to solve the problem in real life are also required by the assessment task (Gielen et al., 2003). Based on these criteria, authentic competency-based assessments have higher construct validity for measuring competencies than the so-called objective or traditional tests. Consequential validity describes the intended and unintended effects of assessment on instruction or teaching (Biggs, 1996) and student learning (Dochy & McDowell, 1998). As stated, Biggs's (1996) theory of constructive alignment stresses that effective education requires instruction, learning, and assessment to be compatible.

If students perceive a mismatch between the messages of the instruction and the assessment, a positive impact on student learning is unlikely (Segers, Dierick, & Dochy, 2001). This impact of assessment on instruction and on student learning is corroborated by researchers as Frederiksen (1984, "The Real Test Bias"), Prodromou (1995, "Backwash Effect"), Gibbs (1992, "Tail Wags the Dog"), and Sambell and McDowell (1998, "Hidden Curriculum"). Frederiksen (1984) and Prodromou (1995) implied that tests have a strong influence on what is taught, because teachers teach to test, even though the test might focus on things the teacher does not find most important.

Some consider authentic assessment as a synonym for performance assessment (Hart, 1994; Torrance, 1995), while others argue that authentic assessment puts a special emphasis on the realistic value of the task and the context (Herrington & Herrington, 1998). Reeves and Okey (1996) pointed out that the crucial difference between performance assessment and authentic assessment is the degree of fidelity of the task and the conditions under which the performance would normally occur. Authentic assessment focuses on high fidelity, whereas this is not important issue in performance assessment. These distinctions between performance and authentic assessment indicate that every authentic assessment is performance assessment, but not vice versa (Meyer, 1992).

Savery and Duffy (1995) defined authenticity of an assessment as the similarity between the cognitive demands-the thinking required-of the assessment and the cognitive demands in the criterion situation on which the assessment is based. A criterion situation reflects or simulates a real-life situation that could confront students in their internship or future professional life. Darling-Hammond and Snyder (2000) argued that dealing only with the thinking required is too narrow. In their view, students need to develop competencies because real life demands the ability to integrate and coordinate knowledge, skills, and attitudes, and the capacity to apply them in new situations (Van Merriënboer, 1997). Birenbaum (1996) further specified the competency concept by emphasizing that students need to develop not only cognitive competencies such as problem solving and critical thinking, but also meta-cognitive competencies such as reflection, and social competencies such as communication and collaboration.

In light of the constructive alignment theory (Biggs, 1996) authentic assessment should be aligned to authentic instruction in order to positively influence student learning. Authentic assessment requires students to demonstrate relevant competencies through a significant, meaningful, and worthwhile accomplishment (Resnick, 1987; Wiggins, 1993).

Computing-mediated distance education introduces extraneous factors that could affect the validity of the course assessment system. One of these factors is identified as the usability of the web site. Usability deals with how well a system satisfies user needs and requirements. It applies to all the aspects of a system with which a user might interact, including installation and maintenance procedures (Orde, 2001). Another factor is attitude. Weller (2002) examines technical barriers in the assessment process of a web-based course, and points out the tension between individuality and robustness in submissions and the detection of plagiarism. Clarke et. al. (2004) state that feedback to students on their assignments is an essential activity. They point out that tutorial support must be a crucial part of good distance course, where emails should be considered as a non-intrusive means of communication. Orde (2001) offers some suggestions to develop online courses, for instance: to consider a description of learners; to provide readily available technical support; to eliminate group activities easily done face-to-face; and to record and grade interactions such as e-mail and group discussion contributions. To Orde, the testing portion of Course Info requires that each quiz item be individually entered and submitted. If this feature of the software is used, the ID students advise allowing multiple attempts. To Orde, formative evaluation is an essential component and necessary to online course development.

Gatlin and Jacob (2002) discuss advantages of digital portfolios as part of one university's authentic pre-service teacher assessment. Fenwick and Parsons (1997) assert that effective assessment must be intricately woven throughout the teaching-learning process. Collaborative learning activities enable subjects to share their abilities and limitations, providing a better quality product than one that is the mere sum of individual contributions. Group interactions, following the indications for collaborative work given in a course, facilitate vicarious learning, which is hard for some subjects to experience if they do not interact with their peers (Bandura & Walters, 1963; Vygotsky, 1986).

Tools for objective testing, within virtual learning environments and within dedicated assessment engines (e.g. Question Mark Perception) allow teachers to orchestrate frequent assessment testing (e.g. online objective testing) which can be used both to offer flexibility in the time and place of assessment and/or to encourage students to spend more 'time on task' out of class. Time on task has been correlated with enhanced student learning (Chickering & Gamson, 2001) with many studies showing that frequent objective testing enhances the performance of students in final exams (cited in Haigh, 2007).

Computer-supported assessment also makes it possible to enrich and make assessment tasks more authentic, for example, incorporating multimedia presentations and to enable better alignment of tests to student's levels of understanding (Conole & Warburton, 2005). For instance, as a test of their understanding, students learning a foreign language might watch a recorded video of current affairs program and answer objective questions relating to the content (Nicol, 2009). Adaptive testing involves modifying the nature of the test based on the responses the student has made to earlier tests. Although modifying interactions in this way can be achieved in paper tests, this is far more efficient in computer-supported environments. Some researchers have also attempted to use computer programs in specific disciplinary domains (e.g. mathematics) to automatically generate multiple variations of the same class of problem types (Bennett, 1999).

## **E-ASSESSMENT CHALLENGES**

A major problem of learning and education policy in educational system is the separation of ‘academic’ and ‘practical’ subjects. Regrettably, learning and education policy is separated from ‘practical’ subjects. E-assessment has undoubtedly to play a major role in defining and implementing curriculum change in education. Governments have strong commitment to implementation of high quality e-assessment by good initial progress has been made in education system; therefore, there is a need to be vigilant that the design of e-assessment systems is driven by considerations (Shojaei et al., 2013).

It should be emphasized that there is a significant relationship between how to perform e-assessment and what the outcomes are in education because use of lonely technology will not lead to effectively teaching-learning outcomes (Shojaei et al., 2013). Therefore, for implementation and administration of viable and practical e-assessment platform in educational system should be studied from different viewpoints as below:

### ***Economic issues***

The high price of paper around the globe has already made official administrators both in the ministry of education and in the ministry of Sciences; Research and Technology use e-assessment in educational environments instead of traditional paper and pencil tests (Shojaei et al., 2013). Running e-assessment plays a valuable role in educational measurement, and especially in distance education (ED). Because the data are often easily collected and analysis of them can be automated by coding the questions and responses, costs can be significantly avoided in e-assessment implementation. On the other hand, e-assessment costs involving in providing electronic equipment (e.g. computers), reliable software, bandwidth, training specialized administrators, and spending a lot of time in developing test questions. Additional costs of maintenance, secrecy, security, and trouble-free operations are also involved (Scottish Qualifications Authority, 2004). In the short to medium term, e-assessment tools can be expensive to implement, and traditional assessment methods may be less expensive. Once created, however, e-assessment applications become less expensive, being easy to operate and score, and reusable from year to year in different combinations (Ridgway et al., 2004).

By considering that e-assessment systems can be more cost-effective than traditional assessment methods but third developing countries get into trouble for equipping their educational system by e-assessment because of hardware, software, training skilled administrators and instructors, and maintenance costs.

### ***Technical requirements***

Due to the variety of e-assessment systems being applied for different purposes, technical requirements of such systems are also different. However, there are basic technical requirements that should be met by all e-assessment systems such as: software; connectivity and bandwidth; data storage and transfer; security; accessibility; and lastly technical standards.

The e-assessment runs from software installed on a computer and connection speeds to the Internet need to be considered. Security is regarded as of prime importance in the administration of e-assessments because security increases issues such as privacy, confidentiality, authentication of transferring data via e-assessment system.

Usability of the assessment system is of dominant importance in the effectiveness of the assessment delivery; subsequently modern e-assessment should ideally be administered anytime, anywhere and on any operating system. One of the threats in using e-assessment systems refers to the specific platform on which the e-assessment runs. An assessment system loses its value if learners find it difficult to use.

Administrators in designing an e-assessment system should provide simple, clearly explained and consistent navigational facilities that allow the candidate to navigate through the items in the assessment as freely as permitted by the assessment principles. Designing e-assessment systems should match the user needs, user control over presentation where applicable, consistent navigation, functionality, positioning and names of buttons and icons, and also alternative input or navigation methods where practicable. Depending on the specific e-assessment system in use, dedicated testing centres may be needed with an on-going requirement for technical support throughout the assessment period (Sangi & Malik, 2007). The reliability of e-assessment systems is easily threatened because e-assessment system requires reliable hardware, software, network and power systems at all testing centers. Through administering e-tests at multiple educational centers, synchronizing data management and operational security issues among centers is very important to impede jeopardizing the e-assessment system’s reliability.

### ***Security and Privacy***

The e-assessment database is a large pool of related components from which assessments can be built; including test items, scoring keys and assessment algorithms (Anzaldúa, 2002). Therefore, it is vital that steps are taken to ensure security of e-assessment database. On the other hand, according to Rowe (2004), cheating online becomes easier, since what or who the student brings to the assessment site cannot be seen. Therefore, one of the major challenges of an e-assessment system is the ability to securely provide a test which is delivered to only legitimate students that means secure log-in of users based on pre-defined users' identification such as usernames/passwords. Responses by administrators to the sub-project survey have indicated the importance of alternative network links and increased security measures while online exams are being conducted (Sangi & Malik, 2007). In fact, the user security process is fallible to security threats which plague existing online summative assessment systems (Warren & Hutchinson, 2003; Sangi, 2008).

The problem of having a secure, fair and effective e-assessment system is not new. Several solutions have been applied to avoid this problem over the years. Marias et al., (2006) classify the security of e-assessment into four main types. The first is Web security: this type of security is concerned with the security of servers where the web application is running. The second is user security: which is concerned with the authenticity and identity of the users. The third is location security: which is related to the correct/supervised location that e-assessment should be performed. The fourth is data security: refers to privacy and confidentiality of assessment data. In Gilbert et al., (2009) recommendations to ensure data security in summative e-assessments are divided into two classes, security of test materials and results; security of assessment data transferred over networks. Several solutions have been discussed by the authors varied from the simplest cheapest way of using passwords to the more complex and more expensive techniques of adding physical instruments to the assessment system such as, Biometric authentication and using video conferencing setups (Barker & Lee, 2007). Maintaining users' privacy is another concern which aims to protect specific users' data not to be accessed by other users. A big issue in this context is to find a good compromise of providing adequate information of students' performance to teachers and keeping specific details secret (Bull & McKenna, 2001). Then for maintaining the reliability and validity of an online test, security measures should not jeopardized by accessing to the results data, including back up results data.

### ***Plagiarism***

One obstacle which can prevent teaching staff from utilizing technological solutions to run student assessment is the worry about securing transfer of test materials over the network. Because it is so easy to plagiarize using the Internet sources, learners may plagiarize without recognizing that they are doing so, even though they believe that plagiarism is ethically wrong (Kraus, 2002). These "casual plagiarists" may also plagiarize due to poor time management skills (Beasley, 2004), information overload (Collberg & Kobourov, 2005), or lack of academic preparation prior to college (Adeva, Carroll & Calvo, 2006; Jackson, 2006; Kirkpatrick, 2006). Many students, however, make self-serving decisions to plagiarize with the hope of materially improving their grades (Beasley, 2004; Braumoeller, 2001; Hart & Friesner, 2004; Hughes & McCabe, 2006; McGowan, 2005). Computer security is the generic name for the collection of related components such as assets, threats, goals and preventive measures designed to protect the system (Stallings, 2000). In general, every computer system is required to protect three primary assets, i.e. the hardware, software and data assets (Pfleeger & Pfleeger, 2003). Plagiarism is a concern for many thinking of using CAA, (Weller, 2002); but Rovai, (2000) and Carroll, (2002) suggest that assessment design is the key to deterring plagiarism. O'Hare and Mackenzie, (2004) assert that there is a level of imagination and rigor required for the design of assessment online compared to that for more traditional forms of assessment. Weller (2002) suggests that the use of portfolios can help to counter plagiarism, as these places less reliance on single assessment items.

### ***Administrative/ operational issues***

The administration of e-assessment requires careful and continual record-keeping. To ensure the reliability of the system, a well-trained staff is needed at all testing centers (Scottish Qualifications Authority, 2004). In addition, Nicol and Macfarlane-Dick (2006) assumed that automated policies and security procedures are essential, with electronic and manual student authentication procedures. Specialized skills are required to produce high quality e-assessments. This is while many instructors fear that e-assessment will de-skill their profession. Some are threatened by the introduction of e-learning and e-assessment, and suspect the motives involved. Such fears need to be handled by the institution.

### ***Social/Ethical issues***

The electronic manipulation of information in e-learning systems raises major social and ethical issues (Marais et al., 2006). E-assessment platforms provides stress free and safe environment for examination than traditional exam environment. E-assessment contexts are fair to learners in contrast to traditional teacher-based evaluation that is susceptible to subjective assessment. By considering the point that facilities in e-assessment provide complementary environment for better education but low-speed internet connection and abrupt disconnection cause severe concern for learners that result in their mal-performance. It should be mentioned that information technology (IT) literate learners are more succeed in cyber shot space to respond electronically than illiterate learners. Therefore, illiterate learners by creating a sense of fragility, defensive, and raising of inhibition within themselves through answering questions directly affect their capacity to succeed in the e-assessment platforms, and online assessment leads to underestimate illiterate learner's ability.

One of the most important issues that should be noted is the law of copywriting that unfortunately is ignored to some extent in third developing countries because gain access to, manipulate, copy, and misuse the designed e-assessment environments is easy therefore, careful policy decision for preventing to abuse is tangible.

## CONCLUSION

Today, e-assessment is one of the available tools for learning but its application and development face challenges and obstacles. In the same line, in this paper, the authors tried to identify what challenges and infrastructures exist for the expansion of authentic e-assessment in educational system and what solutions make e-assessment success considering the fact that e-assessment is a need for improving e-learning in educational system. On the one hand, governments have strong commitment for implementation of high quality e-assessment in educational systems. Consequently, there needs to be vigilant that the design of authentic assessment systems is driven by identification internal and external hinder conflict factors. As noted, internal factors and external factors play a major role in defining and implementing consistent e-assessment in web-based courses. It should be noted that there are many internal as well as external factors which influence implementation of e-assessment, however, in this study, only some notable affected factors, which play a fundamental role, are considered.

In nutshell, although the importance of e-assessment has been emphasized by the majority of the researchers, little has also been written about how e-assessment can be wisely used and implemented in educational system to enhance student learning. The government of developing countries should invest as much money on using e-assessment, as medium supporting educational system, and administrator and instructor training for supporting the educational system shift from traditional assessment to reliable and valid electronic assessment.

#### BIODATA:

**TAHER BAHRANI** is a Ph.D. holder in TEFL. He has published 4 ISI-indexed papers and many peer-reviewed ones. His field of interest is mainly related to the use of technology and second language acquisition. He has recently been selected as the international examiner for an M.A thesis from the University of Newcastle, Australia (2013).

**Marziyeh Nekoueizadeh** is Adjunct Professor of TEFL at Islamic Azad University in Iran. She has published some papers in international academic journals. She is as editorial member of some journals. She is specifically interested in research areas related to use of technology and learning styles.

#### THE RELATIONSHIP BETWEEN MEDIUM OF COMMUNICATION AND EFL LEARNERS' USE OF COMMUNICATION STRATEGIES

Aasa Moattarian

## **ABSTARCT**

Being able to communicate effectively is the optimal goal of all language learners; therefore, despite difficulties they face and restrictions they have while expressing themselves, they rely on employing diverse communication strategies (CSs). This descriptive study was set to analyze the Iranian English as a foreign language (EFL) learners' use of CSs in oral and written performances. To this end, 60 university students of EFL were selected. The participants' oral and written performances were analyzed quantitatively and qualitatively using Dornyei's (1995) taxonomy of CSs. The results of the study revealed that medium of communication plays a significant role in the use of communication strategies. The most frequent problem areas that led to the use of communication strategies were "lexical gaps", "problems in discourse management", and "uncertainty in conveying the message", which can be considered by language teachers and material designers.

**KEYWORDS:** interlanguage, communication strategies, communicative competence, strategic competence, oral performance, written performance

## **INTRODUCTION**

People communicate with others from the first moment of their birth, by crying, touching, and later on by use of words. However, there are always some deficiencies; gaps exist between what the speakers have in mind and their linguistic performances. Corder (1981) asserts that due to their willingness to communicate, speakers try to find ways for solving problems. The ways which help people communicate in the presence of such deficiencies are called communication strategies (CSs).

Theoretical antecedents of CSs can be traced back to interlanguage studies and learner errors in early 1970s when Selinker (1972) introduced the notion of second language communication strategies in his seminal article entitled "Interlanguage". He argued that learners' insufficient knowledge of language and at the same time willingness to communicate leads to the use of CSs. Later, Corder (1981, p.103) suggested a working definition for CSs as: "systematic techniques employed by the speaker to express his meaning when faced with some difficulty".

Studies on CSs enjoy a four-decade history. Different studies have been conducted considering such variables in the use of CSs as communication medium, language proficiency level, ethnic and sociolinguistic factors, psycholinguistic factors, and cognitive factors. Varadi (1973) was the first scholar who studied CSs empirically. He asserted that in order to study CSs a learner should interact with a native speaker. Tarone (1977) adopted an interactional approach and contended that CSs are used when two speakers do not share the same meaning systems; therefore, to study CSs, interaction between a native and a nonnative speaker is not necessary (as cited in Ellis, 1994).

Speaking is the most basic means of communication; therefore, for most people knowing a language means being able to speak it. However, speaking appears to be demanding for foreign language learners (Lazarton, 2001). In order to speak, one should not only know the language, but also social and pragmatic rules to perform appropriate structures of the language (Martinez-Flor, Uso-Juan & Alcon-Soler, 2006). CSs are inevitable in oral communication for language learners. These strategies keep speakers flexible, and confident, and make their communication more effective. Therefore, the use of CSs in oral communication has been investigated in various studies (Nakatani, 2005; Phothongsunan, 2010; Puffer, 2006; Wannaruk, 2003, to name a few). Writing also plays a crucial role in communication. In the past, writing was thought to be noninteractive and decontextualized. Today, however, it is believed to be an interactive process since the writer, reader, and the text are all involved in the process of writing (Massi, 2001). Therefore, studying CSs in written communication is of great significance. Aliakbari and

Karimi (2009) investigated the use of CSs in the written performances of EFL learners at different proficiency levels. They found that the higher the proficiency level, the more reconceptualization strategies and the less substitution strategies were used. They also noted that the use of lexical CSs varied by the participants' language proficiency. Chimbanga (2000) investigated the use of CSs by university students of Biology. He found that students were eager to use L2-based strategies like 'circumlocution', 'paraphrase', and 'generalization' and concluded that those who took the risk of applying resource expansion strategies irrespective of grammatical problems were more successful in achieving their goal of communication.

Lots of studies have been conducted to investigate CSs considering different variables; however, the existing literature shows that there is still room for researchers to investigate the use of CSs by language learners. For instance, some studies can be found in which both oral and written performances are compared (e.g., Lai, 2010, Yarmohaamdi & Seif, 1992); however, we still need to create a more comprehensive view of learners' performances beyond just the differences in these two mediums. The reasons behind the use of CSs should be investigated as well. In fact, this study tackled how differently CSs are used by Iranian EFL learners in their oral and written performances. Accordingly the research question addressed in this study was:

- How do communication strategies used by Iranian EFL learners vary by medium of communication?

## METHODOLOGY

### *Participants*

One hundred and fifteen, 21 male and 94 female, Persian speaking university students aged between 19-25 were randomly selected. In order to have a homogenous group of participants, measures of central tendency were used. Those whose scores were between -1.5 and + 1.5 standard deviations were considered as the participants. Table 1 presents the descriptive statistics of the participants' performance on the placement test.

*Table 1: Descriptive statistics of placement test*

Descriptive Statistics				
N	Minimum	Maximum	Mean	SD.
115	16.00	53.00	33.26	8.40

The results turned out to be 70 participants. Then 60 were randomly selected as the final participants of the study.

### *Material*

To collect data in this study two tasks, one for oral and one for written data elicitation, were designed by the researchers. Nunan (2004, p. 58) based on an analysis of communicative use of language contends that "Many communication activities can be stimulated through the use of pictures". In order to check the comparability of oral and written performances in both tasks, pictures were used as visual aids to elicit data. An important reason for choosing pictures was that they displayed the intended point; deviations from the suggested topics were thus prevented. In order to verify the tasks in terms of reliability, they were piloted in a similar situation to that of the present study.

### *Procedure*

The participants were asked to perform one task for oral, and one for written data elicitation. To avoid misunderstandings, before performing the tasks, participants were briefed on the process they had to undergo in Persian (their mother tongue). Since appeal for help was eliminated in written performances due to manageability purposes, participants were informed that during the writing sessions they were not allowed to ask any questions. After completing the written task, were assigned to groups of five to attend group discussion sessions. The purpose behind holding group discussion was to reduce participants' anxiety and also to make the situation as authentic as possible. All the discussion sessions were sound recorded and transcribed, and all paralinguistic strategies were jotted down at the moment for later analysis. In order to ensure that paralinguistic strategies were not neglected, all the group discussion sessions were observed by the researchers and a graduate TEFL student who had been briefed on the process and aim of the study to record the paralinguistic strategies. Finally, the performances were analyzed based on Dornyei's (1995) taxonomy of CSs.

## RESULTS

Analyzing the data based on Dornyei's taxonomy (1995), the researchers found 1934 instances of the twelve CSs defined by Dornyei. Moreover, 176 of the sentences which the participants had used to compensate for their communication needs could not be accommodated within the existing taxonomy. Close examination of those sentences revealed that some techniques had been employed systematically which led the researchers to suggest the following four new strategies:

*Appeal for approval:* in oral communication, sometimes compensating for the linguistic gaps, the participants stopped talking and asked if they were understood. In fact, when they were not sure if they had conveyed the message, they sought for approval; for example, "he can search for other information as well. *Do you know what I'm saying?*"

*Use of redundant notes:* in both oral and written performances some participants used some excessive notes. Examination of 'redundant use of language' revealed that the participants used this strategy to make sure that the interlocutor understood them; for example, "you can take a *trip or travel* to another country\*".

*Use of nonlinguistic means along with other communication strategies:* in this strategy the participants, while adopting a CS, tried to express the meaning by using nonlinguistic means too; for example, "you can see *whole* (using hands to show all of the people) the people\*".

*Paraphrasing:* using this strategy, the participants tried to paraphrase the sentence to convey a message; for example, "we can know about their ideas and share the ideas about ..... *We can know how they think about it.*" This way, in this study the performances were analyzed based on a sixteen item taxonomy as presented in Table 2

Table 2: Extension of Dornyei's taxonomy of CSs (1995)

Strategy	Definition
1 Message abandonment	leaving a message unfinished because of language difficulties.
2 Topic avoidance	avoiding topic areas or concepts which pose language difficulties
3 Circumlocution	describing or exemplifying the target object or action
4 Approximation	using an alternative term which expresses the meaning of the target lexical item as closely as possible
5 Use of all purpose words	extending a general, empty lexical item to contexts where specific words are lacking
6 Word coinage	creating a nonexistent L2 word based on a supposed rule
7 Use of nonlinguistic means	mime, gesture, facial expression, or sound imitation
8 Literal translation	translating literally a lexical item, an idiom, a compound word or structure from L1 to L2
9 Foreignizing	using a L1 word by adjusting it to L2 phonologically and/or morphologically
10 Code switching	using a L1 word with L1 pronunciation or a L3 word with L3 pronunciation in L2.
11 Appeal for help	turning to the conversation partner for help either directly or indirectly
12 Time gaining	using filling words or gambits to fill pauses and to gain time to think
13 Appeal for approval*	seeking for the interlocutor confirmation to continue the utterance
14 Use of redundant notes*	using redundant notes to fill the possible existing gaps
15 Use of nonlinguistic means along with other CSs*	accompanying the use of mime and facial expression with the use of other CSs
16 Paraphrasing*	using the sentences with the same meaning

Note \* strategy added to Dornyei's taxonomy

Since the researchers aimed at figuring out the differences between performances by different mediums, each and every sentence was closely examined and the use of each CS was identified and counted. In order to find out whether the differences between the use of each strategy in oral and written performances were statistically significant at  $p < .05$ , chi-square tests were applied, the results of which are presented in Table 3.

Table 3: Results of chi-square tests for the use of CSs in oral and written performances

		Oral performances	Written performances	$\chi^2$	Df	Sig.
1	Topic avoidance	366	208	43.491	1	.000
2	Time gaining	326	-	-	1	-
3	Literal translation	250	202	5.097	1	.024
4	Approximation	176	137	4.859	1	.027
5	Use of nonlinguistic means along with other CSs	75	-	-	1	-
6	Paraphrasing	64	0	-	1	-
7	Use of all purpose words	57	10	32.970	1	.000
8	Use of nonlinguistic means	52	-	-	1	-
9	Message abandonment	50	2	44.308	1	.000
10	Code switching	33	11	11.000	1	.001
11	Use of redundant notes	25	8	8.758	1	.003
12	Circumlocution	18	14	.500	1	.480
13	Appeal for approval	14	-	-	1	-
14	Appeal for help	10	-	-	1	-
15	Word coinage	5	5	.000	1	1.000
16	Foreingizing	2	0	-	1	-

As shown in Table 3, for strategies which could not be used in written performances chi-square tests were not applicable. The differences between the use of all CSs, except for *word coinage* and *circumlocution*, in oral and written performances were statistically significant ( $p < .05$ ). The researchers also noticed that all the 16 strategy types were applied in oral performances; whereas, in written performances only 9 types were used. By comparing the frequencies of CSs used in oral and written performances, it was revealed that more strategies were used in oral performances than written performances (72% of the strategies were used in oral and only 28% in written performances). In Figure 1, the distribution of CSs in the oral and written performances is illustrated.

Figure 1: CSs used in oral and written performances

To examine whether the observed differences between the use of CSs in terms of medium of communication were statistically significant, a chi-square test was performed whose result is presented in Table 4.

Table 4: Result of chi-square test for the use of CSs in different mediums of communication

	Oral performances	Written performances	$\chi^2$	Df.	Sig.
Total	1523	597	4040.470	1	.000

The value obtained from the chi-square test was indicative of the fact that the difference between the use of CSs in oral and written performances was statistically significant ( $p < .05$ ).

A detailed discussion of all the numerical analyses is presented in the following.

## DISCUSSION

Based on the statistical analyses mentioned above, it can be inferred that the use of CSs significantly vary by the medium of communication.

Although some strategy types were obviously not applicable in written communication (*use of nonlinguistic means*), and some were eliminated in written performances due to manageability purposes (*appeal for help*, *appeal for approval*, and *time gaining*), in oral performances more strategy types were used than in written performances. Consequently, the total number of CSs used in oral performances was more than written performances, as shown in Figure 1. This is related to fundamental features of personal involvement in oral and written communication. Findings of this study confirm the findings of many previous studies (García, 2011; Khamis, 2010; Warschauer, 1996; Yarmohammadi & Seif, 1992; Zhao, 2010, to name a few) that argue CSs are used distinctively in different mediums of communication. Analysis of the data also revealed that, participants employed CSs to compensate for three main gaps: "lexical deficiency", "problems in discourse management", and "uncertainty in conveying the message".

To compensate for lexical deficiencies, the participants used *time gaining*, *approximation*, *code switching*, *circumlocution*, *word coinage*, *appeal for help*, *use of all purpose words*, and *foreignizing*. These CSs comprised 40.12% of the total number of CSs used by the participants. Discourse management, which indicates management of available resources in interaction, includes the strategies learners adopt to convey the message they have in mind to meet their communicative goals in different environments (Schegloff, 1968; Schegloff & Sacks, 1973 as cited in

Condon & Cech, 2010). One of the problems participants encountered in this study was “deficiencies in discourse management”, for which they adopted *paraphrasing*, *use of nonlinguistic means*, and *message abandonment*.

Goodboy and Myers (2008) argue that participants are sometimes not sure whether they can convey the message; therefore, they need to be confirmed; they may also employ a strategy to make sure that their interlocutor will understand them. Moreover, participants employed '*appeal for approval*', '*use of redundant notes*', and '*use of nonlinguistic means*' along with other CSs in order to make sure that their interlocutor understood them.

It should also be noted that finding out about the strategies used by foreign language learners provides a more comprehensive view of interlanguage communication, which can help language teachers, and material designers to understand the problem areas which should be catered for in the classroom.

## CONCLUSION

This descriptive study aimed to investigate the use of CSs in different mediums of communication. CSs are used to tackle communication problems; therefore, studying CSs leads to finding out problem areas. Knowing the problem areas, language teachers are recommended to design class activities in ways which help learners overcome such communication problems. Since strategic competence plays a crucial role in successful communication, foreign language teachers and material designers are expected to improve students' strategic competence in order to enable them to communicate effectively.

Although the research has reached its goal, there were some unavoidable limitations. A notable shortcoming was that due to manageability purposes, some strategies like *time gaining*, *appeal for help*, and *appeal for approval* were not considered in written performances. Moreover, in this study data obtained in one shot design; therefore, some affective factors like motivation, anxiety, etc. played some role. If there were opportunity to collect data in time series design the researchers could generalize the findings more confidently.

For further research, researchers may take gender, age, language proficiency, and task variability into account. Moreover, following the performances with think aloud sessions, the researchers will find out what were the mind processes the learners underwent before choosing a CS.

### ABSTRACT

The role of storytelling in the acquisition of grammatical rules and structures has not clearly been discovered, but it is claimed that it is one of the most effective techniques for conveying information in a compelling and memorable way. There are many reasons to tell stories in our classes as they can give relief from the routine and stimulate the mind, they are a great motivator for teachers as well as for students, they can also foster understanding and acceptance of the foreign language and culture. This study aims at investigating the effect of teacher's telling short stories on the acquisition of grammatical rules and structures of the Iranian English as a foreign language (EFL) learners. The sample of the study consisted of 30 female intermediate students who were randomly chosen from one of the public high schools in Isfahan and assigned into experimental and control groups, 15 in each. Grammatical point that was related to conditional sentence (type III) was taught traditionally in the control group; however, in the experimental group, it was taught by telling short story. Data of the study were collected via a pre-posttest design for equivalent groups. The tests were identical and consisted of 15 multiple choice items. The analysis of the collected data through applying t-test revealed that telling story has a positive effect on learning grammar structures but the experimental group didn't outperform the control group significantly on the measure. In other words, there wasn't a significant difference between the two groups in terms of the acquisition of grammatical rules and structures.

**KEY WORDS:** Telling short stories, Learning grammar, Iranian EFL learners

### INTRODUCTION

Teachers have been debating on what is the best method for teaching grammar for generations. Many people, including language teachers, hear the word "grammar" and think of a fixed set of word forms and rules of usage. They associate "good" grammar with the prestige forms of the language, such as those used in writing and in formal oral presentations, and "bad" or "no" grammar with the language used in everyday conversation or used by speakers of nonprestige forms.

Language teachers who adopt this definition focus on grammar as a set of forms and rules. They teach grammar by explaining the forms and rules and then drilling students on them. This results in bored, disaffected students who can produce correct forms on exercises and tests, but consistently make errors when they try to use the language in context.

Other language teachers, influenced by recent theoretical work on the difference between language learning and language acquisition, tend not to teach grammar at all. Believing that children acquire their first language without overt grammar instruction, they expect students to learn their second language the same way. They assume that students will absorb grammar rules as they hear, read, and use the language in communication activities. This approach does not allow students to use one of the major tools they have as learners: their active understanding of what grammar is and how it works in the language they already know.

The communicative competence model balances these extremes. The model recognizes that overt grammar instruction helps students acquire the language more efficiently, but it incorporates grammar teaching and learning into the larger context of teaching students to use the language. Instructors using this model teach students the

grammar they need to know to accomplish defined communication tasks. So, in order to make a grammar lesson effective, beneficial, and interesting a teacher should use some new and fascinating techniques in the classroom. Since the meaning is an important device in teaching grammar, it is important to contextualize any grammar point (Celce-Murcia & Hilles, 1988).

Story telling seems to be one of the most enchanting and culturally rich resources that can easily be used in language classrooms. Stories offer a change from routine classroom activities. They are precious resources to develop students' abilities in listening, speaking, reading, and writing. They can also be used to teach a variety of language items such as sentence patterns, vocabulary, and pronunciation. As stated by Lo and Fai Li (1998:8), learning English through stories also provides a non-threatening atmosphere for students, who usually are tense when speaking English in a formal classroom setting.

## **REVIEW OF LITERATURE**

Storytelling is almost as old as language itself. In fact, some cultures still use spoken stories to pass on information to younger generations because the language is not written down. Storytelling is also not just for children; it covers the entire age range of the population and covers all aspects of life. Stories also give new insights into the target culture. They are the means through which cultural themes are presented effectively. Since they provide authentic texts, they are motivating. According to Hill (2001:29) "There are many advantages of using stories in the classroom through using contemporary popular stories, which are already familiar to teenagers, the teacher can meet the challenges of the teenage needs in the classroom. Since stories are motivating, in many forms they may constitute a powerful subculture with their own rituals."

Pederson (1995) considers storytelling as the original form of teaching and states that there are still societies in which it is the only form of teaching. He mentions that although some attempts have been made to imitate or update it, like the electronic storytelling of television, live oral storytelling will never go out of fashion and a simple narrative will always be the cornerstone of the art of teaching.

Brian Ellis(1997) in his article "*Why Tell Stories*" believes that storytelling is the perfect embodiment of whole language pedagogy and it teaches higher level of thinking skills, addresses the needs of students with different learning styles, provides opportunity for cooperative learning and building social skills and most importantly storytelling has been shown to build intrinsic motivation and self-esteem, even in the students who are labeled hard to reach.

Deacon and Murphy's *Deep Impact Storytelling* (2001) discuss why giving a course depth through storytelling is important. They describe ways to help teachers deepen the impact of storytelling through language and thinking activities that include shadowing, summarizing, student retelling, action logging, and newslettering. They Share one "split" story and student reactions to it as a way of exemplifying the ideas provided.

The study by Hui-Ling Huang on *The Effects of Storytelling on EFL Young Learners' Reading Comprehension and Word Recall* (2006) has indicated the necessity of teacher intervention in EFL reading; the teacher's story interpretation through contextualized storytelling as a multi-sensory approach could result in perceptible benefits in young learners' reading comprehension. The teacher is thus encouraged to incorporate storytelling in teaching and experience the magic of this ancient art in modern language classrooms, even though it may place some extra burden on the teaching preparation. Despite the effective framework of storytelling for vocabulary learning, the findings of this study on word recall did not support the theoretical assumption.

According to Fitzgibbon and Wilhelm (1998), teachers are increasingly being provided with an array of creative storytelling materials and ideas for second language learning. They discuss benefits which include enhanced student enjoyment, lower affective filters, authentic and enriched language input, and more inclusionary, collaborative classrooms. Stories appear to enable students to draw upon their own experiences and to organize information in personalized ways, thus better comprehending and retaining information and concepts.

In terms of grammar learning, storytelling may serve as a steppingstone to the learning of syntax as it demonstrates grammatical and syntactic features in meaningful context. As Mallan (1991) points out, storytelling demonstrates a varied use of tense and linking devices in organizing ideas. With a deliberate design of learning activities, the teacher can draw learners' attention to specific linguistic features in the story presentation (Taylor, 2000; Wajnryb, 2003).

### ***The Importance of Teaching Grammar***

Grammar is central to the teaching and learning of languages. Grammar explains the types of words and word groups that make up sentences in any language and makes it possible for us to talk about language. In fact, grammar is the way in which sentences are structured and the language is formatted, so while studying correct grammar may be a bit boring, it really is worth the time and effort. If we don't know the rules of grammar, then we will never be able to communicate clearly and effectively in English language. People associate grammar with errors and correctness. With the use of incorrect grammar sentences can become meaningless and their message is unclear. So, knowing about grammar helps us understand what makes sentences and paragraphs clear and interesting and precise. Grammar can be part of literature discussions, when we and our students closely read the sentences in poetry and stories. And knowing about grammar means finding out that all languages and all dialects follow grammatical patterns.

Grammar teaching has often been regarded as a structure based formal activity. But it no longer has much credibility when we believe the precise focus on a particular form leads to learning and automatization (Skehan, 1996). After the integration of several sources and techniques, which are mainly based on communicative activities, the teaching of grammar gained a new insight. In communicative tasks, the learners comprehend, manipulate, produce or interact in the target language while their attention is basically on meaning rather than form (Nunan, 1989). Swan (1998) suggests that we should consider the needs of the students in teaching grammar. Furthermore, he states that the principles of comprehensibility and acceptability should be considered.

### ***The importance of story telling***

By stories, we mean the incidents or events in the news or on TV, stories about people and things our students know and care about. One of the best opportunities to use stories is, lessons on the supposedly dry subject of grammar (as well as punctuation and usage). A story provides a realistic context for presenting grammar points and holds and focuses students' attention in a way that no other technique can. Stories can be used for both eliciting and illustrating grammar points. The former employs inductive reasoning, while the latter requires deductive thought, and it is useful to include both approaches in lesson planning. In addition, a well-told story is the perfect context for a structure-discourse match, but the technique can also be used effectively for a structure-social factor match. However, when teachers include grammar stories in their lessons, students have a better understanding of real world and grammar lessons are not so boring for them. (Baker & Green, 1977)

There are many reasons why we want to tell stories in our classes. Stories provide students with opportunities to listen to language in context rather than in bits and pieces. Stories also introduce new vocabulary and language forms within rich networks of associations. Equally important, stories can have a deep impact on a person's construction of knowledge and self. However, storytelling consists of more than just telling stories. It may include not only creating a story but also the use of pictures, acting, singing, story writing and so forth.

According to Chambers (1970) there are a number of ways in which storytelling can enhance intercultural understanding and communication. Stories can...

- allow children to explore their own cultural roots
- allow children to experience diverse cultures
- enable children to empathize with unfamiliar people/places/situations
- offer insights into different traditions and values
- help children understand how wisdom is common to all peoples/all cultures
- offer insights into universal life experiences
- help children consider new ideas
- reveal differences and commonalities of cultures around the world
- Promote a feeling of well being and relaxation
- Increase children's willingness to communicate thoughts and feelings
- Encourage active participation
- Increase verbal proficiency
- Encourage use of imagination and creativity
- Encourage cooperation between students
- Enhance listening skills

### ***Integrative Grammar Teaching***

Integrative grammar teaching combines a form-based with a meaning-based focus. Spada and Lightbown (1993:205) have also argued "that form focused instruction and corrective feedback provided within the context of communicative interaction can contribute positively to second language development in both the short and long term". Thus, integration of form and meaning is becoming increasingly important in current research. Celce-Murcia, Dornyei and Thurrell (1997:14) call it "a turning point" in communicative language teaching, in which "explicit, direct elements are gaining significance in teaching communicative abilities and skills". Of course, depending on the students and their particular needs, either form or meaning can be emphasized. But in having various students with different needs in the same group, or having various needs in the same students, an integrative grammar teaching approach creates optimal conditions for learning for everyone in the classroom. Musumeci (1997) mentions the idea of connecting *form* and *meaning* in grammar teaching as a developing trend in reference to the proficiency oriented curriculum. She points out that students should be able to learn explicit grammar rules as well as have a chance to practice them in communication in the authentic or simulation tasks. Interestingly, Musumeci advocates giving students a chance to look at the language on a sentence level to see how certain grammatical rules are applied.

Integrative grammar teaching, which presupposes students' interaction while learning, can be viewed as a cognitive process of learning an L2 that reflects the sociocultural theory proposed by the Russian psychologist Vygotsky (1978). In talking about the development of a child's brain and his socialization, Vygotsky argues that there is a strong relationship between learning and cognitive development, in which cognition develops as a result of social interaction and sharing the responsibility with a parent or a more competent person. From an early age, children look to their parents for clues to acceptable social behavior. This brings us to Vygotsky's *zone of proximal development* (ZPD) in which there are two main stages of an individual's development. The first stage is what a child or learner can do by himself; the second stage is his potential, what he can accomplish with the help of another, more competent person. The distance between two points is called the *zone of proximal development*. Vygotsky also introduces the notion of a *mediator* - a person who helps students to accomplish what they cannot do by themselves. According to Appel and Lantolf (1994) and Lantolf and Pavlenko (1995), the role of the mediator in teaching an L2 is placed on an L2 teacher, whose task is to direct students in the right direction and help them reach the second stage in the ZPD.

Similar to Vygotsky's theory is the often-criticized Krashen's (1981, 1985) *Input Hypothesis*, also well-known as the "*i + 1*" hypothesis. According to this hypothesis *i* represents students' current level of L2 proficiency, and *+1* is level of the linguistic form or function beyond the present students' level. Krashen's *Input Hypothesis* and Vygotsky's *Zone of Proximal Development* are basically describing the same cognitive process of social interaction in students' development. For Krashen, optimal input should be comprehensible, i.e. focused on the meaning and not on the form. In this study students will be focusing on the form, but actively, through *communicative, meaning-based, exploratory assignments*. Even though well-criticized for lack of empirical evidence (Faerch & Kasper, 1986; Gregg, 1984; McLaughlin, 1987, etc.), the significant contribution of the Input Hypothesis to the field of applied linguistics is that it shows how teachers can focus on the actual level of students, adjusting the complexity of the material so that learners will be able to reach what initially was beyond their level.

### **SIGNIFICANCE OF THE STUDY**

Teaching grammar is now the most challenging task that any Iranian teacher may face in her/his daily classroom. Many do not wish to teach grammar explicitly but they are aware that students need an understanding of the rules to achieve fluency as well as accuracy. Unfortunately, many students leaving schools and entering universities do not have adequate English proficiency to excel in their studies. One possible solution is integrated approach to grammar teaching where there is a focus on the form but the activity is meaning based.

The primary purpose of this study, then, is to determine whether story telling activities is effective or help comprehension of grammar. Among many factors attributed to the listener, language proficiency and teaching grammar through context are two factors under investigation in this research, the extent to which story-telling activities affect the improvement of learner grammar is also examined in this study

The technique that is going to be used is teaching grammar using story telling activities. In any case, by this method of teaching grammar, we can challenge students and stimulate their interests by letting them choose favorite stories and that is in itself, a major success to breaking the traditional view of grammar classes as dull and boring.

## RESEARCH QUESTIONS

This study is an attempt to answer the following questions:

1. Does using storytelling for teaching grammar have any significant effect on the acquisition of grammatical rules and structures by Iranian EFL learners?
2. Is there a significant difference between teaching grammar traditionally and teaching grammar through storytelling with regard to their influence on the acquisition of grammatical rules and structures by Iranian EFL learners?

## METHODOLOGY

### *Subjects*

The participants in this study were 30 Iranian under-intermediate EFL learners (based on Nelson Solution Test), aged 17-18, studying in the fourth grade in one of the high schools in Isfahan and were homogenous with regard to their English proficiency level. The sample included female participants with the same native language, that is, Farsi. The learners participated voluntarily and then were randomly assigned into the two groups (one experimental and one control) involved in the study (15 students each).

### *Instruments*

In order to answer the questions of the study, for the main experiment ,a story containing some grammatical points related to conditional sentence ( type III ) were chosen , then the teacher wanted the students to answer the questions that were at the end of the passage . The story was chosen according to the length and difficulty level. Also, a pre-test and an identical post-test including 15 item-multiple choice test was selected and administered to two groups. It should be mentioned that the grammatical point (conditional sentence type III) was taught to the control group based on the exercises of their textbook.

### *Procedure*

In the first place the students were divided into two group of experimental and control, 15 each. Then a pre-test of the grammar test was conducted immediately before starting the experiment to both groups to evaluate the subjects' ability in grammar. The researcher developed a 15-item-multiple choice test on conditional sentences (type 1, 2, 3) and the modal verbs usage that only 5 of them tested conditional sentence type3. Test items had 4 choices only one of which was correct. In scoring, (1) point for each correct answer and (0) for each wrong answer was allotted.

The treatment consisted of two levels: the method of telling short story and the traditional method alone. The experimental group undertook the first level of the treatment and the control group undertook the second level. For the main experiment, a story which contains some grammatical points related to conditional sentence ( type 3) was chosen (the learners were taught conditional sentences type 1 &2 in grade two), then the teacher taught new vocabulary from the story, told the story and wanted the students to answer the questions that were at the end of the passage .The answer of all of the questions related to conditional sentence . Traditional teaching was conducted to the control group. It means that after introducing the grammatical point, examples and patterns related to that point is read and some exercises were done.

To be sure of the efficiency of the treatment, the researcher administered a post-test, an achievement test, both to the experimental and the control group about two weeks after the treatment. The post-test was identical to the pre-test as it had the same type of items, number, and structure.

## RESULTS

The purpose of this study is to find out the impact of using storytelling as a teaching strategy on EFL learners' grammar acquisition and to investigate if there is significant difference in students' achievements between traditional method and storytelling method of grammar teaching. The data were collected through a pretest-treatment-posttest design for equivalent groups and analyzed via the statistical package SPSS.

To determine if there are any significant differences in the students' achievements between the means of the two groups (experimental and control) on the pre- test, the researcher used the pre- test for the two groups so as to emphasize homogeneity between them. And an independent-samples t test was carried out to compare the two groups. Table 1 shows the results:

*Table 1: The independent samples t- test for revealing the differences between two groups on pre- test*

Group	N	Mean	Standard deviation	Computed T	DF	Sig.
Experimental	15	1.5	1.45	1.42	28	0.16
Control	15	0.85	0.86			

Table (1) shows that there is no significant difference between experimental group and control group on the pre- test, because the computed T (1.42) is smaller than the critical T (2.131), so we accept the null hypothesis (Ho) that there is no significant difference between the means of the two groups. This result can be represented in the following diagram. (Figure 1)

*Figure 1: The differences between the means of pre- test for the experimental and the control groups*

To answer the first question of the study and determine if there are any significant differences in the students' achievements between pre and post tests among the experimental group due to storytelling strategy, the researcher used the paired samples t- test. Table 2 shows the results:

*Table 2: The paired samples t- test to show the differences between pre- test and post –test results among the experimental group*

Measurement	N	Mean	Standard deviation	Computed T	DF	Sig.
Pre-test	15	1.5	1.45	-2.68	14	0.19
Post-test	15	2.92	1.32			

Table (3) shows that there are significant differences between the pre-test and the post-test among the students of the experimental group in favour of the post test, because the computed T (-2.68) is bigger than the critical T (1.96) at  $\alpha=0.05$  , so we reject the null hypothesis (Ho) that there is no significant difference between the means of measurement (pre- test and post-test). This indicates that using storytelling in English language instruction to the intermediate students has a positive effect on students' acquisition of grammatical rules. This result can be represented in the following diagram. (Figure 2)

Figure 2: The differences between the means of pre- test and post- test for the experimental group

Then the researcher used the paired samples t- test to discover if there are any significant differences in the students' achievements between pre and post tests among the control group due to traditional method. Table 3 shows the results:

Table 3: The paired samples t- test to show the differences between pre- test and post –test results among the control group

Measurement	N	Mean	Standard deviation	Computed T	DF	Sig.
Pre-test	15	0.85	0.86	-3.27	14	0.00
Post-test	15	2.85	1.87			

Table (3) shows that the computed T (-3.27) is bigger than the critical T (2.94) at  $\alpha=0.01$ , so there are significant differences between the pre-test and the post-test among the students of the control group in favour of the post-test and the null hypothesis ( $H_0$ ) that there is no significant difference between the means of measurement (pre- test and post-test) is rejected. This result can be represented in the following diagram. (Figure 3)

Figure 3: The differences between the means of pre- test and post- test for the control group

To answer the second question of the study and determine if there are any significant differences in the students' achievements between the means of the two groups (experimental and control) due to using storytelling method as shown by the post- test, the researcher used the independent samples t- test. Table 4 shows the result:

Table 4: The independent samples t- test for revealing the differences between two groups on post- test

Group	N	Mean	Standard deviation	Computed T	DF	Sig.
experimental	15	2.92	1.32	0.11	28	0.90
control	15	2.85	1.87			

As Table (4) shows, there is not statistically significant difference between experimental group and control group on the post- test, since the computed T (0.11) is smaller than the critical T (2.131) the, so we accept the null hypothesis (Ho) that there is no significant difference between the means of the two groups. This result can be represented in the following diagram. (Figure 4)

Figure 4: The differences between the means of post- test for the experimental and the control groups

## DISCUSSION AND CONCLUSION

This study set out to investigate two research questions: (1) whether teaching grammar through storytelling have any significant effect on the acquisition of grammatical rules and structures by Iranian high school EFL learners; and (2) whether there is a significant difference between teaching grammar traditionally and teaching grammar by using storytelling with regard to the influence they exert on the acquisition of grammatical rules and structures by Iranian high school EFL learners. The findings revealed that using storytelling had a positive impact on the acquisition of the grammatical rules, as suggested by the post-test results. Moreover, the findings indicated that teaching grammar using storytelling was not significantly different with regard to the influence they exerted on the acquisition of the grammatical rules and structures by Iranian high school EFL learners. Of course, this is true according to the results of this study. It seems that the students in higher levels benefit less than lower level proficiency level because, according to Thanajaro (2000) they have the ability to organize new information and helping methods have little additional effect on them. Moreover, since the low proficient learners do not have enough experience with the new language they are learning, they need to be helped in whatever way possible. Although the results of this study did not turn out to be as expected, it is evident that storytelling is one of the most basic ways of sharing knowledge, of making sense of experiences, and of seeing oneself in relation to others. In the classroom, storytelling is an important activity with strong links to literacy. As professional storyteller Jeff Gere (2001) points out, "Storytelling can encourage students to explore their unique expressiveness and can heighten a student's ability to communicate thoughts and feelings in an articulate, lucid manner." In our fast-paced, media-driven world, storytelling can be a

nurturing way to remind children that spoken words are powerful, that listening is important, and that clear communication between people is an art.

Every study, evidently, has some shortcomings imposed on it because of some limitations. This research is no exception. To support the results obtained through this study, there are some suggestions made for further studies in order to complement the findings of this study. They are as follows:

1. The participants in this study were intermediate learners. Some other studies can be conducted with participants of other proficiency levels, that is, elementary, lower-advanced, and advanced, to find out whether or not the same results will be obtained.
2. The focus of attention in this study was teaching grammar. Other studies can be carried on in the areas of reading and writing and find out how the participants react in those structures.
3. The material used in this study was a short story that was suitable for the intermediate level. In other studies of this kind we can use some complicated and longer passages can be used to see if the groups will still response in the same way or differently regarding their proficiency level , because with longer text , the situation may be different
4. The participants of this study were monolingual speaker of Persian; in other studies researchers can employ bilingual participants and understand whether or not the same results will be obtained. The rational for this is that since bilinguals' cognitive ability is higher than monolinguals (Bialystok, 1992; Romaine, 1989), they may or may not benefit more from such activities.

**ABSTRACT**

In this research, the intention was to testify 'Dialogue Journal Writing' (DJW) as an active reflective practice among adult learners with low Emotional Intelligence (EI). Among the various individual differences that the adult learners bring to the EFL classrooms, "EI" trait has been mostly focused upon as one social skill needed for learning a language. However, in a bulk of research, rarely have the researchers put emphasis on maximization through educational tools that they have had at their disposal. Here, the intention was to capitalize on low EI adult learners' active and conscious role through active learner-teacher written dialogue communication. Thus, 126 adult academic students were randomly selected through cluster sampling from academic students and homogenized through a standardized Nelson TOEFL test. Through Bar-On's EI questionnaire (1980), the target groups were screened. Students' performances were compared on two successive posttests after the treatment induction. The results indicated the outperformance of the experimental group for the two posttests. (Time 1: Sig. 2-tailed=.001< 0.05 & time 2: 0.02<0.05). As to the interconnectivity effect of gender and EI level, the MANOVA results showed the outperformance of females over the males especially, at lower and medium EI just in the first post test. At last, two qualitative assessments including informal interviews and a semi structured questionnaire were triangulated with the results. The findings indicated that DJW could efficiently help adult EFL Iranian learners who suffer from lower EI to participate more in learning tasks and get better achievements. The pedagogical implications for utilizing DJW in EFL settings have been fully discussed at the end.

**KEYWORDS:** Emotional intelligence, self-awareness, Dialogue journal writing, academic achievement

**INTRODUCTION**

Psychologically speaking, adults are usually considered as unmotivated and uncooperative and mostly confronted with affective barriers to their learning. Among the crucial learner variables in EFL settings, in a multitude of research articles in recent years, just few studies have been directly devoted to affective domain. A bulk of research has indicated that the focus of present educational system is on rational and/or cognitive aspects such as memory and problem solving skills and that lip service has been paid to the important contribution of the emotional mind (Nelsend 2003). Tunkey (2002) accentuates that the research studies conducted so far to explore the relationship between Emotional intelligence (EI) as a pertinent affective factor on language performance shows that the extent to which EI can be put into practice to improve language teaching and learning needs more deliberation. But what does EI exactly involve? And how can it orient EFL learners to better educational achievements? Does it move parallel with IQ or takes a different route?

Goleman (1995) as one of the pioneers of the personality trait, 'EI', asserts that it refers to the learners' ability to recognize and regulate emotions in both themselves and in others. It entails the innate ability of a person and can be improved by external factors such as the environment. It can help people to be better students. It can be as much powerful and even at times more powerful than IQ in predicting success in various life challenges. The possession of high IQ rating is not the sole indicator when it comes to being successful in all fields (Goleman1995). It is believed

---

**\*Corresponding Author: Islamic Azad University of Sabzevar, Iran; +98-0571-2646810 <sup>1</sup>**

that those learners having a lower index of EI trait are less able to get across their messages for their intended situations. Nevertheless, the research papers which discuss EI theory seem not to pay enough attention to the ways as to how of maximizing learning among those who suffer from lower EI. In this research project, the intention is to assess EI as one personality factor among a group of adult learners by the active learner-teacher written dialogue writing termed as '*dialogue journal writing*' (DJW). The authors want to investigate the issue in more details and testify the effect of DJW on the academic achievements of some EFL learners with lower EI. Below, an operational definition of the term DJW is given very briefly to clarify the issue.

According to Peyton (1992), '*journal writing*' is *an ongoing or constant written conversation in which adult ESL/EFL learners and their teacher exchange their messages or impressions regularly over their learning progression*. What '*journal writing*' generally seeks for is not directly pertained to pedagogy but it also refers to the recently-developed concepts like alternative-assessment, portfolio assessment and self- monitoring practices in which the students esp. adults come to the forefront to actually control their improvements in learning which in effect this might activate a sense of belonging through active participation both inside and outside of class. The applicability of such reflective practices in real situations like classroom and home is however a little vague.

### **BACKGROUND OF THE STUDY**

Reflective or insightful approaches toward language learning have been mostly put forward by constructivists like Vygotsky since 1978 up to the recent decades. The main intention behind constructivists current with Vygotsky was that '*learning is largely a social activity and learners create their own learning through their experiences and beliefs*.' Such interaction between the teacher-student doesn't take place occasionally but it is an ongoing process through which the teacher monitors and takes care of the whole process of teaching-learning procedures for a whole term (Hatton & Smith, 1995; Richards, 1990; Short & Kauffman, 1994). Richards & Lockhart (1996) mentioned some sources for such critical reflections over the course including reflective journals, learning logs, lesson reports, autobiographies, collaborative dairy keeping, audio and video recording, teacher narratives, portfolios, observation and action research. Gibb's model (1988) of reflective frameworks in self-awareness approaches might be a great help here to mention. He elaborated on six successive stages of such reflective processes in resolving a problematic situation:

- A: Description: What happened?
- B: Feeling: What were you thinking/ feeling?
- C: Evaluation: What was good/bad about the situation?
- D: Analysis: What sense could you make of the situation?
- E: Conclusion: What else could you have done?
- F: Action plan: If it rose again, what would you do?

By definition, reflection is '*a natural activity in which individuals are engaged to a greater or lesser extent*' (Cottrell, 2003). Moon (2005) offers a definition of reflection as "...a form of mental processing that we use to fulfill a purpose or to achieve some anticipated outcome" (Moon, 2005, p.1). Moon argued that this process is generally used to help understand complex or unstructured ideas that do not have an obvious solution.

Lowenstein (1987, p. 87) traces the history of personal journal writing to the development of '*self consciousness*' for the purposes of self-understanding, self-guidance, expanded creativity, and spiritual development. Interestingly, the '*journal writing*' practice arrived in language teaching strands from various previous professions like chroniclers, travelers, pilgrims, creators, apologists, confessors, and prisoners, (cited in Thomas Mallon, in his popular *A Book of One's Own: People and Their Diaries* (1984).

### ***Pushing movements for journal writing approaches***

The main reasons behind the popularity of journal writing to other professions including language learning (LL) was that after the 20<sup>th</sup> century, the growth of psychology and psychotherapy encouraged scholars to look inside people's minds, in order to scrutinize their feelings, and explore their dreams. Phil Rich (1999), a Clinical Director of the Stetson School, believes that Journal writing provides a way to put thoughts down on paper where the learners can be seen and this in turn gives substance to feelings. He implies that journaling is an effective technique

for self expression since it fosters personal growth, and can be a valuable companion on the road to self discovery. He asserts journal writing can provide a place to express and explore innermost thoughts, feelings, ideas, questions, and concerns, and later return to reminisce or re-examine.

Still another reason for a support towards journal writing approaches was that of growth in personal spirituality dating from the 1980's that linked personal journal writing to creativity, expansion of consciousness, and the deepening of spiritual awareness and growth (Santa- Maria, 1983; Solly and Lloyd, 1989; Baldwin, 1990; Wakefield, 1990, Cameron, 1992; Rainer, 1997). Hiemstra (2001) mentioned several benefits that was another cause for journal writing as a reflective approach to become more popular. He asserted the mind trackers of this device were able to see tangible evidence of mental processes in their subjects; On the other hand the journal keepers had a safe place to practice writing without restrictions of form, enabling the articulation of connections between new information and what they already know, and making meaning. Building confidence was another benefit mentioned by Hiemstra that was termed as '*the nurturing of voice and spirit*'.

Now one may ask what inside factors can trigger best use of such capabilities in adults to have more control over their learning. Such realizations have occurred for people in their routine everyday life activities. When it comes to education, the first thought that comes to mind is how such reflective devices can put in operation in language classes. Do really students at older age benefit more from such reflective approaches? What mechanisms can help a teacher-student interaction? Which groups of learners can gain more in this way? What other factors can mediate in the process? Should we consider other socio-ethnographic factors like gender, education level, marital status in the learning process through such interaction or not? How can such reflective tools as DJW be promoted for the target group of the present study? These and some other relevant issues on the association of reflection and language development in adults with lower EI has been at issue in the present research. Below, the research studies done specifically on EI trait centering on language studies are mainly put forward to scrutinize the issue in more details.

#### ***What is Emotional intelligence?***

Emotional intelligence is generally defined as the ability to perceive, control and evaluate emotions. Some researchers believe that emotional intelligence is an inborn capability while others suggest that it can be learned and thus strengthened for extending further learning. The most recent definition that attempts to cover the whole construct of EI describes it as the ability, capacity, skill, or potential to feel, use, communicate, recognize, remember, describe, identify, learn from, manage, understand and explain emotions (Hein, 2007).

In their seminal article, "Emotional Intelligence", Peter Salovey & John D. Mayer defined emotional intelligence as, "*the subset of social intelligence that involves the ability to monitor one's own and others' feelings and emotions, to discriminate among them and to use this information to guide one's thinking and actions*" (1990).

Goleman (1998) the founder of EI defines it as the capacity for recognizing our own feelings and those of others for motivating ourselves and managing emotions in ourselves and in our relationships. He believes that we have two ways of knowing: The rational and the emotional. Both of these ways of knowing are intertwined, but emotional intelligence is a greater determiner of success in life. His EI model includes: 1. Knowing one's emotions, 2. Managing emotions, 3. Motivating oneself, 4. Recognizing emotions in others, 5. Handling relationships

Gardner (1983) suggested that all individuals have personal intelligence profiles that consist of a combination of several different intelligence types, including linguistic. Gardner (1999) has described Linguistic Intelligence as sensitivity to spoken and written language and the ability to use language to accomplish goals, as well as, the ability to learn new words.

#### ***Recent research accounts on EI promotion within ELT domains***

In order to follow those studies which had focused on aspects of EI promotion, a comprehensive search gave us the following results.

In EFL, there was a bulk of research on EI trait and various aspects of academic achievement like Rostami, N. 1383, khosravi, Z 1378, Kouhsar et al, 1386. Jamali Nesari, et al (2011) worked on EI traits and learning English vocabulary. Among the research studies, among those working on EI and EFL aspects of successful oral participation we found another interesting work by khazade A. et al (1386) and Pishghadam and Ghonsooli (1387). According to Hassanzadeh R. et al (2011) two of the EI main components, intrapersonal intelligence (independence, assertiveness, self-actualization, self-regard, and self-awareness) and general mood (optimism and happiness), and language achievement are positively correlated. Fahim and Pishghadam (2007) showed educational success and intrapersonal, general mood and stress management dimensions have positive correlations.

In the recent literature, a shift of emphasis overbearing EI findings from students to teachers' mentality was seen in some major work like Nelson and Low (2005). In their research, they supported the view that the main reasons behind the success for those teachers who model emotional intelligence are exemplified by intentional reflective and not reactive behavior, more flexible behavior, assertive and not aggressive or passive communication, more optimistic and thus not pessimistic or negative viewpoints which are really helpful for the learning environments. Such reliance on skills and positive habits, they believed, aids the teachers with higher EI. Abdollahi (2001) maintained the same standpoint by relating the probable success of those teachers with high EI by creating a pleasurable classroom through a dynamic group discussion with the students. In Saeidi's and RimaniNikou's (2012) article on EFL Teachers' EI and their students' language achievement, a significant relationship was found between the two variables. That is, the higher teachers' EI, the more students' language achievement.

In settings apart from Iran, other studies related to EI accounts and ELT were also prominent like Vanett and Jurich (1997), Pierson (2003), Santa-Maria, M. (1983), Lowenstein, S. (1987), among others. Kerka, S. (1996), Hiemstra, R. (2001), Peyton (1977) and Yayli, D. (2009) had worked on the effect of journal writing in EFL/ESL settings. Parker et al(2004) found positive relationship between success and intrapersonal, stress management and adaptability intelligences.

In the present research, it has been tried to testify the effect of reflective thought activators on EI promotion among those adult students who lack a plausible EI level in social settings.

The authors believed through applying DJW the teachers might be able to stir confidence, autonomy and self-awareness among those adults with lower EI which in effect this might bring more success in their language learning processes.

## **RESEARCH QUESTIONS**

The questions put forward at this research project were thus:

1. To what extent can constant dialogue journal writing help the adult students with low EI to have more achievements in the learning situation?
2. Can gender as a subsidiary variable predict success in EFL adult learners through journal writing? Do Male and female learners with different EI levels benefit equally from journal writing?
3. What are the students' overall impression on 'dialogue journal writing' as an active task-report tool?

## **METHODOLOGY**

### ***Participants***

The participants included 126 adult Iranian EFL learners (male / female) between the ages of 20 and 25 who were randomly selected via cluster sampling from among 400 adult students attending in Sabzevar both public and private universities. Their majors were law and Family management.

### ***Instrumentation***

A pre-test including a validated TOEFL proficiency test version of Nelson was first administered among all the subjects to cater for their probable variability concerning language proficiency. The validated Nelson English Language Test battery was chosen at elementary level. A typical test of this series entails 50 items comprising a 37-item grammar section along with 13 items on vocabulary knowledge.

At the second stage, a translated version of Trait Emotional intelligence (EI) questionnaire by Bar-On (1980) into Persian was administered among the remaining 156 subjects. The translation to Persian was prepared and checked by two EFL professors in order to ensure that all the items were fully understood by all the subjects. The intention was to select those students who had a lower EI index compared with their classmates with higher EI. The validity for the self report trait EI in relation to personality was psychometrically demonstrated as discriminately reliable in Iranian Context by Dehshiri, (1385). Its Chronbach Alpha was reported %73 which shows an acceptable index. The whole

90- item inventory examined 15 different scales including inter-personal skills, intra-personal skills, adaptability, stress management, emotional self-awareness, assertiveness, self-respect, independence, problem-solving, emotional self-awareness, inter-personal skills, assertiveness and reality-testing among others.

### Procedures

Initially, a pre-test including a validated TOEFL proficiency test version of Nelson at elementary level was first administered among some 180 subjects to homogenize the population. The aim was to cut the scores at two extreme poles highest and the lowest 20 % scores from the experimental phases of the study in order to ensure maximum control over the homogeneity of the subjects concerning their language proficiency. Thus, 24 students who were not within the homogenized selected sample at level of elementary level were excluded at this phase of the study.

After administering the EI questionnaire, those that were included in the two extremes of very low vs. very high EI index were advertently deleted from the experimentations due to the purposes of the study. 30 subjects were also excluded at this phase of the study. The remaining 126 subjects went through a three-month treatment inducement stage for journal writing practices.

Those subjects whose EI total score was between -1 and +1 standard deviation from the mean or one standard deviation above and below the mean were classified as 'medium EI'. Accordingly, high EI learners were those whose score was between +1 and +2 standard deviation from the mean and consequently low EI ones included those with -1 and -2 SD from the obtained mean. The measured scores in each level have been specified in Table 1 Mean for the total EI scores was estimated as 312.03 with SD= 37.2.

*Table 1: The criterion for classifying the subjects' total EI index*

+3	>	+2	+2	>	+1	+1 ( $\mu=312.03$ )	-1	-1	>	-2	-2	>	-3
Standard Deviation			Standard Deviation			Standard Deviation		Standard Deviation			Standard Deviation		
Too high EI index			High EI Index			Medium EI Index		low EI Index					Too low EI Index

In order to check the normal distribution of the population in the study, One-Sample Kolmogorov-Smirnov Test was run for the obtained scores in SPSS ver.20. The distribution was decided normal since the p-value ( $0.599 > 0.05$ ). Table 2 indicates the normal distribution of the subjects. Since the data followed a normal distribution,  $\frac{1}{3}$  of the medium level scores was devoted to EQ lower group in order to increase the number of subjects and maintain a more plausible research population in terms of number for the purposes of the present research.

*Table 2: One-Sample Kolmogorov-Smirnov Test for distribution checking*

		EQ Scores
N		126
Normal Parameters <sup>a,b</sup>	Mean	312.0317
	Std. Deviation	37.21783
Most Extreme Differences	Absolute	.068
	Positive	.046
	Negative	-.068
Kolmogorov-Smirnov Z		.767
Asymp. Sig. (2-tailed)		.599

a. Test distribution is Normal.

b. Calculated from data.

Having administered the EI questionnaire, the researchers decided on four groups (2 exp. and 2 con.). Those that were included in the two extremes of very low vs. very high EI index were advertently deleted from the experimentations due to the purposes of the study. 28 subjects were excluded at this phase of the study. The remaining 126 subjects constituted the subjects targeted for the purposes of the current research project. Table 3. shows the distribution of the groups comprising a plausible distribution of subjects having trichotomous low/medium/ high EI index for both experimental and control groups.

*Table 3: A cross-tab exhibiting the general distribution of the population and sample size for each research group*

Research Groups	Number of subjects	Gender		EI index level and gender		
		Male	Female	High	Medium	low

Experimental	67	27	40	Total: 12	Total: 25	Total: 30
				M 5	F 7	M 10
					F 13	F 20
Control	59	25	34	Total: 12	Total: 14	Total: 33
				M 7	F 5	M 12
					F 6	F 21
	Total: 126	Total: 52	Total: 74			

During the experimental stage, which lasted for nearly four months, the subjects were required to initiate a dialogue communication with their instructor. The subjects were asked to do the proper ordinary given tasks in each session plus reporting their impression over their work as to what problems they have faced while doing the due tasks. Afterwards, the instructor responded to the reports following a strict format touching the students' areas of difficulty and gave proper solutions and more reassurance that everything was ok and went well at the right time. Journal writing along with continuous task report by the learners were paralleled and continuously assessed by the instructor during an academic three-month period. The subjects were first provided with necessary knowledge in their ordinary courses. They were then asked to do the proper given tasks in each session plus reporting their work as to what problems they faced while doing the due tasks.

In the present study, students and their teachers were continually participating in a dyad conversation through which they presented their impressions and probable problems during the course.

Two successive posttests of achievement type were finally used to verify the learners' progress rate after the treatments. The reason for administering two successive posttests of achievement type was to make sure if the applied treatments in this research can bring about progressive progress among the learners.

#### DATA ANALYSES AND RESULTS

After the interventions, statistical analyses of the variables were conducted to test the first hypothesis as to the effect of journal writing and overall progress concerning reading skills in English. T-test was selected as the statistical measurement device in order to test the first null hypothesis;

H01: 'Dialogue Journal writing can't bring about success in linguistic achievements among adult students with lower emotional intelligence (EI).'

The acceptance level was set at .05 with 95% confidence and reliability. Since it was intended to examine the mean of the groups and due to the fact that the groups under study were independent of one another *independent sample t-test* was selected as the statistical measurement. The other factor leading to the use of t-test was that the data used in this study were all interval.

Measuring the dependent variable with both groups was performed at two stages with one month interval. So two post-tests were involved in statistical analyses. (Time 1 & Time 2)

The achievements by target group ie., those students with lower EI levels whose achievements were probably affected by the induced reflective treatments of journal writing were statistically investigated. Just the subjects with a low EI level in the experimental vs. control group were included in the data analyses for both time 1 and time 2 post tests.

Table 4 below depicts the results for the independent T-test for Time 1 comparing just the low Eq level subjects together.

**Independent Samples Test***Table 4: T-test for independent samples experimental \* control groups among lower EI levels (time 1)*

	Levene's Test for Equality of Variances		t-test for Equality of Means						
	F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
								Lower	Upper
time1 Equal variances assumed	.237	.628	3.397	61	.001	3.41591	1.00568	1.40492	5.42689
Equal variances not assumed			3.413	60.999	.001	3.41591	1.00083	1.41464	5.41718

Apparently, as the table 4 clearly shows the obtained p value (Sig. 2-tailed=.001) was less than (.05). Also, the observed T-value of (3.397) is enough above the t-critical 1.64 at 95% probability level. The same statistical analyses were rerun for Time 2 post testing among the same groups of lower EI levels. This time also the sig level for 2-tailed T was less than the critical 0.05. (.02<.05) and the observed T-value is larger than the t-critical with 95% confidence. So, we were safe at rejecting the null hypothesis and accepted the alternative one as to the positive effects of journal writing practices among the target group i.e. subjects with a low EI Table 5 shows the statistical results for the T test analyses for time 2 post testing.

**Independent Samples Test***Table 5: T-test for independent samples experimental \* control groups among lower EI levels (time 2)*

	Levene's Test for Equality of Variances		t-test for Equality of Means						
	F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
								Lower	Upper
time 2									
Equal variances assumed	.407	.526	2.389	61	.020	2.25530	.94403	.36761	4.14300
Equal variances not assumed			2.399	60.994	.020	2.25530	.94007	.37552	4.13509

In this research project, the researchers wanted to investigate the association of gender and EI levels with final linguistic achievements too. The second Null hypothesis investigated in the present survey was as the following:

- H02: Gender can't predict any differences in achievement among male and female EFL adult learners across EI levels after receiving journal writing practices.

Here since the impact of two independent variables (EI levels and gender) was involved on the performance of two post-tests in one month interval, Two-Way ANOVA (MANOVA analysis) was selected for statistical analyses at 0.05 Alpha.

The results of a two-way ANOVA with EI level (3 levels) as one independent variable and the subjects' gender (2 levels) as a second independent variable revealed a significant interaction,  $F(4,509) = .015$ ,  $p < 0.05$ . (Table 6)

#### Tests of Between-Subjects Effects

Dependent Variable: time1  
Table 6: Two-Way ANOVA for Time 1 post-test testifying EI vs. Gender

Source	Type III Sum of Squares	Df	Mean Square	F	Sig.	Partial Eta Squared
Corrected Model	237.208 <sup>a</sup>	5	47.442	2.685	.029	.180
Intercept	9587.460	1	9587.460	542.691	.000	.899
eqlevel	2.341	2	1.170	.066	.936	.002
gender	8.319	1	8.319	.471	.495	.008
eqlevel * gender	159.325	2	79.663	4.509	.015	.129
Error	1077.657	61	17.667			
Total	13444.750	67				
Corrected Total	1314.866	66				

a. R Squared = .180 (Adjusted R Squared = .113)

The mean scores for gender at three EI levels at Table 7 below clearly shows that females gained better results compared with males at two EI levels of low and medium.

Dependent Variable: time1

Table 7: Descriptive statistics for EI vs. Gender as two independent variables for time 1 posttest

Eqlevel	gender	Mean	Std. Error	95% Confidence Interval	
				Lower Bound	Upper Bound
low EQ	1.00	11.700	1.329	9.042	14.358
	2.00	14.888	.940	13.008	16.767
medium EQ	1.00	11.500	1.213	9.074	13.926
	2.00	15.308	1.166	12.977	17.639
high EQ	1.00	15.200	1.880	11.441	18.959
	2.00	10.536	1.589	7.359	13.712

The same statistical procedure was re-run for time 2 post test. Again, the mean variability for females was higher than males at two lower and medium EI levels. However the interaction of EI and gender this time wasn't statistically significant. ( $F(2,73) = .07, p > 0.05$ ). The critical value for F. ratio at 0.05 was 4.49 which all the obtained F-tests didn't exceed this critical value. So we couldn't have any significant evidence to prove the cross effect or interaction of gender and EI level together on the overall improvement of the experimental group after the treatments for a second time. Table 8 and 9 below shows the MANOVA analysis at time 2 post-test for one month interval. Possible implications have been given in the next section.

### 3. eqlevel \* gender

Dependent Variable: time2

Table 8: Descriptive statistics for EI level vs. gender at time 2 post-test

Eqlevel	gender	Mean	Std. Error	95% Confidence Interval	
				Lower Bound	Upper Bound
low EQ	1.00	12.575	1.128	10.319	14.831
	2.00	14.675	.798	13.080	16.270
medium EQ	1.00	12.292	1.030	10.232	14.351
	2.00	14.250	.989	12.272	16.228
high EQ	1.00	15.800	1.595	12.610	18.990
	2.00	12.429	1.348	9.732	15.125

### Tests of Between-Subjects Effects

Dependent Variable: time2

Table 9: Two-Way ANOVA for Time 2 post-test testifying EI vs. Gender

Source	Type III Sum of Squares	df	Mean Square	F	Sig.	Partial Eta Squared

Total	13447.000	67				
Corrected Total	869.030	66				

a. R Squared = .107 (Adjusted R Squared = .034)

Paralleled qualitative results for the informal interviews with the teachers and the target group of the present survey were performed at the end. Both positive and negative viewpoints by the stakeholders were referred to, though the final codings were pointed towards the positive points of the continuum, there were also some negative aspects which have all been discussed along with possible implications of utilizing reflective techniques like dialogue journal writing and keeping in the following section.

## DISCUSSION

The current research project was mainly carried out to investigate the effect of reflective practices like dialogue journal writing on the possibility of EI development practices among those adult English learners who suffer from lower levels of this prominent aspect of the mind. At first place, the statistical measures gave us enough evidence to prove the overall effectiveness of the induced treatment on the subjects. Concerning this result, Vygotskian viewpoints on learning as a social activity is again more strengthened. Here, the main role that the instructors may possess was focused upon through an ongoing active process to change the learning behavior of the learners by their self-initiated screening activities with the teachers' supervision. As Cochran-Smith & Fries (2005) have specified, the research movements on teacher development are highlighted through school-based enquires which focus on learning in its social context.

In the present survey, the researchers made use of journal logs in order to investigate the critical reflective thinking on the achievement of some learners specifically those who in normal times can't communicate their thoughts easily through class channels along with their classmates or their teachers. Other still reflective mechanisms therein involve learning logs, lesson reports, autobiographies, collaborative dairy keeping, audio and video recording, teacher narratives, portfolios etc. (Richards & Lockhart, 1994).

In this research project, three questions were specifically followed. The first and the foremost enquiry was to investigate the effect of reflective practices on the overall linguistic performance of a group of adult learners with a relatively low EI index. The first question is here then rephrased for a recall.

**Question 1:** To what extent can constant dialogue journal writing help the adult students with low EI to have more achievements in the learning situation?

The results of statistical analyses all proved the outperformance of the experimental over control group among the target group including learners with lower level Eq. Without any doubt, there is now wide recognition that reflective practices like journal writing can be a good vehicle for self-understanding, self-guidance, expanded creativity, and spiritual development.

**Question 2:** Can gender as a subsidiary variable predict success in EFL adult learners through journal writing? Do Male and female learners with different EI levels benefit equally from journal writing?

Concerning the nature of reflective journal writing, gender can be a crucial issue since as Pica (1991) declares; it is possible that interactions in matched-gender pairs differ from interactions in mixed-gender pairs, both in the amount and type of interaction. The gained results from MANOVA (time 1) analyses let us reject the null hypothesis safely as to the interaction between gender and EI level concerning the linguistic improvement of males and females after the induced treatment. The statistical analyses all were weighted for females rather than males thus they indicated that those female learners esp. at lower and medium EI levels achieved better results compared with their matched EI levels among their male counterparts. Since two post-tests were taken within a one month interval, a second time post test was also administered. However, as previously mentioned in the result section, the interaction of EI and gender this time wasn't statistically significant. ( $F. 2.73 = .07 > .05$ ). Possible reasons might be that though females benefitted more from the reflective practices from the outset, in the long run, they couldn't prove completely adaptable to the treatments compared with their male counterparts. A very crucial point to consider here is to probe into the underlying psychological variables that might have been also in process along with the EI trait within each individual subject. Mayer and Salovey (1997) proposed that emotional skill develops partially within the context of interpersonal relationships. Among such inter-related and complex situations, the interaction of individual traits such as gender with EI must be paid more attention as to what hindering factors have been in action to change the result towards the outperformance of males at the end. Still another implication could be that in the present research study, trait EI typology and not ability EI has been investigated. As Austin, (2004) accentuates, there is a distinction between trait EI (or "emotional self-efficacy"), which concerns emotion-related traits and self-perceived abilities measured via self-report questionnaires, and ability EI (or "cognitive-emotional ability"), which concerns actual emotion-related abilities measured via maximum-performance tests. In this study, EI index has been measured and evaluated through self-report questionnaires which accordingly assessed the trait EI among the selected participants and not ability EI which is cognitive-emotional based. Since gender is also concerned with cognition, it is probable that more assessments must have been done to assess ability EI for the EQ level classification and then probe into its interaction with EI level of ability type.

One last interpretation could be obtained considering Roxburgh, 1996 and Simon, 1995 as many gender differences in situ are initiated by differences in the experiences, responsibilities, and types of stressors that pose differential challenges to the two genders. Females, more often than their male peers, are simultaneously exposed to family- and job-related stressors as a result of their dual roles as mothers and professionals. Fluctuations might have occurred due to such family-type reasons too.

**Question 3:** What are the students' overall impression on 'dialogue journal writing' as an active task-report tool?

Finally, some informal interviews with both teachers and the learners were performed through open-ended semi structured questionnaire. Informal interviews with the learners were finally done to inquire about their opinions of this way of communicating with their teacher. About 85% of the students had a positive impression on utilizing dialogue journal writing as a useful tool for maximizing class participation esp. among those suffering lower EI index. They enumerated the following benefits in their talks. Some of their viewpoints are briefly given below:

A: They believed they had found a unique opportunity to talk interactively to their teacher; the occasion that to their opinion they had never experienced before. They said they felt great.

B: Most of the students asserted they liked the teachers' written explanation directed towards themselves. They liked the air.

C: Nearly most of the learners enjoyed this means of communication because all their language problems were resolved by the teacher.

D: Some students had benefitted from compensation strategies which they had taken in the process of utilizing dialogue journal writing in which the teachers' verbal aids were considered an appeal for authority on the part of the learners seeking for help. They enquired on their various strategies for learning English. They corrected some of their naïve learning strategies.

E: Students with lower EI index were interviewed individually in order to let them transfer their feelings without any threatening atmosphere. They really wished for such two-sided communication due to its stress-free situation.

F: Students accentuated they had become more orderly, focused and more organized in their lesson.

Although the learners really had positive views on the whole process of journaling, some complaints were also reported like the following:

- A. Teachers' responses to their question sheets were sometimes similar to their classmates' when they compared their own sheets to those of their classmates.
- B. Teachers sometimes evaded some points as to the students' suggestion over class management procedures.
- C. Some students didn't like weekly or sometimes daily reports on their tasks. They thought it was tedious.
- D. We liked to communicate some of our points anonymously, while in this way the teachers knew who had made a point.

Possible reasons behind such negative viewpoints though could be the nature of feedback by the teachers which in the long run can change into a monotonous verbatim of their previous responses without their immediate awareness of such repetitive responses to the same subject.

The teachers were generally satisfied with the reflective tools such as journaling due to its various benefits. To the teachers, the main vantage points involved advancing critical thinking among learners, promoting communication skills, enhancing intellectual growth among many others. The interviewed teachers were all agreed upon the accelerating effects of journaling for the learners' writing performance if they urged the learners to focus on meaning rather than the form. In the long run, they accentuated, this could help the learners overcome their various blocks in writing skills communicatively. In the questionnaire, the teachers were asked if it is possible for DJW to be applied for all age groups. The responses showed that they liked to agree enthusiastically for DJW practices to be enforced and run for all age groups. However, one of the two teachers asserted that it is the matter of time if it is going to be run for adults. Since adults are usually pressed for time, this could be a hindrance point for those age groups. In response to another question as to utilizing DJW for multi-level classes, both teachers agreed forcefully that such reflective practices can really bridge in the gap among learners with various levels and language proficiencies. Among the reasons brought was more efficient time management for class periods. Still another positive aspect could include the opportunity that the learners can gain in reading their other classmates' journals published by the teacher supervision.

## CONCLUSION

In a nutshell, the gained benefits for journaling practices specifically for adults have also been verified by many researchers in the field. Stress reduction and health maintenance has been mentioned by Bruce (1998). Adams (1998) also talks about journaling as a therapy for enhancing psychological healing and growth. Most adult education

students may not need psychotherapy or medical recovery assistance, but some can use whatever helps them to release pent-up emotions, counter anger or frustration, and overcome or reduce the stress so typical in today's busy work world and lifestyle. Peyton (1987) even adds that other academic disciplines improve if journal writing is systematically included in the curriculum.

### **LIMITATIONS OF THE STUDY**

Concerning the DJW processes, there are usually two drawbacks reported in the literature: First, this activity requires considerable time commitment by the teacher to read and respond meaningfully to each learner's entry. To lessen the workload, the teacher can require learners to write two or three times a week instead of daily. This might have a probable impact on the final results, by prospect. Second, some adult students may be reluctant to participate in journal writing continuously. If this were the case, the ESL/EFL instructor may want to engage the learners in the process of writing for an extended period of time which due to time restriction and four-month schedules of academic semesters, the authors had to manage it during just one semester for the target group. Maybe further research work on other aspects of the whole self-report dialogue journal writing processes through longitudinal case studies in language centers that allow for longer periods of time.

### **POSSIBLE SUGGESTIONS**

In this regard, some promising suggestions might be considered. One way could be to hold in-service courses for teachers in order to train them for reflective thinking and dialogue practice mechanisms which really benefit the class time. Through participating in journal writing courses together collaboratively, teachers may augment more dialogic skills. Still another proposition can be to lessen the workload for the teachers. As the learners sometimes get tired of writing, so do their teachers. Meanwhile, this might have been the reason for not providing suitable phrases or providing repetitive verbiage on the part of the teachers. They can require their students for instance to write and report their feelings and impressions two or three times a week instead of daily.

### **ACKNOWLEDGEMENT**

This research project has been kindly funded by Islamic Azad university of Sabzevar, Iran. All their efforts concerning various supervisory processes, blind reviewing by the experts in the field and all the related research mannerisms are appreciated therein.

**ABSTRACT**

This quasi-experimental study attempted to compare the effectiveness of focus on form instruction with focus on forms instruction on conditional sentence learning to Iranian pre-intermediate English as a foreign language (EFL) learners. To this end, six intact classes involving 97 participants who had gained pre-intermediate level scores on the proficiency test and showed relative unfamiliarity with the target structures on the pretest were assigned into three groups. The study employed a pretest, posttest, delayed posttest design and multiple choice type achievement tests were used to measure the effects of treatment. The focus on form group received textual enhancement, contextualized explicit teaching, and dictogloss; the focus on forms group received explicit deductive grammar instruction. Moreover, the control group was taught reading passages containing the conditional structures. The findings indicated a significant difference among the performance of the three groups on both immediate and delayed posttests with focus on form group outperforming the focus on forms and the control groups. The findings also showed a significant difference between the mean scores of the two posttests of each group. Finally, this study suggests that a focus on form instruction can lead to higher accuracy in learning grammatical knowledge in comparison to focus on forms.

**KEYWORDS:** focus on form, focus on forms, planned focus on form, textual enhancement, dictogloss

**INTRODUCTION**

Among the issues in second and foreign language teaching and learning, there has always been significant controversy about whether and how to include "grammar" in second/foreign language instruction/acquisition (Doughty & Williams, 1988). In this regard, with the appearance of form-focused instruction (FFI), as a modification of communicative language teaching, a shift occurred from incidental and implicit grammar teaching instruction to formal and meaningful grammar teaching syllabus. Long (1988) suggested that FFI can be of two types: Focus on form, and focus on forms. Long (1991) defined focus on form as "an instruction that draws students' attention to linguistic elements as they arise incidentally in lessons whose overriding focus is on meaning or communication" (p. 45-46). On the other hand, focus on forms instruction refers to teaching isolated linguistic forms in separate lessons in accordance with a structural syllabus.

Further, Ellis (2001) used FFI as a cover term to refer to any planned or incidental instructional activity that is aimed to direct language learners to linguistic form. Compared to Long's taxonomies of FFI, Ellis (2001) categorizes it in terms of three types including "focus on forms", "planned focus on form", and "incidental focus on form". Thus, it includes both traditional approaches to teaching forms and more communicative approaches.

In focus on forms instruction, the primary attention is on form and instruction is the intensive treatment of preselected forms. In planned focus on form, however, the teacher decides in advance what forms should be focused on, but the primary attention lies on meaning rather than on form. In incidental focus on form, attention is distributed among a wide range of forms that have not been preselected, but the primary of attention is to meaning (Ellis, 2001).

***Focus on Form Instruction***

Focus on form instruction suggests that learners need to develop communicative use while attention to form should not be overlooked by them. This kind of instruction stresses on the integration of form and meaning without excluding either of them for successful language learning (Izumi & Bigelow, 2001). After focus on form instruction was put forward, many researchers have proposed various options for integrating a focus on grammar and a focus on

communication and many strategies have been used for this purpose (Nassaji & Fotos, 2011). Some of these techniques are presented below.

### ***Textual enhancement***

Textual enhancement is one of several techniques of input enhancement manipulated in this study. In textual enhancement, readers/learners attend to particular information in a text with typographical cues including coloring, boldfacing, underlining, italicizing, changing the font type, enlarging the font size, or any combination of these techniques (Wong, 2005). Textual enhancement aims to present more salient features of written input to which learners may not usually attend in a text and to make form-meaning connections for the target language.

### ***Dictogloss***

Dictogloss is a kind of collaborative output task designed to encourage students to produce language forms cooperatively by reconstructing a text. Nassaji and Fotos (2011) defined collaborative output as "instructional options that push learners to produce output by performing tasks that require them to pay attention to both meaning and grammatical forms." (p. 103). In a dictogloss, teachers usually read a text to their students at a normal pace. Students listen to the text and note any words or phrases related to the content. Then, they work in small groups to reconstruct the text in terms of grammatical accuracy and cohesion (Nassaji & Fotos, 2011).

### ***Focus on Forms Instruction***

Focus on forms instruction "is equated with the traditional teaching of discrete points of grammar in separate lessons" (Sheen, 2002, p.303). The primary purpose of the activity designed for this kind of instruction is to learn a pre-selected form. It is based on analytic syllabus and the teacher and students are aware of what the linguistic target for the lesson is.

Focus on forms has also been defined as "instruction involving a structure of the day approach, where the primary focus is on the form that is being targeted" (Ellis, Basturkmen, & Loewen, 2002, p.420). In this type of instruction, learners are required to focus their attention on some specific form intensively in order to learn it. It also offers different means for understanding of grammar (including explaining grammar rules in the L1, identifying differences between the L1 and the L2).

### ***Studies on Form-Focused Instruction***

Many different models and strategies are designed for conducting a form-focused study. Lee (2007) examined the effects of input enhancement on learners' reading comprehension and learning of passive forms. The results showed that in the form correction task the participants with enhanced texts performed better than those with the unenhanced texts. The findings also revealed that manipulation of printing in bold had positive effects on Korean students' acquisition of passive voice in English. Moreover, in another study, Jourdenais, Ota, Stauffer, Boyson, and Doughty (1995, cited in Nassaji & Fotos, 2011) showed that the learners of enhancement group performed better than unenhanced group in both noticing and subsequent production of the target forms.

Mayo (2002) investigated the effect of two focus on form tasks (a dictogloss and a text reconstruction) in advanced EFL level. Although the two tasks had been claimed to be effective and encouraging learners to produce language and reflect on its form (Kowal & Swain, 1994; Swain 1998), the quantitative analysis of the data indicated that the text-reconstruction task was a suitable form-focused task for this group of learners.

Sheen (2001) conducted an on-going comparative research for the last school year in an elementary school in Quebec. For the study, two sixth grade classes were taught, one of which was considered the control group with the usual focus on form instruction. The experimental group was taught as usual except that the researcher was allowed to provide a focus on forms for approximately one hour a week. Both groups achieved very similar results in pretest. After two months they took a posttest in the form of oral interviews which were broadly similar to the pretest. The result of this study showed that a focus on forms approach helped students in the experimental group to make solid progress in the two targeted grammar areas, while the control group, which was taught based on a focus on form, continued producing largely incorrect forms, thus allowing fossilization to continue to develop.

Some research studies have also been conducted in Iran (Abdolmanafi, 2010, Charanli, 2010, Mokhberi, 2011, etc.) to investigate the effectiveness of focus on form instruction on learning some target forms; however, to the best of the researchers' knowledge no studies have so far compared the effectiveness of a combination of input enhancement, delayed explicit focus on form and an output-based task (a dictogloss) as a model for focus on form instruction with explicit deductive grammar teaching as a model of focus on forms instruction on conditional sentence learning by Iranian pre-intermediate English language learners.

### ***Conditionals***

The present study focused on conditionals as the target structures because of the syntactic and semantic complexities embedded in conditional constructions (Chou, 2000). The difficulty degrees of conditionals in English can be related to the structures themselves. Mindt (1996) also argued that conditionals complexity and particular tense uses in comparison with other sentential patterns turn them into fairly problematic constructions, both in first and second language acquisition. Moreover, conditionals consist of main clauses and subordinate clauses which are difficult for students to comprehend because of the syntactic complexity (Lord, 2002).

Nayef and Hajjaj (1997) suggested three points in teaching conditionals: "forms of the verbs, the time reference of the verbs, and the meaning of the condition in each of the patterns" (p.140). They also pointed that the difficulty of conditionals lies in the interaction of forms (verb form changes) and meanings. It seems that asymmetry between forms and functions in conditionals may cause serious problems for L2 learners. Likewise, the agreement of the forms of two verbs in the two clauses of a conditional sentence is the source of difficulty for learners (Ke, 2004). So, the present study centered on all the three basic patterns of conditionals.

## **RESEARCH QUESTIONS**

In order to compare the effectiveness of focus on form and focus on forms instructions on the conditional sentence learning of Iranian pre-intermediate English language learners, the following research questions were developed:

1. Is there any significant difference among the language learners who were instructed through focus on the form, focus on the forms, and control group in learning of conditionals in the immediate posttest?
2. Is there any significant difference among the language learners who were instructed through focus on the form, focus on the forms, and control group in learning of conditionals in the delayed posttest?
3. Is there any significant difference between the immediate posttest and the delayed posttest scores of the language learners who were instructed through focus on the form, focus on the forms, and control group in learning of conditionals?

## **METHODOLOGY**

### ***Participants***

To accomplish the objectives of this study, 112 male and female EFL learners of six intact classes from two private language institutes in Iran were given a homogeneity test (44 males in three intact classes and 68 females in three intact classes, respectively). These learners were at pre-intermediate level of language instruction based on the screening system used by the two institutes' authorities but for increasing homogeneity of the students of two institutes, all the learners were given a homogeneity test. In the test, a table of interpreting scores acts as a guideline for teachers to choose which level is suitable for their students. From among the initial participants, 105 learners gained the scores range of pre-intermediate level in the test.

In the next step, learners were pretested by means of a multiple-choice test to determine their level of knowledge with regard to the target structures. One hundred and one learners met the necessary condition. Four learners were absent in one of the phases and their scores were omitted from the study, thus making the final number of data providers 97. These six intact classes were put into three groups randomly; two groups as the experimental groups (focus on form group,  $n = 33$  and focus on forms group,  $n = 32$ ), and the third as the control group ( $n = 32$ ). Each of these three groups included one female's class and one male's class and all learners had Persian as their first language.

### ***Instrumentation***

As mentioned above, *Solutions* placement test with a reliability of .80 was used to find out the degree of homogeneity with regard to the language knowledge of the three groups. This test has been designed to assess students' knowledge of the key language as well as their receptive and productive skills. The next instrument used in

this study was an achievement test containing 30 items, 20 of which were related to the target structure and were used for statistical analyses. The other ten items were not related to the targets of the study. The items were taken from *Objective test in English as a foreign language*, *Nelson English language tests*, and *Grammar in use tests*. This test was also used as a delayed posttest two weeks after the treatment to compare the recall of the target structures in posttest and delayed posttest.

A third instrument was a 30 item multiple-choice type achievement test on English conditional sentences parallel with pretest administered to the participants after the treatment as a posttest. Both tests were piloted on 20 learners similar to the sample of the current study with the difference that these students were familiar with the target structures. The reliability of the pretest and posttest scores was calculated through KR-21 method which turned out to be 0.72 and 0.70 respectively. A time allocation of 20 minutes was also estimated for both tests.

For treatment, in the experimental group 1 (focus on form group), one passage for textual enhancement purpose and one passage for dictogloss purpose were extracted for each type of conditional structures. As a whole, six passages were extracted for this group. In focus on forms group five types of exercises and drills (fill in the blanks, consolidation drill, matching, chain drill, and correcting order) were acquired for each type of the target structure. In control group, two passages for reading comprehension purpose were extracted for each structure. Most of the passages used in this group were the same as the passages of the focus on form group.

### ***Procedure***

This study was conducted in the summer of 2012 at two private language institutes which adhered to a meaning driven syllabus with almost similar educational conditions and facilities. In these two institutes, each session lasted 90 minutes and the classes met two times a week. The instructional treatments were provided during three training sessions for each group, each of these sessions lasted approximately 60 minutes.

All groups (six intact classes) received the instructions from the same instructor who was also one of the researchers. The two instructional treatments were matched for the target structure, and all three groups were matched for instruction time. Each session focused on one type of conditional structure. Before the treatment, two tests were administered. A homogeneity test was administered to all three groups to find out whether the participants were at pre-intermediate level. Another test was a pretest administered to discover whether the participants had almost similar familiarity with three main forms of conditional sentence structures. One session after the pretest, the learners participated in the study treatment. At the beginning, the researcher-instructor presented overall instructions about the experiment in each group. In each session for the focus on form group (experimental group 1), input enhancement activity, delayed explicit focus on form, and dictogloss for each structure were presented to participants for focus on form purpose.

For input enhancement activity, in each session the participants were provided with one reading passage which contained one type of conditional structure. The target forms were typographically enhanced through bolding, italicizing and underling. In detail, the If-clauses including the word *if*, two verbs of if-clauses and comma (if necessary) used in the passages given to this group is visually enhanced. After reading the passages the participants were asked to complete certain tasks. The task required the learners to use the conditional sentences in the different contexts. It should be mentioned that the primary attention was on meaning.

After being exposed to the target structure, the learners were taught the features of language they had already attended to meaningfully in a contextualized explicit instruction. For example, one sentence of the passage containing an if-clause which had been textually enhanced was considered and the structure was explained to the learners. This was followed by an output-oriented task which was a dictogloss. The teacher read aloud a text containing the target structures three times. The participants initially listened to the reading, next took notes, and later checked their notes and reconstructed the original text which contained the target structure with the other members of the group.

Experimental group 2 received focus on forms instruction. In this group, first, the participants were provided with grammar rules of the target structure, and then five activities related to focus on forms instruction were done by the

participants individually or in group. The types of exercises were traditional drill (fill in the blanks), consolidation drill, matching, chain drill, and putting the words in correct orders. It should be mentioned that the grammar rules were explained in participants' mother tongue (Persian) and in each of these phases if a student used the target structure wrongly, the teacher corrected it or asked the student or the other student to take part in its correction.

In control group, the members were provided with two reading passages, containing the target structures, in each session and did reading comprehension exercises for about 60 minutes; it should be reiterated, however, that they were not taught the target structures explicitly. All the passages used for both focus on form and control groups in this study incorporated different topics and were taken from different sources including Chinese speakers' acquisition of English conditionals: Acquisition order and L1 transfer effects., *Interchange* (3<sup>rd</sup>ed). Some passages used as dictogloss were also retrieved from: [http:// www.Englishpage.com](http://www.Englishpage.com).

After the treatment, all the participants were unexpectedly tested on the target structures with an immediate posttest. Two weeks after the posttest, a delayed posttest which was the same as the pretest was administered to examine both short- and medium-term effects of the instructions. It should be mentioned that before starting the study all of the test items, exercises, and passages used in this study has been also checked by another teacher who had more than five years of experience in English language teaching. As a result, some of the items were modified to be more suitable for learners of pre-intermediate level. The readability of all of the passages used in the study was also calculated based on Flesh-Kincaid Reading Ease. The result showed that all used passages were relatively suitable for pre-intermediate level learners.

## RESULTS

The results of the study are presented in the following two main sections: (1) result of the pretest, (2) results of testing the hypotheses.

### *Result of the Pretest*

Table 1 shows the group statistics results of the three groups in the pretest. In order to decide upon the homogeneity of the variances of the two groups, a Levene's test was deployed. It indicated that the three groups were homogeneous in terms of their variances,  $F(2, 94) = 1.028, p = 0.362 > 0.05$ . Therefore, in order to ensure that there was no significant difference among the three groups in terms of their knowledge of the conditional structures, an ANOVA was conducted. The comparison of the means in the pretest,  $F(2, 94) = .434, p = 0.649 > 0.05$ , indicated that there was no statistically significant difference among the performance of the three groups in the pretest indicating the relative unfamiliarity of participants with the target structures.

*Table 1: Group Statistics for the Achievement Pretest*

groups	N	Minimum	Mean	Median	Maximum	Std. Deviation
Focus on Form	33	2	4.61	5.00	8	1.713
Focus on Forms	32	1	4.28	4.00	8	1.631
Control Group	32	1	4.59	5.00	7	1.388
Total	97	1	4.49	4.00	8	1.575

### *Results of Testing the Hypotheses*

The comparison of the mean values of the three groups in the immediate posttest indicated that the difference between the means of the three groups was statistically significant. Table 2 shows the group statistics for the immediate posttest.

*Table 2: Group Statistics for the Immediate Posttest*

Groups	N	Minimum	Mean	Median	Maximum	Std. Deviation
Focus on Form	33	6	13.06	13.00	20	4.077
Focus on Forms	32	5	11.28	11.00	19	3.245
Control Group	32	3	6.91	7.00	11	2.161

Total	97	3	10.44	10.00	20	4.148
-------	----	---	-------	-------	----	-------

Levene's test for homogeneity of variances showed a significant value of 0.003 for the immediate posttest. The ANOVA results demonstrated that there were significant differences among the mean scores of the three groups,  $F(2, 94) = 30.404, p = 0.000 < 0.05$  (see Table 3).

Table 3: ANOVA Results for the Immediate Posttest

	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	648.872	2	324.436	30.404	.000
Within Groups	1003.066	94	10.671		
Total	1651.938	96			

Since the ANOVA results indicated a significant value of 0.000, the multiple comparisons among groups were performed by using least square differences (LSD) to determine which groups were significantly different from each other. As the first line (row) of Table 4 shows, the mean difference (MD) of focus on form and focus on forms group was 1.779 which revealed that focus on form group was better than focus on forms group. Moreover, when focus on form group and control group were compared with each other, the result showed that there was a significant difference between them ( $MD = 6.154, sig = .000$ ). As line two shows, the mean difference of focus on forms and control group was 4.375 which revealed that focus on forms group was better than control group.

Table 4: Multiple Comparisons(LSD) for the Immediate Posttest

(I) group		(J) group	Mean Difference (I-J)	Std. Error	Sig.	95% Confidence Interval	
						Lower Bound	Upper Bound
LSD	focus on form	focus on forms	1.779*	.810	.031	.17	3.39
		control group	6.154*	.810	.000	4.55	7.76
	focus on forms	focus on form	-1.779*	.810	.031	-3.39	-.17
		control group	4.375*	.817	.000	2.75	6.00
	control group	focus on form	-6.154*	.810	.000	-7.76	-4.55
		focus on forms	-4.375*	.817	.000	-6.00	-2.75

\*. The mean difference is significant at the 0.05 level.

Regarding to comparison of the mean values of the three groups on the delayed posttest, group statistics showed a significant difference between the mean scores of the three groups (see Table 5).

Table 5: Group Statistics for the Delayed Posttest

Groups	N	Minimum	Mean	Median	Maximum	Std. Deviation
Focus on Form	33	5	10.48	10.00	19	4.154
Focus on Forms	32	3	7.91	7.00	18	3.383
Control Group	32	3	5.75	6.00	9	1.778
Total	97	3	8.07	7.00	19	3.778

Table 6: ANOVA for the Delayed Posttest

	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	365.534	2	182.767	17.095	.000
Within Groups	1004.961	94	10.691		
Total	1370.495	96			

Levene's test for homogeneity of variances showed a significance value of 0.001 for the delayed posttest. As Table 6 displays, the ANOVA results demonstrated that there were significant differences among the mean scores of the three groups,  $F(2, 94) = 17.095, p = 0.000 < 0.05$ .

As Table 7 shows, the post hoc LSD test displayed the notably significant differences between focus on form group and focus on forms group ( $MD = 2.579, sig = 0.002$ ) which revealed that focus on form group was better than focus

on forms group. Moreover, when the delayed posttest scores of focus on form group and control group were compared, a significant difference was found ( $MD = 4.735$ ,  $sig = .000$ ). As line two shows, the mean difference of focus on forms and control group was 2.156 which revealed that focus on forms group was better than control group.

Table 7: Multiple Comparisons (LSD) for the Delayed Posttest Scores

			Mean Difference (I-J)	Std. Error	Sig.	95% Confidence Interval	
(I) group	(J) group	Lower Bound				Upper Bound	
LSD	focus on form	focus on forms	2.579*	.811	.002	.97	4.19
		control group	4.735*	.811	.000	3.12	6.35
	focus on forms	focus on form	-2.579*	.811	.002	-4.19	-.97
		control group	2.156*	.817	.010	.53	3.78
	control group	focus on form	-4.735*	.811	.000	-6.35	-3.12
		focus on forms	-2.156*	.817	.010	-3.78	-.53

\*. The mean difference is significant at the 0.05 level.

Table 8 also shows a significant difference between the mean scores of each group in the immediate and delayed posttests.

Table 8: Summary of Paired Samples Statistics for the immediate posttest-delayed posttest scores

groups			Mean	N	Std. Deviation	Std. Error Mean
focus on form	Pair 1	delayed posttest	10.48	33	4.154	.723
		immediate posttest	13.06	33	4.077	.710
focus on forms	Pair 1	delayed posttest	7.91	32	3.383	.598
		immediate posttest	11.28	32	3.245	.574
control group	Pair 1	delayed posttest	5.75	32	1.778	.314
		immediate posttest	6.91	32	2.161	.382

As shown in Table 9, there is a significant difference between the mean scores of the immediate and delayed posttests in focus on form group ( $t = 7.023$ ,  $df = 32$ ,  $sig.$  (two-tailed) =  $0.000 < 0.05$ ). It could be concluded that the participants gained better scores in the immediate posttest with the mean of 13.06 than in the delayed posttest with the mean of 10.48. There is also a significant difference between the mean scores of the immediate and delayed posttests in focus on forms group ( $t = 6.573$ ,  $df = 31$ ,  $sig.$  (two-tailed) =  $0.000 < 0.05$ ). It showed that the participants obtained better scores in the immediate posttest with the mean of 11.28 than in the delayed posttest with the mean of 7.91.

In control group,  $t = 4.773$ ,  $df = 31$ ,  $sig.$  (two-tailed) =  $0.000 < 0.05$  revealed that there was a significant difference between the mean scores of these posttests in control group. Table 9 also displays that the participants of control group gained better scores in the immediate posttest with the mean scores of 6.91 than in the delayed posttest with the mean scores of 5.75. Based on the indicated results, it can be concluded that the participants of all three groups had better performance in the immediate posttest than in the delayed posttest.

Table 9: Paired Samples T-test of the Immediate posttest-Delayed Posttest Scores

groups			Paired Differences					t	df	Sig. (2-tailed)
			Mean	Std. Deviation	Std. Error Mean	95% Confidence Interval of the Difference				
						Lower	Upper			
focus on form	Pair1	delayed posttest–immediate posttest	-2.576	2.107	.367	-3.323	-1.829	-7.023	32	.000
focus on forms	Pair1	delayed posttest–immediate posttest	-3.375	2.904	.513	-4.422	-2.328	-6.573	31	.000

control group	Pair1	delayed posttest– immediate posttest	-1.156	1.370	.242	-1.650	-.662	-4.773	31	.000
---------------	-------	---	--------	-------	------	--------	-------	--------	----	------

## DISCUSSION

The aim of this study was mainly to compare the relative effects of the two instructions of focus on form including textual enhancement, contextualized explicit grammar teaching, and dictogloss with focus on forms including explicit deductive grammar instruction in learning of the three basic patterns of conditional sentence learning of Iranian pre-intermediate students.

In the first and second questions concerning the existence of a significant difference among the three groups in the immediate as well as the delayed posttest, the results indicated that the students who were taught based on focus on form instruction outperformed those who were taught based on focus on forms instruction in both immediate and delayed posttests. Therefore, the results suggested that the manipulation of focus on form instruction could facilitate the participants' learning of conditional structures. The findings also revealed that, the control group, which received non-formal instruction, did not significantly improve their scores on the posttests. The results are in accordance with the Long's claim that a focus on form approach is more effective than both focus on forms and focus on meaning (Long & Robinson, 1998 cited in Nassaji & Fotos, 2011). There are four interpretations of why the focus on form instruction might be more effective than focus on forms instruction in this study. First, when learners read the enhanced passages, they tended to naturally pay attention to the highlighted target forms unknown to them. It is in accordance with the Sharwood Smith's view (1993) that the effects of focusing learners' attention to specific aspects of input can lead to further cognitive processing. Second, contextualized explicit teaching of the target structures created an opportunity for the teacher to explain the grammar points by the use of the enhanced text. Third, using dictogloss as a collaborative output task helped learners to reflect on their own language output, and encouraged them to cooperate with their peers in the group and learned from each other. Finally, this model of focus on form instruction was designed in such a way that provided learners with opportunities to do both input and output tasks for learning the target structures.

In the third question concerning the possible existence of a significant difference between the immediate posttest and the delayed posttest scores of the three groups, results revealed that in all three groups the gains were not maintained in the longer term. However, the findings lead us to assume that focus on form instruction has more lasting positive effect than focus on forms instruction. More specifically, the results of this study suggest that lasting instructional effects can be obtained through providing learners with opportunities to use the target form in a meaning-oriented task in combination with appropriate form-focused treatment.

## CONCLUSION

First of all, this study can conclude that although both instructions are effective, focus on form instruction is more effective than focus on forms instruction. Moreover, though the time lag of two weeks between immediate posttest and delayed posttest revealed that the gains were not maintained in the medium term, the improvements in the mean scores of the two posttests when compared to the pretest suggested that for the two experimental groups, especially focus on form group, learning of the target structures had taken place to a great extent. So, it cannot be denied that focus on form instruction has more lasting positive effect on grammar learning than focus on forms instruction. This conclusion seems to be consistent with Spada's (1997) claim that when grammar points introduced through formal instruction are accompanied with communicative exposure for the learners, their accuracy of use improves and their awareness of the forms becomes longer-lasting. This study also brings into light the advantage of integrating form and meaning in EFL contexts and the facilitative function of combination of input enhancement, explicit teaching, and collaborative output task in L2 learning. In this study, the focus on form instruction included the combination of two techniques of textual enhancement and dictogloss with the former being a kind of input-based task and the latter a kind of output task. It is in accordance with Swain's (2005) claim that the most effective strategy for most teaching situations is to use all the techniques and resources available and not to limit oneself to one type of activity. The study also support the current view which encourage teachers to combine different techniques of focus on form as a design for focus on form instruction, such as rule instruction (Alanen, 1995) and output tasks (Izumi, 2002).

Although there have been a lot of research studies in the literature regarding the comparative examination of the effect of different types and techniques of focus on form, very little research has directly compared the effectiveness of focus on form and focus on forms approach (Ellis, 2002). Moreover, it is difficult to compare the results of this study with the results of other studies which investigated FFI together with a communicative task because different studies use different numbers of grammatical structures, different types and techniques of focus on form instruction, and use different ways to measure learning. However, the findings revealed that focus on form instruction is more effective than focus on forms and focus on meaning on the learning of grammar, lending support to findings in previous studies on the effects of different types of focus on form instruction on the grammar learning. Therefore, the present study could be considered as an additional support for focus on form instruction in comparison with focus on forms instruction.

However, the findings should be interpreted by taking into account the limitations of the study. The first limitation is related to the sample size. It should be noted that the number of participants is not large enough to generalize the conclusions to all pre-intermediate English language learners. Moreover, the use of intact groups imposes its own limitations on generalizability of the findings. Second, the placement test which was used to check the homogeneity of the participants was the Solution Placement test which is lesser known and used standard test. Third, this study only focused on learning three grammatical structures through some techniques of focus on form and focus on forms instructions by the pre-intermediate English language learners; therefore, the findings cannot be generalized to the whole grammar or other structures in English. Hence, future research necessity to investigate the effects of different techniques of focus on form and focus on forms instructions in learning of various grammatical structures on learners with different proficiency levels. Moreover, the effects of longer duration of treatment need to be addressed to gain more understanding on the effect of long-term retention on the conditional structures.

### ABSTRACT

This study aimed to probe into the semantic opaqueness of English euphemisms and investigate it in view of the maxims of cooperative principle based on the mindset of Iranian EFL graduates. For this purpose, data from 100 Iranian EFL graduates on 60 English euphemistic expressions were collected and analyzed. The results indicated that interlocutors do not constantly observe the CP maxims but recurrently flout them, while using euphemisms. In this vein, considering the rate of flouting, the manner maxim ranked first and the quantity maxim ranked last. Besides, concerning EFL learners' recognition of semantic opaqueness in English euphemisms, the supremacy of flouting of the manner maxim revealed that interlocutors have frequent tendency to do flout and say vague things to avoid unpleasant and embarrassing issues in a direct way. So it supported the idea that EFL learners' recognition of English euphemisms can characterize the semantic opaqueness of English euphemisms. It was finally concluded that due to semantic opaqueness, a potential threat to EFL learners could be their being unenlightened about the implications of the shades of meanings of euphemisms when they are exposed to them, or when they are recognizing or producing discourse.

**KEYWORDS:** Cooperative principle, euphemism, maxim, semantic opaqueness.

### INTRODUCTION

It seems axiomatic that in every culture there are a fair number of words labeled as frivolous, vulgar, or uncaring. Also, there are certain things that are not supposed to be mentioned directly. Such roundabout type of language is known as euphemism in linguistics, which comes in a variety of forms and is used for a variety of reasons.

According to Kenworthy (1991), the word euphemism "is taken from Greek and means good speech" (p.20). Also, Abrams (1999) holds that "euphemisms are devices to replace unpleasant words or expressions by conventionally more acceptable ones" (p.83). Besides, Thomas (1989) believes that "euphemism can be figuratively called 'a whitewashing device' which is a mirror of morality, customs, lifestyle, and social psychology in everyday life" (p.103).

The relationship between euphemism and culture is also largely noticeable. Euphemism, as a cultural-linguistic product, displays its multiple mapping relations with culture (Rawson, 1995). Likewise, as a social tool, it is widely used to show courtesy; to help to fit to the proper context; and to express the ideas more politely (Allan & Burridge, 2007). Meanwhile, conducting investigations into the euphemisms in view of the pedagogical and socio-pragmatic implications can be noteworthy, as at the educational level, learning euphemisms well means more than merely mastering the pronunciation, words, and grammar (Alkire, 2002). In the same vein, learning euphemisms could mean learning to see the world as the native speakers of language see and understand it (Allan & Burridge, 1991).

In brief, though euphemism can be defined from varied perspectives (Allan & Burridge, 1991, 2007; Rawson, 1995; Alkire, 2002), the definitions share some features, as follows:

1. Euphemism is a kind of polite, roundabout, and gracious mode of expression.
2. Euphemism is used to mitigate the unpleasantness of reality.
3. The main purpose of euphemism is to shun directly speaking out the unpleasant or taboo reference like death, illnesses, and the supernatural.

### *Chronological aspects in the study of euphemisms*

In a valuable legacy, Mencken (1936) explained why hundreds of euphemisms were born and popularized based on the historical and sociocultural backgrounds. Besides, Enright (1985) put forward a collection of essays providing clues for a comprehensive study on English euphemisms in various fields. Later on, Dingfang (1989) expanded the study scope of euphemisms and proposed distant, relevant, sweet-sounding, and self-defending principles. Alternatively, Allan and Burridge (1991) studied euphemisms from a pragmatic perspective, assuming that a perspective on the human psyche was gained from euphemisms as a protective shield against the disapproval of natural beings. On the other hand, Hodge and Kress (1993) investigated the dichotomy of 'euphemistic' and 'derogatory' and claimed it as one of the very effective techniques in naturalization of ideologies. More to the point, Rawson (1995) widely accounted for the characteristics, definition, classification, and scope of euphemisms. Also, Holder (1995) in the study of euphemisms endeavored to unmask the language of deceit and highlighted human tendency to use roundabout terms in preference to bluntly accurate words.

At the chime of the 21<sup>st</sup> century, Hong-hui (2000) indicated that euphemistic wording can meet the requirements and accomplish the communicative task. Alternatively, van Dijk (2004) resorted to social, cognitive and discourse analysis of the text to uncover ideology in discourse, and used 'euphemism' to elucidate 'positive self-representation' and 'negative other-representation'. Also, Ham (2005) studied euphemism formation by extracting examples from Austen's *Emma*, Lawrence's *Lady Chatterly's Lover*, and Walker's *Well Groomed*. Then, the rules by Warren (1992)'s model of classification were tested against euphemisms which transpired that improvements were required to account for deconstructing euphemisms.

In a more recent study, Jangjorn (2004) investigated the Internet users' techniques in avoiding impolite words on the Web boards, the most common ways of which were shown to be pausing, changing letters, clipping, spelling, employing loanwords, and using metaphors. Alternatively, Fernandez (2006) examined the euphemistic language on obituary pages from the 19<sup>th</sup> century, the results of which indicated a tendency to present sentimental obituaries in which the taboo of death could be accounted for by various conceptual metaphors. At the same time, Rahimi and Sahragard (2006) took van Dijk's framework in the analysis of euphemisms and investigated the discursive structures which lead to ideologically based prejudiced statements in emails addressing the death of the late Pope, John Paul II.

More recently, Hai-Long (2008) paid particular attention to the relationship between cross-cultural communication and euphemisms as well as the necessity of teaching euphemisms and argued that there were not enough instances of euphemisms in EFL textbooks and materials. In the same vein, MirzaSuzani (2009) paid attention to the translation of euphemism addressing issues of background, classification, and semantic equivalence, based on which euphemism study was not restricted to the lexicon, but extended to the level of sentence and discourse.

### ***Grice's maxims of cooperative principle***

Grice (1975) considered verbal exchanges as oriented to a set of purposes, for achieving which the participants should cooperate with each other. Also, he described cooperative principles as "make your conversational contribution such as is required, at the stage at which it occurs, by the accepted purpose of the talk exchange in which you are engaged" (1989, pp. 26-27). For further explanation of the CP, he proposed four maxims as follows:

- A. Maxim of Quantity: Give the right amount of information.
  - a. Make your contribution as informative as is required;
  - b. Do not make your contribution more informative as is required.
- B. Maxim of Quality: Try to make your contribution one that is true.
  - a. Do not say what you believe to be false;
  - b. Do not say that for which you lack adequate evidence.
- C. Maxim of Relation: Be relevant.
- D. Maxim of Manner: Be perspicuous and specific.
  - a. Avoid obscurity of expression;
  - b. Avoid ambiguity;
  - c. Be brief;
  - d. Be orderly.

For the most part, the CP accounted for the relationship between the literal and actual meanings, but it could not explain why people violate the maxims so as to express themselves in an indirect way, so Leech (1983) proposed the

PP from the pragmatic viewpoint based on which it was justified why speakers resort to such oblique methods as, for example, instead of saying tersely "Give me a light." they say "Could you give me a light?" He connected illocutionary acts with politeness in the verbal exchange wherein to be polite means to be tactful, modest and nice to others and the more indirect the illocution, the more polite it should be reevaluated.

### OBJECTIVES OF THE STUDY

Considering the semantic facet of euphemisms, a potential threat to the learners could be that they might be unenlightened about the implications of the shades of meanings of euphemisms when they are exposed to them, or when they are recognizing or producing discourse. This may be mainly due to an important feature of euphemisms called semantic opaqueness (or noncompositionality) defined by Moon (1997) as "the degree to which a multiple-word item cannot be interpreted on a word-by-word basis, but has a specialized unitary meaning" (p.44). Therefore, this study primarily aimed to probe into the semantic opaqueness as a part of the pragmatic function of euphemisms in English and investigate this feature through the maxims of CP. In this vein, it was also aimed to examine which maxims of CP might be flouted most and least via the use of euphemisms and euphemistic expressions. The results could provide the readers with a lucid idea about the euphemisms while flouting the CP maxims and pave the way for further studies at discursual and socio-pragmatic levels.

### RESEARCH QUESTIONS

In this study, the following research questions were made:

1. Do Iranian EFL graduates observe or flout the maxims of CP while using social euphemisms in English?
2. To what extent do EFL graduates observe or flout the maxims of CP while using social euphemisms in English?
3. Which maxims of CP are flouted most and least by Iranian EFL graduates?
4. Does Iranian EFL graduates' recognition of English euphemisms characterize the semantic opaqueness of social euphemisms in English?

### RESEARCH HYPOTHESES

In the current study, the following null hypotheses were addressed:

1. EFL graduates may not observe or flout the maxims of CP while using social euphemisms in English.
2. At no time may EFL graduates observe or flout the maxims of CP while using social euphemisms in English.
3. There is no difference among CP maxims in terms of being flouted by EFL graduates.
4. The Iranian EFL graduates' recognition of English euphemisms may not characterize the semantic opaqueness of social euphemisms in English.

### METHODOLOGY

#### *Participants*

Following a quantitative research design, the data were collected from 100 participants ranging between 23 to 35 years of age in 2012. They comprised 100 MA and PhD students of TEFL at Islamic Azad University, Shiraz Branch and Fars Science and Research Branch. The nonrandom purposive selection of participants from the graduate programs was based on the assumption that in comparison with undergraduates, they should hold and carry higher experiences and analytic abilities in their judgment, as well as detailed familiarity with linguistic and pedagogical issues. It was also expected that participants from the graduate programs could develop their potential insights into more effective procedures related to the recognition and appreciation of euphemisms.

#### *Materials*

In this research, instances of euphemistic expressions were taken from *Rawson's dictionary of euphemisms and other double talks* (1995), and Allan and Burridge's *Euphemism and dysphemism* (1991). Likewise, Grice's maxims of CP (1975) in Logic and Conversation were employed as the frameworks for developing the questionnaire items. Also, some online data banks and relevant Internet sites were used, and for analyzing the data the SPSS software was employed.

#### *Instruments*

A questionnaire containing 60 items on euphemistic expressions in view of the CP maxims was designed and validated under the supervision of experts such as Professor Yarmohammadi (See Appendix 1). To improve the quality of the data, it was exceedingly attempted that the relevancy and clarity of the questions be taken into account. In the same vein, to demonstrate the internal consistency of the items, the Cronbach's alpha reliability was calculated

which yielded a reliability estimate of 0.86 for the questionnaire that was statistically satisfactory regarding the purpose of the study.

#### Data collection procedures and data analysis

To collect the data, a questionnaire comprising an inventory of 60 items on English euphemisms together with the maxims CP was employed. The participants were put in a relaxing atmosphere and the necessary instructions on the items of questionnaire were given. The participants' options were based on their recognition of the observance or flouting of the four-fold maxims of CP. They were required to decide on the matter of the observance or flouting of each expression, and tick one or more of the options in front of the respective item. Next, the participants' opinions were collected to investigate the mindset of the graduates about English euphemistic expressions in view of the observance or nonobservance of the CP maxims. The data gathered were sorted out and categorized and the results were analyzed.

### FINDINGS, RESULTS AND DISCUSSION

#### Data analysis

Chi-square test was run to examine the significance of the differences between the frequencies of the *observance* or *flouting* of the multiple maxims of CP.

#### Observance and flouting of the maxims of CP

Concerning the first two research questions, Chi-square was used to examine the significance of the differences between the frequencies of the *observance* or *flouting* of the maxims of CP. Thus, the observed frequencies of the *observance* and *flouting* of the maxims of CP together with the expected values of the *observance* and *flouting* of the maxims were given. Also, the modified values, based on the correction factor proposed by Hatch and Farhady (1981), were calculated and provided to the different frequencies. Then the  $\chi^2$  value obtained for each participant was compared with the critical value to decide if the null hypothesis could be rejected. In Table 1,  $\chi^2$  and the results of the observance and flouting of the CP maxims are represented:

Table 1: Chi-square on the Observance and Flouting of the CP Maxims for Each Individual Participants

Participant No.	Freq. of CP Maxims Observed (OUT OF 60)	Value (Modified) Based on Correction factor	Value (Expected)	Freq. of CP Maxims Flouted (OUT OF 60)	Value (Modified) Based on Correction factor	Value (Expected)	$\chi^2$ (Obtained)	$\chi^2$ (Critical) P=0.05	Result (Null Hypothesis)

Since the critical value of  $\chi^2$  with 1 d.f. is 3.84 for the 0.05 level, so we can feel fairly confident that the null hypothesis claiming that the individuals may not observe or flout the maxims of CP is rejected. In other words, since there is a significant difference between participants in terms of their positions regarding observance and flouting of the CP maxims the data support the idea that the individuals may observe or flout the maxims of CP in specific occasions. To put it another way, in 81 cases out of 100 cases (i.e., 81%) the individuals held that the maxims of CP are either observed or flouted, and as a result, the difference between frequencies of observance and flouting appeared to be significant (since in 81% of the cases calculated, the value of Chi-square at the probability level of 0.05 was larger than the critical value). Alternatively, only in 19% of the cases the value of Chi-square at the probability level of 0.05 was smaller than the critical value. In Table 2, Chi-square and total frequency for observance and flouting of the CP maxims are illustrated:

Table 2: Chi-square and Total Frequency for Observance and Flouting of the CP Maxims

	Observed <i>f</i>	Expected <i>f</i>	<i>O-E</i>	$(O-E)^2$	$(O-E)^2 / E$
Maxim Observance	1260	3000	-1740	$(1260-3000)^2$	$(1260-3000)^2 / 3000$
Maxim Flouting	4740	3000	1740	$(1740-3000)^2$	$(1740-3000)^2 / 3000$

2017.24

Considering  $\chi^2$  in Table 2, the null hypothesis in a chi-square goodness-of-fit test states that the sample of observed frequencies supports the claim about the expected frequencies, so the bigger the calculated chi-square value is, the more likely the sample does not conform to the expected frequencies, and therefore we would reject the null hypothesis. Also, it could mean the data may deviate a large amount from the model or from what we thought. To verify the results obtained, the SPSS was employed to calculate the Chi-square for total frequencies, considering the number and opinion of the participants. The results are illustrated in Table 3 and Ta

Table 3: Chi-square Table from the Output (Number and Opinion)

		Opinion		Total
		1(OBS)	2(FLT)

a. 0 cells (.0%) have expected count less than 5. The minimum expected count is 264.60.

b. Computed only for a 2x2 table

In Table 4, as  $P < .05$ , we can feel confident that the null hypothesis claiming that the individuals may not observe or flout the maxims of CP is rejected since the difference between frequencies of observance and flouting appears to be significant.

#### Flouting of the Maxims of CP

In regard with the last two research questions, particular attention was paid to the maxim of *manner* as it could be an illuminating factor in revealing the semantic opaqueness of euphemistic expressions. Likewise, due to the lack of mutual exclusivity in the participants' options as well as the existence of some overlaps in their options of flouting of the CP maxims, the application of Chi-square test was practically impossible that will be discussed later. Table 5 represents participants' comprehensive profile on the frequency of the flouting of the maxims of CP:

Table 5: Participants' Comprehensive Profile on the Frequency of the Flouting of the Maxims of CP

Based on the assumptions of  $\chi^2$  procedure, all the categories have to be considered mutually exclusive; that is, each observation could appear in one and only one of the categories in the table. For example, one participant could not concurrently give both a *Manner* and *Quality* answer for the CP maxims in the questionnaire survey. Nevertheless, as

many participants had selected two or more of the categories simultaneously, this condition made it impossible to go on with the  $\chi^2$  procedure. Therefore, it was decided to analyze the data simply based on the descriptive statistics, as shown in Table 6 below.

Table 6: Descriptive Statistics of the Flouting of the Maxims of CP

	N	Min.	Max.	Mean	Std. Deviation
Number	5530	792	2198	1572.53	535.036
Valid N (listwise)	5530				

The minimum occurrence of the flouting of the CP maxims is 792, which belongs to the quantity maxim, whereas the maximum occurrence is 2198, which belongs to the manner maxim. Figure 1, shows CP maxims and the percentage of the frequencies of flouting for each maxim.

Figure 1: CP Maxims and Percentage of the Frequencies of Flouting

As shown above, the manner maxim ranks first in terms of flouting of the CP maxims, and 36.7% of the cases of flouting of the CP maxims allocate to this maxim. On the other hand, the quantity maxim with 13.23% ranks last among other maxims of CP. Also, it is noteworthy that due to Grice's (1975) four categories overlapping with each other, euphemisms may flout more than one maxim of the CP simultaneously, so when, say, the quantity maxim is flouted, the expression will be unclear by providing less or more information, and hence, the manner maxim is flouted immediately. From this view, almost all the examples cited above primarily flout the manner maxim when they are placed under the flouting of other maxims.

## CONCLUSION

The current study aimed to probe into the semantic opaqueness of English social euphemisms as a central issue and scrutinize it in view of observance or flouting of the maxims of Grice's cooperative principle. To be more specific, the main aim of the current study was to investigate whether any maxim(s) of cooperative principle is/are observed or flouted during the use of euphemisms, and to what extent these *observances* or *floutings* may occur. Moreover, the study aimed to reveal which maxims of CP are flouted most and least by Iranian EFL graduates.

By analyzing the findings in the study, it was indicated that the maxims of CP cannot be observed by learners at all time, taking into consideration what people say is likely to maintain, enhance, or damage their own face, as well as taking into account the effect of their utterances on others. In the same vein, it was shown that it is not the case that the users' euphemistic utterances scrupulously follow the maxims of CP so that they could reduce the amount of interpretive work that recipients would have to do. In fact, in order to meet certain communicative needs, participants seldom speak by faithfully observing all four maxims of the CP. Hence, an intriguing way to deal with the maxims of conversation is to flout one of them. When a maxim is flouted, a speaker doesn't observe the maxim, but cannot be accused of violating it either, because the transgression is so flagrant that it is entirely obvious that the speaker knows s/he is not observing it and realizes everyone else in the conversation knows it too.

The results of the data analysis, moreover, proved to be in line with Grice's (1975) claim that people occasionally flout one or more of the maxims of the CP to meet a certain communicative need, and that there will be no

conversational implicature if people *always* follow the maxims of CP. What's more, in order to maintain effective communication, users of language may be supposed to do their best to preserve certain regulative goals, and if a speaker manifestly appears not to observe these precepts of good communicative behavior, then a reason may be that s/he intends the hearer to infer from his/her utterance some meaning(s) additional to the conventional sense of the words and other signals s/he has uttered.

With reference to the frequencies of the flouting of the CP maxims, the results indicated that the manner maxim ranked first in terms of flouting of the CP maxims while using euphemisms. That is, 36.7% of the cases of flouting of the CP maxims allocated to the manner maxim, which, by far, put it in the first rank in comparison to the other maxims of CP. On the contrary, the quantity maxim with only 13.23% ranked last among the CP maxims. Considering the supremacy of the manner maxim one point is noteworthy. Since flouting of the manner maxim, by definition, refers to giving obscure and ambiguous information, under particular communicative conditions, the speaker may say something obscure to avoid mentioning something unpleasant and embarrassing directly. Thus, the hearer should carefully infer the conversational implicature of the speaker and his/her real intentions, according to the specific context. This is the reason why many euphemisms might tend to flout the manner maxim so as to achieve the mild, indirect and pleasant-sound effects. From this view, almost all examples cited in the study primarily flouted the maxim of manner when they were placed under the flouting of other maxims, which could recurrently verify that EFL learners' recognition of euphemisms could characterize the semantic opaqueness of social euphemisms in English. Another point is that due to the maxims overlapping, euphemisms may flout more than one maxim simultaneously. For example, when flouting the quantity maxim, the expression would be unclear by providing less or more information, so the manner maxim would be flouted immediately.

#### ***Pedagogical implications***

Considering semantic opaqueness as a central feature of euphemisms in the study, a potential threat to academic settings could be EFL learners' being unenlightened about the implications of the shades of meanings of euphemisms or lack of familiarity with them when they are exposed to them, or when they are recognizing or producing discourse. This is because the educators' lack of familiarity with euphemisms in language use and usage may create an academic lacuna which could result in a dearth of attention to the high levels of linguistic development.

Linguists, translators, teachers, and educators can benefit a lot from studies on euphemistic expressions as well as extensions of the multiple maxims of CP. The current study due to its concern with cultural qualities could provide readers with the ability to enhance comprehensiveness in detecting potential inculcations beyond idiomatic power of euphemistic expressions. Moreover, the semantic opaqueness feature of euphemisms can suggest criteria for classifying languages based on the strategies they provide for reality distortion. Another important insight gained is to unravel how language can be a strong device in distorting the unwelcome realities, and in covering social, cultural, and political taboos.

The findings of the study can also give some insights into the linguistic, pedagogical, and sociopragmatic factors which determine the strategies applied in translation. In this vein, there are a number of factors, including rhetoric, stylistic and contextual ones that affect the pragmatic inference of euphemism by its receiver and the expressive effect of it. Considering stylistic factor, translators should always remember the stylistic differences in rendering the same euphemism into different writing styles. With reference to rhetoric factor, one should try to employ the equivalent of euphemistic expression in target language. And concerning contextual factor, appropriateness to the occasion and contextual cohesion are major concerns to the translation of euphemisms.

Based on the above discussion the following pedagogical statements can be made:

1. Learners are advised to learn the contrast between the use of euphemism and direct expressions in language; they should also be able to distinguish the taboo subjects in English that give rise to most of euphemisms in language.
2. The students should recognize basic rules and principles of euphemisms' formation; likewise, they ought to identify different classifications of euphemisms based on the scope of source, scope of sense, and sphere of application.

3. Learners should learn euphemisms' chief properties including semantic opaqueness, beautification, politeness, and disguising; also, they should know why it is used, and what it connotes as compared to the original word it stands for.

4. EFL learners are advised to appreciate the use of CP in euphemistic and direct language as primary principles guiding people's communication to maintain the social equilibrium and the friendly relations between interlocutors.

5. As the field of translation would benefit from learners' awareness of euphemisms and the differences in SL and TL cultures, so it is evocative to put further emphasis on the cultural aspects of euphemisms in the translation works in future.

6. In order to develop their insights into effective learning techniques, learners are advised to become conscious of different aspects of the linguistic, historical and the cultural overtones in texts with euphemistic expressions.

### ***Suggestions for Further Research***

This study could set groundwork for further research on the linguistic, pedagogical, and sociopragmatic functions of euphemisms in EFL context. In this vein, more detailed research could be done on the related issues such as adopting strategies for translating euphemisms in particular genres, employing other pragmatic or theoretical frameworks, and investigating the impact of euphemisms on language awareness and acquisition. Besides, the study could raise some more challenging questions for the continued research such as the following:

1. What is the role of euphemisms in enhancing 'critical thinking' as an important indication of cognitive competency?

2. How can learners' awareness of euphemism be reflected in everyday use of language?

Additionally, the following topics and issues are proposed as further suggestions:

1. Conducting a comparative study can reveal similar and/or different aspects of English and Persian euphemisms in use, means of formation, and communicative functions.

2. By performing a comparative study the cultural differences or the national characteristics reflected by euphemisms in Persian and English could be disclosed.

3. A comparative study may uncover the effect of euphemisms on the EFL learners' awareness of the English language skillfully in cross-cultural communication.

It should be mentioned that the research made is indisputably open to further discussions and hence, it is hoped that it could evoke more attention on the recognition, perception, and interpretation of euphemisms and direct expressions.

### Appendix 1

No.	Direct Term in English	Term Used as Euphemistic Expression in Context	Maxim(s) of CP Flouted			
			Qt	Ql	R	M
1	<i>fat</i>	Liz looks <i>traditionally built</i> .				
2	<i>fired</i>	Some office workers had to be <i>rightsized</i> .				
3	<i>old age</i>	Bill is in his <i>golden years</i> .				
4	<i>poor nation</i>	The immigrants came from an <i>emerging nation</i> .				
5	<i>old</i>	Her flat is a year <i>new</i> .				
6	<i>poor students</i>	The conscientious teacher attempted to push the <i>underperformers</i> .				
7	<i>illegal worker</i>	He was working as an <i>undocumented worker</i> abroad.				
8	<i>genocide</i>	Some soldiers were accused of <i>ethnic cleansing</i> .				
9	<i>failed to</i>	The young man <i>fell short</i> to meet the required qualifications for job.				
10	<i>-She isn't pretty.</i>	-Do you think she is pretty? -She is quite <i>knowledgeable</i> .				
11	<i>clumsy</i>	Tom was <i>gravitationally challenged</i> in writing skills.				
12	<i>toilet paper</i>	Where could I find some <i>bath tissue</i> ?				
13	<i>cheating</i>	The dishonest guy had a constant tendency toward <i>peer homework help</i> .				
14	<i>-Your zip is down.</i>	-Your <i>fly</i> is <i>undone</i> .				
15	<i>simultaneous existence of mental and physical health issues</i>	The patient suffered from <i>co-morbidity</i> .				
16	<i>drug addiction</i>	Unluckily, he fell into <i>chemical dependency</i> .				
17	<i>war</i>	The <i>peace process</i> between the two opposing sides lasted for eight years.				
18	<i>torture</i>	He had to confess under <i>persuasion</i> .				
19	<i>garbage man</i>	For over 25 years, he has been working as a <i>sanitation engineer</i>				
20	<i>picky eater</i>	Mary is <i>specific about what she eats</i> .				
21	<i>cancer</i>	The doctors diagnosed her disease as <i>the big C</i> .				
22	<i>used cars</i>	He is interested in <i>pre-owned</i> .				
23	<i>garbage dump</i>	His main job is to work in a <i>sanitary landfill</i> .				
24	<i>killing of innocents</i>	The army officer banned soldiers from <i>collateral damage</i> .				
25	<i>having both mental illness and drug problems</i>	The patient was <i>dual-diagnosed</i> .				
26	<i>benefits and treatments in times of sickness</i>	The sick man enjoyed <i>wellness</i> .				
27	<i>having sex</i>	It was inconsiderate to show individuals <i>acting like rabbits</i> .				

28	<i>bribe</i>	He was provided with some <i>motivation</i> to do the job right away.				
29	<i>lesbian</i>	She is known to be a <i>woman in sensible shoes</i> .				
30	<i>short</i>	It didn't appeal to her to look so <i>vertically-challenged</i> .				
31	<i>ghetto/ slum</i>	The poor man had to live in a <i>culturally-deprived environment</i> .				
32	<i>torture</i>	The imprisoned man could no more resist against <i>enhanced interrogation technique</i> .				
33	<i>very poor/ bad</i>	The proposed suggestion was an <i>ill-advised</i> way to deal with the problem.				
34	<i>mental illness center</i>	He had to be kept in a <i>mental health center</i> for several years.				
35	<i>sex change</i>	It is startling that <i>gender reassignment</i> is on vogue in some communities.				
36	<i>divorced</i>	Jack met his <i>pre-loved</i> by accident.				
37	<i>attacking</i>	A new series of <i>active defending</i> was on track by military forces.				
38	<i>find a toilet</i>	Where can I <i>powder my nose</i> ?				
39	<i>vomit bags</i>	The passengers were informed how to use <i>motion discomfort bags</i> .				
40	<i>pregnant</i>	Bev's friends surprised when they heard she <i>was in the family way</i> .				
41	<i>lazy</i>	The newly-employed clerk proved to be <i>having a rather relaxed attitude to work</i> .				
42	<i>poor people</i>	Unfortunately, the number of <i>economically deprived</i> is increasing rapidly.				
43	<i>supporter of woman's having abortion</i>	The doctor was a <i>pro-choice</i> .				
44	<i>Blindness</i>	Braille was suffering from <i>visual impairment</i> .				
45	<i>-Some fruits are luscious, but others are not.</i>	<i>-Some fruits are luscious, but others could be better.</i>				
46	<i>liar</i>	Don't be such <i>economical with the truth</i> .				
47	<i>pornographic movies</i>	The children were banned from watching <i>adult movies</i> .				
48	<i>unemployed/ jobless</i>	My cousin is presently <i>between jobs</i> .				
49	<i>disruptive</i>	She failed the test due to being <i>unable to concentrate</i> .				
50	<i>loud and arrogant</i>	Frank is <i>having strong opinions about everything and not being afraid to voice them</i> .				
51	<i>killed/ massacred</i>	The natives were <i>neutralized</i> .				
52	<i>spy</i>	He is acting as a <i>source of information</i> .				
53	<i>death penalty</i>	The murderer was sentenced to the <i>capital punishment</i> .				
54	<i>taxes</i>	The people protested against rising <i>user's fees</i> .				
55	<i>out of control</i>	She was so adamant that everybody knew her <i>above critical</i> .				
56	<i>burglary</i>	The police accused the thieves of <i>covert operation</i> .				
57	<i>official lying</i>	The president was well-known for his <i>plausible denial</i> .				
58	<i>cleaning dirty money</i>	Some people collect huge wealth through <i>launder</i> .				
59	<i>death insurance</i>	The employee was given <i>life insurance</i> .				
60	<i>has been dead</i>	John's mother <i>has gone the way of all flesh</i> for five years.

## **ABSTRACT**

This study attempted to investigate the comparative effect of two different types of a vocabulary learning strategy, "vocabulary notebooks with definitions" and "vocabulary notebooks with pictures", on the vocabulary retention of extrovert and introvert EFL learners. To begin with, a group of 180 students took the Eysenck Personality Inventory (EPI) from among 160 students were selected to take a piloted sample Proficiency Test of Key English Testing (KET) as a proficiency test to select homogeneous participants in terms of their English proficiency level. After that, 60 introvert and 60 extrovert students were selected to compromise the participants of the study. Each of these groups was divided into two classes with 30 participants (totally 4 classes). One extrovert and one introvert classes were going to implement the vocabulary notebooks with definitions and the other extrovert and introvert classes were going to implement vocabulary notebooks with pictures. Prior to the instruction, a piloted researcher-made vocabulary pretest was administered. After teaching the vocabularies in class, for homework the students used their vocabulary notebooks. Students in this group were to make notebooks to write just vocabulary definitions and use them in meaningful contexts. In case of the two other classes, the participants were to make the words' definitions visualized by paintings or cutting pictures from different sources and glue them in their notebooks. Two weeks after the end of the instruction, a piloted researcher-made post-test was administered to investigate the participants' retention of vocabularies. The outcome reveals that: There is a significant difference between the effect of keeping a vocabulary note book with definitions and a vocabulary notebook with pictures on extrovert EFL learners' vocabulary retention. The extrovert students keeping note books with pictures outperformed the extrovert students keeping note books with definitions on the post-test of vocabulary retention.

**KEYWORDS:** vocabulary notebook with definitions and pictures, extrovert, introvert, vocabulary retention

## **INTRODUCTION**

Teachers and students of second and foreign languages agree that vocabulary acquisition is a major goal of language learning (Walters, 2004). Many scholars (Meara, 1980, 1982; Read, 2000; Stoffer, 1995) believe that not only the acquisition of a large number of vocabulary items but also retention of them may be considered as of the most difficult aspects of learning a second language for most L2 learners.

According to Richards and Schmidt (2002) retention of vocabulary does not necessarily mean memorizing but the ability to recall or remember vocabulary after an interval of time. Peter (2007) believed that when students want to learn new words, they need to notice unknown words and pay enough attention to them. Retention of new words is further determined by the way in which these words are processed, whereby deeper and elaborate processing results in better word retention. In spite of the fact that keeping a vocabulary notebook is listed as a single vocabulary learning strategy in Schmitt's (1997) taxonomy, it seems clear that the very act of keeping a vocabulary notebook will involve the practice of a variety of different vocabulary learning strategies (Walters & Bozkurt, 2009).

"Notebook with Definitions" is a student-made notebook which is totally non-pictorial and mainly focuses on definitions, in addition to other information in a dictionary. (Hall, 2004). Vocabulary Notebook with Pictures, as another type of vocabulary notebook in this research, is a student-made notebook mainly focuses on pictures made by students. Levine and Reves (1990) stated that "it seems to be easier to recall the visual image of the word even in the context of long term memory" (P. 40).

The students can use any sources to prepare relevant pictures for each single word (Edyburn, 2010). It can also be included in other information in a dictionary if the students like. In order to understand foreign language learning, it is necessary to examine not only the linguistic properties of the language but also the psychological, sociological characteristics and personality types of the learner (Falk, 1978, p. 353). One of the important facets of the affective domain of second language acquisition is the intrinsic side of affectivity: personality type within a person that contributes greatly in some way to the success of language learning. In recent thinking (Arnold, 1999; Dornyei & Skehen, 2003), there is no doubt at all about the importance of examining personality types in building a theory of second language acquisition. Extraversion/Introversion has attracted the most attention in L2 research (Dornyei, 2005, p. 26).

According to Dewaele (as cited in Gan, 2008), Extroversion /Introversion dimension has received widespread acceptance in the psychology community over the past several decades (p. 24). According to Eysenck (as cited in Gan, 2008), "Extroverts tend to be outgoing, sociable and risk-taking. They take chances and act on the spur of the moment and tend to be aggressive; introverts tend to be quiet, unassertive and seldom behave in an aggressive manner" (p. 25).

## REVIEW OF THE RELATED LITERATURE

### *Vocabulary Notebooks*

In spite of the fact that keeping a vocabulary notebook is listed as a single vocabulary learning strategy in Schmitt's (1997) taxonomy, it seems clear that the very act of keeping a vocabulary notebook will involve the practice of a variety of different vocabulary learning strategies.

Fowle (as cited in Walters & Bozkurt, 2009) points out that learners may use multiple determination strategies to discover meaning and other aspects of unknown words: they may use monolingual or bilingual dictionaries, guess from context, or seek the help of teachers or classmates. Consolidation strategies are also used when adding to the information in the notebook, and when studying new words in the notebook. Use of the notebook in class work also supports the use of consolidation strategies, as students return to the notebook to retrieve words, use the words in classroom activities, and share their words with their classmates. Thus, vocabulary notebooks offer learners the chance to expand their repertoire of vocabulary learning strategies, and they have the potential to enhance vocabulary learning, perhaps more than any other single vocabulary learning strategy used on its own (p. 404).

### *Vocabulary Notebooks with Pictures*

As mentioned before this study took place in elementary levels which most of the books contain too many concrete vocabularies, using pictures is really an interesting way to elicit meanings. There are many researchers such as Blessman and Myszcza (2001), and Marzano (2001) who have really advocated that pictures make an impact on students' learning.

Carter, Hardly and Hardly (as cited in Sams, 2011) reported that getting pupils to visualize vocabulary before testing improved scores. Sams (2011) also mentioned that "as a pupil, I used to draw and label vocabulary to help me learn" (p. 16). My research combines this practice with another visualization technique (the keyword strategy) as Nation (2001) discusses. This technique involves "linking a first language word which the unknown word sounds like with the meaning of the unknown word, by picturing an image involving both the first language word and the meaning" (p. 11).

Sams (2011) has Pointed to the fact that "It is experienced drawing or applying pictures roots the items in students' mind and one is more likely to be able to visualize and retain an image which has been personally created" (p. 17). These visual images also provide powerful cognitive prompts to vocabulary development as this task engages both sides of the brain (Edyburn, 2010, P. 23).

### *Vocabulary Notebooks with Definitions*

Students can form notebooks to write just vocabulary definitions and use them in meaningful contexts. A dictionary can be an excellent source to use in discovering meanings of unfamiliar words, particularly for determining the appropriate meaning of words that have multiple, or specific, technical definitions. In line with the mention points, Obermeier (2008) stated that combining target and native languages in definitions proved to be significantly more helpful than the translations or monolingual definitions alone; it appears that the interaction of native and target languages might be a powerful factor to help learning.

### *Personality Traits*

Individual differences in personality are important in predicting individuals' behavior in umpteen real world conditions (Eysenck, 2004). Traits represent implicit connection between noticeable behaviors and internal dispositions or preferences to act, these associations picture the individual's unchanging patterns of behavior and delineate differences between rather than within individuals, this in turn may lead to various types of feelings, thinking, and behaving in different ways and among different people (Chamorro-Premuzic, 2007).

The issue of personality types, including temperament, is as old as psychology. Eysenck's original research found two main dimensions of temperament: "Neuroticism/Stability and "Extroversion/Introversion" (Boeree, 2006).

### ***Extroversion***

Sharp (1987), held that extroversion can be defined by believing that they are fully interested in the external objects, responsiveness, and a ready acceptance of external happenings. They are flexible in a way that they can have effect and at the same time be affected by events taking place around them. They are tolerant of noise and crowd and also find it fascinating. Their attention is mostly on their friends and the world they live in.

Comparing to introverts, extroverts are harder to condition and the consistency of their conditioned responses are less likely to be seen. Consequently, they were more likely to be impulsive and punishment does not prove to have any effect on their learning (Zuckerman, 2005).

### ***Introversion***

People having introverted personality type are not willing to associate with groups. Some people suffer early traumatic experiences that for example cause them to act in the background as a defense mechanism. Whatever the reason, the interior forces that keep the person quiet can be very effective, while at the same time the situation in which you are situated may invite you to participate actively (Bergin, 2006).

In comparison with the extroverts, the introvert has weak inhibition, in case of trauma such as car crash their brains don't protect them fast enough so they won't forget easily. Instead, they are highly alert and learn well, and so remember everything that happened (Boeree, 2006).

### ***Vocabulary Learning***

The term vocabulary refers to a list or a set of words for a particular language or a list of words that individual speakers of a language might use. No one can learn a language without knowing its vocabulary (Hatch & Brown, 1995).

Decarrico (2001, p. 285) points out that "vocabulary learning is central to language acquisition whether it is a second, or a foreign language". Vocabulary learning is a vital element for being able to communicate whether in first or foreign language. Vocabulary is basic to communication and often seen as the greatest source of problems by second language learners. "When students travel, they don't carry grammar books, they carry dictionaries" (Krashen, cited in Lewis, 1993).

Vocabulary is what makes the essence of a language, without it speakers cannot convey meaning and communicate with each other in a particular language (Laufer, 1986). Lexical problems frequently interfere with communication; moreover, communication breaks down when people do not use the right words (Allen, 1983). Moreover, McCarthy (1990, p. 12) points out, "no matter how well the student learns grammar, no matter how successfully the sounds of L2 are mastered, without words to express a wide range of meanings, communication in an L2 just cannot happen in any meaningful ways".

### ***Vocabulary Retention***

Wei (as cited in Jenpattarakul, 2012, p. 443) stated that nowadays long-term retention has received wide attention as one of the greatest problems in learning new words. Quinn and Irvings (1997) mentioned that the hardest way to learn the new words is to try to memorize a list of unrelated words and their meanings. The students need not only learn a lot of words, but to remember them.

Khabiri and Pakzad (2012) stated that as it is obvious in the domain of vocabulary learning, the problem is not just in learning second language words; rather in remembering them. Bahrick (1984) stated that how well people remember something depends on how deeply they process it.

Craik and Lockhart (1972), Craik and Tulving (1975) (cited in Nemati, 2009, p. 15) mentioned that according to "Depth of Processing Hypothesis", the more cognitive energy a person exerts when manipulating and thinking about a word, the more likely it is that they will be able to recall and use it later. This hypothesis implies that it is not important how recently learners have learnt something. What is of more importance in learning is, in fact, the depth of processing; in other words, students must be taught on how to process information deeply. Such implications extend to pedagogy as well, suggesting that exercise and learning strategies which involve a deeper engagement with words should lead to higher retention compared to shallow activities. Rubin (1987), O'Malley and Chamot (1990) (as cited in Marefat & Ahmadi Shirazi, 2003) stated that "Language learning strategies are any set of actions, plans, tactics, thoughts or behaviors that the learners employ to facilitate the comprehension, storage, retrieval, and use of information" (p. 47).

#### ***Retention Techniques in Vocabulary Notebooks as a Strategy***

Out of different vocabulary retention techniques by which students use to store vocabularies in long-term memory and recall or retrieve easily, some techniques such as following are examined:

1. *Pronouncing the word correctly* refers to figuring out the pronunciations of the new words and speaking aloud and consistently.
2. *Using word study and context* refers to remembering the new words or expressions from collocation, word family or derivation, idiom usage, breaking down the new words, and context where the words are located.
3. *Making visual picture* refers to either mental or actual picture of what has been heard or read. For example, to remember "taciturn" which means speaking very little and unfriendly, the students have to create the picture of their friends who have this characteristic, and whenever they see this word, they will close their eyes and make a mental picture of those friends. Another example is that when the students want to remember "pinnacle" which means the highest point, they will close their eyes and think of the picture of the mountain especially its top.
4. *Repeating and reviewing* refer to rehearsing and practicing the learned words by saying, listening, speaking and writing several times over spaced intervals until the students reach the stage of automatic use (Lenier and Maker, 1984; Nemati, 2009; Oxford, 1990; Thornbury, 2008; cited in Jenpattarakul, 2012, P. 445).

#### ***Impact of Context on Vocabulary Retention***

Engelbar and Theuerkauf (1999) mentioned that various studies in previous years have shown that explaining the meaning of words in context is a very good method for learning vocabulary and this has been proven to be more successful than other methods, such as learning from lists. Already in the early 1980s Doye (1980) points out, using the new word in a semantically typical linguistic context is an excellent way for working out the meaning of a word.

Chern (cited in Walters, 2004, p.243) described four types of context cues available to readers: sentence-bound cues, parallelism cues, forward cues and backward cues. Sentence-bound cues are also labeled local cues, while the remaining three are labeled global cues. Parallelism cues point to grammatical relationships and semantic similarity between words. Forward cues help in understanding an unknown word in the following text, while backward cues aid understanding of an unknown word in the preceding text.

### **RESEARCH QUESTIONS**

1. There is no significant difference between the effect of keeping a vocabulary notebook with definitions and a vocabulary notebook with pictures on extrovert EFL learners' vocabulary retention.
2. There is no significant difference between the effect of keeping a vocabulary notebook with definitions and a vocabulary notebook with pictures on introvert EFL learners' vocabulary retention.

### **METHODOLOGY**

#### ***Participants***

To fulfill the objective of this study, 120 female elementary EFL learners with the age range of 12-15 studying in Alvand Language School (Tehran, Iran) were selected. These participants were non-randomly selected and homogenized through a KET which is suitable at elementary level among 160 learners. The participants whose scores were one standard deviation above and one standard deviation below the mean were selected.

They were divided into two experimental groups, each group contains 60 participants. (60 extroverts in one group and 60 introverts in the other one) and then into four classes (30 introvert learners and vocabulary notebooks with definitions, 30 extrovert learners and vocabulary notebooks with definitions, 30 introvert learners and vocabulary notebooks with pictures, 30 extrovert learners and vocabulary notebooks with pictures).

Before administrating the KET and vocabulary pre and post-tests, a group of 30 students with almost similar characteristics to the target sample were used for the piloting of these tests.

### ***Instrumentation***

#### ***Proficiency Test of Key English Testing (KET)***

The English language proficiency test used in this study was a sample of the Key English Test (KET) adopted from *KET practice tests* by "Capel and Ireland" (2008), Oxford University Press.

The KET test covers two skills reading, writing. It also measured the subjects' vocabulary and grammar level. It consisted of 55 questions in 9 parts and each question carried one mark. The reading section (in parts 4 and 8) consisted of 12 questions including multiple choice and completion. In part 5, there was a cloze test with 8 multiple choice questions. In the writing section (in part 9), the participants were presented with some kind of information in terms of postcard. They were supposed to write a paragraph of 23-35 words.

The KET Test was already piloted with 30 students of the same level and almost similar characteristics to the subjects of the study. The reliability, item facility, and also choice distribution of the test were checked.

Analysis of the results showed that ten malfunctioning items were found. After omitting these ten items the KET has 55 items. The administration of the whole test took 1 hour. It should be mentioned that the listening and speaking parts of KET was not administered because of not having permission from institute officials to perform these parts.

#### ***Vocabulary Pretest***

Prior to the instruction, a researcher-made test including 30 multiple-choice items was administered. The test content is based on those vocabularies which are going to be taught during the instruction. The purpose of pretest is to make sure that participants are not familiar with these vocabularies. Furthermore, the result of the pretest was compared with the result of the post-test at the end of the treatment.

The test was already piloted with a group having almost similar characteristics to the target group and after running item analysis no item was discarded. The reliability of the test was also estimated.

#### ***Vocabulary Post-test***

At the end of the treatment, with a 15-day interval a piloted researcher-made post-test (the parallel form of pretest) was administered in order to investigate the students' retention of vocabularies. It was similar not identical to the pretest. Like the pretest, the test included 30 four-option items. The test was already piloted with a group having almost similar characteristics to the target group and after running item analysis no item was discarded. The reliability of the test was also estimated.

#### ***Eysenck Personality Inventory (EPI)***

The EPI is a questionnaire to assess the personality traits of a person. It was devised by the German psychologists Hans Jürgen Eysenck and his wife Sybil B.G. Eysenck initially conceptualized personality as two, biologically-based categories of temperament which include: "Extroversion/Introversion" and "Neuroticism/Stability". This test consists of 57 Yes/No items and is scored based on the EPI rating scale. Those who fill out the EPI receive three different kinds of scores: the E score which is related to how much extrovert a person is, the N score measuring the neuroticism, and the Lie score which tries to measure how socially desirable a person has wanted to prove to be. The E score is computed out of 24 since it consists of 24 items, the N score is out of 24, and the Lie score is out of nine.

The Yes/No answers should be given based on the usual way of acting or thinking of an individual. This instrument is originally written in English. To avoid any linguistic confusion and misunderstanding, the translated Persian version of the questionnaire by "Seena Institute of Behavioral Sciences and Research" was used in order to make sure of the participants' full comprehension. The answer key and the standard rating scales were also provided in the battery.

Scale reliabilities are robust, and confirmatory factor analyses demonstrated good factor structure (D' Apollonia, Galley, & Simpson, 2001). In addition, the instrument shows reasonable predictive validity to the actual course performance of students (Barker & Olsen, 1995, 2002; Garcia & Pintrich, 1994). The test was piloted and its reliability was calculated by SPSS (0.81 on Cronbach's Alpha).

#### *Let's Go (5) Textbook*

All of the subjects in this research study, received instruction based on "Let's Go 5", by "Nakata, Frazier, Hoskins, and Graham", Oxford publication (2008). This textbook is used in Alvand Language School for elementary learners which contains 8 units and mainly focuses on vocabulary, grammar, at an elementary level. This book has a pertinent CD to practice the pronunciation and repeat the sentences and also a workbook. For the purpose of this study, students dealt with all six units of this book.

#### *Longman Elementary Dictionary and Thesaurus*

Longman Elementary Dictionary and Thesaurus (2010, Pearson Publications) was used by "vocabulary notebooks with definitions" group. Students in this group had to form notebooks with vocabulary definitions and use the definitions in meaningful contexts.

The dictionary was used as a source in discovering meanings of unfamiliar words, particularly for determining the appropriate meaning of words that have multiple, or specific, technical definitions. The dictionary also provides example sentences which is an important segment in vocabulary presentation, because it increases information processing loads. It helps learners effectively to elaborate relevant syntactic information, and thus the target words can be restored in the long-term memory in more complete forms, which leads to a better access to them (Obermeier, 2008).

#### ***Procedure***

To accomplish the purpose of the study the following procedure was pursued:

To begin with, a group of 180 students took the Eysenck Personality Inventory (EPI) from among 160 students (80 on extrovert side and 80 on introvert side) were selected as those who merited more features on the extroversion and introversion.

Following the administration of the Eysenck Personality Inventory, the 160 students which were selected took a sample KET as a proficiency test in order to enable the researcher to select homogeneous participants in terms of their English proficiency level. The sample test had already been piloted using 30 students with almost the same characteristics as the target sample before the actual administration and Cronbach  $\alpha$  was run in order to make sure that the test had appropriate reliability and thus, was suitable for the target sample. After calculating item facility, item discrimination, and choice distribution ten items were shown to be malfunctioning. Thus, they were discarded from the test battery.

It should be mentioned that the listening and speaking parts of KET was not administered because of not having permission from institute officials to perform these parts. After administration of the KET, 120 students' scores fell between one standard deviation below and above the mean, from among 60 introvert and 60 extrovert students were selected to compromise the participants of the study.

The 120 subjects were divided into two groups: one extrovert (60 participants) and one introvert (60 participants). Since 60 is too large a number for the students in one class, two classes of 30 and 30 for each group was used. This means that, each of these groups was divided into two classes with 30 participants (totally 4 classes). One extrovert and one introvert classes were going to implement the vocabulary notebook with definitions and the other extrovert and introvert classes were going to implement vocabulary notebook with pictures.

Prior to the instruction, a researcher-made test including 30 multiple-choice items was administered as pretest. The test content was based on those vocabularies which were going to be taught during the instruction. All the participants were taught using the same material and they received the same amount of instruction. The course

consisted of 18 sessions of 90 minutes spanning over a period of six weeks. For the purpose of this study, students dealt with six units of Let's Go (5).

It should be mentioned that Let's Go (5) consists of 8 units the 2 remainder units were not considered in this study to allow a two-week time span between the instruction and administering the post-test. A six-week schedule for the implementation of the vocabulary notebooks were drawn up, adapted from Schmitt and Schmitt (1995). Fifty words were highlighted and singled out from six units which were presented to the students and to be recorded in the notebooks, along with some aspect of the words knowledge.

The participants in both groups were taught how to organize a vocabulary notebook. As mentioned before, 50 target words were chosen from the course book that was to be covered during 12 sessions. For teaching these 50 words, the researcher followed the usual routines in vocabulary teaching classes, which generally consisted of arranging words in a hierarchical order from easy to difficult, writing the target words on the board, explaining the meaning of words, and writing their parts of speech. This process is followed by making example sentences using the words, sometimes by the students, and sometimes by the teacher.

After teaching the vocabularies in class and making sure about participants' understanding, for homework the students were going to use their vocabulary notebooks. The participants of both groups could also be enriched with some of other aspects of word knowledge, for example its pronunciation, synonyms.

#### ***Vocabulary Notebooks with Definitions***

Students were going to look the words up in a Longman Elementary Dictionary and thesaurus. Students in this group were to make notebooks to write just vocabulary definitions and use them in meaningful contexts.

The "Longman Elementary Dictionary and Thesaurus" is a source to discover meanings of unfamiliar words and to provide example sentences as an important segment in vocabulary presentation and increases information processing loads. It also helps learners to elaborate relevant syntactic information, and thus the target words can be restored in the long-term memory in more complete forms, which leads to a better access to them (Obermeier, 2008, p. 418).

#### ***Vocabulary Notebooks with Pictures***

In case of the two other classes, the participants were to make the words' definitions visualized by paintings or cutting pictures from different sources and glue them in their notebooks, (everything except writing the exact definitions). As mentioned before, this study took place in elementary levels in which most of the book contains concrete vocabularies, so using pictures is really an interesting way to elicit meaning of unknown words (Blessman & Myszcza, 2001; Marzano, 2001).

The implementation schedule also included activities for incorporating the notebooks into classroom activities. Each week, time set aside for students to share the information in their notebooks with their classmates, and to test each other on the notebook words.

At the end of each week of treatment, the teacher collected the notebooks and checked if the students added the assigned information such as, arranging pictures. The relevancy of pictures in the other groups the information which was copied from dictionary and correctness and also relevancy of the sentences as examples for each vocabulary were checked.

The notebooks would be returned to the students on the following session. Students were totally aware that their notebooks would be graded as part of their final score. Two weeks after the end of the instruction, a piloted researcher-made post-test consisted of 30 multiple-choice items based on those 50 vocabularies presented during the instruction was administered to investigate the participants' retention of vocabularies. The time allocated to this test was 15 minutes and range of scores was from 15.

The data obtained from the post-test were analyzed in order to study the impact of two independent variables (keeping notebooks with definitions and keeping notebooks with pictures) and two moderator variables (extrovert and introvert) on the dependent variable (vocabulary retention) of this study.

## FINDINGS AND DISCUSSION

Tables 1 to 11 are presented to address and discuss the research questions, respectively. Following the piloting of the KET on 30 subjects with almost similar characteristics to the target group, the mean and standard deviation were calculated and were found out to be 25.23 and 9.71, respectively. Table 1 shows the descriptive statistics of the KET in the pilot phase.

*Table 1: Descriptive Statistics of the KET Piloting*

	N	Minimum	Maximum	Mean	Std. Deviation
SCORE Valid N (listwise)	30 30	8	42	25.23	9.71

The reliability of the test scores gained in the KET piloting phase. The Kuder-Richardson 20 formula (K-R 20) was employed for this purpose and an acceptable reliability of .81 was calculated. After deletion of the 10 malfunctioning items, the reliability of the test shifted to .88.

### *Descriptive Statistics of KET Administration*

After the procedure of piloting the KET test, it became an instrument to homogenize the students for this study. On the whole, 160 students participated in the test administration. After the administration of the test, descriptive statistics were conducted just as was done in the piloting phase. Table 2 shows these statistics with the mean of 22.26 and the standard deviation of 7.06.

*Table 2: Descriptive Statistics of the KET Main Administration*

	N	Minimum	Maximum	Mean	Std. Deviation
TOTAL Valid N (listwise)	160 160	8	38	22.26	7.06

The reliability of the KET in this actual administration for homogenization of the subjects was calculated too (Table 3). An index of .85 reassured the researchers of the reliability of this test.

*Table 3: Reliability of the KET Administration*

Cronbach's Alpha	N of Items
.85	45

### *Dividing the Learners into the Two Groups*

From among the 160 students who took the test, 120 students' scores fell between one standard deviation below and above the mean, from among which 60 introvert and 60 extrovert students were selected to compromise 120 participants of the study.

### *Checking the Normality*

Four assumptions should be met before one decides to run parametric tests. The data should be measured on an interval scale; the subjects should be independent that is to say none of them participates in more than one group, the data should enjoy normality distributions and the groups should have homogeneous variances (Field, 2009). The present data are measured on an interval scale and none of the subjects participate in more than one group. The assumption of normality is also met. As displayed in Table 4 the values of skewness and kurtosis are within the ranges of  $\pm 2$ .

*Table 4: Normality Test*

Groups		N	Mean	Variance	Skewness		Kurtosis	
		Statistic	Statistic	Statistic	Statistic	Std. Error	Statistic	Std. Error
Extrovert Definition	Pretest	30	8.35	7.416	.506	.427	-.807	.833
	Posttest	30	16.42	8.277	-.878	.427	-.168	.833
Introvert Definition	Pretest	30	7.53	6.947	-.350	.427	-.817	.833
	Posttest	30	16.57	6.530	-.999	.427	1.140	.833
Extrovert Picture	Pretest	30	8.03	10.154	-.214	.427	-.795	.833
	Posttest	30	22.17	10.829	-.910	.427	.489	.833
Introvert Picture	Pretest	30	7.42	10.208	.219	.427	-.845	.833
	Posttest	30	15.30	13.907	-.621	.427	-.149	.833

The assumption of homogeneity of variances will be discussed when reporting the results of the one-way ANOVA.

### Vocabulary Pretest

Prior to the instruction, a researcher-made test including 30 multiple-choice items was administered as pretest. The test content was based on those vocabularies which were going to be taught during the instruction. The test was already piloted with a group having almost similar characteristics to the target group and after running item analysis no item was discarded. Table 5 shows descriptive statistics of vocabulary pretest piloting.

Table5: Descriptive Statistics of Vocabulary Pretest Piloting

Vocabulary Test	Participants	N	Mean	Std. Deviation	Minimum	Maximum
Pre-test	30	30	6.66	8.606	1	4

This study includes four groups; extrovert students and introvert students who keep vocabulary note books with definitions and extrovert students and introvert students who keep vocabulary note books with pictures. A one-way ANOVA is run to compare the four groups' means on the pretest of vocabulary in order to prove that they were homogenous in terms of the vocabulary knowledge prior to the main study.

As displayed in Table 6 the results of the one-way ANOVA ( $F(3, 116) = .65, P = .58 > .05; \omega^2 = .009$  it represents a weak effect size) indicates no significant differences between the mean scores of the four groups on the pretest of vocabulary. Based on these results it can be concluded that the four groups were homogenous in terms of the vocabulary knowledge prior to the main study.

Table 6: One-Way ANOVA Pretest of Vocabulary by Groups

	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	17.117	3	5.706	.657	.580
Within Groups	1007.050	116	8.681		
Total	1024.167	119			

Table 7 displays the means of the four groups on the pretest of vocabulary.

*Table 7: Descriptive Statistics Pretest of Vocabulary by Groups*

	N	Mean	Std. Deviation	Std. Error	95% Confidence Interval for Mean		Minimum	Maximum
					Lower Bound	Upper Bound		
Extrovert Definition	30	8.35	2.723	.497	7.33	9.37	4	14
Introvert Definition	30	7.53	2.636	.481	6.55	8.52	2	12
Extrovert Picture	30	8.03	3.187	.582	6.84	9.22	2	13
Introvert Picture	30	7.42	3.195	.583	6.22	8.61	2	13

**Post-test of Vocabulary Retention**

At the end of the treatment, with a 15-day interval a piloted researcher-made post-test (the parallel form of pretest) was administered in order to investigate the students' retention of vocabularies. It was similar not identical to the pretest. Like the pretest, the test included 30 four-option items. Table 8 shows descriptive statistics of vocabulary post-test.

*Table 8: Descriptive Statistics of Vocabulary Post-test Piloting*

Vocabulary Test	Participants	N	Mean	Std. Deviation	Minimum	Maximum
Post-test	30	30	6.73	8.433	3	30

A one-way ANOVA is run to compare the four groups' means on the post-test of vocabulary in order to investigate the effects of personality types of extrovert and introvert and teaching vocabulary through definitions and pictures on the retention of vocabulary items by Iranian EFL learners.

As displayed in Table 9 the results of the one-way ANOVA ( $F(3, 116) = 28.94, P = .000 < .05; \omega^2 = .41$  it represents an almost strong effect size) indicates significant differences between the mean scores of the four groups on the post-test of vocabulary.

*Table 9: One-Way ANOVA Post-test of Vocabulary by Groups*

	Sum of Squares	Df	Mean Square	F	Sig.
Between Groups	858.356	3	286.119	28.942	.000
Within Groups	1146.750	116	9.886		
Total	2005.106	119			

Table 10 displays the means of the four groups on the post-test of vocabulary.

*Table 10: Descriptive Statistics Post-test of Vocabulary by Groups*

	N	Mean	Std. Deviation	Std. Error	95% Confidence Interval for Mean		Minimum	Maximum
					Lower Bound	Upper Bound		
Extrovert Definition	30	16.42	2.877	.525	15.34	17.49	10	20
Introvert Definition	30	16.57	2.555	.467	15.61	17.52	10	20
Extrovert Picture	30	22.17	3.291	.601	20.94	23.40	14	27
Introvert Picture	30	15.30	3.729	.681	13.91	16.69	6	20

Although the F-value of 28.94 denotes significant differences between the means of the four groups on the post-test of vocabulary retention the post-hoc Scheffe's tests should be run to compare the means two by two in order to probe the two research questions raised in this study.

### *Testing the Hypotheses*

Based on the results displayed in Table10 it can be concluded that:

A: There is a significant difference between the effect of keeping a vocabulary note book with definitions and a vocabulary notebook with pictures on extrovert EFL learners' vocabulary retention (Mean Difference = -5.75;  $P = .000 < .05$ ). The extrovert students keeping note books with pictures (Mean = 22.17) outperformed the extrovert students keeping note books with definitions (Mean = 16.42) on the posttest of vocabulary retention. Thus the first null-hypothesis **is rejected**.

B: There is not any significant difference between the effect of keeping a vocabulary note book with definitions and a vocabulary notebook with pictures on introvert EFL learners' vocabulary retention (Mean Difference = 1.26;  $P = .49 > .05$ ). Thus the second null-hypothesis **is supported**. The mean scores for the introvert students keeping note books with definitions and pictures are 16.57 and 15.30 respectively.

(I) Groups	(J) Groups	Mean Difference (I-J)	Std. Error	Sig.	95% Confidence Interval	
					Lower Bound	Upper Bound
Extrovert Definition	Introvert Definition	-.150	.812	.998	-2.45	2.15
	Extrovert Picture	-5.750*	.812	.000	-8.05	-3.45
	Introvert Picture	1.117	.812	.597	-1.19	3.42
Introvert Definition	Extrovert Picture	-5.600*	.812	.000	-7.90	-3.30
	Introvert Picture	1.267	.812	.490	-1.04	3.57
Extrovert Picture	Introvert Picture	6.867*	.812	.000	4.56	9.17

\*.The mean difference is significant at the 0.05 level.

*Table 11: Post-Hoc Scheffe's Tests Posttest of Vocabulary Retention by Groups*

## DISCUSSION

Through the analysis of the data, it was found that the subjects in the four groups of the study showed some vocabulary gains but it was revealed that the significant improvement occurred in the vocabulary retention of the extrovert learners received vocabulary notebooks with pictures, in comparison to extrovert using vocabulary notebooks with definitions and the two introvert groups of learners.

Using pictures fixed the meaning of the words in the minds of learners, as Monroe (as cited in Robinson, 2011) says, "When students create or use their own pictures, they participate actively and process ideas themselves". She also acknowledges that drawing or using pictures are effective tools for students to refer back to what they have previously learned.

These visual images also provide powerful cognitive prompts to vocabulary development as this task engages both sides of the brain (Edyburn, 2010).

As Sams (2011) claims "It seems logical that this process of longer-term memory through visualization worked because pupils were creating their own personal connection with the vocabulary". Carter, Hardly and Hardly (as cited in Sams, 2011) reported that getting pupils to visualize vocabulary before testing improved scores. Nation (2001) pointed that "This strategy (using pictures) has two strengths; firstly, it provides a bi-directional link with the unknown word since it aids recall of the meaning if given the word and vice versa, and secondly, it provides a highly personalized and therefore memorable method of recall.

Sams (2011) has Pointed to the fact that "It is experienced drawing or applying pictures roots the items in students' mind and one is more likely to be able to visualize and retain an image which has been personally created". These visual images also provide powerful cognitive prompts to vocabulary development as this task engages both sides of the brain (Edyburn, 2010).

Though extrovert learners in this research were better performers, Hutchinson and Gul (1997) found that extrovert students with the desire to participate in group learning situations more are not always those who can really outperform introverts. They also concluded that while the personality traits of introvert students are not considered by the teacher, the innate competence and ability of the students will be mostly hindered and they will not act as they can really do. This is while they concluded that using a proper and convenient method by the teacher can help the introvert students to stick to their real competence and try their best in learning situations.

## CONCLUSION

The outcome of the post-test and pretest analysis clarified that keeping vocabulary notebooks with pictures had a significant effect on extrovert EFL learners' vocabulary retention.

Since all learners were homogenized with respect to their English reading and writing proficiency and then randomly assigned to the four groups prior to the treatment, the final significant difference among the achievement post-test could be attributed to the difference in the types of vocabulary strategy they used.

Also, the extrovert students keeping notebooks with pictures outperformed the extrovert students keeping notebooks with definitions on the post-test of vocabulary retention. According to Ones, Dilchert, Viswesraran, and Judge (2007), hundreds of the primary studies and many of the meta-analyses conducted since the mid-1980s have indicated high support for using personality measures in staffing decision. Further, they maintained that personality conducts can predict and explain attitudes, behavior, performance, and other outcomes in organizational settings.

Therefore, while personality characteristics affect performance in many fields, it seems logical to claim that the teaching/learning profession is not an exception. They concluded that using a proper and convenient method by the teacher can help the introvert students to stick to their real competence and try their best in learning situations.

It is worth mentioning at the end, the rules and restrictions which exist in some language schools in Iran did not allow the teacher –herself being a female– to have male learners in her classes as well as female learners. Hence, the

results of this research cannot be necessarily generalized to male EFL learners. Furthermore, since the participants under study were young adults, the results may not be generalized to older learners.

## **ABSTRACT**

This study was an attempt to carefully analyze the subject of test bias. Different sources of bias have been mentioned by different scholars, to be taken into consideration while constructing and administering a test. The most comprehensive account of these sources has been given by Bachman (1990:pp.271-278). He considers cultural background, background knowledge, cognitive characteristics, native language, ethnicity, sex, and age as different sources of bias. In this study, the researcher went through two of these sources of bias namely the impulsivity – reflectivity cognitive styles and sex, and by providing two null hypotheses attempted to find out the effect of these sources of bias on the test takers' performance on a multiple – choice test. After collecting data by the use of a TOEFL test and Eysenck's Personality Questionnaire, two t-tests were run to confirm whether the difference between the means of different groups (i.e. male, female, on the one hand, and impulsive / reflective, on the other hand) is statistically significant or not? The statistics and results showed the rejection of the first null hypothesis and the acceptance of the second one. The first null hypothesis being rejected indicates that the impulsivity -reflectivity cognitive styles of test takers influence on their performance on multiple – choice items test. The second null hypothesis, being accepted, indicates that test takers' sex does not affect their performance on multiple-choice items test.

**KEYWORDS:** Test bias, Cognitive style, Impulsivity, Reflectivity, Gender, Multiple – choice Test.

## **INTRODUCTION**

The historical background of all the trends of testing including the essay – translation, discrete – point, integrative, and communicative approach show that the main concern in all of these trends has been to assess one's true language or communicative ability. However, this task cannot be accomplished easily. And this is largely due to the factors other than communicative language ability which affect performance on language tests. Such a challenge has been described by Bachman (1990) as follows: "Performance on language tests is affected by a wide variety of factors and an understanding of these factors and how they affect test scores is fundamental to the development and use of language tests" (p.81). In order to interpret test scores as indicators of a given language ability, a language testing specialist must be sure that they are influenced as much as possible by that ability. Any factors other than the ability being tested that affect test scores are potential sources of error that decrease both the reliability of scores and the validity of their interpretations. Therefore; it is essential that we be able to identify these sources of error and estimate the magnitude of their effect on test scores. Bachman (1990: 146) classifies these sources of error into three broad categories: (1) test method facets; (2) attributes of the test taker that are not considered part of the language abilities we want to measure, and (3) random factors that are largely unpredictable and temporary. The second category in this classification (i.e. attributes of individuals that are not related to language ability) include individual characteristics such as cognitive style, knowledge of particular content area, and group characteristics such as sex, race, and ethnic background. The individual attributes are likely to affect test scores (Hansen & Stansfield, 1981; Stansfield & Hansen, 1983; Hansen, 1984; Chapelle & Roberts, 1986). Test scores may also be affected by group characteristics such as sex (Clearly, 1968; Cole, 1973; Swinton & Powers, 1980; Farhady, 1982). These attributes are systematic in the sense that they are likely to affect a given individual's test performance. To the extent that an individual test score is affected by test method facets, attributes other than the abilities we want to measure, and

random factors, any inference we make about his/her level of language ability on the basis of his / her test score will be in error to some degree.

### **PURPOSE OF THE STUDY**

Tests as devices to reinforce learning and to motivate students are usually constructed as a means of assessing students' performances (Heaton, 1988: 24). However, students' performances are affected by different factors including individual characteristics such as impulsivity – reflectivity cognitive styles and group characteristics such as sex. The purpose of this study is to determine the extent to which test performance is influenced by factors (i.e. the impulsivity – reflectivity cognitive styles and sex) other than language ability. In fact the exact purpose of this study is to find out how and to what extent the impulsivity-reflectivity cognitive styles and sex affect performance on one of the most common testing techniques namely multiple – choice test.

### **SIGNIFICANCE OF THE STUDY**

A problem related to measurement theory is that of determining the extent to which test performance is influenced by test method and test takers' characteristics. If studies demonstrate that these extraneous factors influence learners' performance on language tests, then language test developers need to take into consideration the effects of these factors while developing tests or interpreting learners' test scores. As this study is an attempt to investigate the extent to which test takers' impulsivity-reflectivity cognitive styles and sex can affect performance on multiple-choice items, its findings would no doubt help those involved in testing to minimize the effects of the factors, and thus make a fairer assessment of the learners' true language ability. This would help language teachers as well in that any development or advancement in language testing would never let language teaching go unaffected. As Upshur (1971: 435–42) noted several years ago, there is an intrinsic reciprocal relationship between research in language acquisition and developments in language teaching on the one hand, and language testing on the other. That is, language testing both serves and is served by research in language acquisition and language teaching.

### **REVIEW OF THE RELATED LITERATURE**

#### ***Test Bias***

##### ***Introduction***

Problems related to bias were among the very first to be addressed in the emerging field of language testing (Bachman 1990: 272). A lot of studies have been carried out to investigate the nature and potential sources of test bias, but there still remains a lot unknown about it. This problem has been articulated by Oller (1979) as follows: "Part of the difficulty is the lack of adequate data. For instance, until recently (Oller & Perkins, 1978) there was no data on the relative importance of language variety bias, or just plain language bias in educational testing in general. There was always plenty of evidence that such a factor must be important to a vast array of educational tests, but how important?" (p.85).

##### ***What is Test Bias?***

Bachman (1990) defines test bias as "the possible systematic differences in test performance that are the result of differences in individual characteristics, other than the ability being tested of test takers, are defined as test bias." (p. 271). Angoff (1993) reviewed the literature on item bias and summarized various definitions as follows: "an item is biased if equally able or proficient individuals, from different groups, do not have equal probabilities of answering the item correctly" (p.4). Angoff quotes Shepard et al. (1981) who viewed biased items from a social perspective and defined it as "a kind of invalidity that harms one group more than another" (p.318). Scheuneman (1975) discussed normal items and believed that "an item is unbiased if, for all individuals having the same score on a homogenous subtest containing the item, the proportion of individuals getting the item correct is the same for each population group being considered." (p.2)

Item response theory which is also known as latent trait theory and item characteristic curve theory was developed to explain how and why certain items favor particular groups (i.e. are biased). Khodadady (1999: 132) contends that due to the influence of external factors such as the gender and ethnicity of test takers on item functioning, item response theory was introduced (Lord & Novick, 1968). The theory tries to estimate item difficulty and other item characteristics without "being affected by the sample of students responding to the items" (Roid & Haladyna, 1982: 216). Lord (1980) explicates the underlying assumption of the item response theory (which accounts for the distinction between biased and unbiased items) as follows: "If each test item in a test had exactly the same item response function in every group, then people of the same ability or skill would have exactly the same chance of getting the item right, regardless of their group membership. Such a test would be completely unbiased. If, on the

other hand, an item has a different response function for one group than for another, it is clear that the item is biased "(p.212)

***Cognitive Style (Learning Style) as a source of bias:***

Cognitive style has been defined in many ways. Some of the definitions are as follows: The term "learning style refers a person's general approach to learning and problem solving" (Reid, 1995: 1997). Learning styles are "relatively stable indicators of how learners perceive, interact with, and respond to the learning environment" (Keef, 1979: 4). They are "the overall patterns that give general direction to learning behavior" (Cornett, 1983: 9). "Learning style is the biologically and developmentally imposed set of characteristics that make the same teaching wonderful for some and terrible for others" (p. 3).

Brown (1994: 104) contends " the way we learn things in general and the particular attack we make on a problem seem to hinge on a rather amorphous link between personality and cognition; this link is referred to as cognitive style". Witkin et al. (1977: 10) define the term "cognitive style" as "characteristic self-consistent mode of functioning which individuals show in their perceptual and intellectual activities." Ausubel (1968: 170) defines cognitive style as "self-consistent and enduring individual differences in cognitive organization and functioning." Ellis (1990: 114) defines cognitive style as "a term used to the manner in which people perceive, conceptualize, organize, and recall information." He (1994: 499) also states that "the idea of learning style comes from general psychology. It refers to characteristic ways in which individuals orientate to problem – solving." Shumin Kang (1999), discussing the topic of learning style, mentions that: "Learning styles are internally based characteristics of individuals of the intake or understanding of new information (Reid, 1995). All learners have individual attributes relating to their learning processes. Some people may rely heavily on visual presentation, others may prefer spoken language, still others may respond better to hands-on activities. It is evident that people learn differently and at different paces because of their biological and psychological differences (Reiff, 1992).

***Impulsivity VS Reflectivity***

It is common for us to show in our personalities certain tendencies toward reflectivity sometimes and at other times impulsivity. Psychological studies have been conducted to determine the degree to which, in the cognitive domain, a person tends to make either a quick or gambling (impulsive) guess at an answer to a problem or a slower, more calculated (reflective) decision (Brown, 1994).

Impulsive and reflective cognitive styles are considered to be an individual's different style of forming concepts, solving problems, and thinking. They are ways in which individuals select hypotheses and process information. R/I describes the disposition to reflect on the solution to a problem where several alternatives are possible and there is high uncertainty over which is correct (see Kagan, Rossman, Day, Albert, and Phillips (1964) for the initial development of R/I). As Kagan (1966) explained, the "impulsives" reach decisions and report them very quickly with little concern for accuracy. Others, of equal intelligence, are more concerned with accuracy and consequently take more time to reach a decision. These are "reflectives."

As a cognitive style impulsivity is a dimension of fast, spontaneous and unplanned performance in cognitive tasks (Kagan 1965). According to Gilpin and Larsen (1981), Kagan (1965) and Porteus (1942) impulsives in psychological literature are described as those easily carried away by new and exciting ideas, and by the prospects of immediate gratification. They tend to act quickly without thinking through the consequences of planning ahead. Reflectives, on the other hand, like to stand back to ponder experiences and observe them from many different perspectives. They tend to postpone reaching definite conclusions for as long as possible. They are thoughtful people who like to consider all possible angles and implications before making a move. Moreover, they tend to adopt a low profile and have a slightly distant, tolerant unruffled air about them (cited in Pirouznia 1994). According to Fontana (1995), reflective children tend to make fewer errors than impulsive ones particularly on challenging and difficult tasks, since they show a strong desire to be right first time, and seem able to tolerate the ambiguity, say, of a long silence in front of the class while they think out the right answer before responding. Impulsive children on the other hand, adopt a "shotgun" approach, firing off answers in the hope that one will be right and that in any case errors will provide appropriate feedback from the teacher to help them to get nearer to the solution next time.

*Impulsivity / Reflectivity and Information Processing:*

People process information in various ways. The majority of the research literature tends to favor some factors related to information processing behaviors as the likely antecedent (s) of R/I. In a number of studies analytic and global processing has been the main concern.

Zelnicker and Jeffry (1976) state that reflective children by attending to the detailed information of a stimulus tend to process information analytically. On the other hand, impulsive children tend to process information globally by attending to a stimulus as a whole. This result was revealed in a series of experiments. In the first, reflective children recalled significantly more detailed information from five sentences than the impulsive ones. In the second, a variant of the Matching Familiar Figures Test was given which included stimuli that could be processed either analytically or globally. Again reflectives were better at analytic processing while impulsives were better at global processing. In the final experiment, impulsive children used a large number of dimensions (global processing) as a first hypothesis in a concept attainment task. However, reflective children were more likely to focus on a single dimension (analytic processing).

Loper and her colleagues (1982) in another study administered a conceptual style task with a modification in which children were reinforced specifically for either global or analytic processing. The results indicated that both impulsive and reflective children were capable of offering either a global or an analytic hypothesis under appropriate reinforcement. Inductive reasoning as a means of processing information, in a study was found to be more effective with reflective persons (Kagan, Person, and Welch, 1966), suggesting that generally reflective persons could benefit more from inductive learning situations. Perhaps the success of inductive teaching methods therefore varies depending on the I/R index of individual students.

*Other Studies on I/R*

It has been found that children who are conceptually reflective tend to make fewer errors in reading than do conceptually impulsive children (Kagan, 1965; Messer, 1976). However, impulsive persons are usually faster readers than the reflective ones, and eventually master the “psycholinguistic guessing game” (Goodman, 1970) of reading in a way that their impulsive style of reading may not necessarily deter comprehension.

A study conducted at the University of Michigan (Doron, 1973) sought to examine the relationship between R/I and reading proficiency in students of English as a second language. Kagan’s Matching Familiar Figures test was used to measure R/I in a sample of ESL student; Doron then administered reading tests of comprehension and speed to the same subjects to determine the correlation between R/I and reading. She discovered that reflective students were slower and more accurate than impulsive students, and suggested that this fact be taken into account in the teaching of reading in ESL (Brown, 1974). Pirouznia’s study (1994) provides continuing evidence for the positive relationship between reflectivity and EFL reading comprehension. In her study, reflective students were perfect and error detection and the mean differences between reflective and impulsive students across grade levels were significant.

***Native Language, Ethnicity, Sex, and Age as other sources of Test Bias***

Ethnic, sex, and age biases in the use of tests for selection decisions have been extensively discussed in the measurement literature (for example, Clearly, 1968; Cole, 1973; Linn, 1973; Flaughher, 1976). These factors, along with native language background, have also been the focus of research in language testing (Bachman, 1990: 278). In studies examining native language background as a factor in performance on the Test of English as a Foreign Language (TOEFL), Swinton and Powers (1980) and Alderman and Holland (1981) both found differential performance across different native language groups. Swinton and Powers found different factor structures for European and non-European language background groups on the structure, written expression, reading, and vocabulary sections of the old five-part TOEFL. Alderson and Holland compared the performance on individual TOEFL items of individuals whose total TOEFL scores were comparable, and found significant differences across different native language groups. Several studies have examined the effects of multiple background characteristics on language test performance. Farhady (1982), for example, found significant relationship between sex, university status, academic major, and nationality, and performance on several measures of language ability. Similarly, Spurling and Ilyin (1985) found that age, language background, and high school graduation have small but significant effects on cloze, reading, and listening test.

In this study, gender and sex refer to the condition of being male or female. In the classification of different sources of test bias, it was mentioned that one of these sources is sex. Though few studies have been carried out on actual foreign or second language performance of males and females, those that exist show the superiority of one sex (i.e. male or female) on specific types of tasks, and for the other sex having superiority on some other tasks. Some SLA studies that have reported sex-related differences are as follows:

Farhady (1982) found that female subjects significantly outperformed male subjects on a listening comprehension test. Eisenstein (1982) also showed that females performed significantly better than males on a dialect discrimination task and in the extent to which they could recognize dialects of greater or lesser prestige. Maccoby and Jacklins (1974) authoritative survey of all extent researches in the area showed that where a gender difference is found, it is nearly always girls who are ahead. To straighten this position, Jespersen, in a section on the "volubility of women", quotes examples from research done on reading speed which found that women tended to read a given passage faster than men and to remember more about the passage after reading it (Jespersen, 1972: 252). Shipman (1971; Stanford research Institute, 1972) found girls clearly ahead on a number of language measures. These studies are representative of the many that have been carried out on child language and show that at any given age, girls will be found to be superior in terms of comprehension, size of vocabulary, reading ability, and handling of complex expressions, etc.

### ***Multiple – Choice Items***

Multiple choice items are said to be the simplest type of fixed response objective item (Hudson, 1973), the most commonly used short answer format (Tuckman, 1975), the most popular form of test item (Popham, 1990), and the most highly regarded objective test item (Mehrens & Lehman, 1991) in measurement and evaluation. Multiple choice items are utilized in almost all pure and applied fields of knowledge ranging from literature and fine arts to medicine. The widespread application of multiple choice item tests stems from their capacity to address the most important processes of cognition and their practicality to be put to almost all educational and non-educational purposes: diagnosis, placement, proficiency, selection, awards, certification, licensure, and employment (Haladyna, 1994). Brown (1976) stated that multiple choice items can be used to measure complex "intellectual" or "reasoning" skills as did Anderson (1972).

Khodadady (1999: 1-3) states that multiple choice items are used in almost all fields of knowledge to measure the mental process of knowledge, comprehension, application, analysis, synthesis and evaluation. Multiple choice items are not the product of measurement and evaluation per se. Whatever is done, thought, felt, seen, etc., by human beings has a multiple choice format in real life. For example, the underlying reason behind a person's preference, to study a book, to write about a topic, to speak with a certain person, to attend a particular meeting and to eat a certain dish can be identified by recognizing his interests, attitudes and aptitudes. Hypothetically speaking, the person's favorite book can be regarded as the best book for him selected among an infinite number of books rivaling as alternatives within the context of his interest. Similarly, selecting a particular dish among all other possible alternatives mentioned in a menu can be justified in terms of that person's tastes. Farhady et al. (1995: 92-93) contend that multiple choice form items are probably the most widely used types of items. They are applicable to a wide variety of skills. Multiple choice items can measure simple learning outcomes more effectively than true-false or matching item can.

## **RESEARCH QUESTIONS**

This study aims at answering the following research questions:

1. Do the test takers' impulsivity – reflectivity cognitive styles affect their performance on multiple – choice items?
2. Does test takers' sex affect their performance on multiple –choice items? If so, to what extent?

## **METHODOLOGY**

### ***Participants***

The participants in this study were 82 graduate and undergraduate students from different fields of study who took the placement test for TOEFL preparation classes held at Tehran University. They were all within the age range of 19-33. First, on the basis of sex, they were divided into two groups: males with 42 and females with 40 subjects. Then, on the basis of their grades on Eysenck's Personality Questionnaire,

they were divided into two groups of reflective and impulsive personality made up of 47 and 35 participants respectively.

### Instrumentation

Two instruments were used in this study:

*Eysenck's Personality Questionnaire*: A questionnaire prepared by Eysenck (1975) to assess the participants' degree of impulsivity / reflectivity. It includes 30 items and in front of each item three answers including 'Yes', 'No', and '?' are presented. The participants are instructed to answer each item by putting a circle around the 'Yes' or the 'No' as quickly as possible. If they find it impossible to decide one way or the other for any reason, they are asked to put a ring around the '?'. The key for scoring this questionnaire is given in table 1.

Table 1: The key for scoring Impulsivity – Reflectivity questionnaire

1,	-	11,	-	21,	+
2,	+	12,	-	22,	+
3,	+	13,	+	23,	+
4,	-	14,	+	24,	-
5,	+	15,	+	25,	-
6,	-	16,	+	26,	+
7,	+	17,	+	27,	-
8,	+	18,	+	28,	+
9,	+	19,	+	29,	+
10,	-	20,	-	30,	+

In this key, the numbers refer to the item numbers in the questionnaire and the sign tells whether it is a 'Yes' or 'No' answer that should be given a point. As an example, consider question 1: "Do you like planning things well ahead of time?" Because there is a minus sign after the number 1 in the key, you give the subject a point if s/he answered with a 'No'. If s/he answered 'Yes', s/he scores nothing; if s/he responded with a '?' s/he scores 1/2. The second question is reverse scored: 'Do you usually make up your mind quickly?' This time, because the sign is a plus, it is the 'Yes' which scores 1 and the 'No' which scores zero; the '?' again scores 1/2. To summarize then: if there is a plus sign the 'Yes' scores 1, if there is a minus sign the 'No' scores 1. In either case a '?' is scored 1/2. As there are thirty items in this questionnaire, so the possible range of scores is 0 to 30. To assess the participants' degree of impulsivity reflectivity, Eysenck (ibid: 66) provides the following scale:

#### AVERAGE

I 30 29 28 27 26 25 24 23 22 21 20 19 18 / 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 R

In this scale, those who score 17 or less are considered as reflective and those who score 18 or more are considered as impulsive. The score 17.5 indicates that the subject is in the average domain (i.e. not being a true impulsive nor a true reflective).

*TOEFL test*: As this study was an attempt to find out how and to what extent the impulsivity – reflectivity cognitive styles and gender affect performance on multiple – choice items, and as all the items of a TOEFL (IBT) are in the form of multiple – choice, a TOEFL test (1998) was used as the second instrument of this study.

### Design

The study was conducted on the basis of the ex post facto design (Best 1977), as all the requirements for such a design were fulfilled:

1. There is no treatment.
2. There is no control over the independent variable.
3. The relationship between the variables is not a cause – effect relationship.

### Procedure

#### Data collection

The procedures applied to collect the data are as follows:

Phase (1): Eysenck's Personality Questionnaire was administered to 105 participants to assess their degree of impulsivity- reflectivity. As 23 of these participants failed to fulfill the requirements of participating in this study, (i.e. not being a university graduate or undergraduate, and concerning I/R, falling in the average domain, i.e. scoring

17.5) they were excluded from the rest of the study. The answers given by the 82 remaining participants were scored and 47 participants fell in the reflective domain (i.e. scoring 17 or less) and 35 in the impulsive (i.e. scoring 18 or more). Before the main questionnaire, there were some personal questions about sex, age, and field of study. It turned out that out of 82 participants, 42 were male and 40 were female.

Phase (2): To assess the participants' performance on a multiple- choice test, a TOEFL test was employed. 105 participants took the test, and again for the abovementioned reasons, 23 of them were excluded from the study.

#### *Data Analysis*

To analyze the data, in addition to descriptive statistics, t – test was also used as the appropriate statistical test to confirm whether the differences between the scores are statistically significant or not. To be more exact, first, on the basis of TOEFL scores, the mean of each group (i.e. male, female, impulsive, and reflective) was calculated. Then, to confirm whether the differences between the means are statistically significant, two t – tests were conducted (the first one to compare the means of males and females and the second one to compare those of the impulsive and reflective groups).

## **RESULTS AND DISCUSSIONS**

Testing the first null hypothesis comprised of a comparison between the performance of the impulsive and reflective participants on the aforementioned multiple – choice items test. These statistics are given in table 2.

*Table 2: Descriptive statistics for the impulsive and reflective groups*

GROUP	N	Mean	Std. Deviation	Std. Error Mean
Reflective	47	397.2340	73.6827	10.7477
Impulsive	35	342.2857	65.7126	11.1075

As it can be seen in this table, the mean of the 47 participants who form the reflective group is 397.23. And the mean of the other 35 participants forming the impulsive group is 342.28. To see whether the difference between the means of the groups is significant or not, a t-test was run. The statistics obtained are  $t=3.49$ ,  $df=80$ ,  $p<.001$  (2-tailed).

*Table 3: Descriptive statistics for the impulsive and reflective groups*

	Levene's Test for Equality of Variances		t-test for Equality of Means							
	F	Sig.	t	df	Sig. (2-tail)	Mean Difference	Std. Error Difference	95% Interval Difference	Confidence of the	
								Lower	Upper	
Mark Equal Variances assumed	.602	.440	3.496	80	.001	54.95	15.72	23.67	86.23	
Equal Variances not assumed			3.555	77.352	.001	54.95	15.46	24.17	85.72	

As mentioned before, the level of significance in this study was determined at the 5% (0.05) level of significance. This means that if p (the probability that the result occurred due to chance factors) is 0.05 or smaller, the result is said to be significant, i.e. the result is unlikely to have occurred by chance and is likely to be repeatable. If p is greater than 0.05, the result is said not to be significant. Therefore, it can be concluded that the result of this test is highly significant indicating that the difference between the means of the two groups was due to the independent variable (i.e. the impulsivity- reflectivity cognitive styles). The above-mentioned statistics and results demonstrate that the first null hypothesis of this study is rejected; implying that the performance of test takers on a multiple – choice test is affected by their impulsivity / reflectivity cognitive styles. Testing the second null hypothesis comprised of a comparison between the performance of males and females on the aforementioned multiple – choice test. The descriptive statistics for each group were obtained. These statistics are given in table 4.

Table 4: Descriptive statics for males and females

sex	N	Mean	Std. Deviation	Std. Error Mean
Male	42	371.1905	79.4555	12.2603
Female	40	376.5000	71.2003	11.2578

As shown in table 4 the mean of the male group with its 42 participants is 371.19 and the mean of the female group with its 40 participants is 376.50. Table 5 summarizes the statistics obtained from the t-test. Since the p value of this test (sig (2-tailed) = .751) is greater than our level of significance. (0.05), it can be concluded that the result of this test is not significant indicating that the difference between the means of the two groups was likely (a.75 probability) to be due to chance factors rather than the independent variable (i.e. gender). So the second null hypothesis of this study is accepted, i.e. test takers' gender does not affect their performance on multiple – choice tests.

Table 5: T- test for the performance of males and females

	Levene's Test for Equality of Variances		t-test for Equality of Means						
	F	sig	t	df	Sig. (2-tail)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
								Lower	Upper
Mark	.871	.354	-.318	80	.751	-5.31	16.69	-38.5	27.90
Equal Variances assumed			-.318	79.712	.751	-5.31	16.64	-38.4	27.82
Equal Variances not assumed									

## CONCLUSIONS AND IMPLICATIONS

### Conclusions

The results of this study confirm the effect of cognitive characteristics (as one source of test bias) on the performance of test takers on M.C test. The great difference between the means of the two groups (i.e. impulsive and reflective) and the low P value (a.001 probability) encourage the researcher to claim that this result was just due to the independent variable. Concerning the first hypothesis, the researcher came to the conclusion that reflective participants performed better than the impulsive ones on the multiple – choice test. Several reasons might account for this. The most tangible and important reasons are the features of each style and also the nature of multiple – choice tests. Having characteristics of impulsive – reflective and features of multiple – choice items, it can be concluded that the result of the present study was somehow predictable; that is, answering a multiple choice item just requires the psychological process of recognition, and in responding to such an item, there is no “obstacle” (utilizing other psychological processes) to the hurried and premature decisions of impulsive examinees. Thus, in this type of test item, the speed with which the impulsive examinees take a decision is very high and this adds to the probability of having more mistakes. However, this is not the case with reflective subjects. As they always think before making a decision, so the presence or absence of this “obstacle” makes no (or little) difference.

Concerning the second null hypothesis, a difference was noticed between the means of the two groups (i.e. male and female), but it was not statistically significant enough to reject the hypothesis. So, the researcher couldn't find enough evidence to confirm the effect of gender on the test takers' performance on multiple –choice tests. However, this is not to say that this factor undoubtedly doesn't have any influence on the performance of test takers on M-C test in particular and language test in general, and this area (i.e. gender as a source of test bias) is open to further research. A different or larger sample will perhaps show other results.

### Implication

The findings of this study can be useful for English teachers (involved in language testing) in that their judgment about students' scores on difference types of test including multiple – choice items should not be merely attributed to their language ability, but factors such as the impulsivity – reflectivity cognitive styles of test takers should be taken into consideration. The findings may also be of many uses to curriculum developers, syllabus designers, and test developers. Taking insights from such studies, they will be able to justifiably change the linguistic approaches to both language teaching and testing. In that case, psycholinguistic approaches would be the focal point of language teaching syllabuses and language testing materials. The results of such studies can help ESL / EFL professionals deepen their understanding of the nature of human differences in learning, so that they can use more effective

procedures in teaching and testing different groups of learners. In the researcher's opinion, the ultimate goal of such studies will be individualized teaching and testing, i.e. each learner or group of learners with the same learning style must be taught and tested through their individual characteristics.

To make ESL / EFL learning / teaching successful, educators must understand and respect individual's diverse learning styles and make efforts to create optimal learning environment for learners. Testing is, no doubt, one part of learning / teaching process, so here again individuals' different characteristics such as the impulsivity – reflectivity cognitive styles, sex, age, background knowledge, etc (as different sources of test bias) must be taken into consideration, otherwise tests will be biased for or against various test takers.

### **Delimitation**

The first limitation of this study is its confinement to just one of testing techniques (i.e. multiple – choice test). Another limitation is that the researcher limited himself to the test takers' impulsivity – reflectivity cognitive styles and sex without taking into consideration the other sources of bias including age, background knowledge, cultural background, ethnicity, and native language.

## **ABSTRACT**

The purpose of this study was to examine the English language needs of Medical students at Tehran University of Medical sciences. Analysis of the needs took place for three groups: 320 undergraduate students, 30 postgraduate students and 20 university instructors. A triangulation approach to collect data was used in which a combination of the quantitative (using the questionnaires) and qualitative (interviews) methods was employed. The questionnaire was slightly modified version of the one used by Farhady (2007). Interviews were held with randomly selected 10 participants in each groups. The obtained data from the questionnaires were analyzed through a variety of descriptive statistics such as frequencies, percentages, means, and standard deviations. Comparisons across the groups were then made through inferential statistics such as ANOVA. The findings revealed that Instructors gave highest importance to all four categories: current language skills, current academic skills, future academic skills, and future career skills. Undergraduate students basically rated all four kinds of skills as moderately important. As such, the postgraduate students group can be seen to diverge completely from ratings given by the Instructors and Undergraduate students in the current language and academic skills categories, and to a lesser degree as it relates to future career and academic skills. The results of interviews indicated that Instructors regarded English language as important in medical fields and Undergraduate students stated that the general English books courses were dissatisfied but Postgraduate students indicated that Language skills and specialized skills importance were also top priority for all Undergraduate students.

**KEYWORDS:** Needs Analysis, Needs Assessment, English for specific purposes ESP courses, Medical Students, IRAN

## **RESEARCH STUDIES IN NEEDS ANALYSIS**

Typically, needs analysis is done on language programs serving adults in academic and professional programs. The following overview provides a sampling of recent studies in needs analysis conducted in different parts of the world. This overview will first present studies conducted within the field of medical English and then present other studies in English for specific purposes. Boshier (2002) conducted a needs analysis study to determine why many ESL students enrolled in a nursing program were not succeeding academically. Interviews, observations, and questionnaires were used to gather information about the objective needs of students. The findings indicated that communicating with clients and colleagues in the clinical setting was perceived as the greatest difficulty. Based on the needs analysis, a course on Speaking and Listening in a Health-Care Setting was developed to respond to what was identified as students' area of greatest difficulty. The content of the course was divided into four units: assertiveness skills, therapeutic communication, information-gathering techniques, and the role of culture in health-care communication. A variety of methods and materials drawn primarily from sources for developing health-care communication skills was used to develop the curriculum.

Mazdayasna and Tahririan (2008) investigated the foreign language learning needs of undergraduate medical sciences students studying in faculties of nursing and midwifery in Iran. A total of 681 undergraduate students as well as 168 subject-specific instructors and 6 EFL instructors participated in the study, which was designed on a qualitative-quantitative survey basis using interviews and questionnaires. Extensive qualitative and statistical analysis of the data revealed that most of the students perceived that they needed to master the foreign language before they attended their specialized courses because they needed to use Persian and English sources to study their subject. Over one-third of the students expressed their dissatisfaction with the number of students in each class, with the teaching methodology used, the method of evaluation, and the amount of foreign culture taught in the class and

content of the textbook. Equally, the subject-specific instructors' responses revealed total dissatisfaction with their students' language skills. It can be inferred that this course does not fully prepare the students to embark on their studies because it does not sufficiently take into account their (1) learning needs, (2) present level of foreign language proficiency, (3) objectives of the course, (4) resources available in terms of staff, materials, equipment, finances and time constraint, (5) the skill of the teachers and the teacher's knowledge of the specific area.

Salehi (2010) investigated the English language needs of Engineering Students. The purpose of the study was three-folds: to evaluate students' needs, to evaluate the psychometric qualities of the developed questionnaire, and to explore the possibility of writing a textbook based on the insights gained from the study. To evaluate the students' needs, wants, and lacks (Hutchinson & Waters, 1987), a questionnaire was administered to 225 students at Sharif University of Technology when they took their final exams. Students' scores were made use of with respect to one dimension of the questionnaire which dealt with students' self-assessment of themselves most of which correlate positively with their final scores. Another purpose of the study was to evaluate the questionnaire itself in terms of its statistical properties. In other words, a construct validation study was conducted. There were distinct parts to this questionnaire. A confirmatory factor analysis using Principal Components Analysis (PCA) with varimax rotation was applied to see if different needs were neatly delineated by the questionnaire. Having applied a CFA with PCA using a three-factor solution, it was seen that items loaded on the expected factors with high loadings. In terms of students' needs, here are the findings: Translation was not deemed appropriate. Note taking was not considered important in their future careers. Technical writing was considered to be very important. Unfortunately, the skill has been totally ignored in the English curriculum in the university. Eslami (2010) investigated the English language needs for Academic Purposes (EAP) in Iran. She believes EAP plays a highly important role in countries where English is used mainly for academic purposes. However, EAP programs have been developed without conducting a systematic needs analysis from both the students' and instructors' perspective. The purpose of this study is to describe the perception that EAP students and instructors have of the problematic areas in EAP programs. A total of 693 EAP students majoring in different academic fields and 37 instructors participated in this study. Survey information included respondents' perception the importance of problematic areas in EAP programs. The results show discrepancy between the perceptions of EAP learners in different academic fields and between learners and instructors. The study has implications for curriculum design and instructional delivery of EAP courses for college level students.

## RESEARCH QUESTIONS

The researcher formulated the following research questions:

1. What are the specific English language needs of Iranian medical students?
2. What language skills do medical students need to develop in high level of education?
3. What language skills and sub-skills students' vocational future lack?

## METHODOLOGY

To obtain more reliable data from the participant via different sources, a triangulation approach to collect data was used in which a combination of the quantitative (using the questionnaires) and qualitative (interviews) methods was employed. Triangulation is a procedure long used by researchers, for instance, ethnographers, to work within a tradition to help validate their data and thereby, eventually, to increase the credibility of their interpretations of those data (Long, 2005). The process involves the researcher to compare two or more different sources, methods, investigators or theories, and sometimes combinations thereof (Lincoln & Guba, 1985; Long 2005). In this study, the data sources are of two kinds: one is the language instructors and the other is the students. By triangulating these sources and methods of collection of data, the obtained information would be more reliable and as put forward by Jick (1979) would depict a more complete, holistic and contextual portrayal of the unit(s) under study. In the present study, interviews were done with 30 that were randomly selected from each of the three levels at the Medical University of Tehran (i.e., Instructors, postgraduate students, and undergraduate students). The methodology underlying the research was both quantitative (through the implementation of the questionnaire) and qualitative (the interviews).

### *Participants*

The required data were collected through two channels: semi-structured interviews and a questionnaire. The questionnaire was slightly modified version of the one used by Farhady (2007) and is applied by the researcher and it was developed in three versions, one for the Undergraduate students and the other for the instructors and, one for postgraduate students.

All the items of the questionnaires categorized into three main parts: 1) the undergraduate students' present status in terms of their English language proficiency and educational level; 2) the perceived needs of postgraduate students in academic context and 3) the perceived needs of the future of students in the occupational context. All the items in the questionnaires were in Likert-scale form within the range of not important, fairly important, just important and very important.

The questionnaire used in this study was originally developed in three different versions to be used with the instructors, the undergraduate students, and the postgraduate students of three faculties in Medical University of Tehran and related hospitals. The questionnaires were piloted in the second semester of the academic year 2013. The reliability of the questionnaire according to the present context and situation was calculated by piloting the questionnaire with a population of 15 numbers from the Tehran Medical Sciences University. The participants gave the questionnaires during their final exam and gave enough time to complete them. Semi-structured interviews were conducted with a sub sample of the participants. Interviews were held with randomly selected 30 undergraduate students and 30 postgraduate students and 30 Instructors at Tehran University of Medical Sciences. Semi-structured interviews lasted 45-60 minutes, conducted in order to elicit their perception about language skills at the university. Interview questions addressed what they thought about academic listening, writing, requirements for their writing, how they get about writing a paper, how they solved their writing difficulties and so on. Questions asked were not in a fixed order, nor were they asked by repeating exact phrasing for each question. They were asked and answered in Persian, the participants' mother tongue. All interview data was later transcribed into English, with each participant given a pseudonym. The interviews were semi-structured and the main theme of the questions based on the items in the questionnaire in order to elaborate on some of the issues and gather some supportive data to clarify the already mentioned aspects in the questionnaire. The interview participants were 30 numbers in each group (Instructors, postgraduate students, Undergraduate students). The main goal in interviewing the graduate students was to find out which areas of the English language skills they are in need of more, hence predicting the most necessary subject matters to be included in the syllabus of undergraduate ESP courses. During the interviews, the participants could have the questionnaire with themselves which help them elaborate on their ideas which they had already expressed in the questionnaire. The questions of the interview were the required skills and knowledge of students about language skills.

### ***Questionnaire Development***

The following steps were taken to the development of the questionnaires: The questionnaire used in this study was the adaptation and modified version of one used by Farhady (2007). A few items from the original study were deleted and some background questions were added to obtain more information about the participants. To ensure the appropriateness and comprehensibility of the questionnaire items, four instructors and four postgraduate students were consulted. The questionnaires were piloted in the second semester of the academic year 2013. The reliability of the questionnaire according to the present context and situation was estimated after piloting the questionnaire within a population of 20 students. Then, the items were translated into Farsi. After checking the translation for accuracy, they were evaluated by 20 students attending their ESP classes at Tehran Medical Sciences University and some of their opinions were considered while preparing the last draft in Farsi. A total of 320 undergraduate students and 30 postgraduate students and 20 instructors majoring in TUMS were selected through purposive sampling. The students were taking ESP as a compulsory course during their university studies at Tehran university of Medical Sciences. The questionnaires were used in forms of three groups of participants: one for the instructors, another for undergraduate students and the other for the postgraduate students of the Medical University of Tehran.

### ***Interviews***

The interviews asked students about the language skills needs about ESP course and their teachers' attitudes. To search for the rival explanation, interviews were performed with randomly selected instructors, as well. They were asked about English level of students and language skills at university and vocational future. The students from the Medical University of Tehran list were called individually in an attempt to obtain the permission to conduct in-person interviews.

Semi-structured interviews were also conducted with a sub sample of the participants. The interview participants were 10 that were randomly selected from each of the three levels at the Medical University of Tehran (i.e., Instructors, postgraduate students, and undergraduate students) total 30 participants. These Semi-structured interviews, each lasting 45-60 minutes, were conducted in order to elicit their perceptions about language skills at the university levels. The constituting questions addressed what they thought about academic listening, writing, requirements for their writing, how they get about writing a paper, how they solve their writing difficulties and so on. The questions asked were not arranged in a fixed order, nor were the students asked through repeating exact phrasing for each question. The questions were asked and answered in Persian, the participants' mother tongue. The main theme of the interview questions was developed on the basis of the questionnaire items in order to elaborate on some of the issues raised in such quantitative data, also to gather supportive data that can clarify the already mentioned aspects in the questionnaire. All interview data were then later transcribed into English, with each participant given a pseudonym. Both the students from the TUMS list as well as their instructors were called individually in an attempt to receive their consents and permission to conduct in-person interviews.

### ***Procedures***

The first questionnaire was distributed among 20 university instructors at Tehran University Medical sciences and second questionnaire was distributed among 30 postgraduate students at Tehran university medical science and the third questionnaire developed to probe the language skills of the subjects was distributed among 320 undergraduate students at Tehran Medical Sciences University who made copies. The researcher called the officials at the hospitals and explained to them the nature of the study and informed them that his assistant would hand them the questionnaires. When the assistant went to each selected hospital, he also explained orally to the heads of Human Resources at each hospital the nature of the study. The cover page of the questionnaire also contained written explanation about the nature of the study. The researcher and the assistant made daily follow up phone calls to each hospital in order to ensure the maximum possible response rate. As mentioned, there were over 320 undergraduate students, 20 university instructors and 30 postgraduate students participating in this study. All the undergraduate students studied at Tehran University medical science consisted of different proficiency levels. This variance was due to the fact some of the undergraduate students might had English courses apart from the ones needed for university. This discrepancy was useful, because in this way researcher could had a collection of ideas from different viewpoints around the same subject. In TUMS all the students from all language proficiency levels had to pass the same course, therefore, there might be sharply different attitudes about the course among the students. TUMS has been placed among the best universities in Iran; to enter this university, the candidates passed the national university entrance exam with the highest rankings possible.

### ***Data analysis***

The data obtained through the data collection phase were of two distinctly different types; one was the numerical data gathered via the questionnaire and the other one was the qualitative data gathered during the interviews. Analyzing the data of these two sources requires different analysis approaches. The obtained data from the questionnaires were analyzed through a variety of descriptive statistics such as frequencies, percentages, means, and standard deviations since the nature of this part of study was descriptive. Comparisons across the groups were then made through inferential statistics such as T-Tests. All the data obtained from the quantitative phase were analyzed using SPSS software. Analyzing the qualitative data was a time-consuming task which required plenty hours of close scrutiny. Content analysis was followed in order to extract the underlying themes of the datasets produced by the interviewees. In this way, first the categories of data were developed from the interviews transcriptions and notes and then each category was further analyzed to determine major themes. Open and selective codings were thus used as the major procedures for data analysis.

## **RESULTS**

The main objective of the questionnaire was to find out about the participants' perception of the purpose of English language future communicative needs of Tehran Medical Sciences University students in medical fields. Information about the four skills was important to compare and contrast their usage in the medical field. The data showed in total, 55 % of participants in the study were females and 45 % were males.

### ***The findings of the Research Questions***

#### ***Questionnaire Analysis***

Q1: What are the language needs of the medical students of TUMS in the undergraduate level in terms of skills and language areas?

*Table 1: One-Sample Test (Instructors' views)*

	Test Value = 2.5	
--	------------------	--

		Mean	Std. Deviation	T	df	Sig. (2-tailed)	Mean Difference	95% Confidence Interval of the Difference
Groups	var							Lower Upper
Instructors (20 samples)	Language skills requirement(current)	3.27	0.53	6.49	19	.000	.7687	.5211 1.0164
	educational skills(current)	2.90	0.56	3.21	19	.005	.4000	.1396 .6604
	Language skills requirement(future career)	3.19	0.61	5.00	19	.000	.6875	.4000 .9750
	Specialized skills(future career)	3.18	0.52	5.77	19	.000	.6767	.4314 .9220
	Reading and Writing Text spices(During the study)	2.85	0.77	2.03	19	.056	.3500	-.0092 .7092
	Reading and Writing Text spices(future career)	3.04	0.85	2.85	19	.010	.5444	.1458 .9431

The data on Table 1 showed t-test on Instructors' views. Since t-test calculated for all components in comparison with the t-test table (1.96) is larger. Therefore, it can be concluded with 95% confident level Instructors mean views on language needs students studying the language skills they learn, assuming the mean ( 2.5), there are significant differences( $p < 0/05$ ).

*Table 2: One-Sample Test (Postgraduate Students views)*

		Test Value = 2.5							
		Mean	Std. Deviation	T	f	Sig. (2-tailed)	Mean Difference	95% Confidence Interval of the Difference	
Groups								Lower	Upper
Postgraduate Students (30 samples)	Language skills requirement (In studying)	1.86	0.69	-5.111	9	.000	-0.64	-0.90	-0.38
	Specialized skills	1.78	0.67	-5.874	9	.000	-0.72	-0.98	-0.47
	Relationship with cases (Except in special field)	2.03	0.54	-4.847	9	.000	-0.48	-0.68	-0.27
	Language skills importance (in career situation)	2.82	0.73	2.375	9	.024	0.32	0.04	0.59
	Specialized skills importance(in career situation)	2.66	0.68	1.282	9	.210	0.16	-0.10	0.42

The data on Table 2 showed the results of the test statistics on Postgraduate Students views. Since test statistics calculated for all components in comparison with the test statistics table (1/96) is larger. Therefore, it can be concluded with 95% confident level Postgraduate Students mean views on language needs students studying the language skills they learn, assuming the mean ( 2/5), there are significant differences( $p < 0/05$ ).

Table 3: One-Sample Test (Undergraduate students' views)

		Test Value = 2.5							
		Mean	Std. Deviation	t	df	Sig. (2-tailed)	Mean Difference	95 Confidence Interval of the Difference	
Groups								Lower	Upper
Undergraduate students (320 samples)	Individual assessment of English language ability	2.62	0.55	3.992	319	.000	.1228	.0623	.1833
	Language skills importance	3.02	0.64	14.622	319	.000	.5227	.4523	.5930
	Specialized skills importance	2.92	0.70	10.793	318	.000	.4207	.3440	.4974
	Language skills importance (in career situation)	3.06	0.63	16.019	318	.000	.5631	.4939	.6322
	Specialized skills(future career)	2.97	0.64	12.896	318	.000	.4653	.3943	.5363

The data on Table 3 showed the results of test statistics on Undergraduate students' views. Since test statistics calculated for all components in comparison with the t-test table (1.96) is larger. Therefore, it can be concluded with 95% confident Undergraduate Students mean views on language needs students studying the language skills they learn, assuming the mean (2.5), there are significant differences( $p < 0.05$ ).

Q2: Do the current ESP courses offered at this university meet the needs of the students in the higher levels of education?

Table 4: Frequency distribution answers of Instructors to Medical students need language skills (career future)

Improving Language skills	Not important		fairly important		just important		very important	
	Frequency	Percent	Frequency	Percent	Frequency	Percent	Frequency	Percent
1. Listening and comprehension(general)	1	5.0	2	10.0	8	40.0	9	45.0
2. Listening and comprehension(proficiency)	2	10.0	4	20.0	7	35.0	7	35.0
3. Speaking (general)	1	5.6	1	5.6	10	55.6	6	33.3
4. Speaking(proficiency)	1	5.6			6	33.3	11	61.1
5. Reading and comprehension(general)			4	20.0	7	35.0	9	45.0
6. Reading and comprehension(proficiency)			3	15.0	7	35.0	10	50.0

The data on Table 7 revealed that 30.83% of Postgraduate students submitted that specialized skills were very important needs of Students in their career and academic future; 44.31% was of the view that Improving specialized skills were just important items; 19.46% of Postgraduate students said that Improving Language Skills were fairly important while; 5.43% of Postgraduate students claimed that they were not important. This result indicated that more than 74% of Postgraduate students agreed that Improving Language skills were high needs of Medical Students in their career and academic future.

*Table 8: Comparison of the frequency responses and the percentage of Instructors, Postgraduate Students and Undergraduate Students required Skills of Medical Students at university and vocational status*

Groups	Required Skills of Medical Students	Not important	fairly important	just important	very important
<i>Instructors</i>	Improving Language skills(current)	2.50	13.75	38.13	45.63
	Improving Academic Needs(current)	15.71	12.21	36.09	35.97

	Improving Academic Needs (Career and Academic Future)	5.43	19.46	44.31	30.83

The data on Table 8 are analyzed in discussion section.

## DISCUSSIONS AND CONCLUSIONS

After analyzing the data, the needs of the Postgraduate Students and Undergraduate Students were determined as well as the extent of the relationship among these needs and their Instructors' perception of them. This study set out to explore Medical students' needs of English. Based on Perceived importance of required second language skills of medical students among university Instructors, Postgraduate students and Undergraduate students, when compared in terms of frequency responses varies considerably. The most marked difference among the three groups of raters ( Instructors, Postgraduate students and Undergraduate student is due to the Postgraduate students' ratings. Postgraduate students rated current language skills, current academic skills as unimportant, future academic skills as important, and future career skills as moderately important. As such, the post graduate students group can be seen to diverge completely from ratings given by Instructors and Undergraduate students, in the current language and academic skills categories, and to a lesser degree as it relates to future career and academic skills. The postgraduate students marked Language and specialized skills as equally important for success in their current academic studies and their future jobs. The chance to improve certain language skills and specialized skills were a top priority for all postgraduate students. They had a marked preference for being trained on issues involving 'Language skills 'and specialized skills' in career situation. Language skills and specialized skills importance were also top priority for all Undergraduate students. Required Skills of Medical Students by Instructors marked Improving Language skills (current) and career future and Improving Academic Needs (current) as top priority. In contrasts, the postgraduate students group can be seen to diverge completely from ratings given by Instructors and Undergraduate students, in the current language and academic skills categories, and to a lesser degree as it relates to future career and academic skills. Also postgraduate students' interviews expressed fully that the role of Instructor is to draw on students' knowledge of the content to generate communication in the classroom and to help students develop academic language skills which are useful in the study of their disciplines rather than to help them acquire knowledge of their subjects. Postgraduate students' interviews also revealed that the Instructors' objective is to help learners use English effectively in the study of their major disciplines in medical sciences. The discipline-based English books should be developed with a future perspective and with demonstrative practical functions for vocational careers. The Postgraduate Students' assessments of the most difficult specialized skills implies the necessity of directing attentions to those areas in which Medical students have more problems in career and academic future. Including Translation, Writing Scientific Articles, Technical Letter writing may be one solution to this problem. In general all Postgraduate Students were disagreeing on language lessons were learned and to improve further steps should be taken to achieve

a high level language. While the degree of importance was lower for undergraduate students group; nonetheless, undergraduate students basically rated all four kinds of skills (current language skills, current academic skills, future academic skills, and future career skills) as moderately important, just like the Instructor group, albeit, as just stated, to a lesser degree. This implies the necessity of making the ESP Medical students conscious of the part language and specialized skills may play in their career achievements. The results also indicated that, according to Undergraduate students' perceptions, they need knowledge of language in their future career, more than half of the Undergraduate Students agreed that Improving Language skills and Improving Academic Needs were high needs of Medical Students at university, the most important academic English language skill for the Undergraduate students' study is web search, followed by Writing Scientific Articles, and then Translation. It also has an implication for course designers or authors to reconsider the current lack of emphasis on the development of Improving Language and academic skills. Some insights into postgraduates' students, undergraduate students and Instructors' expectations and needs were provided through interviews, which complemented the findings of the questionnaires.

The results of Instructors' interviews indicated that Instructors regarded English language as important in medical fields because science is changing and developing and English is the lingua franca of medical sciences. The results of Undergraduate Students' interviews revealed that the general English books courses were dissatisfied. Nearly all English classes are Instructor-led tutorials in which Undergraduate students are passive. This implies reconsidering the kinds of teaching approaches used in such classes. To sum up, the current study explored Instructors, Postgraduate Students and Undergraduate Students' perceptions about the importance and use of English language skills for the students' academic and career needs in the context of teaching English. Since the Instructors' views did not match the Postgraduate student's self-perceptions of their language abilities, need for doing further research in a wider scope with a larger population is felt in order to investigate the match between Instructors and subjects' views regarding the difficulty of different aspects of language for ESP students. This may enable course designers or material developers to focus their attentions more on those aspects of the language with which the subjects have more problems.

### **LIMITATIONS OF THE STUDY**

The results of the current study might be treated with circumspection with regard to the following de(limitations): The following limitations might somehow influence the values of the reliability, validity and correlation coefficients of the tests, and the generalizable extent of the results of the research to other situations and participants.

1. The size of the statistical population of this study (20 university Instructors and 30 Postgraduate Students participating in this study except Undergraduate Students) among Instructors and Postgraduate Students are too small to generalize the findings.
2. The effect of the participants' gender on the results of the research has been ignored.
3. There were not enough sources regarding the issues such as language skills ,academic skills and Specialized skills in career and Academic Future .

### **ACKNOWLEDGEMENT**

The researchers of the present study would like to thank to Mr.Rasoul Babamoradi researcher of Tarbiat Modares University in Tehran for his helpful comments and suggestions on earlier versions of this paper.

**ABSTRACT**

Throughout the years, word association methods have established themselves as valuable resources for gaining knowledge in various domains of research. This study, therefore, was an attempt to compare and contrast the word association behavior of children and adults in Persian language. To this end, 24 four to six-year-old children recruited from a day care center and 23 undergraduates studying at an institute of higher education in Shiraz, Iran were given a single-response free word association test. The analysis of the responses to the word association test revealed that both age groups had an inclination towards generating syntagmatic responses, and the concrete stimulus words elicited more syntagmatic responses than the abstract words; Moreover, in all word class types under scrutiny (e.g., nouns, adjectives, and verbs), syntagmatic responses outnumbered the other three types of responses. The findings of this study bring into question the generality of the syntagmatic/paradigmatic shift phenomenon for a language like Persian.

**KEYWORDS:** word association, syntagmatic responses, paradigmatic responses, free word association task

**INTRODUCTION**

Word associations, initially used for investigation of human thought and personality (Koff, 1965), are renowned from the field of psychology (Wettler, Rapp, & Feber, 1993, cited in Rapp, 2002). In essence, knowledge about words and word associations (i.e., their relationship to one another) is crucial to various domains of research.

The significance of word association methods in experimental psychology is well documented. Computer-based psychological research has taken advantage of word association methods in the creation and investigation of word association networks (De Deyne & Storms, 2008), semantic networks (De Deyne, Navarro, & Storms, 2012), knowledge organization systems (Peters & Weller, 2008), and other related studies (Altarriba, Bauer, & Benvenuto, 1999; Rapp, 2002; Eakin, 2010).

Word associations have also been used in the study of deaf children (Frick, 1966), mental retardates (Keilman & Moran, 1967), and, recently, children with Autism Spectrum Disorder (ASD) and Language Impairment (McGregor et al., 2012).

These are not the only disciplines that have shown a keen interest in word association methods. Cognitive psychology, psycholinguistics, and applied linguistics are disciplines that have found word association tests quite useful in gaining insights into the very nature of human cognitive system and semantic knowledge. The sizable number of word association studies conducted in the above-mentioned disciplines does not allow us to list them all here; however, a few lines of research pertinent to the current study are going to be presented below after summarizing the rudiments that seem necessary for a better understanding of the discussion that follows.

Wolter (2001) identified three categories of word associations: paradigmatic, syntagmatic, and phonological or 'clang' responses" (Khazaeenezhad & Alibabae, 2013, p. 108). Paradigmatic responses, which reflect within-category associations (e.g., dog- cat), are the same part-of-speech as the stimulus word; therefore, we can substitute one of the two words in the association for the other one without affecting the grammaticality of the sentence (Rapp,

2002). Syntagmatic responses, on the other hand, show thematic or within-event associations (e.g., dog-bone) and are not necessarily the same part-of-speech as the prompt word. Syntagmatic responses often appear within a phrase or in a syntactic structure (Rapp, 2002; Rahimi & Haghighi, 2009). Phonological responses, also called clang responses are "semantically unrelated but similar-sounding words" (Khazaenezhad & Alibabae, *ibid*). Clang responses also include orthographical responses, which are associations based on the spelling or physical form of the word. McCarthy (1990), as cited in Rahimi and Haghighi (2009), speaks of another type of responses called encyclopedic responses, which have to do with the respondent's personal experience or knowledge about a given word.

It is evident from earlier studies (Woodrow & Lowell, 1916; Brown & Berko, 1960; Ervin, 1961) that the word association responses of children differ consistently from the association responses of adults. Children have shown a general inclination towards syntagmatic responses, while adults are more likely to produce paradigmatic responses. This developmental change within word association responses has come to be known as the syntagmatic-paradigmatic (S-P) shift. It is assumed that the shift is largely due to schooling and an increasing mental age (Cronin et al., 1985).

Some scholars conceive of the differences in the associative responses of children and adults as being semantic in nature (Brown & Berko, 1960). According to these scholars, "children are said to give more 'contiguity' responses and more 'whole-part' responses while adults are said to give more 'coordinate', 'contrast', and 'similarity' responses (Brown & Berko, 1960, p. 2). In addition to these differences, children's associations are heterogeneous-by-part-of-speech, yet adults' associative responses are homogeneous-by-part-of-speech (Brown & Berko, 1960).

The present study, therefore, aims at investigating the word association behavior among Iranian children and adults in order to come up with the differences that exist between the two populations in the type of associative responses.

## **SIGNIFICANCE OF THE STUDY**

The word association studies carried out to date have been conducted, for the most part, in English or other European languages. It is, therefore, of great interest to investigate the word association behavior in a language structurally and culturally different from languages already studied (Sharp & Cole, 1972). Moreover, the very few studies conducted on this issue in Iran have focused solely on Iranian undergraduate EFL learners (Rahimi & Haghighi, 2009; Mohammadi, Alavinia, & Pouyan, 2012; Khazaenezhad & Alibabae, 2013). No published studies have been reported on word association behavior among young children in Iran as compared with adults; consequently, this study is the first one to be conducted on both children and adults in Iran, and it is of particular significance as a developmental study.

## **RESEARCH QUESTIONS**

The present study was an attempt to seek answers to the following research questions:

- 1) Are there any differences between the associative responses of children and adults in Persian language?
- 2) Does concreteness affect the type of elicited responses?
- 3) Do different word class forms (nouns, verbs, and adjectives) elicit different response types?
- 4) Is the syntagmatic/paradigmatic shift phenomenon generalizable to the Persian language?

## **METHODOLOGY**

### ***Participants***

The participants for this study were 24 four to six-year-old children (13 girls, and 11 boys) recruited from Bachehaye Emrooz Day-care Center located in a middle-class residence area of Shiraz, Iran, and 23 freshmen (18 females, and 5 males) studying at Zand Institute of Higher Education. The freshmen, aging from 18 to 46, were in the second semester of their studies.

The gender variable was not controlled for the present study owing to the fact that previous studies had not shown any significant differences in the response behavior of male and female participants. Among children of different age groups, this study showed particular interest in the investigation of four to six-year-olds due to the fact that according to Lenneberg (1964), as cited in Keilman and Moran (1967, p. 42), "in the normal child, language is said to be essentially established by the age of four".

### ***Instrumentation***

Free word association tests have proved to be "the most direct and immediate reflection of human understanding behind the linguistic forms or semantic meanings" (Yuping, 2010, p. 75); in addition, they are time efficient and easy to administer.

Therefore, a single-response free word association test was adopted for the present study, wherein the participants are generally asked to respond to every stimulus word presented to them with the first word coming to mind.

The researchers have chosen to administer a twelve-item word association test. The stimulus words for the test were taken from children's association frequency tables formulated by Woodrow and Lowell (1916). One advantage of Woodrow and Lowell's stimulus list is that 90 of its stimuli were taken from Kent and Rosanoff's (1910) adult frequency tables; therefore, it is appropriate for both age groups specified in this study as it has taken into consideration both children and adult populations. Besides, it has been applied in earlier studies yielding distinctive differences between the associative responses of children and adults.

The stimulus words selected for the present study belong to three different word class forms (nouns, verbs, and adjectives) and two concreteness categories (concrete and abstract). The stimuli appeared in a constant order for all the participants. Table 1 represents the stimulus words and the order in which they were presented.

*Table 1: Stimulus words classified by concreteness and word class*

Stimulus Word	Concreteness	Word Class
table	Concrete	noun
laugh	concrete	verb
red	concrete	adjective
mountain	concrete	noun
eat	concrete	verb
black	concrete	adjective
illness	abstract	noun
dream	abstract	verb
thirsty	abstract	adjective
anger	abstract	noun
wish	abstract	verb
beautiful	abstract	adjective

### ***Procedure***

For children, the test was administered in the form of an interview, in which the first author acted as both the interviewer and the experimenter. The children were interviewed individually outside their classroom in the corridor. Prior to the interview, the interviewer gave each individual a set of oral instructions in Persian, the English translation of which is as follows: "we are going to play a game. I am going to show you 12 picture cards one at a time. Look at each card and tell me the first word that you think of". After providing two examples, as practice words, and ensuring that the participants have understood the game, the interviewer immediately started the test. The responses for each child were recorded by the interviewer on separate response sheets. The interview time was ten minutes per person, and the picture cards were presented in a constant order for all the children.

As for the adult participants, the written-written method of data collection for word association tests (Wolter, 2001, cited in Rahimi & Haghighi, 2009) was adopted. The adult participants were tested in their classroom. They were informed that they were taking part in a study. After giving oral instructions in Persian, the participants were provided with a sheet of paper with written instructions on the top and a list of 12 stimulus words with slots to provide the answers. The participants were asked to jot down the first word that came to mind for each stimulus word. The participants were told not to contemplate deeply or too long on the stimulus words or not to go back to previous stimuli. Also, they were asked not to discuss the responses with their classmates. The time allotted for the

test was approximately ten minutes.

### **Data Analysis**

For the sake of data encoding, the elicited responses were classified into association types based upon traditional models of word association tests. Therefore, the associative responses in this study were classified into four types: paradigmatic responses, syntagmatic responses, clang-other type responses, and encyclopedic responses.

Paradigmatic responses belong to the same word class as the stimulus word and can be further classified into synonymy (x has the same meaning as y, e.g., happy-glad), antonymy (x is the opposite of y in meaning, e.g., cold-hot), hyponymy or subordination (x is a kind of y, e.g., dog-pet), hypernymy or superordination (x incorporates y as one of its kind, e.g., pet-dog), co-hyponymy or coordination (x and y are kinds of z, e.g., cat-dog), and meronymy (x is part of y, e.g., kitchen-house).

Syntagmatic responses, which bear a collocational or sequential relationship with the stimulus word, are, in turn, classified into lexical, grammatical, and restricted collocations. In lexical collocations, lexical items play a significant role in forming repeated patterns. Grammatical collocations, on the other hand, rely on syntactic structures such as prepositional or verb particles (e.g., buckle up), and restricted collocations are lexico-grammatically restricted in a way that very few words can co-occur with them (e.g., auburn is only used to describe hair color).

In clang responses, associations are often made based on the form of the word rather than its meaning. Clang responses are of two types: phonological (associations made based on sound play or rhymes, e.g., think-thank, up-cup), and orthographic (associations based on the spelling or the physical appearance of the word, e.g., there-three, beat-beet). On the other hand, other-type responses incorporate unrelated responses, blank and 'I don't know' responses, anecdotal responses, and responses that are repetition of the prompt word.

Finally, encyclopedic responses are associated with one's personal knowledge about the word. For instance, if the word *fire* is elicited in response to the stimulus word *disaster* just because the respondent reminds his/her house catching fire as a child, the response can be considered as encyclopedic (Pigott, 2006).

However, classification of the elicited responses into paradigmatic/syntagmatic types is more complicated than it might appear at first glance as we often encounter ambiguous responses and we have no further access to the participants to ask for clarification. Therefore, in order to maintain consistency in our paradigmatic/syntagmatic classification, the elicited responses were classified as paradigmatic if their lexical class was the same as the stimulus word and as syntagmatic if their lexical class was different, yet the responses were classified as syntagmatic when they could form a syntactic string with the stimulus word (e.g., telegraph office).

In addition, the following lemmatizations were made to keep consistency in classification:

- 1) Inflected forms were regarded as the repetition of the stimulus word and were, therefore, classified as clang-other type responses.
- 2) Derived forms (e.g., dwell-dweller) were regarded as words separate from the stimulus word rather than the repetition of the stimulus word.
- 3) In case of multiple responses, only the first response was considered and others were excluded.
- 4) In multi-word responses, which appear in the form of phrases, only the head word was taken into consideration (e.g., 'single males' was counted as *males*).

After classifying the elicited responses, the frequency of each association type was calculated. Chi-square analysis was also administered to determine whether the observed differences between the associative response types were statistically significant at .05 probability level ( $P < .05$ ). The data were further analyzed in terms of stimulus words' quality (concreteness vs. abstractness) and word class forms (nouns, verbs, and adjectives), the results of which were tabulated.

## **RESULTS AND DISCUSSION**

Table 2: Frequency of association responses as a function of age

Association Age	Syntagmatic			Paradigmatic						Encyclopedic	Clang					
	L	G	R	S	A	HO	HE	M	C		P	O	B	U	RE	AN
Children	128	0	0	3	7	1	0	1	38	78	0	0	9	15	2	6
Adults	155	0	0	6	2	3	1	2	21	82	0	0	1	2	1	0

L: Lexical collocation  
G: Grammatical collocation  
R: Restricted collocation  
S: Synonymy  
A: Antonymy  
HO: Hyponymy  
HE: Hypernymy  
M: Metonymy  
C: Coordination  
P: Phonological association  
O: Orthographic association  
B: Blank response  
U: Unrelated response  
R: Repetition  
A: Anecdotal

As Table 2 demonstrates, for both children and adults, a consistent pattern was detected for all the four association response types. In both age groups, syntagmatic responses had the highest frequency of occurrence (adults: 155, children: 128), encyclopedic responses had the second highest frequency of occurrence (adults: 82, children: 78), paradigmatic responses came third (adults: 35, children: 50), and clang-other type responses had the lowest frequency of occurrence (adults: 4, children: 32). The Chi-square test revealed that the significance for *P* value was less than .05 ( $P < .05$ ), indicating that the differences in the frequency of association responses of the children and adults were statistically significant (see Table 3).

Table 3: Chi-Square Tests for association responses as a function of age

	Value	Df	Asymp. Sig. (2-sided)
Pearson Chi-Square	26.858 <sup>a</sup>	3	.000
Likelihood Ratio	29.876	3	.000
Linear-by-Linear Association	10.998	1	.001
N of Valid Cases	564		

a. 0 cells (.0%) have expected count less than 5. The minimum expected count is 17.62.

It follows from Table 2 that, among the syntagmatic responses, all the elicited responses belonged to the category of lexical collocations, yet there were no instances of grammatical or restricted collocations. This might be justified in two ways: first, grammatical collocations and particularly restricted collocations are not very frequent in the Persian language; second, the particular choice of stimulus words in this study might have elicited certain types of association responses in preference to others. As demonstrated in Table 2, among the paradigmatic responses, coordination was dominant in both age groups (adults: 21, children: 38). This is in accordance with Atchinson's (2003) view, as cited in Rahimi & Haghighi's (2009), that coordination has proved to be the commonest type of pragmatic response. As for the clang-other type responses, there were no instances of phonological associations observed. This is, of course, in line with Rahimi & Haghighi's (2009) view who maintain that phonological responses are not very frequent. Among the elicited responses, orthographic associations were not observed either. This is probably due to the very nature of the oral-written method of test administration often adopted for children in which orthographic responses are less activated in the absence of visual stimuli (Rahimi & Haghighi, 2009). However, unrelated responses were more frequent than their counterparts in both age groups (adults: 2, children: 15). (see Table 2).

Table 4: Frequency of association responses based on stimulus word class and quality

	Quality		Word Class		
	Concrete	Abstract	Noun	Adjective	Verb

	Ch	A	Total	Ch	A	Total	Ch	A	Total	Ch	A	Total	Ch	A	Total
<b>Syntagmatic</b>	74	84	158	54	71	125	46	58	104	43	53	96	37	48	85
<b>Paradigmatic</b>	29	11	40	21	24	45	17	13	30	22	11	33	13	11	24
<b>Encyclopedic</b>	21	40	61	57	42	99	23	18	41	21	37	58	36	28	64
<b>Clang</b>	17	2	19	15	2	17	13	3	16	9	0	9	11	0	11

As far as the stimulus word quality (abstractness/concreteness) is concerned, the analysis of responses revealed that concrete words elicited more syntagmatic responses (adults: 84, children: 74) than did abstract words (adults: 71, children: 54). This is while abstract words elicited more paradigmatic responses (adults: 24, children: 21) than concrete words (see Table 4). The result from the Chi-square test indicated a significance difference in the response types elicited by concrete vs. abstract stimuli (see Table 5 below).

Table 5: Chi-Square Tests for association responses based on stimulus word quality

	Value	df	Asymp. Sig. (2-sided)
<b>Pearson Chi-Square</b>	13.167a	3	.004
<b>Likelihood Ratio</b>	13.261	3	.004
<b>Linear-by-Linear Association</b>	7.863	1	.005
<b>N of Valid Cases</b>	564		

a. 0 cells (.0%) have expected count less than 5. The minimum expected count is 17.74.

Finally, the elicited responses were analyzed from the stimulus word class perspective (nouns, adjectives, verbs) in order to determine if there are any significant differences in the response frequencies. The results of the analysis revealed that the nouns elicited the highest number of syntagmatic responses, followed by the adjectives, followed by the verbs in both children and adults (see Table 4). However, the Chi-square test suggested that the differences in the frequency of the responses elicited by the stimuli belonging to different word class families were not statistically significant ( $P > .05$ ), implying that the observed differences might be due to chance alone (see Table 6).

Table 6: Chi-Square Tests for association responses based on stimulus word class

	Value	df	Asymp. Sig. (2-sided)
<b>Pearson Chi-Square</b>	10.450 <sup>a</sup>	6	.107
<b>Likelihood Ratio</b>	10.585	6	.102

<b>N of Valid Cases</b>	571		

a. 0 cells (.0%) have expected count less than 5. The minimum expected count is 11.60.

These findings, together, highlight that, in Persian language, syntagmatic associations take priority over paradigmatic ones, the very fact which assumes the possibility for the existence of a language-specific acquisition route for word association knowledge that is typical of Persian speakers and a highly specified organizational pattern for their mental lexicon. However, further studies are required for a better understanding of the hidden depths of this consistency in the elicited responses. Moreover, a closer investigation of the developmental changes in the type of association responses from childhood to adulthood sounds necessary. A comparison of association responses elicited from speakers of other languages could be of great help in this regard (Yuping, 2010).

## CONCLUSION

The present study aimed at exploring the differences in the word association responses of Iranian children and adults and the influence of the stimulus word class and quality (concreteness/abstractness) on the elicitation and type of association responses. To this end, four research questions were posed.

In reference to the first research question, it must be pointed out that despite the existence of statistically significant differences in the frequency of children and adults' responses, both age groups are likely to follow a consistent pattern in their word association behavior in Persian, i.e., syntagmatic responses > encyclopedic responses > paradigmatic responses > clang-other type responses. This general tendency towards syntagmatic responses is in line with Rahimi and Haghighi's (2009) conclusion that Iranian students tend to respond syntagmatically to word association tests.

In response to the second and third research questions, it is worth mentioning that all the word quality and class types seem to elicit the same types of responses, mainly syntagmatic ones. The very fact that concrete and abstract nouns,

verbs, and adjectives elicit similar types of association responses in Persian, may lead us to conclude that concreteness and word class types do not influence the type of association responses that much.

As for the fourth question, the results of the study points to a consistent pattern of responding, i.e., a tendency towards syntagmatic associations in both age groups under scrutiny in Persian. This is, of course, in accordance with the view that for non-native speakers of English, association responses are often syntagmatic rather than paradigmatic (Deigan et al, 1996, cited in Rahimi & Haghighi, 2009). This very fact casts doubt on the generality of the syntagmatic-paradigmatic shift phenomenon emphasizing the need for re-evaluation of the syntagmatic-paradigmatic shift for non-native speakers (Wolter, 2001, cited in Khazaenezhad & Alibabae, 2013).

Why this study revealed such a consistent response pattern for the Persian language, might have been affected by the choice of stimulus words or methods of test administration or there might have been educational, cultural, societal, or linguistic reasons for it (Rahimi & Haghighi, 2009), the investigation of which is beyond the scope of this study. In fact, this study focused, for the most part, on the 'what' aspect of the issue rather than the 'why' aspect. Therefore, while we have to exercise extreme caution in drawing absolute conclusions about Persian language simply based on the findings from the present study, the results of this study could be illuminating and might have various pedagogical implications.

### **LIMITATIONS OF THE STUDY**

Several factors might have imposed limitations upon the present study which are going to be enumerated below:

1. Due to the absence of children and adults' frequency tables in Persian language, the stimulus words chosen for this study were taken from Woodrow and Lowell's (1916) children's association frequency tables formulated basically for English language, the very fact that might have influenced the results from this study.
2. For time considerations, a short word association test consisting of merely 12 items was administered for this study. More precise results might have been gained if the number of stimulus words could be expanded.
3. Finally, the relatively small number of participants in this study might have limited the results. If the researchers had not been pressed for time, they could have interviewed a larger number of participants, which would add to the accuracy of the obtained results.

## **ABSTRACT**

Web 2.0 refers to web sites that use technology beyond the static pages of earlier web sites allowing for creating, collaborating, editing and sharing user-generated content online. With the emergence of Web 2.0 tools, a large body of societies has embraced the new wave of technology. One of these affected sections is education in general, and language pedagogy in particular. Accordingly, in this era of fundamental changes, it is necessary to rethink the effective use of Web 2.0 tools in language learning and teaching. Accordingly, the present study investigated the Iranian EFL teachers' attitudes towards implementing Web 2.0 tools in teaching various language skills and components in Iranian EFL context. In so doing, a questionnaire was distributed among 112 Iranian EFL teachers. The main focus of the questionnaire was on the most important Web 2.0 tools, namely Blogs, Social networks, Emails, Podcasts and vodcasts, and Wikis. The findings showed that Iranian EFL teachers had positive attitudes towards the use of such tools in English language classrooms. Implications are discussed.

**KEYWORDS:** Language pedagogy, Web 2.0 tools, EFL teachers' attitudes, Iranian context

## **INTRODUCTION**

As Web-based technology evolved from Web 1.0 to Web 2.0, everyday lives have increasingly integrated with Web-based tools. Web 2.0 tools have become a vehicle of innovation in different areas of education, as a part of life. Consequently, the traditional methods of education are gradually shifting toward web-based educational methods. This new paradigm provides new and effective dimensions in education, and language pedagogy as well. The large body of literature on the incorporation of Web 2.0 tools in education (Beldarrain, 2006; Grosseck, 2009; Usluel & Mazman, 2009; Chong, 2010; Grosseck & Holotescu, 2010; Arnold & Paulus, 2010; Lai & Eugenia, 2011; Chandra & Watters, 2011; Gokcearslan, & Ozcan, 2011; Brown, 2011), and in language pedagogy (Heift & Schulze, 2003; Palfreyman, 2006; Yang & Chen, 2007; Bran, 2009; Küfi & Özgür, 2009; Pop, 2010; Baltaci-Goktalay & Ozdilek, 2010; Girgin, 2011; Abdous, Facer & Yen, 2011; Eyyam, Meneviş & Doğruer, 2011; Kovacic, Bubas & Coric, 2012) indicates the effectiveness of these tools in education in general, and in language pedagogy in particular. Bran (2009) referred to the authentic contexts provided by the use of Web 2.0 tools in language learning environments as a beneficial feature for the students to create, collaborate, and connect with other people all around the world with no limit in time and place. According to Pop (2010), implementing Web 2.0 tools in language pedagogy resulted in higher levels of motivation, confidence, and disposition which are crucial factors in communicative foreign language learning. Yang and Chen (2007) also believed that Web 2.0 based language learning program helped enhance students' knowledge of computer, increase their interest in learning, improve their English language abilities, and provide a broad learning range and possibilities.

In addition to the literature concerning the effectiveness of Web 2.0 tools in language learning and teaching, assessing the stakeholders' attitude towards implementing Web 2.0 tools in language pedagogy as an important issue that has been addressed in foreign language learning research. According to Küfi and Özgür (2009), students had positive attitudes towards interactive web environment use in learning English. In contrast, Girgin (2011) found that despite learners' pleasure in using web 2.0 tools in their English classrooms, they were more comfortable with the face to face traditional methods of teaching in gaining language competence. Positive attitudes of teachers toward using web 2.0 tools play a crucial role in implementing these tools in education. Baltaci-Goktalay and Ozdilek (2010) found pre-service teachers' positive attitudes and high level of acceptance of web 2.0 tools in education. According to Eyyam, Meneviş and Doğruer (2011), teachers mostly used some well-known web 2.0 tools such as

Wiki, Social Networks and Instant Messaging Software in their classrooms, but they were not eager to use some other useful but less known tools. On the other hand, there still exists some misperception about the Web 2.0 tools. Brown (2011) argued that having too many tools and not enough time to use them makes student confused.

Teachers' epistemological beliefs, their views about the nature of knowledge and learning, and the effectiveness of Web 2.0 tools may affect their teaching approaches. It worth mentioning that different Web 2.0 tools address diverse needs of English language learners, and each may be suitable for tasks of different complexity. They can be implemented to organize the learning content, support learning activities, and address different learning styles (Kovacic, Bubas & Coric, 2012). Despite the numerous research on the effectiveness of Web 2.0 tools in language pedagogy and also positive attitudes of teachers towards using Web-based tools in language learning classrooms, still there are some controversies about the implementation of Web 2.0 tools in English language learning environments in Iran. The field seems to lack a unified theory of the use of Web 2.0 tools in language pedagogy and the scope within which such tools can be applied. On the other hand, due to social and cultural constraints, much needs to be done to see how such factors affect the success or failure of the use of such tools in different cultures and languages. To this end, this study is going to investigate Iranian EFL teachers' attitudes toward implementing web 2.0 applications in teaching various language skills and components in Iranian EFL context.

## METHODOLOGY

### *Participants*

A researchers-made questionnaire was distributed among 112 English language teachers teaching in different private language institutes and universities in Iran. The sample included 80 females and 32 males, with B.A and M.A degrees. Their age ranged between 26 to 46 years, with 1 to 27 years of experience.

### *Instruments*

To achieve the objectives of this study a researchers-made questionnaire was used. The main focus of the questionnaire was on the main Web 2.0 tools, namely blogs, social networks, podcasts, vodcasts, and wikis. The questionnaire comprised of two parts; the extent to which teachers were familiar with the mentioned Web 2.0 tools, and the extent to which teachers would agree or disagree with statements about learning English through using Web 2.0 tools in foreign language classrooms. It is presented in the appendix.

### *Procedure and Data Analysis*

To achieve the goals of this study, a questionnaire comprising of a list of the most studied Web 2.0 tools in the literature was designed and piloted among 15 EFL teachers with M.A degree. They were asked to identify the tools with which they were the most familiar. According to the data gleaned from the pilot questionnaires, five tools – blogs, wikis, social networks, emails, and podcasts and vodcasts- were the most familiar to the participants. The main questionnaire consisting of 34 items was prepared based on Bachman's (1991) Framework of Communicative Language Ability, in winter 2012. The questionnaires were distributed among the participants in spring 2012, they were asked to answer the questionnaire considering the five mentioned tools. (The reliability of the questionnaire was estimated at 0.92).After collecting the data, certain statistical techniques were run, which are presented and discussed at length in the following section.

## RESULTS

The questionnaires were analyzed quantitatively to calculate percentage of familiarity of the participants with these tools, and  $X^2$  value, df, and level of significance of each item to recognize the participants' attitudes towards implementing these tools in language teaching.

### 3.1. Iranian EFL teachers' attitudes towards implementing Web 2.0 tools

*Table 1: Percentage of the participants' familiarity with Web 2.0 tools*

	Very little%	Little%	Average%	Much%	Very much%
Blogs	0	13.4	37.5	33	16.1
Emails	0	0	15.2	40.2	44.6
Social networks	7.1	14.3	8	25.9	44.6
Podcasts & Vodcasts	0	12.5	40.2	27.7	19.6
Wikis	0	8	33	29.5	29.5

As Table 1 shows, the participants were familiar with emails and social networks more than the other four tools. Blogs were also the least known Web 2.0 tools to the participants. Wikis were recognized as the third most known Web 2.0 tool to the participants, followed by podcasts and vodcasts respectively.

3.2. Iranian EFL teachers' attitude toward teaching and learning different skills and components of language by the use of Web 2.0 tools

*Table 2: The Pearson chi-square test results for the items concerning language skills and components.*

<b>Web 2.0 tools help our students</b>	<b>X<sup>2</sup></b>	<b>df</b>	<b>Asymp.Sig</b>
enhance their textual knowledge.	78.071	3	.000
enhance their sensitivity to dialect.	102.821	4	.000
enhance their sensitivity to social register.	17.357	3	.001
enhance their sensitivity to cultural norms.	47	3	.000
enhance their reading comprehension skill.	121.482	4	.000
enhance their speaking skill.	54.214	3	.000
enhance their writing skill.	104.429	3	.000
enhance their listening skill.	99.786	4	.000
increase their vocabulary knowledge.	109.929	3	.000
improve their knowledge of grammar.	22.357	3	.000
have coherence and organization in their writings.	80.786	3	.000
enhance their communicative competence.	721.929	3	.000
become familiar with the differences between the target and the native culture.	46.214	3	.000
achieve an acceptable level of language proficiency.	76.786	3	.000
develop their foreign language pragmatic competence.	43.357	3	.000

As the results of the above table shows, participants agreed that Web 2.0 tools have positive effect on learning different components and skills of language. As it is evident, it is believed that these tools are much more helpful enhancing vocabulary knowledge, and reading comprehension skill, writing skill, sensitivity to dialect, and communicative competence.

*Table 3: The Pearson chi-square test results for the items to which Web 2.0 tools can be tailored.*

<b>Web 2.0 tools and activities can be tailored to</b>	<b>X<sup>2</sup></b>	<b>df</b>	<b>Asymp.Sig</b>
the students' personality traits.	52.929	3	.000
the students' learning strategies.	88.357	3	.000
the students' needs.	48.714	3	.000
the students' affective features.	20.696	2	.000
the teachers' teaching strategies.	11.375	2	.003

As is evident from the above table, the participants agreed that Web 2.0 tools are highly compatible to the students' learning strategies and personality traits.

*Table 4: The Pearson chi-square test results for the items concerning affective factors.*

<b>Classes using Web 2.0 tools and activities</b>	<b>X<sup>2</sup></b>	<b>df</b>	<b>Asymp.Sig</b>
make students feel more motivated in learning the foreign language.	41.375	2	.000
reduces the students' anxiety.	43.357	3	.000
are more interesting to the students than the traditional ones.	58.196	2	.000
are more interactive than the regular classes.	35.589	2	.000
are authentic.	48.714	3	.000
have fixed but dynamic Curriculum.	46.357	3	.000

As the table 4 shows, classes using Web 2.0 tools and activities seem to be more interesting, interactive and authentic. These classes can be more motivating and less stressful to the students than the regular ones.

*Table 5: The Pearson chi-square test results for the items concerning tasks and activities.*

<b>Tasks and activities designed by the use of Web 2.0 tools</b>	<b>X<sup>2</sup></b>	<b>df</b>	<b>Asymp.Sig</b>
are more challenging.	38.786	3	.000
are more meaningful to the students.	41.786	3	.000
have more information gaps.	41.929	3	.000
are authentic, personalized, and learner-driven.	62.643	3	.000

As it can be inferred from the above table, tasks and activities designed by the use of Web 2.0 tools include the essential features of a communicative language classroom. Authentic, personalized, and learner driven tasks and activities were the most agreed features from the participants' points of view.

*Table 6: The Pearson chi-square test results for the items concerning the students' performance.*

<b>In classes using Web 2.0 tools, students</b>	<b>X<sup>2</sup></b>	<b>df</b>	<b>Asymp.Sig</b>
become more creative.	49.143	2	.000
receive more feedback from teachers and peers.	11.643	2	.003
collaborate more with each other.	21.714	2	.000
Can design the materials based on their needs.	7.196	2	.027

The results of the above table shows that most of the participants agreed that students can collaborate more with each other so that they become more creative and can even cooperate in designing their learning materials.

## DISCUSSION AND CONCLUSION

In this section, the results of the study are discussed at length. Before that, however, the summary of the findings are presented in 5.1.

### *Summary of the findings*

The results from Table 1 showed that the participants were highly familiar with the Web 2.0 tools including blogs, social networks, wikis, emails, and podcasts and vodcasts. Among the mentioned tools, emails and social networks were the most known to the participants. The results attained from Tables 2 showed that the participants believed Web 2.0 tools could help students in learning the four macro skills, namely reading comprehension, writing, listening, and speaking. They agreed that these tools could also help students enhance their vocabulary knowledge and sensitivity to dialect the most. Looking at Table 2, one could easily figure out that among the four macro skills, development of reading comprehension skill seemed to be more in line with the features of the so-called tool. On the other hand, Web 2.0 tools should be tailored to the needs and personality traits of the students both from a linguistics perspective as well as an educational direction if they are expected to be effective. As illustrated by Table 3, most of the teachers agreed that these tools could be tailored to students' learning strategies, and personality traits. This may result in classes which respect all students with different learning styles and personality traits. Moreover, affective factors as a critical aspect of language learning and teaching have always been important to the curriculum developers. As it is evident from the results demonstrated by Table 4, the participants agreed that using these tools makes the classrooms more interesting, authentic and dynamic which would result in a more effective learning. Participants also agreed that these tools have a positive effect on the foreign language classrooms' atmosphere, tasks and activities and on the students' cooperation in the classrooms. From the results of table 5 and 6, it can be inferred that using Web 2.0 tools motivates students to collaborate in designing their own tasks and activities which results in more authentic and personalized tasks, and makes students more creative.

### *Discussion and Conclusion*

As it was stated earlier, though Web 2.0 potentials in Education and Language pedagogy has been highlighted (Palfreyman, 2006; Yang, 2007; Bran, 2009; Pop, 2010; Abdous, 2011; Girgin, 2011), there are still some controversies about the implementation of these tools in language pedagogy. Since Web 2.0 tools have not been originally designed for education, lack of an adequate design for the appropriate use of these tools in language pedagogy turns to be one of the major constraints. Accordingly, the aim of this study was to investigate the Iranian EFL teachers' attitudes towards implementing these tools in English language classrooms and to see how this constraint can be overcome.

Web 2.0 technology prepares more effective environments on interactive and collaborative cooperation of the students, though not designed especially for practical educational aims. Moreover, this technology is important to the studies of teaching and learning for quality learning in education about the efficacy of technology, significance of active participation, critical thinking, social interaction, collaborative learning and two way communications (Beldarrain, 2006). Language pedagogy as a subset of educational system can benefit from these technologies if these tools are designed in a way compatible to learning language skills and components. Since the most important features of these tools are social interaction, collaboration, creativity, information sharing, and authenticity, they can be easily compatible to Communicative Language Ability models, e.g. Canale and Swain (1980), Bachman (1991).

Canale and Swain (1980) suggested a set of three competences which combine to produce communicative competence. The first, grammatical competence, included “knowledge of lexical items and rules of morphology, syntax, sentence grammar semantics and phonology”. The second competence was sociolinguistic competence, comprising of “sociocultural rules of use and rules of discourse”. The third competence was strategic competence, which related to “verbal and non-verbal communicative strategies that may be called into action to compensate for breakdowns in communication due to performance variables or to insufficient competence”. Bachman (1991) defined authenticity as the appropriateness of a language users’ response to language as communication. Because this definition was too broad, Bachman and Palmer (1996) divided it into two parts; one relates to the target language use which refers to authenticity, and the other relates to learners’ involvement to the test. They defined interactiveness as “the extent and type of involvement of the test taker’s individual characteristics in accomplishing a test task” (p.25). On the basis of these definitions, Web 2.0 tools can be served as potential authentic and interactive tools in communicative language learning and teaching. Furthermore, the most Web 2.0 tools enjoy features which are highly in line with both instructional and situational authenticities delineated by Bachman (1991).

Finally, as displayed in Tables 2, 3, 4, 5, and 6 and emphasized in previous sections, Web 2.0 tools each may enjoy potentials more compatible for the development of certain language skills and components and for certain ages and personality traits under conditions and in certain contexts. These besides the constraints on the way of using these tools in English language Education should be taken into considerations in the justification, development, and implementation of any task, test, and activity for the language classrooms.

#### **LIMITATIONS OF THE STUDY**

Like any other researches, there are some limitations for this study. As it was stated earlier, web 2 tools enjoy intrinsic cultural and social constraints that call for a cautious use in educational contexts in general and language teaching and learning contexts in particular. Furthermore, a few of web 2 tools were investigated in this study. Further tools might divulge the potentials and possible constraints of web 2 tools more. Finally, this study was carried out in Iranian EFL context. Any generalization about the findings of this study should be limited to the given context.

### Appendix

Please put a check mark in the appropriate box.

- Gender: male ☐ female ☐
- Age:..... ☐
- Degree of education: Bachelor ☐ M<sup>er</sup> ☐ Ph.D ☐
- Years of experience:..... ☐

#### 1. To what extent are you familiar with the following internet tools in EFL teaching?

Degree Tool	None	Very little	Little	Average	Much	Very much
Blogs						
Podcasts						
Social networks						
Vodcasts						
Wikis						

#### 2. Do you agree or disagree with the statements about learning English using web 2.0 tools?

(Strongly disagree (SD) Disagree (D) Neutral (N) Agree (A) Strongly agree (SA))

Statements	SD	D	N	A	SA
<b>Web 2.0 tools help our students</b>					
1 enhance their textual knowledge.					
2 enhance their sensitivity to dialect.					
3 enhance their sensitivity to social register.					
4 enhance their sensitivity to cultural norms.					
5 enhance their reading comprehension skill.					
6 enhance their speaking skill.					
7 enhance their writing skill.					
8 enhance their listening skill.					
9 increase their vocabulary knowledge.					
10 improve their knowledge of grammar.					
11 have coherence and organization in their writings.					

12	enhance their communicative competence.					
13	become familiar with the differences between the target and the native culture.					
14	achieve an acceptable level of language proficiency.					
15	develop their foreign language pragmatic competence.					
	<b>Web 2.0 tools and activities can be tailored to</b>					
16	the students' personality traits.					
17	the students' learning strategies.					
18	the students' needs.					
19	the students' affective features.					
20	the teachers' teaching strategies.					
	<b>Classes using Web 2.0 tools and activities</b>					
21	make students feel more motivated in learning the foreign language.					
22	reduces the students' anxiety.					
23	are more interesting to the students than the traditional ones.					
24	are more interactive than the regular classes.					
25	are authentic.					
26	have fixed but dynamic Curriculum.					
	<b>Tasks and activities designed by the use of Web 2.0 tools</b>					
27	are more challenging.					
28	are more meaningful to the students.					
29	have more information gaps.					
30	are authentic, personalized, and learner-driven.					
	In classes using Web 2.0 tools, students					
31	become more creative.					
32	receive more feedback from teachers and peers.					
33	collaborate more with each other.					
34	Can design the materials based on their needs.					

## THE ARCHETYPE OF THE HERO'S JOURNEY IN ODYSSEY

### ABSTRACT

The Odyssey is a classic representation of an epic in literature. With that understood, it is no surprise that the main character of the story helps to define an epic hero. A character must express certain virtues to be considered such. Strength, courage, and nobility are almost prerequisites. Cleverness is an added bonus. Odysseus possesses many characteristics and virtues that make him a true representation of an epic hero. The Hero's Journey is never an easy one. This particular journey, as detailed in Homer's The Odyssey, is one of struggle, loss, heartache, pain, growth and triumph. It is comprised of many steps that Odysseus has to overcome and battle through in order to achieve his final goal of reaching his home and his loved ones, from the Call to Adventure to the Freedom or Gift of living.

**KEYWORDS:** archetype, Odyssey, hero's Journey, Jung, Campbell

### INTRODUCTION

Carl Jung and Joseph Campbell are two of the most prominent explorers of the psycho analytical and mythological origins for human and social behavior.

Carl Jung expanded the unconscious mind to emphasize the mythological forces working within the individual to shape his or her personality. Jung formed the concept of archetype and collective unconscious to explain the commonality of dream images and situations found in all people. Jung believed individual and social behavior and thought have their roots in a common palette of characters and situations the mind retains from early human consciousness development. To Jung, the archetypal hero represents the psyche's quest for individuation, the process that makes each person unique (Jung, 1959).

Joseph Campbell built on Carl Jung's concept of the collective unconscious to encompass all the world's mythologies. Campbell studied the world's religions, art, and stories and discovered common threads throughout all, including the hero. Campbell believed that mythology is the collective "dream" of mankind, the "song of the universe." (Campbell, 1970). Campbell's work highlights mankind's common search, both personally and socially, for meaning and truth through the ages.

### THE ARCHETYPE

An archetype is a recurring pattern of character, symbol, or situation found in the mythology, religion, and stories of all cultures. In the context of archetypes, Campbell defined his work as a search for "the commonality of themes in world myths, pointing to a constant requirement in the human psyche for a centering in terms of deep principles." (Campbell, et al 1988). Jung defined his concept of the archetype as a formula that is the result of "countless experiences of our ancestors. They are, as it were, the psychic residue of numberless experiences of the same type" (Strauch, 2001). Both men felt that the experience of being human can be examined collectively across time, space, and culture, and that our commonality can be traced to the most primitive origins of the human consciousness, where the archetypal themes originate in modern men and women.

Archetypes can be thought of as the precursor to conscious thought, existing in the unconscious mind as expressions of psychic happenings, but without a basis in the physical world. Humans didn't "invent" archetypes, but they do express archetypes in the conscious world of art, literature, and religion (Dundes, 1984).

Unconscious energies are given form in this way. Therefore, the hero is not someone "out there" in the world; he is all of us and our need to grow and mature.

The following paragraphs describe several of the archetypal characters that can occur in the stories, myths, etc.

## EXAMPLES OF ARCHETYPES

**Outsider**-The outsider archetype also takes the form of the rebel (Preminger and Brogan, 1993). This is the character which, by virtue of what he or she is or thinks, is an outsider to the community. The character often displays an attitude of radical freedom, a feeling of powerlessness, or anger over perceived injustice. This frequently results in behavior that can be viewed by the community as outrageous or rebellious. The classic Italian folk tale about the puppet named Pinocchio presents the outsider archetype in the form of the misfit. Another example might be the character often played by Clint Eastwood in his early Western movies. In that case, the outlaw archetype is often combined with the rescuer, or hero, archetype.

**Innocent**-The archetypal character named innocent represents something beyond simply "one who isn't guilty" (Rasmussen, 1998). The innocent is one whose purity has not (or at least not yet) been compromised by knowledge of the world and its evils. Thus, the innocent can take the form of the child, the naive youth, the saint, or the mystic. This character usually carries the symbolism of optimism, simplicity, goodness, or faith. An example of this archetype might be Beatrice, one of Dante's guides in the Divine Comedy. Another example, much more recent and probably more familiar to most of you, would be Dorothy from the movie The Wizard of Oz. (Note that Dorothy also represents another archetype -- the explorer. Just like Odysseus, she's in search of a way home.)

**Ruler**-The ruler archetype also appears as the leader, the commander, the boss, or the manager. The ruler strives to be in control of the circumstances, assumes responsibility, and/or shows leadership. The objective of the ruler archetype is usually order, harmony, and control. Gilgamesh is an instance of the ruler archetype. So is Priam, from the Iliad, even though he's an older, more defeated version of the ruler (Tallman, 2005).

**Trickster**-The trickster archetype can also be called (or appear as) the jester, the clown, the comedian, or the fool (in the Shakespearean sense of the fool (Garry and Shamy, 2005)). The trickster is one who relies on his or her wits and is willing to cross boundaries, break taboos, or say the unmentionable. Typically, this transgression of barriers is executed using humor, sarcasm, or irony, all of which are heavily dependent on language and its openness to multiple or ambiguous meanings. Odysseus is a trickster character: in the Odyssey, he relies on his wits and cleverness to get him out of one tight spot after another; and, in the Iliad, it was he who proposed the idea of the Trojan Horse, the ruse by which the Greeks were able to defeat the Trojans. A contemporary example of the trickster archetype would be Axel Foley, the character played by Eddie Murphy in the Beverly Hills Cop movies.

**Magician**-The magician archetype can also appear as the healer/shaman, the sorcerer, the visionary, or the innovator. This is the character that has much knowledge of the physical world, and knows how to use it to forge solutions to problems. (This knowledge will sometimes be portrayed as magical in the sense of fantastical, but it can also be magical in the same sense that electricity or magnetism is magical (natural forces that are unseen and sometimes difficult to understand.)) The magician also will frequently act on hunches or intuitions. The sorcerer king Soumaoro from the tale of Sundiata is an example of the magician archetype, but so is Faust from the poem by Goethe.

**Sage**-The sage archetype can also appear as the oracle, the teacher or mentor, or the expert. This character is usually portrayed as knowledgeable and/or understanding, the source of wisdom or the guardian of truth. Frequently the sage will appear as an old man or old woman, whose years symbolize his or her wisdom. Utnapishtim, from the Epic of Gilgamesh, is an example of the sage archetype: Gilgamesh seeks him out to learn the secret of immortality, and Utnapishtim instead tries to teach him a different kind of wisdom. The figure of Virgil as used by Dante in the Divine Comedy can also be seen as a sage. (Kostera, 2012)

**Protector**-The protector archetype can take the form of the caregiver, the helper, the altruist, or the parent figure. The protector usually displays the qualities of compassion, generosity, and/or protectiveness. This archetype appears to have a need to meet the needs of others. You could probably consider Beowulf as an example of the protector

archetype, at the same time that he is also an instance of the warrior. The protector also frequently appears in stories in the guise of a mother figure or a father figure, each of which can also be thought of as archetypal characters in themselves (Jung, 1990).

**Explorer**-The explorer archetype can also come in the form of the seeker or the pilgrim. This character is usually on some kind of quest or in search of something: a way home, self-knowledge, a key to happiness or wisdom, or a "better way," whatever that might be. The narrator/protagonist in Dante's Divine Comedy is a primary example of the explorer archetype. In that case, the archetype takes the form of the seeker of spiritual revelation. Odysseus, from the Odyssey, is also an explorer, on a quest to get home, but as you saw above he also represents another important archetype, the trickster (Plotkin, 2008).

**Creator**-The creator archetype also comes in the form of the artist or the inventor. This archetype is usually recognized by its importance in the generation of life and fertility, or in its creativity, imagination, and deliverance of something new or of enduring value. The creator archetype often acts out of inspiration or even out of dreams or fantasies. Examples of the creator archetype would include any of the gods or goddesses who are described as taking part in the creation of the world in the various creation myths in your textbook. Also, any of the fertility deities, such as Isis or Inanna or Ceres, would be ongoing examples of the creator archetype. A different kind of example might be Sundiata or Aeneas, each of whom are said to have created new empires (Knapp, 1986).

**Warrior**-The warrior archetype can also take the form of the rescuer, the hero, or the crusader for a cause. This character is usually notable for his or her courage, competence, and sense of self-worth or self-reliance. The warrior archetype (and its variations) is quick to respond to a challenge or to aid those in distress. Because the warrior is willing to commit violence to achieve his or her task, this character exists somewhat outside the mainstream of the community. However, the community is generally willing to accept the warrior's violent capacities, as long as they don't begin to present a problem for the community. Achilles, from the Iliad, is an obvious example of the warrior archetype, as is Roland (McGonagle, 1996).

**Intimat**-The archetype can take the form of the best friend, the lover, the spouse, or the connoisseur (Isaac, 2008). This is the character that finds satisfaction and fulfillment through intimacy or a passionate commitment of some kind a bonding with someone or something else. While the object of devotion is often another creature (human or animal), it can also be something like food, to whom the gourmand, for instance, is passionately devoted. Examples of the intimate archetype would be Enkidu, who becomes Gilgamesh's fast friend, or Patroclus, bosom friend of Achilles whose death drives Achilles to fight.

**Martyr**-The martyr archetype can also appear as the scapegoat who is usually reborn or resurrected in some way (Knapp, 2010). This is the character whose individual sacrifice (whether of life or of something else having great value and importance) purchases something of even greater value to the community as a whole or to the central character of the story. In this sense, Enkidu can be seen as a martyr, since his death serves eventually as an impetus to a greater wisdom for Gilgamesh (and, by implication, for all of humankind). The Egyptian god Osiris can be seen as a martyr in the guise of the dying god. The story of his death, the scattering of his dismembered body in the waters of the Nile, and his reconstitution and resurrection through the efforts of his wife, Isis, symbolically represent the gift of fertility that comes from the waters of the Nile, upon which Egypt has always depended for its survival.

### ARCHETYPAL LITERARY CRITICISM

Archetypal criticism argues that archetypes determine the form and function of literary works that a text's meaning is shaped by cultural and psychological myths. Archetypes are the unknowable basic forms personified or concretized in recurring images, symbols, or patterns which may include motifs such as the quest or the heavenly ascent, recognizable character types such as the trickster or the hero, symbols such as the apple or snake, or images all laden with meaning already when employed in a particular work.

Archetypal critics find New Criticism too atomistic in ignoring inter textual elements and in approaching the text as if it existed in a vacuum. After all, we recognize story patterns and symbolic associations at least from other texts we have read, if not innately; we know how to form assumptions and expectations from encounters with black hats, springtime settings, evil stepmothers, and so forth. So surely meaning cannot exist solely on the page of a work, nor can that work be treated as an independent entity.

Archetypal images and story patterns encourage readers (and viewers of films and advertisements) to participate ritualistically in basic beliefs, fears, and anxieties of their age. These archetypal features not only constitute the intelligibility of the text but also tap into a level of desires and anxieties of humankind (Sugg, 1992).

### **THE HEROIC ARCHETYPE**

The heroic archetype is a literary or movie character that is all-round good. He or she will save people, do the right thing, protect that which is good and will fight any monster that comes his or her way. They are one of the basic paradigms in tales and mythology from across the world, but particularly in European culture. Such examples of the hero archetype range from Achilles to Beowulf via superheroes like Superman and 1980s action heroes (Simon, 2007).

The roots of the hero archetype go back to ancient Greece and the beginnings of many polytheist and animist religions. They are based, like many other archetypes, on folktales linked to Gods and ancestors. Over time, the attributes and deeds of these ancestors have changed as the stories are repeated down the generations. These social developments are linked to Carl Jung's ideas on archetypes and collective dreams (Wood, 2005).

There are a number of basic characteristics for the hero archetype. Traditionally, the hero is strong of both physique and moral character. They may have special fighting or intellectual skills that allow them to function as a hero. This runs from martial arts skills to weapon knowledge. They are moral and do good. They do not have to be intellectual giants, but they are skilled and resourceful while doing the right thing.

Types of heroes include action heroes and superheroes. The action hero does not have to be special, but fights his or her way to defeating the main villain (Aylestock, 2009). There are also types of the hero archetype that deviate away from the traditional mold. Other variations on the hero archetype include the wannabe hero and the anti-hero. The wannabe hero is a wide-eyed idealist who, due to a lack of skills or the wrong circumstances, fails to become a hero. He or she often looks up to the main hero. The wannabe hero often dies heroically trying to emulate the hero. Examples include Don Quixote (Tallman, 2005).

The anti-hero is a character lacking many of the good qualities of the hero. They often do the right thing eventually, but their lives and personal back stories are more dubious and less wholesome than that of Superman or Spiderman. The anti-hero is often morally compromised. In a monomyth, the hero begins in the ordinary world, and receives a call to enter an unknown world of strange powers and events. The hero who accepts the call to enter this strange world must face tasks and trials, either alone or with assistance. In the most intense versions of the narrative, the hero must survive a severe challenge, often with help. If the hero survives, he may achieve a great gift or "boon." The hero must then decide whether to return to the ordinary world with this boon. If the hero does decide to return, he or she often faces challenges on the return journey. If the hero returns successfully, the boon or gift may be used to improve the world. The stories of Osiris, Prometheus, Moses, Gautama Buddha, for example, follow this structure closely (Campbell, et al, 2003).

Campbell describes 17 stages or steps along this journey. Very few myths contain all 17 stages—some myths contain many of the stages, while others contain only a few; some myths may focus on only one of the stages, while other myths may deal with the stages in a somewhat different order. These 17 stages may be organized in a number of ways, including division into three sections: Departure (sometimes called Separation), Initiation, and Return. "Departure" deals with the hero's adventure prior to the quest; "Initiation" deals with the hero's many adventures along the way; and "Return" deals with the hero's return home with knowledge and powers acquired on the journey.

### **STEPS OF MONOMYTH**

***The Call to Adventure***—The hero begins in a mundane situation of normality from which some information is received that acts as a call to head off into the unknown.

***Refusal of the Call***—Often when the call is given, the future hero first refuses to heed it. This may be from a sense of duty or obligation, fear, insecurity, a sense of inadequacy, or any of a range of reasons that work to hold the person in his or her current circumstances (Campbell, 1949).

**Supernatural Aid-** Once the hero has committed to the quest, consciously or unconsciously, his guide and magical helper appear, or become known. More often than not, this supernatural mentor will present the hero with one or more talismans or artifacts that will aid them later in their quest.

**The Crossing of the First Threshold-**This is the point where the person actually crosses into the field of adventure, leaving the known limits of his or her world and venturing into an unknown and dangerous realm where the rules and limits are not known (Packer, 2010).

**Belly of the Whale-**The belly of the whale represents the final separation from the hero's known world and self. By entering this stage, the person shows willingness to undergo a metamorphosis (Smith, 1997).

**The Road of Trials-**The road of trials is a series of tests, tasks, or ordeals that the person must undergo to begin the transformation. Often the person fails one or more of these tests, which often occur in threes (Rochelle, 2001).

**The Meeting with the Goddess-**This is the point when the person experiences a love that has the power and significance of the all-powerful, all encompassing, unconditional love that a fortunate infant may experience with his or her mother. This is a very important step in the process and is often represented by the person finding the other person that he or she loves most completely ( Monaghan, 2011).

**Woman as Temptress-** In this step, the hero faces those temptations, often of a physical or pleasurable nature, that may lead him or her to abandon or stray from his or her quest, which does not necessarily have to be represented by a woman. Woman is a metaphor for the physical or material temptations of life, since the hero-knight was often tempted by lust from his spiritual journey (Jobling, 2010).

**Atonement with the Father-**In this step the person must confront and be initiated by whatever holds the ultimate power in his or her life. In many myths and stories this is the father, or a father figure who has life and death power. This is the center point of the journey. All the previous steps have been moving into this place, all that follow will move out from it. Although this step is most frequently symbolized by an encounter with a male entity, it does not have to be a male; just someone or thing with incredible power (Salla, 2002).

**Apotheosis-**When someone dies a physical death, or dies to the self to live in spirit, he or she moves beyond the pairs of opposites to a state of divine knowledge, love, compassion and bliss. A more mundane way of looking at this step is that it is a period of rest, peace and fulfillment before the hero begins the return (Leeming, 1998).

**The Ultimate Boon-**The ultimate boon is the achievement of the goal of the quest. It is what the person went on the journey to get. All the previous steps serve to prepare and purify the person for this step, since in many myths the boon is something transcendent like the elixir of life itself, or a plant that supplies immortality (Indick, 2004).

**Refusal of the Return-**Having found bliss and enlightenment in the other world, the hero may not want to return to the ordinary world to bestow the boon onto his fellow man.

**The Magic Flight-**Sometimes the hero must escape with the boon, if it is something that the gods have been jealously guarding. It can be just as adventurous and dangerous returning from the journey as it was to go on it (Okum, 2009).

**Rescue from Without-**Just as the hero may need guides and assistants to set out on the quest, oftentimes he or she must have powerful guides and rescuers to bring them back to everyday life, especially if the person has been wounded or weakened by the experience (Bartle, 2004).

**The Crossing of the Return Threshold-**The trick in returning is to retain the wisdom gained on the quest, to integrate that wisdom into a human life, and then maybe figure out how to share the wisdom with the rest of the world.

**Master of Two Worlds-**This step is usually represented by a transcendental hero like Jesus or Gautama Buddha. For a human hero, it may mean achieving a balance between the material and spiritual. The person has become comfortable and competent in both the inner and outer worlds (Ellwood, 1999).

**Freedom to Live-**Mastery leads to freedom from the fear of death, which in turn is the freedom to live. This is sometimes referred to as living in the moment, neither anticipating the future nor regretting the past.

## THE HERO'S JOURNEY

The phrase "the hero's journey," to describe the monomyth, first entered into popular discourse through two documentaries. The first, released in 1987, *The Hero's Journey: The World of Joseph Campbell*, was accompanied by a 1990 companion book, *The Hero's Journey: Joseph Campbell on His Life and Work* (with Phil Cousineau and Stuart Brown). The second was Bill Moyers's series of seminal interviews with Campbell, released in 1988 as the documentary (and companion book) *The Power of Myth*. The phrase was then referenced in the title of a popular guidebook for screenwriters, released in the 1990s, *The Writer's Journey: Mythic Structure For Writers*, by Christopher Vogler. Though they used the phrase in their works, Cousineau, Moyers, and Vogler all attribute the phrase and the model of *The Hero's Journey* to Joseph Campbell (Leeming & Sader, 1997).

### **THE HOMERS ODYSSEY**

Odyssey is one of the most popular classic epic poems in the field of socio-cultural development. Its narration gains credit in the way to attain the means of structuring and restructuring the life of Greece as whole. The concept of Odyssey is an amalgamation of cultural entities and diversified mythological representation. The elements of myth and cultural depiction are very clear by the elaborative description of Odysseus. The dominance of cultural entity and mythical elaborations are the basis for understanding the character of Odysseus

### **THE 12 STAGES OF A HERO'S JOURNEY IN ODYSSEUS**

**Ordinary World-** In the case of Odysseus in the "Odyssey", our hero's ordinary world can not wholly be defined or looked at as "ordinary". However, for this book and tale of Odysseus, it is the closest thing to fit for this segment of the journey. His ordinary world is living on the island of Ogyia, retained by the goddess Calypso, who ever tries to win over his heart, and never does (Breyfogle & Grene, 1999).

**Call to Adventure-** Odysseus' call to adventure takes place while he is still in his ordinary world. Hermes travels from Mt. Olympus to tell Calypso that Zeus has declared that Odysseus is to be set free from her detainment of him. She assents to what her fellow immortal has told her, and she grudgingly relates the news to Odysseus that he is at liberty to finally leave her (Houston, 2009).

**Refusal of the Call-** When Odysseus is told this; he reacts to her in a very stubborn and pessimistic view of things. He talks about how he does not trust her devious mind and suspects her of hatching some trick against him, for he does not believe that she would ever willingly let him go without making sure something bad were to befall him. So with this he for a time refuses her statement that he is emancipated from Ogyia (Leeming, 1998).

**Mentor-** Odysseus' mentor figure is perhaps the single most significant factor of the lengthy poem that Homer writes for us. For the King of Ithaca mentor and helper throughout his journeys, from the beginning of the Trojan War until he finally returns to Ithaca to reclaim his throne, is the bright-eyed goddess, Pallas Athena. She prompts him to have the courage to be able to act in many situations, she knows all and often uses this omnipotence to aid Odysseus, and she is the one who also aids his son, Telemachus, first by providing the impetus for him to search for news of his father around Achaea in the very first books of the "Odyssey". Throughout Odysseus' heroic journey, the immortal Athena plays a major role in the events that occur, by taking on the look of Mentes and other people along the journey of Odysseus (Dimock, 1989).

**First Threshold-** The mighty Odysseus' first threshold is agreeing to leave the island of Calypso, after he has collected her binding oath, and as he sets sail homeward bound for Ithaca. The strong and just Prince begins his voyage home with the thought in mind of stopping off at some benevolent land and making friends and peace with those people, who will then help him furnish a ship and crew to finally assist him in his voyage home. This period of beginning to sail for home, after a long period of stagnation and frustration at not being able to get back to his homeland, comprise what is Odysseus' crossing the 1st threshold of his heroic journey (Miller, 2006).

**Tests, Allies, Enemies-** Odysseus' tests, allies, and enemies segment of his journey does not consist of many events. Although he faces many enemies and feats that he must overcome throughout his struggles getting home from Priamis city of Troy, at this point he faces only one major foe that definitely provides a non-superficial test for him to pass, and only one entity, being the Phaeacians, as his ally. As he begins his journey, Odysseus travels safely for

many days; however the immortal curse bestowed upon him by the relentless and unforgiving Poseidon, god of the seas and earthquakes, is yet to befall him. At around the 29th day into the story of the "Odyssey", Poseidon is seething up on high about the release of Odysseus from the caption of Calypso, and still infuriated by the transgression that the hero waged against his son Polyphemus the Cyclops, he wrecks his raft and Odysseus drifts to the shores of Scheria. This is the island of the Phaeacians, and after meeting the King of these peoples' daughter, Naussica, he is welcomed by King Alcinous and Queen Arete. After he stays at this great land which Homer portrays as being like the perfect utopian society, relating all of his past adventures and stories to the royal court and palace of Phaeacia, he is given a great many gifts and set off in a great ship of these people to sail him quickly home. He finally reaches Ithaca with these great oarsmen rowing him on in their own ship, and finds that he faces another challenge on coming home, perhaps even more trying than all the previous perils that he has faced outside of Ithaca, sailing around the great and mighty seas (Leeming, 2005)

**Approach to the Inmost Cave-** Odysseus approaches his inmost cave when he returns to his homeland and finally touches the ground of Ithaca once again. As he wakes up, after being dropped off by the Phaeacian sailors, he is immediately confronted by Athena and she drapes him in the guise of an old man, and advises him to first go to the swineherd Eumaeus' field and home. He is now back finally on his own land, the homecoming that he has longed for intermittently, for the past twenty years! It must be with great concentration and self-control that he can keep himself from running to his palace and proclaiming his return, an act which would probably have been fatal for him. So he learns from his loyal Eumaeus all that has befallen his kingdom during his absence, primarily the troubles of the suitors lying in wait to marry his bride Penelope. After learning all this, and meeting his son Telemachus for the first time grown-up, these two lay a plan and trap so that they may slowly test the suitors and all the servants of the palace for their loyalty and their resolve before finally slaying all that have wronged the great and now returned Odysseus (Myrsiades, 1987).

**Supreme Ordeal-** Odysseus' supreme ordeal is obviously facing the suitors and all those that have wronged him. He scrupulously and painstakingly draws out the time between when he first arrives and when he will attack. He remains under the guise of the old man, even up until the time when he kills the first suitor. Only he, the hero, knows when the time will come for the attack. The only other person that knows it is coming is Telemachus, and he is only told to be ready for the sign from Odysseus, whenever he decides that he will wreak his ultimate revenge and unfurl his rage. Eventually Odysseus finds out who is loyal to him and who is not, then finally decides to do the deed that he has waited for with thoughts of blood for about two or days. He kills all of the suitors in a battle in the main courtyard of the palace, then has the disloyal maids also executed (Barnes, 1959).

**Reward-** His reward is winning back his place of power and being able to be with his wife again, his son, and his surviving father.

**The Road Back-** Odysseus' road back can be symbolized by his journey on the road to see his father Laertes and bring him back so that he may live with him finally in peace in the palace. Odysseus has to face his last enemy in this denouement section of his journey in the object of the suitor's angry fathers who come after him with a hord from the city to kill Odysseus for his slaughter of the suitors. Odysseus, Telemachus, and even Laertes, of course with the help of the mentor Athena, fend of these aggressors and kill them too (Dougherty, 2001).

**Resurrection-** He is resurrected when he defeats this last enemy and can now take a reprieve from the constant threat of fighting and danger that has plagued him for two decades.

**Return with the Elixir-** The return with the elixir is when Odysseus and his loyal friends finally defeat his last threat to their survival, and peace is wrought over the entire place of Ithaca by Athena and the rest of the immortal gods up on high (Hamilton, 1990). This second version starts off with the Trojan War, so it gives a different perspective on the hero.

1. Ordinary World: The peaceful island of Ithaca is the ordinary world of Odysseus. Here Odysseus is the well respected and loved king of the island. He is married to his love, Penelope, whom he adores with his heart (Anderson, 1991)
2. Call to Adventure: Odysseus is summoned to join Agamemnon and other Achaeans to attack the city of Troy. They are going to Troy to retrieve the wife of Menelaus, Helen, after she is taken by Paris, the prince of Troy (Pucci, 1998).
3. Refusal of the Call: At first Odysseus refuses this invitation because he does not want to leave his quiet and peaceful homeland and leave behind his wife and his newly born son (Salla, 2002, 24).
4. Mentor: The mentor of Odysseus is, without a doubt, Pallas Athena, the bright-eyed goddess. Athena helps Odysseus innumerable times throughout his travels. The daughter of Zeus endows Odysseus with advice for which he is greatly faithful and devoted to her (Nortwick, 2009).

5. First Threshold: The Trojan War is the first threshold of Odysseus. At the war Odysseus becomes renowned for his cunning, bravery, prowess, and this mind. His mental and physical attributes are of equal importance to these heroes (Heubeck, 1990).

6. Test, Allies, Enemies : The journey home is an amalgam of tests, allies, and enemies for Odysseus. There are many tests, not to mention many temptations, through which Odysseus thrives through. The people which befriend Odysseus are the ones who give him food, clothes, and shelter like King Alcinous, and Circe. Obviously throughout the story there is one main enemy who is against Odysseus, this is Poseidon. There are also many small enemies who Odysseus meets on his travels. Scylla, Charybdis, and the Lastrygonians are some of his adversaries, but the most important is the cyclops, Polythemus, who condemns Odysseus to his long, arduous journey home. Primarily speaking Odysseus encounters new tests, allies, and enemies on each new land he falls upon on his trek back to Ithaca (Littleton, 2005).

7. Approach to Inmost Cave: The approach to the inmost cave is when the son of Laertes, Odysseus, finally arrives home at last. At first he does not acknowledge the fact that he is home. When he does come to that fact, he knows he cannot run home and exclaim that he is back. He knows he must bury his great feelings until the time is right (Stanford, 1954).

8. Supreme Ordeal: Getting back to his peaceful home of Ithaca and reuniting with Penelope and Telemachus is the ultimate ordeal of Odysseus. Before he can do that, he must drive the careless suitors from his once proud household.

9. Reward: The reward for Odysseus is when he arrives home and then defeats the complacent suitors. Also Odysseus is abounding with riches in presents from the aristocrats of Phaeacia.

10. Road Back: The road back for our hero, Odysseus, is when he cleanses his house of the incarnadine stains from the vile blood of the suitors and removing their bodies to the outside. After this is done, Odysseus goes to see his sick and emaciated father to bring his spirits back to life.

11. Resurrection: Now Odysseus is once again in his rightful position as King of Ithaca. This can be seen as a resurrection for Odysseus.

12. Return with Elixir: The returning with elixir for Odysseus is partly when he restores peace and tranquility to his house. The other part that fulfills this is when Odysseus is reunited to crestfallen Penelope (and his father later on) he brings back happiness to them once again (West, 2007).

Once again, there is more than one way to do these types of character studies. Here is one view of the character arc of Odysseus.

1. Limited Awareness - Odysseus is living a placid life in the land of Ithaca with his lovely wife, Penelope, and his young son, Telemachus. He is not at all aware of what role that war will play in his life.

2. Increased Awareness - Odysseus' awareness is augmented when Agamemnon and Menelaus come to him ascertaining if he will join them with their warfleet to Troy.

3. Reluctance to Change: At first Odysseus refuses this invitation because he does not want to leave his quiet and peaceful homeland and leave behind his wife and his newly born son.

4. Overcoming: After some convincing Odysseus gives in and embarks on a journey that will take him twenty years to next lay eyes on his homeland once again.

5. Committing: At the Trojan War Odysseus is seen as one of the most respected and important warriors of the Achaeans.

6. Experimenting: The war home and the journey home is what I say as Odysseus' experimenting. At these situations Odysseus gets a chance to show his bravery and his mind (Morris, 1997).

7. Preparing - The journey home is when Odysseus prepares himself for when the times comes of him reaching the shores of Ithaca. There are many temptations which put Odysseus' love for Penelope on the line. Through each one he struggles and triumphant.

8. Big Change: The big change for Odysseus comes when the ruler of all gods, Zeus, permits his long awaited return to Ithaca to continue once more. Prior to this Odysseus thought that reaching home was almost impossible for him. His grieving heart sank more and more each passing day until Hermes, with his wing-tipped golden sandals, flew down to Ogygia, and told Calypso to release Odysseus.

9. Consequences: Calypso had no choice but to release her captive to voyage home. After she tells Odysseus to leave he constructs a makeshift raft to carry him back to his homeland.

10. Rededication: Odysseus' thoughts and actions are redirected to try to return to Ithaca to reunite with Penelope.

11. Final Attempt: The battle between the suitors and Odysseus, Telemachus, and his allies serves as Odysseus' final attempt.

12. Mastery: Odysseus defeats the suitors and restores tranquility to his house. Thus completing his arduous journey that lasted twenty long enduring years (ibid: 326-344).

## CONCLUSION

The 'Odyssey' itself is a form of archetype, an epic journey with various conventions, the crossing of water, obstacles, super natural elements. As for specific archetypes in the odyssey, it's best to simply consider character archetypes. Most, if not all of the characters in the Odyssey follow an archetype, For example Odysseus himself, the galliant and intelligent hero, Athene the mentor, the sirens as 'femme fatals' and Posidon as the antagonist, or 'baddie'.

1. Ordinary World, The hero's normal world before the story begins Odysseus as King in Ithaca.
2. Call to Adventure, The hero is presented with a problem, challenge or adventure.  
He does not want to leave and uphold his oath in having to sail to Troy (so he pretends to be insane)
3. Refusal of the Call - The hero refuses the challenge or journey, usually because he's scared  
Odysseus pretends to be insane and plows a field using salt; but the Greeks force his hand by placing the baby Telemachus in from of the plow. O must turn the oxen aside or kill his own son.
4. Meeting with the Mentor: The hero meets a mentor to gain advice or training for the adventure  
This could be his interactions with Circe as she consults him about his journey. More likely - it is his interactions with Athena as she is constantly weaving in and out of the myth helping both Odysseus and Telemachus.
5. crossing the First Threshold - The hero crosses leaves the ordinary world and goes into the special world: Odysseus in the Underworld
6. Tests, Allies, and Enemies: The hero faces tests, meets allies, confronts enemies and learn the rules of the Special World. All of his "quests" the cave and the Cyclops, Circe and the Underworld, the Cattle of the Sun God, the bag of winds, the Sirens, etc.
7. Approach :The hero has hit setbacks during tests & may need to try a new idea.  
Odysseus's disguise as a beggar allows him to reconnoiter the palace so he can plan his revenge.
8. Ordeal: The biggest life or death crisis the battle royal with the Suitors.
9. Reward: The hero has survived death, overcomes his fear and now earns the reward,  
Odysseus's home coming to his wife and son.
10. The Road Back: The hero must return to the Ordinary World.  
His plans to reconquer his kingdom - he must meet the challenge by the families of the suitors whom he has killed.
11. Resurrection Hero: another test where the hero faces death – he has to use everything he's learned.
12. Return with Elixir: The hero returns from the journey with the “elixir”, and uses it to help everyone in the Ordinary World.

## USING SOCIAL NETWORKS IN LANGUAGE LEARNING IN IRAN

### ABSTRACT

Social networks (SNs) have become an important tool in online communication. Students spend hours using social networks every day, so the scholars in the field of education in general and English as a Foreign Language (EFL) context in particular are trying to integrate SNs in language learning and use them to their advantage. Hence, this research sought to find out to what extent students are familiar with SNs in Iran and are willing to use them as learning tools. Moreover, to what extent teachers believe that SNs can be helpful in teaching different components of language. To this end, two questionnaires were designed; one for students and one for teachers. The results showed that students are active users of SNs and believe SNs are good environments to learn and practice English. Teachers in Iran also recognized SNs as useful tools that can help students in their language learning. It concludes that SNs do have the potential to empower students in their learning English.

**KEY WORDS:** English teaching and learning, social networks, Iranian EFL Context

### INTRODUCTION

The advent of digital age has changed the way people communicate in the last decades. Whether in the form of emails or social networks (SNs), technology has been integrated with communication to challenge the way individuals associate with one another (Richardson & Hessey, 2009). Web 2.0 applications have impacted our life in many ways. E-learning or learning through internet is a by-product of these technologies that had a great impact on education and consequently language learning.

Until recently, studies in second language learning have not paid due attention to the learners as a social being (Holliday, 1994; Norton & Toohey, 2003; Palfreyman, 2003). A significant body of literature has developed concerning learners individually, focusing on the strategies they use to learn language both inside and outside the classroom, with less attention to the context of their learning (Oxford, 1990; O'Malley & Chamot, 1990; Wenden, 1991; Dickinson, 1992; Oxford & Ehrman, 1995).

Web 2.0 technologies offer “numerous opportunities to create innovative, engaging and pedagogically effective learning opportunities” (Conole & Culver, 2009). Internet with its universal features has improved language learning. The students clearly favor electronic sources for language learning; learning language through online technologies can increase the engagement; attendance and motivation of students (Hartman et al., 1991; Palfreyman, 2006; Roohi 2009; & Mohammadi et al, 2011), as well as giving them the chance to express their own preferences, construct their own settings, and present their identities (Girgin, 2011).

Social networks are among the latest examples of communications technologies that are very popular among university students (Kabilan, et. al 2010) and have the potential to become a valuable resource to support their language learning (Roblyer et al., 2010). Social network websites have many applications; they allow each user to create a personalized profile, select other users as friends, send private messages, join groups, post and/or tag pictures, and leave comments on these pictures as well as on either a group or an individual's wall or even create pages for different events. There are also so many third-parties or applications on the social networks platform like Facebook, such as games, polls and quizzes. One feature of social networks that makes them a potentially powerful tool for language learning is that they function primarily as communication tools (Roblyer et al., 2010). As Bakhtin

(cited in Brown, 2007) notes language is “immersed in a social and cultural context and its central function is to serve as a medium of communication.”

## **REVIEW OF LITERATURE**

Using social networks in educational and instructional contexts can be considered as a potentially powerful idea simply because students spend a lot of time on these online networking activities (Mazman, 2010). Mason and Rennie (2007) comments that it is no longer a question of whether to take advantage of these electronic technologies in foreign language teaching or not, the question is how to promote students’ learning using them. Studies showed that social network tools support educational activities by making interaction, collaboration, active participation, information and resource sharing, and critical thinking possible (Mason, 2006; Selwyn, 2007; Ajjan & Hartshorne, 2008).

Based on some studies students believe that SNs like Facebook could be utilized as an online environment to facilitate the learning of English (Kabilan, 2010; Girgin, 2011). Students agree that this online environment can be an appropriate tool to help learning different language skills, enhance their motivation, confidence, and attitudes towards learning English that can bring about successful application of CALL (Kabilan et. al, 2010; Vandewaetere & Desmet, 2009).

One of the problems that students encounter in learning language is the lack of opportunities for authentic communication due to non-personalized course content, and complains about being forced to follow a strict curriculum (Bartlett & Bragg, 2006; Donmus, 2010). Integrating social networks into existing learning practices can provide informal learning contexts and create new opportunities for language learning (Bartlett & Bragg, 2006). The texts that are produced in social networks are authentic materials. Social network sites provide the users the tools to construct their own experience, rather than passively reading the existing material (Mason & Rennie, 2007) Students become autonomous; they can be independent from books and teacher.

## **STATEMENT OF THE PROBLEM**

Unlike all the potentials enumerated above, research on social networking in language teaching is still limited and the need for research on social networks in post structural language learning has been recently recognized. In recent works less attention has been paid to the contexts that the learners are a part of; and in particular to the strategies related to the social context (Oxford, 1990) have been discussed less in later work (e.g. Chamot & O’Malley, 1996) than the more individual centered categories of ‘cognitive’ and metacognitive strategies. The use of available online technologies for education to date has been limited to face-to-face practice in an online context (Conole, 2009).

The education community still continues to struggle to establish the role these innovations can play in effective language teaching and learning. Students come to classes as all equipped with the newest technologies available, but often they have to leave them at the door (Roblyer, 2010), because the field still seems to lack a unified theory and scope of the uses of social networks in language pedagogy. On the other hand, due to social and cultural restraints much needs to be done to see how such factors affect the success and failure of the use of these tools in different cultures and contexts.

## **RESEARCH QUESTIONS**

As suggested by tenets of reflective practice (Schön, 1983), combining the view of students and instructors is valuable for exploring the potential learning opportunities offered by SNs; and students can be most critical of their experience with SNs. Accordingly, the following questions guide the current study:

1. What are the attitudes of Iranian university students towards using SNs to practice their English outside the classroom?
2. What are the views of Iranian language teachers towards using SNs to achieve their teaching goals?
3. What aspects of language do Iranian teachers identify that can be truly practiced in the classroom?

## METHODOLOGY

### *Participants*

The population involved in the present study comprised undergraduate university students at Ilam University and a number of English teachers. The majority of subjects that participated in the study were modest users of English since they were students and teachers of Teaching English as a Foreign Language (TEFL). Based on Oxford Quick Placement Test (2002), 100 EFL undergraduate BA students were assigned to two intermediate and advanced levels of language proficiency (females: 34, males: 66, age range: 18 to 29, mean age: 22). Furthermore, 50 teachers that taught English in university and English teaching institutes took part in the study. They had between 1 to 12 years of experience teaching English. Their age ranged between 21 and 35 with the mean of 27.5.

### *Instruments*

Two questionnaires were used to collect the data. One questionnaire was designed for the students and one for the teachers. The questionnaire for the students was designed in three parts. The items in the first section of the questionnaire (questions 1–5) established some basic information about the respondent, including their level of proficiency, popular SNs and applications, the amount of time that students spend on SNs weekly, how long they have been a member of SN, and the language they use in their interactions in the SNs. The first part elicited data about the social networks and the applications in SNs that were mostly used by the students. These items built up a picture of the kind of SNs and the degree of involvement of students in these web sites. The second part attempted to investigate students' belief towards the usefulness of SNs in improving different skills and components of language (9 items). And the last part was related to affective domain, and the degree that SNs can enhance confidence, motivation, and interest of learners.

In the second questionnaire teachers were asked about their opinions about the potentiality of applying SNs in their classes. First, we used Backman model of components of language (1991), and asked the teachers to what extent applying SNs can be helpful in learning each component of language (items 1-13). Following this section teachers were inquired about their opinion about expediency of SNs and their applications in the affective domain (confidence, motivation, interest of learners, and autonomy) and in the process of learning in the classroom. The reliability estimates of the two questionnaires were 0.89 and 0.94 respectively.

### *Procedure*

The study was conducted in December 2012 among the students of Ilam University and teachers of language institutes of Ilam. The questionnaires were filled voluntarily by the students during their class time. It took up to 15 minutes for the questionnaires to be filled. The questionnaires were returned on the spot. After receiving the first set of questionnaires, the teachers were asked to fill the questionnaires in their break time; they also returned the questionnaires right away. The collected data were analyzed by the SPSS statistic software version 20.

## RESULTS AND DISCUSSION

This paper examines whether SNs are an effective tool for improving second-language learning in Iran. For the analysis of the collected data, frequency and percentages were used; whereas for the description of likert items, mean scores, standard deviation and percentages were employed to describe the students' and teachers' views on SNs as a learning environment for learning English. The data collected by the first part of students' questionnaire revealed the most popular SNs in Iran. Facebook is the world leader among SN sites, and as table 1 shows it is the most popular SN among the TEFL students. 63% of students were member of Facebook, while 57% were members of Google+. Youtube (37%) and Twitter (11%) are next popular SNs. My Space did not have any members among the students. Many students have accounts in multiple SNs.

*Table 1: Percent of members of different SNs*

Social network	%
Facebook	63%
Google +	57%
Youtube	37%
Twitter	11%
My Space	0%

Table 2 shows the applications of SNs and the extent the students use them. Messaging and chat were the most popular applications; 55% of students used messaging regularly, and 44% were regular users of the chat application. The participants use SNs more for their one to one communication; Roblyer (2010) relates the potential of SNs for learning English to their power of communication that frees students from time and distance limitations. Messaging and chat applications are the most popular applications. Messaging is even more popular than chat application,

probably because it provides students an asynchronic meaningful communication which reduces dynamic social context cues that may intimidate students, such as frowning and hesitating (Finholt, Kiesler & Sproull, 1986), besides, it provides students a chance to reflect on their own writing before communicating. Hartman *et al.*, (1991) also reports that students prefer computer mediated communication to face-to-face meetings. Those students who may self-conscious to initiate discussions with their teachers or with other students any use this communication tools which are powerful features of SNs as an alternative, this results in greatly increased student-teacher and student-student interaction.

Photo sharing and giving comments are used most regularly after messaging and chat respectively. Creating group pages is an application that is not used heavily; this can be related to the fact that educational pages like class instruction are less authentic and personalized. Authenticity in language learning is especially important in foreign language contexts (Beauvois, 1998). Table 2 clearly shows that the applications that provide students with more communicating opportunities most easily are utilized more, because using these applications students express their ideas in a more natural and authentic communicative function, rather than just attempting to please the teacher (Cohen & Miyake, 1986).

*Table 2: Facebook applications used regularly by students*

Applications	Percent	Ratio (%)
Messaging	55%	24.66
Chat	44%	19.73
Photo sharing	38%	17.04
Giving comments	25%	11.21
Film sharing	24%	10.27
Game	24%	10.27
Creating group page	13%	5.82
Total	-	100

Regarding the membership in different SNs, 87% of the respondents were at least members of one or more SNs, while the rest (13%) of students didn't use any SNs and was not a member in any online social networks. Table 3 shows the length of time that students have been using SNs. 22.2% of students has been a member of SNs more than three years. And 18.5% have joined SNs recently (between 1 to 3 months). In other words, many have joined SNs and many are joining these communities. Several other studies revealed this growing desire to join SNs among students (2006; Kolek & Saunders, 2008; Mazman, 2010).

*Table 3: Length of time being a SN's member*

	Not a member	Months								Total
		1-3	4-6	7-9	10-12	13-18	18-24	25-36	More than 36	
Percent (%)	13.0	18.5	3.7	5.6	9.3	5.6	14.8	7.4	22.2	100%
Cumulative percent (%)	0.0	18.5	22.2	27.8	37.1	42.7	59.5	66.9	87.0	87%

We further checked the time students spend in SNs. The self-reported information (Table 4) demonstrates that only 14.8 of students do not log in to their SN account and never use them. 85.2% of students use the SN or SNs that they are a member at least 1 to 3 hours weekly. 68.5% of students spend at least 4-6 hours weekly, and 16.7% spend more than 12 hours in a week in their SNs. The details of table 4 reveal that Iranian students are avid users of the social networks, and online social networking is deeply embedded in their lifestyle.

*Table 4: Hours spent in SNs weekly.*

	Hours used weekly						Total
	Never	1-3 hours	4-6 hours	7-9 hours	10-12 hours	More than 12 hours	
Percent (%)	14.8	20.4	33.3	11.1	3.7	16.7	100

Next we inquired the student about their use of language with their Farsi speaker and English speaker friends (in reading, writing, speaking and listening). Table 5 shows the data regarding the language used by students. The mean score was calculated by assigning values to the likert scale as shown in the table. Mean score of these values shows that students use a mix of Farsi and English more frequently (mean, 3.31). Tendency to use English (mean, 3.07) is greater than Farsi (mean, 2.60). Although, as their native language using Farsi is easier for them, TEFL students

prefer to use their English more when communicating with their peers and their native and international friends. SNs give the Iranian students the independent opportunity to use the foreign language with other language learners or cross-cultural communication around the world, which many suggest fostering student autonomy (Soh & Soon, 1991; Barson, Frommer & Schwartz, 1993; Sayers, 1993). Paramskas (1993) asserts that that is why SNs help Student enthusiasm, initiative, and personal commitment.

*Table 5: Language used for SNs interaction with Farsi speakers and English speakers.*

Language used	scale					Mean score
	never 1(%)	seldom 2(%)	sometimes 3(%)	frequent 4(%)	always 5(%)	
Using Farsi	9.8	17.1	39.0	24.4	9.8	2.60
Using English	2.3	22.7	31.8	27.3	15.9	3.07
Using English and Farsi	7.3	14.6	31.7	22.0	24.4	3.31

When asked to rate the usefulness of SNs in their improvement in different aspects of language skills and components, students tended to highly agree with each item. A 5-level Likert scales of ‘Strongly disagree’ to ‘Strongly agree’ was used, similar values to the last part were assigned to the likert scale (strongly disagree 1, disagree 2, slightly agree 3, agree 4, strongly agree 5) to calculate the mean and SD of each item. The percentage of students that agreed or strongly agreed with each item was also included in table 6 as well as mean and SD.

According to table 6, in students’ view SN environment are suitable for improving speaking skills (mean 3.74) more than the other language skills. Reading (mean 3.62), writing (mean 3.41), and listening (mean 3.16) have the highest means respectively. In case of sub-skills of language, students agreed that SNs are good places to improve one’s vocabulary (mean 3.77). And 46.3% of students agreed or strongly agreed that through the SNs they can improve their grammar. Thus, as can be seen from the mean scores for all items in Table 6, the general opinion of the students is that social network platforms can be supportive of their language learning. Unlike traditional classrooms that favor those students who speak up most quickly, most often, and are most willing to interrupt, SNs allow students to contribute at their own time and pace (Selfe & Meyer, 1991; Tella, 1992).

*Table 6: Students beliefs about SNs as a leaning environment.*

		SA/A(%)*	Mean	SD
SNs	improve writing in English	55.5	3.41	.73
	improve reading in English	68.5	3.62	.73
	improve speaking in English	35.8	3.74	1.05
	improve listening in English	32.1	3.16	1.03
	Improve English vocabulary	69.8	3.77	.912
	improve grammar	46.3	3.29	1.10
	improve your communication skills	79.7	4.00	.77
	Make learning English easier	61.5	3.65	.96
	Makes you more familiar with the English culture	72.2	3.88	.83

\*SA/A, strongly agree or agree.

primarily are stages of communications, including cross-cultural communication. Therefore they provide a great opportunity for improving communication skills and raising cultural awareness. Students believed that SNs can improve their communication skills (mean 4.0), make them familiar with English culture (mean 3.88), and make learning English easier (mean 3.65). Abrams, 2006 and Lomicka, 2006 assert that Chat, email and other forms of electronic communication, which are prominent features of SNs promotes cultural, pragmatic and linguistic competence by providing meaningful communication and providing an environment for students to use the language with native speakers or other learners.

Regarding the items that were concerned with the affective domain, motivation and attitudes of students was inspected in their writing, reading, and communicating. Table 7 represents the data related to affective domain of learning. In case of the confidence 72.2% of students think that their confidence in writing increases in SNs context. 65% agreed that their confidence enhances in communicating and 57.4 agreed that their confidence enhances to read English material. So, students had very positive view that SNs boost their confidence in learning English in different aspects.

The case with motivation was the same. As the content of the table shows even a larger number of students believed that their motivation in reading (72.2%), writing (64.8%), communicating (73%) would be enhanced using SNs. Socializing and communication in highly interactive space of SNs makes learning English more interesting and

authentic. 77.4 of students had the same opinion that SNs make learning English more interesting, because SNs increase engagement, attendance, as well as motivation of students (Mohammadi et al., 2011).

Most highly students agreed that SNS make learning English more interesting. This can be linked to the fact that most of the interactions in SNs are not much formal, as they happen between friends and peers. Studies on informal social interaction and its place in foreign language learning suggest that it enhances language proficiency and confidence (Kurata, 2011). When students confirm that SNs enhance their motivation and confidence, and make learning English more interesting, it automatically means that they think SNs as good places to practice their knowledge of English. Therefore, unsurprisingly 70.3% agreed that SNs are a good place to practice English.

*Table 7: Effect of SNs on motivation, confidence, and attitudes of students*

	SA/A	Mean	SD
1. Enhance your confidence to write in English	72.2	3.61	.94
2. Enhance your confidence to read material in English	57.4	3.81	.77
3. Enhance your confidence to communicate in English	65.5	3.90	.93
4. Enhance your motivation to communicate using English	73.6	3.98	.82
5. Enhance your motivation to read English material	72.2	3.92	.88
6. Enhance your motivation to write in English	64.8	3.70	.96
7. Makes learning English more interesting	77.4	4.05	.86
8. Practice in English	70.3	3.96	.95

\*SA/A, strongly agree or agree.

Given the students eagerness for using SNs in their language learning, language teachers need to be able to willing and ready to use SNs in language instruction, therefore teachers opinions was investigated in a separate questionnaire. As for the second questionnaire, similar to the first questionnaire mean and SD were computed as well as the percent of respondent that agreed or strongly agreed with each item. Generally all the items had high means and were highly agreed with.

The lowest mean belongs to item A10 (mean 3.11); teachers agreed less on the usefulness of practicing English in SNs to improve coherence and organization in students writings. Probably, because nearly all the exchanged texts and writings are most often informal and short, and not more than a few sentences. More than any English skill, component, or competence, teachers accepted that SNs are good for students to learn vocabulary (A8, mean 4.20), which makes sense as new words can be practice in meaningful short texts, such as comments, which is suitable for learning vocabulary. After vocabulary, teachers recognize SNs as a good environment to practice writing (A6, mean 4.00). Improving reading comprehension skills (mean 3.88) and getting familiar with the differences between the target and the native culture and enhance their sensitivity to cultural norms (mean 3.97) are also items that had a high percent of agreement. In SNs students are exposed to language variation and have the opportunity to put their pragmatic knowledge in practice. Blattner and Fiori (2009) described the premier SN of the world (Facebook) as a potential language instruction tool to promote socio-pragmatic competence. On the whole teachers seem to be very positive towards the effectiveness of integrating the SNs in their teaching approaches to improve language skills and components.

*Table 8: Teachers view about improving language skills and components.*

	SA/A (%)	Mean	SD
A1. Enhance their textual knowledge	48.5	3.42	.97
A2. Enhance their sensitivity to dialect and social registers.	61.8	3.61	1.07
A3. Become familiar with the differences between the target and the native culture and enhance their sensitivity to cultural norms.	80.0	3.97	.95
A4. Enhance their reading comprehension skill.	71.4	3.88	1.02
A5. Enhance their speaking skill.	60.0	3.54	1.09
A6. Enhance their writing skill.	74.3	4.00	.80
A7. Enhance their listening skill.	55.9	3.41	1.45
A8. Increase their vocabulary knowledge.	85.7	4.20	.99
A9. Improve their knowledge of grammar.	48.5	3.45	.88
A10. Improve coherence and organization in their writings.	34.3	3.11	1.07
A11. Enhance their communicative competence	65.7	3.85	1.08
A12. Achieve an acceptable level of language proficiency.	57.1	3.48	1.09
A13. Develop their foreign language pragmatic competence.	54.3	3.48	1.01

Teachers also agreed to a great extent that SNs can be personalized settings that can accommodate to students personality traits, learning strategies, needs, and affective features. As it was established students already agreed that SNs give them motivation, confidence, and interest them. Moreover, teachers believed that SNs have good compliance with their teaching strategies (mean 3.57) as well as students' learning strategies (mean 3.54). SNs were seen as an independent learning environment that can be easily utilized in the classroom and be in line with teachers' teaching instructions.

*Table 9: The compatibility of SNs with individual aspects*

	Mean	SD
(SNs' tools and activities can be tailored to):		
B1. The students' personality traits.	3.41	1.13
B2. The students' learning strategies.	3.54	1.09
B3. The students' needs.	3.57	1.00
B4. The students' affective features.	3.64	1.06
B5. The teachers' teaching strategies.	3.57	1.06

Similar to students, teachers also believed that one of the most important features of SNs that can help in learning is that they make English learning more interesting than the traditional methods of teaching (mean 4.20), and motivate students to learn English (mean 4.14). As Oroujlou and Vahedi (2011) maintain taking the motives of students into account can make language learning interesting. Students are self-motivated to use SNs and that is what makes learning language interesting in both students' and teachers' view. SNs differ from the traditional classes that had a blackboard and chalk system since they foster community and collaboration.

*Table 10: The compatibility of SNs with Affective features*

	Mean	SD
<b>Social networks:</b>		
C1. Make students feel more motivated in learning the foreign language.	4.14	1.06
C2. Reduces the students' anxiety.	3.91	1.06
C3. Are more interesting to the students than the traditional ones.	4.20	1.02
C4. Are more interactive than the regular classes.	3.80	1.13
C5. Are authentic.	3.62	1.11
C6. Have fixed but dynamic Curriculum.	3.31	1.05
<b>Tasks and activities designed by the use of social networks' tools:</b>		
D1. Are more challenging.	3.88	.79
D2. Are more meaningful to the students.	3.77	.87
D3. Have more information gaps.	3.68	.90
D4. Are authentic, personalized, and learner-driven.	3.91	1.06
<b>In classes using social networks, students:</b>		
E1. Become more creative.	3.85	.91
E2. Receive more feedback from teachers and peers.	3.91	.91
E3. Collaborate more with each other.	4.08	.88
E4. Can design the materials based on their needs.	3.74	1.19

There are so many advantages that make using SNs in the classroom beneficial. In teachers view using SNs in the classroom reduces anxiety, there is lots of interaction between users, the material offered is authentic, and can help teachers have a dynamic curriculum. The tools and applications of SNs can make learning more challenging, meaningful, create more information gap, and the material they offer are more authentic, personalized, and learner-driven. Teachers agreed that classes that uses SNs are more creativite, get more feedback from peers, more collaboration, and offers material that are designed based on their needs. Providing an interactive environment which creates independent and collaborative opportunities is especially important in for foreign language learning when learners where exposure to target is limited.

## CONCLUSION

The data that were drawn two questionnaires showed that Iranian students are active users of SNs and being part of SN's community is gaining more and more popularity with the TEFL students of Ilam University. The data showed that they use a good deal of English and also a mix of Persian and English in their interactions, besides they are highly eager to use SNs in the process of their language learning, and exercise what they have learned about language in SNs. they believe that their interactions in SNs enhances their confidence and motivation in using English, and helps them improve different language skills and components. Thus this is safe to claim that SNs are an excellent tool for fostering new social relations between the learners, resulting in improving their proficiency. When

online social networking of students combines with their education, their education can get innovative and entertaining. This helps students to gain very positive attitudes and get motivated to learn and use their English. Teachers also thought SNs as good places for practice that is interesting for students, motivates them, and is makes them confident in language learning. They were many advantages of using SNs that teachers highly agreed with them. They had a positive view that SNs can be effective in improving the language skills of students, and have many advantages that helps facilitating language learning, such as being creative and challenging, having authenticity and being learner centered, have the potential of adjusting themselves with learners different personality treats. Therefore planning to use SNs in classroom and integrating them into foreign language learning seems very beneficial and facilitating for Iranian classrooms, where classes are often crowded and learning language is mostly a passive experience.

Although the findings of the study are encouraging, the mere readiness of students and teachers to exploit SNs pedagogically does not guarantee the successful integration of SNs in Iranian language learning context. Further investigation into ways of integrating the SNs in the classrooms is necessary by all means.

**L2 IDIOM LEARNING IN THE CONTEXT OF DISTANCE LEARNING: A FOCUS ON  
TEXTUAL AND PICTORIAL GLOSSING AND HYPERLINK**

**Abbas Ali Zarei**

*Assistant Professor, Imam Khomeini International University, Qazvin, Iran*

**Samira Abbasi**

*M.A., Islamic Azad University, Takestan, Iran*

**ABSTRACT**

This study investigated the effects of textual and pictorial glossing and hyperlink on L2 idiom comprehension in distance learning context. The participants, 60 Intermediate female English as a foreign language (EFL) students, were randomly assigned to 4 groups of 15. All groups received two stories a week through Email. Each group received the stories with a different mode of presentation. Two groups were provided with hyperlinked idioms: pictorial and textual hyperlink. The other two groups received instruction through glosses, pictorial and textual glosses. At the end of the treatment period, a multiple choice test was administered to measure receptive knowledge of idioms. The findings showed that the pictorial groups outperformed the textual groups in both hyperlink and glossing conditions on the comprehension test. The present study may have implications for teachers, learners, material writers, textbook authors, CALL package designers and distance learning planners in that it may encourage them to add pictorials to the verbal input.

**KEY WORDS:** idiom learning, distance learning, gloss

**INTRODUCTION**

In today's society, the web-based environment of education has provided learners with the opportunity to improve their knowledge of second language (L2) and enhance their communicative competence by the use of various web-based services such as: Email, chat, online dictionaries, online magazines, electronic banking, electronic books, electronic shopping, private online language tutoring courses, etc. Furthermore, the internet has made it possible for learners to choose and manage the process of their learning regardless of the physical location of them.

Another side of this study is idioms. Idioms are one of the crucial culturally integrated constituents of any language. Idioms have received considerable attention from pedagogical point of view in recent years (e.g., Abel, 2003; Boers, 2001; Cooper, 1999; Gibbs, 1980). Researchers and instructors have offered many presentation modes to instruct idioms including L2 definition, L1 explanation, etymology elaboration, pictorial elucidation, glosses, etc.

Nevertheless, the issue of applying the most effective presentation mode of teaching idioms has generated a substantial amount of controversy among researchers. Boers (2001) states that associating an idiom with its etymology has been shown to enhance retention. He believes that the simple question 'Where might this expression come from?' has a facilitative role in helping learners to call up in their minds a concrete scene. On the other hand, Fotovatnia and Khaki (2012) point out the pedagogical value of pictures for the teaching of both meaning and form of decomposable idioms. Boers, Piriz, Stengers, and Eyckmans (2009), in a small-scale experiment, addressed the question of whether pictorial elucidation helps retention of the form of idioms, i.e. their precise lexical composition. Results revealed that the addition of pictorial elucidation contributes little to learners' retention of linguistic forms.

The objective of the present study is to investigate the effect of four presentation modes (pictorial hyperlink, pictorial gloss, textual hyperlink, and textual gloss) on SL idioms learning. Previous studies on idioms have demonstrated the positive effect of these modes on L2 idiom learning in classroom context. This study is an attempt to compare them with each other in order to see which one is the most effective in the context of distance learning.

## **LITERATURE REVIEW**

By the use of the Internet and the World Wide Web, learners have the opportunity to manage the process of their learning based on their need and purpose. In addition, one culturally integrated aspect of any languages is idioms. Also, there are many modes of idiom presentation. The debate is about which mode is the most effective and compatible mode in distance learning context.

### ***Idioms***

An appropriate use of idiomatic expressions is a sign of language fluency. Many advanced language learners are unable to utilize these expressions appropriately, or they avoid using them. In the literature, idioms have been defined by many linguists and lexicographers in different ways. According to Cooper (1999), an idiom is an expression whose meaning cannot always be readily derived from the usual meaning of its constituent elements. Likewise, Abel (2003) holds that a decomposable idiom is an idiom whose individual components contribute to its figurative meaning, whereas the constituents of a nondecomposable idiom do not make such a contribution. In an attempt to offer a tentative idiom classification, Andreou and Galantomos (2008) believe that Greek idioms can be categorized as figurative idioms, idiomatic expressions based on historical and cultural knowledge in general, and pure idioms (i.e. non compositional idioms).

### ***Different presentation modes of idiom***

Mayer (1997) mentions differences among delivery media, presentation modes, and sensory modalities. He refers to delivery media as the system used to present instruction, such as a book-based medium versus a computer-based medium. Presentation modes refer to the format used to represent the presented instruction, such as words versus pictures, and modality refers to the information processing channel that a learner uses to process the information such as acoustic versus visual information processing. According to Mayer (2008), a central challenge of psychology and education is the development of the science of instruction aimed at understanding how to present material in ways that help people learn.

### ***Multimedia***

Providing appropriate and relevant pictures depicting concrete and relevant scenes makes materials more appealing and may foster comprehension and retrieval of L2 idioms and words. In addition to pictures, using videos, sounds, animated pictures, drawings, and video clips becomes common ways of presenting idioms or words.

The term multimedia means different things on different levels. On the level of technology, it means the use of multiple delivery media such as computers, screens, and loudspeakers. On the level of presentation formats, it means the use of different forms of representation such as texts and pictures. On the level of sensory modalities, it means the use of multiple senses such as the eye and the ear (Mayer, 2005, pp. 49-70).

To demonstrate the importance of pictures in education, Yeh and Wang (2003) conducted a study to compare the effectiveness of three types of vocabulary annotations on vocabulary learning of EFL college students in Taiwan: text annotation only, text plus picture, and text plus picture and sound. The results of the study showed that the version with text plus picture was the most effective type of vocabulary annotation. Similarly, Yushi (2006) investigated the effects of additional pictorial cues in L1 and L2 glosses, and how these additions affect vocabulary learning in a multimedia environment. 195 students from two universities in Japan participated in his study. The students were randomly divided into four groups using four different gloss types: the first group read a story with L1 text-only glosses; the second group read it with L2 text-only; the third group used L1 text-plus-pictorial cues in the glosses; and the fourth group had as their glosses L2 text-plus-pictorial cues. The results showed a significant difference between picture and no-picture groups, suggesting the beneficial effects of pictures with regard to learners' retention of the meaning of words.

Finally, Zarei and Salimi (20012) found evidence supporting the effective role of pictures in L2 vocabulary recognition and production. They compared the effectiveness of three methods of vocabulary presentation: picture, song, and the keyword method on Iranian EFL learners' vocabulary recognition and production. Results showed that the group instructed through picture had the best performance.

### ***Gloss***

Glossing is another useful mode of idiom and word presentation. Generally, glosses are categorized into two types: Computer-based or multimedia-based glosses versus paper-based glosses. Many researchers have examined the effectiveness of glosses in enhancing vocabulary and idioms knowledge of L2 learners, and have compared various kinds of glosses.

Shahrokni (2009) compared the effect of online textual, pictorial, and textual pictorial glosses on the incidental vocabulary learning of 90 adult elementary Iranian EFL learners. 3 groups of participants were exposed to the research treatment. During 3 sessions of instruction, 5 computerized reading texts including 25 target words were studied. The participants read the texts for comprehension and, at the same time, were able to consult the glosses attached to the target words. Results showed that a combination of text and still images resulted in significantly better incidental vocabulary learning.

In a similar attempt, Yousefzadeh (2011) compared computer-based glosses with traditional glosses. Two groups of participants received instruction in the following conditions: The Computer based group were instructed through computer. i.e. new words were presented with their pictures and L1 translations and the traditional group received material on the paper only with L1 translation. The results indicated the superiority of computer-based glosses.

### ***The impact of CALL in foreign language learning***

New technologies offer students a venue for additional interesting and engaging activities in second or foreign language learning. Computer Assisted Language Learning (CALL) provides a motivating and safe environment of learning which may improve students' achievement. Within this context of electronic learning (e-learning), students have the opportunity to choose and manage their learning and to keep interaction and connectivity. To show the powerful role of e-learning, Bielawski and Metcalf (2003) state that e-learning is powerful because it is able to provide the right information to the right people at the right times and places. Furthermore, integrating technologies with language pedagogy may develop learner autonomy and help learners to become independent. Raya and Fernández (2002) emphasizes the effective role of new technologies which can help learners to take a more active part in determining their own objectives and syllabi, as well as the path and timing they choose. They state that by teaching students the necessary skills, they can find information when they need it as well as use it appropriately based on their requirements and purposes.

## **RESEARCH QUESTION**

The present study addresses the following research question:

Are there any significant differences among the effects of various presentation modes (pictorial hyperlink, pictorial gloss, textual hyperlink, and textual gloss) on L2 idiom comprehension in distance learning context?

## **METHODOLOGY**

### ***Participants***

The participants of this study were 60 female EFL students at intermediate level of proficiency. All the participants were native speakers of Persian studying in Iran Language Institute in Kermanshah, Iran. Randomly, they were divided into four groups. Each group contained 15 participants who received one of the treatment conditions via the internet.

### ***Instruments***

In this study, the following instruments were utilized:

In order to homogenize the participants in terms of their level of proficiency, a Michigan Test of English Language Proficiency was used. It contains 100 multiple-choice items including 40 grammar items in a conversational format, 40 vocabulary items requiring the selection of a synonym or completion of a sentence, and reading passages followed by 20 comprehension questions.

To make sure that the participants had no prior knowledge of the target idioms, an idiom pretest was administered. The test included 121 items containing idioms which were to be presented during the treatment. The participants had

to write the English or Persian translation of the idioms. Results revealed that, 20 idioms were familiar for the participants. Therefore, these 20 idioms were excluded for the post tests. All the items of the tests were selected from “*Can You Believe It? Stories and Idioms from Real Life, Book3*” (Huizenga, J., 2000).

The course book used to present idioms was titled “*Can You Believe It? Stories and Idioms from Real Life, Book3*” (Huizenga, J., 2000). The book was published by Oxford University Press. It contained 14 amazing real stories from around the world. Each story included 7 to 10 idioms and 2 to 5 phrasal verbs. For the purpose of this study, phrasal verbs were included in the instruction phase but excluded from the posttests.

A 30-item multiple choice idiom test was administered to compare the effects of textual gloss, textual hyperlink, pictorial gloss, and pictorial hyperlink on the comprehension of idioms and to measure the participants' receptive knowledge of idioms. The time allocated to this posttest was 30 minutes.

### **Procedure**

In order to achieve the aim of the study, the following procedures were followed. First of all, to homogenize the participants, a multiple-choice MTELP was administered to 80 participants. The analysis of the scores indicated that 20 of the participants had to be excluded from the study because of a different proficiency level. So, 60 female intermediate learners took part in the study. Second, to minimize the effect of the participants' background knowledge of the target idioms, a pre-test was administered in the second week of the spring semester 2013. The pre-test contained 112 idioms and the participants were asked to write the meaning of the idioms in English or Persian. Furthermore, they were asked to write their Email address to take part in the virtual course of idioms. Then, the participants were divided into four groups randomly. All the groups received 2 stories a week in pdf format through Email. Each story contained 7 to 10 idioms. The instructor taught the same content to all the students enrolled in the course. However, there were some obvious differences in the way content was delivered. Each group received the content with a different mode of presentation. That is to say, the meaning of the idioms was clarified through various modes for each group:

In group A (textual gloss group), the participants received instruction through textual gloss. To be exact, this group was provided with materials in which the meaning of the target idioms was clarified in a glossary at the end of each story. Participants were asked to read English definition of idioms in a list. In group B (textual hyperlink group), the same materials were sent to the participants. However, the selected mode of presentation for this group was textual hyperlink. When the participants clicked on a hyperlinked idiom, a new page appeared and showed the idiom and its English definition. The third group, group C (pictorial gloss group), were exposed to the same materials. However, for this group, relevant and clear pictures which depicted target idioms were provided in a glossary at the end of each story. Also, group D (pictorial hyperlink group) were provided with the same materials. They had access to the pictures of idioms by just one click. In other words, when the participants clicked on a hyperlinked idiom, a new page appeared and showed the idiom and its picture.

The fourth phase was the administration of the posttest. A 30-item multiple choice idiom test was administered to all groups to compare the effects of the four presentation modes (textual gloss, textual hyperlink, pictorial gloss, and pictorial hyperlink) on SL idiom comprehension.

## **RESULTS AND DISCUSSION**

### **Results**

The aim of the research question was to investigate whether or not there are any significant differences among the effects of various presentation modes (pictorial hyperlink, pictorial gloss, textual hyperlink, and textual gloss) in distance learning context on L2 idiom comprehension. To do so, a One-Way ANOVA procedure was used. Descriptive statistics, including the mean, standard deviation, etc. are summarized in Table 1.

Table 1: Descriptive Statistics for the ANOVA on idiom comprehension

groups	N	Mean	Std. Deviation	Std. Error	95% Confidence Interval for Mean	
					Lower Bound	Upper Bound
Pictorial hyperlink	15	24.3333	3.65800	.94449	22.3076	26.3591
Pictorial gloss	15	23.7333	5.57375	1.43914	20.6467	26.8200
Textual hyperlink	15	19.0000	3.33809	.86189	17.1514	20.8486
Textual gloss	15	18.8000	4.45934	1.15140	16.3305	21.2695
Total	60	21.4667	4.96587	.64109	20.1838	22.7495

Based on Table 1, it can be observed that the highest mean on the idiom comprehension test belongs to the pictorial hyperlink group ( $\bar{X}$  = 24.33) followed by the pictorial gloss group ( $\bar{X}$  = 23.73). The third highest mean belongs to the textual hyperlink group ( $\bar{X}$  = 19). The group instructed through the textual gloss has the lowest mean ( $\bar{X}$  = 18.80). To see whether or not the differences among the groups are statistically significant, the One-Way ANOVA procedure was used. The obtained results are presented in Table 2.

Table 2: ANOVA on learners' idiom comprehension

	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	398.267	3	132.756	7.036	.000
Within Groups	1056.667	56	18.869		
Total	1454.933	59			$\omega^2 = .23$

In Table 2, based on the observed F value and the significance level ( $F(3,56) = 7.03$ ,  $P < .05$ ), we can safely claim that there are significant differences among the means of the groups. So, the null hypothesis developed in chapter one is rejected. At the same time, the index of the strength of association ( $\omega^2 = .23$ ) shows that 23% of the total variance in the dependent variable (idiom comprehension) is accounted for by the independent variable (mode of presentation). This means that the remaining 77% of the variance is left unaccounted for. To locate the significant differences, a post hoc Scheffe test was used, the results of which are summarized in Table 3.

Table 3: Multiple comparisons for the ANOVA on idiom comprehension

(I) group	(J) group	Mean Difference (I-J)	Std. Error	Sig.	95% Confidence Interval for mean	
					Lower Bound	Upper Bound
Pictorial hyperlink	Pictorial gloss	.60000	1.58615	.986	-3.9719	5.1719
	Text hyperlink	5.33333*	1.58615	.016	.7614	9.9053
	Text gloss	5.53333*	1.58615	.011	.9614	10.1053
Pictorial gloss	Text hyperlink	4.73333*	1.58615	.040	.1614	9.3053
	Text gloss	4.93333*	1.58615	.029	.3614	9.5053

Textual hyperlink	Text gloss					
		.20000	1.58615	.999	-4.3719	4.7719

As the above table shows, there are statistically significant differences between both of the pictorial groups and the textual groups. In other words, the pictorial groups outperformed the textual groups in both hyperlink and glossing conditions on the idiom comprehension test. At the same time, there are no statistically significant differences between the pictorial groups. It can be claimed that pictures (regardless of whether they are hyperlinked, or glossed) can positively influence idiom comprehension in the distance learning context.

### **Discussion**

Regarding the research question of this study, the outcomes supported the positive effect of pictures on L2 idiom comprehension in the context of distance learning. This finding of the present study is consistent with a number of studies some of which were reviewed in chapter 2, such as Fotovatnia and Khaki (2012), who pointed out the pedagogical value of pictures in the teaching of both meaning and form of decomposable idioms. Also, Yushi (2006); and Zarei and Salimi (2012) showed the positive effect of pictures in teaching and learning L2 words. Likewise, Kost, Foss, and Lenzini (1999); Shahrokni (2009); and Yousefzadeh (2011) supported the superiority of multimedia gloss in improving L2 learners' comprehension of L2 words. All these studies confirmed the significant effect of picture elucidation in idiom comprehension and word learning. Also, the results of the present study are in accordance with the claim of the cognitive theory of multimedia learning (CTML) (Mayer, 1997, 2001). According to Mayer (2005), human beings process knowledge through two channels: a visual-pictorial and an auditory-verbal (dual-channels assumption); each channel has a limited capacity for processing (limited capacity assumption); and active learning involves carrying out a synchronized set of cognitive processes (active processing assumption). The cognitive theory of multimedia learning specifies five cognitive processes in multimedia learning: selecting relevant words from the presented text or narration, selecting relevant images from the presented illustrations, organizing the selected words into a coherent verbal representation, organizing selected images into a coherent pictorial representation, and integrating the pictorial and verbal representations and prior knowledge. In other words, presentation of the information visually and textually might lead to a deeper level of learning. In this study, pictorial groups were provided with the textual form of idioms in addition to related pictures. They had the opportunity to integrate the textual form of idioms with concrete visual pictures. This may have engaged L2 learners' mind in processing and integrating written form of an idiom and its relevant picture simultaneously.

### **CONCLUSION**

The present study attempted to investigate the effects of various presentation modes namely; pictorial hyperlink, pictorial gloss, textual hyperlink, and textual gloss on L2 idiom comprehension in distance learning context. The findings showed that the pictorial groups outperformed the textual groups in both hyperlink and glossing conditions on the comprehension test. To conclude, the addition of relevant and clear pictures makes materials appealing and facilitates comprehension of L2 idioms.

### **Implications**

As multimedia make materials appealing, using this presentation mode can be useful for both teachers and learners. The present study may also have implications for material writers, textbook authors, CALL package designers and distance learning planners in that it may encourage them to add pictorials to the verbal input.

### **LIMITATIONS OF THE STUDY**

The following limitations and delimitations need to be taken into account about the present study:

1. The first and the most important limitation was the difficulty of finding 60 homogeneous participants who had access to computer and internet, and enjoyed a satisfactory level of familiarity with computer-based learning for this self-access study.
2. The sex of the participants was limited to female learners; therefore, the results of the study may not be generalizable to male learners.
3. The participants of this study were limited to the intermediate level learners. So, care must be exercised in generalizing the results beyond its proper limits.
4. Another factor to be taken into account is the small sample of the participants. This further limits the generalizability of the findings.

5. Modes of idiom presentation are classified into different types. It is impossible to compare all the modes in one study. This study has chosen to focus on only selected modes of presentation.
6. There are many ways of conducting distance education; this study was carried out through only one way of distance learning (instruction through Email).
7. The result of this study may be affected by other variables, like age, personality and social factors. These factors have not been taken into account in the present study.

### ABSTRACT

Pragmatic markers (PMs Hereafter) have been a polemic issue in pragmatic research over the past few decades. Although a substantial amount of research has been devoted to PMs in English and some other languages to define, classify and categorize PMs, we are still far from developing an inclusive typology. Drawing on data from a written and spoken corpus in Persian and the current classifications of PMs in literature such as Gonzalez (2005), Akkaya (2007), Brinton (2008), and Fraser's (2009), the present study tried to find out how such markers are realized in Persian. In so doing, attempt has been made to follow a reductionistic approach. The analysis is based on a dichotomy of interpretational/non-interpretational and notional/ non-notional particles. The study will, also, discuss the areas of convergence and divergence in Persian and English and the theoretical and pedagogical implications.

**KEYWORDS:** Pragmatic markers; Interpretational; Non-interpretational; Notional; Non-notional

### INTRODUCTION

Within the realm of pragmalinguistics, Markers, in general, and Pragmatic Markers (PMs), in particular, have been extensively studied (e.g., Erman, 2001; Norrick, 2001; Chiu, 2002; Martinez, 2002; Cuenca, 2003; Gerner, 2003; Hinkel, 2003; Aijmer, 2004; Grenoble, 2004; Muller, 2004, 2005; 5; Fraser, 2005a,b; Gonzalez, 2005; Akkaya, 2007; Choi, 2007; Brinton, 2008; Feng, 2008; Jalilifar, 2008; Fraser, 2009; Norrick, 2009; Argaman, 2010; and Bell, 2010).

Among the works done on markers, studies carried out on PMs have passed an evolutionary route from 1996 to 2009. These markers have been investigated extensively for their occurrences, types, functions and classifications. Fraser (1996) primarily used the terminology *Pragmatic Markers* and tried to propose a typology of PMs in English. Later, from 1997 to 2009, he made an attempt to give a more inclusive and comprehensive typology by adding new types and subtypes of pragmatic markers to the previous ones. Furthermore, other researchers (e.g., Erman, 2001; Gonzalez, 2005; Akkaya, 2007; and Feng, 2008) have tried to give a thorough all-embracing taxonomy of PMs, considering variant variables in different contextual settings.

Some of the above-mentioned studies have investigated markers from a number of variant perspectives such as, *cross-linguistic study of markers* (e.g., Ozbek, 1995), *typological study of markers* (e.g., Lee, 2002 and Fraser, 1996), *markers of variant sociolinguistic contexts* (e.g., Grenoble, 2004; Choi, 2007; Feng, 2008), *bilingual markers* (e.g., Hlavac, 2006), *markers , discourse coherence and relevance theory* (e.g., Andersen, 2001), *markers , gender and age* (e.g., Andersen, 1997 & 2001; Erman, 2001; Chiu, 2002; Akkaya, 2007;), *multi-functionality of markers* (e.g., Erman, 2001;; Muller, 2005; Cuenca, 2008; Bell, 2009; and Bolden, 2009), *new typology of markers* (e.g., Fraser,

1996, 1997; Goatly, 1997; Lee, 2002; Brinton, 2008; Feng, 2008; and Fraser, 2009), *markers implications for translation* (e.g., Danish, 2008), *synchronic and diachronic study of markers* (e.g., park, 2003, Korean pragmatic markers), *markers in different pedagogical settings* (e.g., Martinez, 2002; Hinkel, 2003; Muller, 2005, SLA; and Jalilifar, 2008), *markers and emotional intensity* (e.g., Argaman; 2010), *markers signaling metaphor* (e.g., Goatly, 1997;), *universality of markers* (e.g., Fraser, 2005a), and finally, *markers in spoken mode of speech* (e.g., Andersen, 1997; Norrick, 2001; Aijmer, 2004).

With all the studies done on PMs, the development of a theory of PMs is yet in its infancy and we are still far from having a comprehensive taxonomy of PMs which can account for all the markers cross-linguistically. Further, to the researchers' knowledge, Persian context has been intact to such cross-linguistic investigations on PMs. As Schiffirin (2001, 2003) points out, cross-linguistic studies help us to have a more vivid and inclusive picture of the behavior of PMs. Having this in mind and based on a sound analytical framework, i.e. Fraser's (2009) classification of PMs, attempt was made to scrutinize types and functions of PMs in Persian.

### ANALYTICAL FRAMEWORK

The reference framework employed in this study to analyze the data was Fraser's (2009) framework of PMs categorization, in which he characterized PMs as:

Syntactic, lexical, phonological linguistic devices which play no role in determining the semantic meaning of the basic propositional content of a discourse segment of which they are a part, but do have a critical role in the interpretation of the utterance. (p. 892).

He distinguished four major categories for PMs: A) Basic Markers (BMs): which give information about the intended use of an utterance (e.g., *I admit, please, My promise*), B) Commentary Markers (CMs): which help the speaker in conveying his/her attitudes towards something (e.g., *frankly, amazingly, apparently*), C) Discourse Markers (DMs): which help the speaker in relating two adjacent pieces of discourse (e.g., *but, so, in addition*), and D) Discourse Management Markers (DMMs): "which signal a meta-discourse comment on the structure of discourse" (Fraser, *ibid*, p.893).

Discourse management markers, in turn, were divided into three subcategories: 1) Discourse Structure Markers (DSMs): which, with consideration of the total structure of discourse, indicate the contribution of the next discourse parts (e.g., *first, then, in summary, I add*), 2) Attention Markers (AMs): which signal that the topic is going to be changed but do not indicate the type of change and in many cases occur before topic orientation markers (e.g., *ah, alright, anyway, anyhow, hey, in any case, in any event, now, now then, oh, ok, so, so good, well, well then*), and 3) Topic Orientation Markers (TOMs).

Topic orientation markers indicate four types of immediate changes in the topic of discourse: a) Returning to a Prior Topic (RPT): for example, *back to my point, returning to my (previous) point, to return to the prior topic, I would like now to go back to what I was discussing, that point notwithstanding, if I might return to my prior point* and so on, b) Adding to or Continuing with the Present Topic (ACPT): for example, *as I was saying, I haven't finished yet, if I might go on, let's go on, not incidentally, to continue, let's say on the present topic, shall we* and so on, c) Digressing from the Present Topic (DPT): for example, *before I forget, by the way, I almost forgot, I just remembered, I totally forgot, incidentally, in passing, parenthetically, speaking of, that reminds me, to update you* and so on, and d) Introducing a New Topic (INT): for example, *but, if I might change the topic, let me broach an entirely new topic, not to change the topic but, on a different note, to change the topic, turning to a new topic* and so on.

Below is the figure illustrating Fraser's (2009) pragmatic markers categorization in brief:

Figure 1: Fraser's (2009) framework of PMs

## METHODOLOGY

### Corpora

Two corpora in Persian have been combined and made the main corpus: a Conversation Corpus (about 50,000 words), and a Speech Corpus (about 90,000 words), which will be explained in details in the following sections.

### Conversational corpus

The collected corpus of Persian conversations was audio-recorded and transcribed. Each conversation lasted between 5 to 15 minutes, depending on the interlocutors' desire to last the conversation or to finish it soon. Also, there were three to six adult interlocutors (both male and female) in each conversation whose age ranged from 20 to 30. Every interlocutor was asked in advance to volunteer for the study. Also, they declared their approval of being audio-recorded.

### Speech Corpus

This corpus consisted of 120 academic and political speeches which were downloaded from Internet and transcribed, as well. The speeches were given by different lecturers, academic people and politicians from 2000 to 2010.

### Data analysis

The collected data in Persian were analyzed qualitatively according to the types and functions of PMs proposed by Fraser (2009). In addition, the Persian PMs which had not been taken into account by Fraser's (2009) were identified and classified, using some new terminologies or borrowing some terminologies from other researchers in the field.

## RESULTS

Following Fraser (2009), four distinct types of PPMs plus their subtypes were found. As they served only one main function, they were considered as **Uni-Functional Markers (UFMs)**. The first type of PPMs was **Basic Markers**, which serve the same functions as their counterparts in English, i.e. they give information on the intended application of the following utterance. The examples of Persian BMs are illustrated in (1) and their function is the same as their counterparts in English. Examples of this type are as follows (1):

- (1) *Pišnæhâd midæhæm* 'I suggest', *Tosie mikonæm* 'I advise', *Xâheš mikonæm* 'Please', *Tæʔkid mikonæm* 'I emphasize', *Ey kâš* 'I wish', *Piš bini mikonim* 'We predict', *Tæbrik ærz mikonæm* 'I congratulate', *Dærxaste bænde ʔin ʔæst* 'My request is', *Qol midæhæm* 'My promise', *Moteʔæsefæm* 'I am sorry', ...

They are illustrated in the following examples(2):

- (2) a) *Qæbul dâæm ke bâæd bištær tælâš mikærdæm.*  
'I accept that I had to put more attempt.'  
b) *Tælâše mâ ʔin æst ke jælæsât be moqe šoru šævæd væ xâtæme yâbæd.*  
'Our attempt is to start and finish the meetings on time.'  
c) *Omidvârim ke ʔin mævâne ʔ ræfʔ šævænd.*  
'We hope that these obstacles will be removed.'

The second type of PPMs was **Commentary Markers**, which convey the speaker's attitudes towards the following utterance. Members of this group are indicated in (2).

- (2) *Hætâ* 'Even', *Hæd-e-ʔæqæl* 'At least', *Dær hæqiqæt* 'In fact', *Mote ʔæsefâne* 'Unfortunately', *ʔehtemâlæn* 'Possibly', *Fæqæt* 'Just', *Hætmaen* 'Surely', *Bedun-e-šæk* 'Undoubtly', *Bædihi ʔæst ke* 'It is clear that', *Lâzem ʔæst ke* 'It is necessary that', *Bârhâ væ bârhâ* 'Repeatedly', ...

They are exemplified in (3):

- (3) a) *ʔælbæte, xâstæn tævânestæn ʔæst.*  
 'Of course, when there is a will, there is a way.'  
 b) *Xošbæxtâne, komite ʔelmi ʔæmælkærde xubi dâste.*  
 'Fortunately, the scientific committee has had a proper function.'  
 c) *Be tore koli, se no ʔfæ ʔâliæt dær ʔin ræveš vojud dâraed.*  
 'Generally, there are three activities in this method.'

The third type of PPMs was **Discourse Markers**, which relates two adjacent discourse segments together. They are shown in (4).

- (4) *Væli* 'But', *Be hæmin sæbæb* 'Because of this', *ʔælâve bæ* 'In addition', *Hæmçenin* 'Also', *Bænâbær ʔin* 'Therefore', *Bærâye mesâl* 'For example', *Yâ* 'Or', *Væ* 'And', *ʔælâræqme* 'Despite of', *ʔgær çe* 'Although', *ʔebâræt ʔæst ʔæz* 'Such as', ...

They are illustrated by the following examples (5):

- (5) a) *Moşkelâte mâ ziâdan, mæseælæn, kæmbud-e væqt vase tæhvîl-e perože.*  
 'There are a lot of problems, for instance, lack of time to deliver the projects.'  
 b) *ʔin mozu be læhâze næzæri mærbut be næzær miresæd, zirâ be færagir budæn-e ræftâr-e sâzmani ʔeşâre dâraed.*  
 'This topic seems related theoretically, because it points out the pervasiveness of the organizational behavior.'  
 c) *ʔæz kâr ʔexrâj şode bud. Lezâ, be donbâl-e şogle jadidi bud.*  
 'He was fired. So, he was looking for a new job.'

The Fourth type of PPMs was **Discourse Management Markers**, "which signal a meta-discourse comment on the structure of discourse" (Fraser, 2009, p.893). This type of PPMs includes three subtypes:

**A) Discourse Structure Markers (DSMs):** which indicate "the contribution of the following discourse segment within the overall structure of discourse" (Fraser, ibid, p.893). They are illustrated in (6):

- (6) *Be tor-e koli* 'Generally', *ʔælqese* 'To put it in nutshell', *Ruy-e hæm ræfte* 'all in all', *ʔævælin mored-e mohem* 'First and most important', *Dær næhâyæt* 'Ultimately', *bæ ʔd* 'Next', *Dær ʔebteda* 'First', *Sepæs* 'Then', *ʔæz suy-e digær* 'On the other hand', ...

Examples of which are shown below (7):

- (7) a) *Se nokte ro dær næzær begir: ʔvælæn, hædæfmand bâš. Dovomæn, ...*  
 'Consider three points: Firstly, specify your goal. Secondly, ...'  
 b) *Dær ʔin motâleʔe do ræveš be kâr gerefte šod. Yeki, ræveš-e peimâyeš ʔæs [...]. Digæri, ræveše tætbîqi-e kæmmi ʔæst ...*  
 'Two methods were applied in his study. One of them is the survey method [...]. The other is the quantitative comparative method...'

- c) *Be tore xolâse, gofte mišævæd ke mâlekiæt dær ʔin se bæxš-e dolæti, tæ ʔâvoni, xosusi tâ jâyi mored-e ʔehteram-e qânun ʔæst.*

‘In short, it is said that the ownership in the state, cooperative and private sectors are honored by the law to some extent.’

**B) Topic Orientation Markers (TOMs):** which imply the prompt changes in the topic of discourse. They are of four types:

**i. Returning to a Prior Topic (RPT):** As in (8)

- (8) a) *Qæblæn-æm goftæm ke æslæn be riskeš nemi-ʔærze.*  
‘I previously said that it does not worth a risk.’  
b) *Hæmântori ke ʔærz šod, šæbæke rustâ-yi be ʔonvâne yek pâilot dær Nogærân mored-e bæhre-bærdari qærâr gereft.*  
‘Returning to what is said before, the rural network was exploited in Nograd as a pilot.’  
c) *Hæmântor ke gofte šod, tærbiaet mædæni yeki ʔæz vojuh va foru ʔ-e jâme ʔe-ye mædæni ʔæst.*  
‘As it was said, the civil nurturing is one of the offshoots of the civil society.’

**ii. Adding to or Continuing with the Present Topic (ACPT):** As in (9)

- (9) a) *Mævâd-e lâzem-e keik-o goftæm. Dær ʔedâme, tærz-e tæhiyye ro migæam.*  
‘I mentioned the ingredients for baking a cake. Continuing, I’ll explain how to bake it.’  
b) *Negâr ʔin ʔævâxer xeili sær-hâl nist [interrupted by somebody]; dâštæm migoftæm bâvæd ye kâri bærâš bokonim.*  
‘Recently, Negar was not in good mood [interrupted by somebody]; as I was saying, we have to do something for her.’  
c) *ʔetelâ ʔâti ʔæz in qæbil bærârâye tæ ʔmin-e bo ʔd-e šenâxti kâfi nist. ʔælâve bær ʔân, bærxi qâbeliaet-hâ væ tævânâyi-hâ-ye fekri væ šenaxti niz mored-e niâz ʔæst.*  
‘Such information and knowledge are not enough to provide the cognitive aspect. Added to that, cognitive and reflective abilities and capacities are needed.’

**iii. Digressing from the Present Topic (DPT):** As in (10)

- (10) a) *Ræftim pârk xoš gozašt, râsti šenidi hæràj-e tâbestuni šoru šode?*  
‘We went to the park. It was fun. By the way, have you heard about the beginning of the summer sale?’  
b) *Mæs ʔulin æz sâzmân-e sænješ ʔâmædænd væ dær tærqib-e sâyere goruh-ha dær peivæstæn be tærh besiâr mofid bud. Be hæxer hâl, tæbliq bæxši ʔæz kâr ʔæst.*  
‘Authorities of Sanjesh Organization came and they persuade other groups to join the plan. Anyway, propagation is a part of the whole task.’  
c) *Næmâyeš færdâ bærgozâr miše, tu pærântež ʔærz konæm xedmætetun ke belit-hâ tæmum šodæn.*  
‘The play will be held tomorrow. Parenthetically, I should mention that all the tickets were sold.’

**iiii. Introducing a New Topic (INT):** As in (11)

- (11) a) *Možu ʔi ke emruz tofiq peidâ kærdæm xedmæt-e šomâ ʔærz konæm, negâhi be vaz ʔæst-e bâzâr kâr-e kešvæ [...] ʔæst.*  
‘The new topic that I want to talk about is having a glance at the state job vacancies...’  
b) *ʔin mored hæm hæł šod. Možu ʔ-e bæ ʔdi ke mixâm dær moredeš tozih bedæm moškelat-e refâhi-e.*  
‘This problem was solved. The next topic that I want to explain about is welfare problems.’  
c) *Væ ʔemâ, dustân-e ʔæziz, ʔemruz jâme ʔe-ye bæšæri bâ no ʔi ʔæz nejâd-pæræsti movâjeh šode ʔæst...*  
‘But (to introduce a new topic), dear friends! Today, men society is confronted with a kind of racism...’

**C) Attention Markers (AMs):** which signal that the topic is going to be changed. However, they do not suggest the type of changes. Also, most of the times, they precede Topic Orientation Markers. As in (12)

- (12) a) *Xânom-hâ va ʔâqâyân, Hæmântor ke gofte šod, šærâyet-e ʔomumi-e jæhân bâ sor ʔet be samt-e tæqirat-e ʔæsâsi piš mi-rævæd.*  
‘Ladies and gentlemen, as it was said (TOM, RPT) the world’s general condition rapidly goes towards drastic modifications.’

- b) *Tævæjoh dâšte bâšid, emruze kudækân hæšâs-tær ʔæz hæmiše hæstæn.*  
 ‘Attention! Today, the kids are more sensitive than ever.’  
 c) *Hâlâ, mixâm beræm sære ʔæsle mætlæb.*  
 ‘Now! I want to talk about the main topic.’

#### OTHER PMS USED IN PERSIAN CORPORA

Although Fraser’s (2009) classification of PMs covers a large number of markers existing in Persian Corpora, there are still some markers which have not been taken into account by this latest classification of PMs. Below, they are elaborated on.

The first PM which is frequently used in Persian Conversation and Speech Corpora is the marker *ʔenšâ ʔellâh* and its synonyms such as *ʔægær Xodâ bexâhæd*, *ʔægær Xodâ tofiq dæhæd* and so on. This marker equals the phrase ‘God willing’ in English. In the present study, they are called **Expectation Markers (EMs)**, hereafter, since Persian speakers as well as English speakers use this marker to show some sort of expectation of an action to happen while they seek God’s will simultaneously. Using this marker, they show their hope towards the compliance of their requests by God. This marker is often used before a discourse segment, and indicates a concept beside the concept carried by the following adjacent discourse segment; as in (13).

- (13) a) *ʔenšâ ʔellâh, ʔemtehânet ro pâs miši.*  
 ‘God willing, you will pass your exam.’  
 b) *Xodâvænd hæmeyer mâ râ tofiq dæhæd ke ʔæz ʔin doran be næhv-e ʔæhsæn ʔobur konim.*  
 ‘May God help us pass this era successfully.’

The second marker which means ‘for the love of God’ in English and is mostly used in Conversation Corpora is *mæhz-e rezâ-ye Xodâ*. It indicates the speaker’s dissatisfaction of the current situation. The speaker employs this marker in order to put an end to the continuation of the unpleasant situation. They are called **Speaker Dissatisfaction Markers (SDMs)** from now on. Like EMs, this marker also carries a concept in addition to the concept of the next discourse segment which follows it. It is illustrated in the Example (14).

- (14) a) *Mæhz-e rezâ-ye Xodâ, bæš kon!*  
 ‘For the love of God, enough is enough!’

Like the found PPMs based on Fraser’s (2009) framework, Expectation Markers and Speaker dissatisfaction Markers serve only one function in their contexts. Hence, they can be put under the umbrella of Uni-Functional Markers. However, there are other found PPMs which serve more than one function in different contexts. They are called **Multi-Functional Markers (MFMs)**. And, the following PPMs are of this type.

The third type of PPMs which are often used before a discourse segment, and indicate a concept beside the concept carried by the following adjacent discourse segment is called **Address Form Markers (AFMs)** (used by Akkaya, 2007). Address form is defined by the Longman Dictionary of Applied Linguistics (1985) as “The word or words used to address somebody, in speech or writing” (cited in Akkaya, 2007, p.3). The examples of this type which are mostly found in the Persian Conversation Corpora are *ʔâqâ*, *bâbâ* and *bâbâ jun*. These address forms literally mean ‘Sir’, ‘Daddy’ and ‘Dear daddy’ which are used in order to address male addressees in English; However, Persian speakers use them to address both male and female addressees. They are illustrated in the example (15).

- (15) a) 1) *ʔâqâ, lotfæn ye adams bedid.* (A girl to a male seller)  
 ‘Sir, give me a gum please.’  
 2) *ʔâqâ, ye bæhs-e jædid konim.* (A boy to her male and female classmates)  
 ‘Guys, let’s start a new discussion.’  
 b) 1) *Bâbâ/ Bâbâ jun, kei bæ-mi-gærði?* (A girl to her father)  
 ‘Daddy/Dear daddy, when are you going to be back?’  
 2) *Bâbâ/ Bâbâ jun, dæst ʔæz særæm bardarin!* (A girl to her mother)

‘Mother, leave me alone please!’

As it is clear in the above examples, the address forms *Āqa* and *Bābā* which are specific to males are used to address males in a, 1) and b, 1). In this context, they can be called **Gender-Specific Address Forms (GSAFs, hereafter)**. Nevertheless, these male-specific address forms can be used to address females in a, 2) and b, 2). In these two examples, they can be called **Gender-Neutral Address Forms (GNAFs, hereafter)**.

Last but not least, the PPM which is frequently used in Persian Conversation Corpora is the marker *Āeslæn*. It roughly means ‘Never’ in English. ‘Never’ functions as an adverb negating its discourse segment, within which it is used. However, the marker *Āeslæn*, like *Āqa*, is one of MFMs in Persian and its function will differ considerably. According to the different meanings it gets in different contexts, this multifunctional marker can play the role of 6 different markers: a) CM, b) AM, c) TOM (INT), d) TOM (DPT), e) DM and f) SDM, the examples of which are illustrated in (16).

(16) a) *Āeslæn, Āestebāh kærdim Āemtehân ro hæzf kærdim.*

‘In fact, we made a mistake when we cancelled the exam.’

In this example, *Āeslæn* is a CM, which comments on the following discourse segment. It conveys the attitude that the message carried by the next discourse segment is the sheer truth.

b) *Āeslæn ye ċizi! Āæge Āæz dær-e pošt berim kæsi nemi-fæhme.*

‘Hey guys, let me say something! If we go in through the back door, nobody will find out.’

As *Āeslæn* is content void in this example, there is no one-to-one equivalence for this marker in English. It can be roughly translated to the phrase ‘Hey guys!’ whose function is to attract the attention of addressees towards the upcoming discourse segment. Hence, this marker plays the role of an AM in this example.

c) *Āirani-hâ be guyeš-hâye ziâdi tækællom mikonænd. Āeslæn, guyeš ċist?*

‘Iranian people speak with a wide variety of dialects. But (to introduce a new topic), what is a dialect?’

In this example, *Āeslæn* plays the role of a TOM whose function is to introduce a New Topic. In fact, this marker puts an end to the topic carried by the previous discourse segment and indicates that a new topic is going to be posed by the speaker.

d) *Āeslæn, Āin hærfâ ro vel kon xâhešæn!*

‘(To change the topic), Please forget about these words!’

Here, *Āeslæn* is content void, as well and cannot be translated literally into English. However, it plays the role of a TOM which signals Digression from the Present Topic.

e) *Hæme Āæz dars-e teori xæste šodæn. Āeslæn, biâyd kelâs ro Āæmæli bærgozâr konim.*

‘Everybody is tired of theoretical class. So, let’s have a practical class.’

Using *Āeslæn*, here, the speaker tries to make a link between its previous and its following discourse segment. In this example, this marker as a DM can be translated to ‘So’ which conveys that the message ‘holding the practical class’ is just due to the message that the previous discourse segment carries, i.e. ‘students are tired of theoretical classes’.

f) *Āeslæn, tænhâm bezâr. Pæšimunæm kærdi!*

‘For the sake of God, leave me alone. You made me regret!’

Here, the role of *Āeslæn* is to convey a concept beside the one which is carried by the next discourse segment. Using the marker, the speaker tries to show his dissatisfaction with the current situation.

## A NEW TYPOLOGY OF PRAGMATIC MARKERS IN PERSIAN

Based on the above results obtained from the Persian Corpora, two broad types of Persian Pragmatic Markers (PPMs) were discovered in the Persian Corpora: a) **Uni-Functional Markers (UFMs)** and b) **Multi-Functional Markers (MFMs)**. Uni-functional markers are those markers which have only one function in every context of use, for instance, *Xošbæxtâne* ‘Fortunately’ functions as a CM, *Āevvæl* ‘First’ functions as a DSM, *Qol midæhæm* ‘I promise’ functions as a BM and so on. However, Multi-functional Markers are those markers whose functions change in different context of use, for example, *Āeslæn* can function as CM, DM, AM, SDM and TOM. Other examples of MFMs are *Āqa* and *Bābā* which can function either as a GSAF or GNAF.

Using new terminologies and borrowing some terminologies from other researchers in the field, PPMs are reclassified here into three main types: a) **Cataphoric Markers (CpMs)**, b) **Conjunct Markers (CjMs)**, (used by Brinton, 2008) and c) **Parallel Markers (PIMs)** (used by Fraser, 1996).

The first type of PPMs is called **Cathaphoric Markers**, here, since the function of such markers is to describe a proceeding or forward discourse segment. They are the forms which are used by the speaker in order to aware the hearer of “the intended use of an utterance”, i.e. **Basic Markers**, “attitude towards an action or state”, i.e. **Commentary Markers**, or “meta-comment on the structure of discourse”, i.e. **Discourse Management Markers**, that is going to be conveyed by the following discourse segments (Fraser, 2009, p. 892-3).

As it was stated before, Fraser (2009) divides Discourse Management Markers into **Discourse Structure Markers**, **Topic Orientation Markers**, and **Attention Markers**. Also, he separates Topic Orientation Markers into four subtypes of markers which are used in order to **Return to a New Topic**, **Add to or Continue with the Present Topic**, **Digress from the Present Topic** and **Introduce a New Topic**.

Below, the subtypes of Cathaphoric Markers are exemplified:

(17) **Cathaphoric Markers:**

- A) **Basic Markers:** *Pišnæhâd midæhæm* ‘I suggest’, *Tosie mikonæm* ‘I advise’, *Xâheš mikonæm* ‘Please’
- B) **Commentary Markers:** *Dær hæqiqæt* ‘In fact’, *Mote ʔæsefâne* ‘Unfortunately’, *ʔehtemâlæn* ‘Possibly’
- C) **Discourse Management Markers:**
  - a) **Discourse Structure Markers:** *Dær næhâyæt* ‘Ultimately’, *Bæ ʔd* ‘Next’, *Dær ʔebteda* ‘First’
  - b) **Topic Orientation Markers:**
    - 1) **Return to a New Topic:** *Qæblæn-æm goftæm* ‘I previously said’, *Hæmântori ke ʔærz šod* ‘Returning to what is said before’, *Hæmântor ke gofte šod* ‘As it was said’
    - 2) **Add or Continue with the Present Topic:** *Dær ʔedâme* ‘Continuing’, *Dâštæm migoftæm* ‘As I was saying’, *ʔælâve bæ ʔân* ‘Added to that’
    - 3) **Digress from the Present Topic:** *Râsti* ‘By the way’, *Be hæ ʔ hâl* ‘Anyway’, *Tu pærântez* ‘Parenthetically’
    - 4) **Introduce a New Topic:** *Mozu ʔi ke emruz tofiq peidâ kerdæm xedmæt-e šomâ ʔærz konæm* ‘The new topic that I want to talk about’, *Mozu ʔ-e bæ ʔdi ke mixâm dær moredeš tozih bedæm* ‘The next topic that I want to explain about’, *Væ ʔæmâ* ‘But’
  - c) **Attention Markers:** *Xânom-hâ va ʔâqâyân* ‘Ladies and gentlemen’, *Tævæjoh dâšte bâšid* ‘Attention!’, *Hâlâ* ‘Now’

The second type of PPMs is **Conjunct Markers**. They are called *Conjuncts* or *Connectors* by Brinton (2008), since their role is to connect two pieces of discourse segments. Fraser (2009) also calls them *Discourse Markers*, and elucidates that the speakers use these markers in order to “signal the intended relationship between two adjacent discourse segments” (p.893).

Below, the examples of this type are illustrated in (18).

- (18) **Conjunct Markers:** *Væli* ‘But’, *Be hæmin sæbæb* ‘Because of this’, *ʔælâve bæ* ‘In addition’

And, the third type of PPMs is **Parallel Markers**. Parallel Markers are those forms which carry a message beside the message that is carried by its following discourse segment. Fraser (1996, p. 21) defines it as a marker “whose function is to signal an entire message in addition to the basic message”. Three sub-types were found for this marker in Persian Corpora: *a) Address Form Markers (AFMs)*, *b) Speaker Dissatisfaction Markers (SDMs)*, and *Expectation Markers (EMs)*.

**Address Form Markers**, as the first sub-type of PPMs, defined in the dictionary of Linguistics and Phonetics (1997) as “the manner of referring to someone in direct linguistic interaction” (Cited in Akkaya, 2007, p. 3). Two types of AFMs were found in Persian Corpora: **Gender-Specific Address Forms (GSAFs)** and **Gender-Neutral Address Forms (GNAFs)**. Gender-specific Address Forms are those markers which are used in order to address people according to their gender. However, Gender-neutral Address Forms are those markers which are employed in addressing people regardless of their gender.

The second sub-type of PIMs is **Speaker Dissatisfaction Markers**, which are used by the speaker in order to show his/her annoyance of a dissatisfactory situation.

Finally, the third sub-type of PIMs is **Expectation Markers**, which are employed by the speaker in order to show some sort of expectation of an action to happen while they seek God's will, simultaneously. Using this marker, they show their hope towards the compliance of their requests by God.

Below, the subtypes of Parallel Markers are exemplified in (19):

(19) A) **Address Form Markers:**

a) **Gender-Specific Address Forms:** *Xânom* 'Madam', *âqâ* 'Sir', *Doktor* 'Doctor'

b) **Gender-Neutral Address Forms:** *âqâ*, *Bâbâ*, *Bâbâ jun* (They do not have fixed equivalences in English, since their meanings will change according to the contexts in which they are applied.)

B) **Speaker Dissatisfaction Markers:** *âeslæn* 'For God's sake', *Mæhz-e rezâ-ye Xodâ* 'For the love of God', *Læ?næti* 'Damned'

C) **Expectation Markers:** *?enšâ?ellâh* 'God willing', *?ægær Xodâ tofiq dæhæd* 'God willing', *?ægær Xodâ bexâhæd* 'God willing'

The following figure taxonomically reports the new typology of PPMs which accounted for the corpora of the present study:

Figure 2: A typology of PPMs

## THE DETERMINANTS AFFECTING THE DISTRIBUTION AND OCCURRENCE OF PPMs

Considering the detected Persian Pragmatic Markers, four determinants were found affecting the occurrence of certain PPMs: a) Modes of speech, b) Level of formality, c) Sociolinguistic orientation, and d) Types of genres.

Regarding modes of speech, i.e. written or spoken, there are certain PPMs which are more frequent in one mode of speech. The marker *Bâbâ jun*, *âqâ*, (Address forms to address both males and females), for instance, is specifically used in spoken mode of speech and they are infrequent in written forms.

Also, level of formality is another determining factor which affects the occurrence of PPMs. For example, *Bebin* (It means 'See' and it is an imperative form to attract other's attention) is a marker which is particularly used in informal situations such as a conversation. However, it is rarely used in, for instance, formal speeches.

Furthermore, there are some markers which are socio-linguistically oriented, i.e. some variations of PMs are frequent in a society due to some social norms. For example, the marker *?enšâ?ellâh* 'God willing!' and its synonyms such as *?ægær Xodâ bexâhæd*, and *?ægær Xodâ tofiq dæhæd* are among those frequent PPMs which are regularly used by Persian speakers who believe in God and expect God to help them achieve their goals.

Finally, there are some PPMs which are generic-specific, i.e. they only occur in particular genres. For instance, the Attention Markers such as *Besiâr xob* 'well!', *Hâlâ* 'Now!', *Tævæjjoh konid* 'Attention!' and so on, only occur in conversation or speech genres and their distribution in research articles in journal genre, for instance, is almost zero. Also, Expectation Markers such as *?enšâ?ellâh* 'God willing!' and Address Forms such as *Xânom-hâ væ ?âqâyân* 'Ladies and Gentlemen' frequently occur in conversation or speech genres but they do not occur in research articles in journal genre.

## DISCUSSION OF THE RESULTS

As it was stated before, the main concern of this research was to study, identify and classify Pragmatic Markers based on Fraser's (2009) model of PMs. In doing so, the following points were revealed.

First, the results indicated that the detected Persian Pragmatic Markers accounted for almost all types and subtypes of PMs in Fraser's classification, i.e. Basic Markers (e.g., *Qol midæhæm* 'My promise'), Commentary Markers (e.g., *Dær hæqiqæt* 'In fact'), Discourse Markers (e.g., *ʔælâræqme* 'Despite of'), Discourse Structure Markers (e.g., *Dær ʔebteda* 'First'), Topic Orientation Markers to Return to a Prior Topic (e.g., *Qæblæn-æm goftæm* 'I previously said'), Topic Orientation Markers to Add to or Continue with the Present Topic (e.g., *Dær ʔedâme* 'To come'), Topic Orientation Markers to Digress from the Present Topic (e.g., *Râsti* 'By the way'), Topic Orientation Markers to Introduce a New Topic (e.g., *Mozuʔ-e bæʔdi ke mixâm dær moredeš tozih bedæm* 'The next topic that I want to explain about'), and Attention Markers (e.g., *Hâlâ* 'Now!').

Second, it was found that there are other PMs presented in Persian Corpora which have not been taken into account by Fraser's framework. To put it in nutshell, the detected markers were of two types: a) Uni-functional Markers such as *ʔenšâʔællâh* 'God willing' as an Expectation Marker, *Mæhz-e rezâ-ye Xodâ* 'For the love of God' as a Speaker Dissatisfaction Marker, and b) Multi-functional Markers such as *ʔâqâ* 'Sir' as a Gender-Specific Address Form and *ʔâqâ* 'Guys' as a Gender-Neutral Address Form, and *ʔæslæn* 'In fact' as a Commentary Marker, *ʔæslæn* 'Hey Guys' as an Attention Marker, *ʔæslæn* 'But' as a Topic Orientation Marker to Introduce a New Topic, *ʔæslæn* (To change the topic) as a Topic Orientation Marker to Digress from the Present Topic, *ʔæslæn* 'So' as a Discourse Marker, and *ʔæslæn* 'For the love of God' as a Speaker Dissatisfaction Marker.

The findings of the present study, also, supported the theory of multi-functionality for some of the markers found in Persian Conversation Corpora. The multifunctionality of markers proposed primarily by Schiffrin (2003). Further, there are some researchers in the field (e.g., Erman, 2001) whose main focus has been on the analysis of different functions of specific PMs in different contexts of use, which support the multi-functionality feature of PMs. Erman (2001, p. 1338) takes this feature as granted and points out that "the importance and multi-functionality of Pragmatic Markers in everyday conversation is not a controversial issue".. Hence, PPMs might be multi-functional, i.e. gaining different pragmatic values and functions in specific genres and mode of speech, such as daily conversations.

The results of this study, also, revealed that no single taxonomy is all inclusive and a thorough classification of PMs needs typological (cross-linguistic) studies and mixed research methodologies. Although the main thrust of this study was to propose a more detailed and inclusive classification of Pragmatic Markers, the findings cannot comprehensively account for all languages. Indeed, the concern of this study was to see how the study of Pragmatic Markers in different linguistic contexts helps our better understanding of the field. De fina (1997), for instance, investigates some Spanish marker such as *bien* (well) and concluded that functions of the markers can differ across languages. The diversity of PMs taxonomies (e.g., Gonzalez, 2005; Akkaya, 2007; and Feng, 2008) in literature also justifies that in order to have a typology which can account for other languages, a cross-linguistic investigation of PMs or the combination of variant existing taxonomies is needed. In order to find a much more representative and inclusive classification of PMs other methodologies should be synthesized into the study and the scope of the corpora should be widened into other contexts of use and languages. In this regard Schiffrin (2003) states that marker research in general and pragmatic markers research in particular, utilizes a variety of data resources that allow analysts to focus on markers across contexts, across languages and/or over time.

Finally, a closer analysis of the behavior of PMs demonstrates that distribution and occurrence of PMs in certain linguistic contexts is a function of a number of determinants such as modes of speech, level of formality, sociolinguistic orientation and types of genres; a thorough analysis of which requires another study.

## CONCLUSION

Pragmatic Markers have been of paramount importance in pragmatic research since the early adaptation of the terminology. Although a substantial amount of research has been devoted to investigate their use, frequencies, and categorization in English (Erman, 2001; Gonzalez, 2005; Akkaya, 2007; and Fraser, 2009) and other languages like Chinese (an Feng, 2008), we are still far from developing an inclusive typology. Furthermore, more research needs to be carried out to see how the given particles are realized in other unexplored languages and cultures. One such unexplored area is Persian. Considering the above issue, attempt was made first, to define, classify, and taxonomize Persian PMs, drawing upon the latest classification of PMs in literature, i.e. Fraser's (2009). Second, borrowing some terminologies from Akkaya (2007), Brinton (2008) and Fraser's (2009) and coining some new terminologies, a new typology of Persian PMs was introduced based on the markers detected in Persian corpora. Finally, as it was revealed from the findings, markers in general and pragmatic markers in particular seem to have certain lexical, syntactic and though considered as semantically bleached, semantic behaviors, a coherent picture of which requires a thorough scrutiny not only in terms of the use, position and function, but in terms of how and on what basis they are preferred over, say, other types of markers. In other words, the prompt behind most of such studies have been bottom up than psycholinguistically oriented considerations. Hence, until we come up with both a top-down mental mechanism besides the textual behavior of the markers, our knowledge of the PMs use and constraints will not be inclusive.

### **ABSTARCT**

The drive to learn English among students to compete in a global society demands efforts of schools' supervisors for betterment of teachers' performance within the classroom which is supposedly in connection with their own attitude toward them. Bandura (1997) proposes that undertaking innovating contexts suitable for improvement of rational abilities is strongly based on the aptitude and self-efficacy of teachers. Teachers' beliefs on their perceived efficacy affect their dedication to the school and how they confront the hindrance of their job. The current study has been conducted to identify degree of self-efficacy of Iranian English teachers in general; and uncover the impact of various techniques supervisor employ to provide teachers with feedback, in particular. Additionally, the study had the purpose of obtaining interference of some characteristics of teachers with the way they perceive feedback from supervisor. The required data for the study were collected applying a researcher-made Likert-scale questionnaire consisted of 30 items. The participants were 30 male of female teachers of varying experiences and university degrees belonged to different age groups. The obtained data were analyzed through SPSS software (version 16). The numerical results proved teachers' sense of efficacy was influenced significantly by feedback-giving techniques applied by supervisor and the change was positive. Moreover, interference of variables of gender, age, experience and level of qualifications with sense of efficacy among teachers was noticed.

**KEYWORDS:** Feedback-giving Techniques; Self-efficacy; Supervisor

### **INTRODUCTION**

It seems not a big claim if teachers are considered as the most influential group of professionals for the improvement of education. . Besides, Teachers' self-efficacy beliefs, which is indicated as opinions about one's own competence to succeed in certain circumstances of learning or accomplishing performances at prospective levels (Bandura, 1986, 1997), have been represented as a serious factor in performing effectively (Tschannen-Moran, Woolfolk Hoy & Hoy 1998), in the level of individual commitment (Coladarci 1992), and in eagerness to teaching (Allinder 1994).

Therefore, it could be of value to investigate which strands affect teachers' performance most, particularly the ones which promote their self efficacy. However, the issue of the effect of supervisors' feedback, whether constructive or destructive, raises a question about the degree of that effect on female and male teachers. Also, it needs to be discussed if teachers of different experiences take the comments of supervisors equally. Therefore, the purpose of the researcher is to find out the possible effects of supervisors' feedback-giving techniques on teachers' sense of self-efficacy. Generally, it seems many teachers do not accept whatever they perceive from supervisors and act defensively and think of the attitude of supervisor toward themselves and criticize the supervisor rather than accepting his/her critics as helpful advices. However, it sounds as if supervisors inevitably involve their personal views in their observations and giving feedback they behave as if they are judges rather than mentors who aim at raising the quality of the program.

In spite of the fact that majority of what teachers experience happens within the classroom, it seems their thoughts, and emotions could directly or indirectly be under influence of the environment of their workplace and other professionals like other teachers and supervisors. (Borman & Dowling, 2008; Johnson & Papay, 2011; Kelchtermans & Ballet, 2002; Weiss, 1999) However, the issue of encountering unpredictable situations which affect teachers' thoughts and emotional states could not be denied as well. It seems that the environment is the most influential factor on teachers' interpretations and feelings about their profession. In line with other researches on teacher's self efficacy, the purpose of this study is therefore to investigate the effect of supervisor's techniques in giving feedback as one of the influential factors on teachers' sense of self-efficacy.

## REVIEW OF LITERATURE

1. Due to the researchers' own experience on receiving different types of feedback from supervisor, each of which has its own effects, it seemed of value to investigate what other researchers have found in terms of self-efficacy and feedback. It could be said that the idea of the role of school leaders or supervisors within the schools or institutes and the way they influence teachers has been of much concern among researchers. Edmonds (1979) believes, "There are some bad schools with good principals, but there are no good schools with bad principals (In Stone, 1992, p. 2). According to him, school leaders have the most influential and essential role in the school's achievements. Having done a research through 44 primary schools in east of the United States, Hoy, Tarter, and Witkoskie (1992) identified role of organizational support significant for effectiveness of school.

Consequently, teachers show more motivation and interest in improving their performance and try to solve their problems with much more determination and deficiency in providing support from the management hinders teachers' sense of self-efficacy and self-confidence (Lortie, 1975).

### *Self-efficacy*

The teachers' belief that they possess the ability to influence student learning and achievement for all students, including those students who may be considered unmotivated and difficult is commonly referred to as teacher self-efficacy (Bandura, 1977, 1997; Guskey, 1987; Hoy, 2000; McLaughlin & Marsh, 1978). In a study of teacher efficacy, Yang (2011) stated that:

There are two kinds of locus of control, internal locus of control and external locus of control.

People with internal locus of control believe that their own actions determine the rewards that they obtain. People with external locus of control believe that their lives are not determined by their own behavior but by sources outside themselves-fate chance and luck. Teachers with Internal locus of control are capable of teaching difficult or unmotivated students and make great achievement in their teaching, while teachers with external locus of control are less confident in their teaching ability and believe that the environment has more influence on student learning than their teaching ability. (p.2)

Based on Bandura's definition (1986) it is individual's opinions about their capabilities and skills which could be defined as self-efficacy not their real capabilities and skills. In other words, whatever belief one may have on his/her success and proficiency seems to have either positive or negative impact in person, the former is constructive and the latter is destructive.

### *Teacher self-efficacy*

Preceding researches have also defined the role of sense of self-efficacy in forming students' approaches toward school and the subject. In other words, they claim that the stronger is the teachers' efficacy; students show the more considerable interest to the school and the subject material. In addition to forming students' approach and idea,

teacher efficacy has been related to the level of individual commitment (Coladarci, 1992, cited in Tschannen-Moran et al., 1998, p. 9) and eagerness in teaching (Allinder, 1994) demonstrated by the teacher.

As Brookfield (1995) stated effective teachers concentrate on their job, make benefit of various educational strategies, manage their time to teach at a suitable pace and check students' understanding regularly, focus on the objectives of the lesson, and apply humor to keep students involved within the class activities. According to Lowman (1996) efficient teachers are the ones whose first aim is to develop students' learning and make students interested and enthusiastic in learning. He also emphasized that successful teachers show interest and enthusiasm to their job. High teacher self-efficacy has constantly been defined to attribute to positive performances of both student and teacher, and have a constructive effect on educational enhancements (e.g., Ross, 1995; Soodak & Podell, 1996), resulting in the notion that teacher self-efficacy is a vital feature in enhancing and developing educational system and teacher education (e.g., Ashton, 1984; Goddard, Hoy, & Woolfolk Hoy, 2000; Ross, 1998; Scharmann & Hampton, 1995; Tschannen-Moran & Woolfolk Hoy, 2001). However despite all the studies which relate teacher's sense of self-efficacy to students' accomplishments, the fact that school leaders or supervisors are effective in enhancing or lowering teachers' self-efficacy is researcher's main reason for doing researches in this area.

To summarize, high-efficient teachers are more hardworking, enthusiastic, and confident and their classes are much more fruitful. They are approachable and friendly to students.

### ***Feedback***

It sounds that teachers' perceptions on feedback they receive from supervisors are somewhat personal; therefore, they must be subjective and changeable with different circumstances and over time. However, the value and prominence of giving feedback with the target of reinforcing and directing the recipient could not be ignored. Feedback aims at promoting the recipients' self-awareness on how they are perceived by others (Herold & Greller 1977). Feedback is to help the recipients modify their perceptions, evaluations, and performances (Atwater & Yammarino 1995).

Some researches have studied how employees' choices to follow feedback are influenced by characteristics of the source of feedback, (Morrison & Vancouver 1993), their rational processes in organizing and making use of feedback (cf. Atwater & Yammarino 1995), and issues affecting raters' truthfulness and incentive (cf. Ilgen, Barnes-Farrell, & McKellin 1993). Along with these studies, some found it necessary to search in the area of issues affect motivation of a supervisor for giving feedback.

It sounds as if through giving feedback supervisors feel like having control over teachers particularly if their feedbacks lead to positive changes in teachers' performance. However, it could be concluded that poor performance of teachers followed by receiving feedback could be a sign of powerlessness for the supervisors.

Generally, the need for authority, attachment and praise is the main reason for getting feedback and benefit from its possible outcomes. It could be said that school leaders whose desire is to achieve authority tend to develop their influence according to the results of the feedback. The ones who seek praise try to gain their subjective goals which may be in line with the goals of their teachers and finally, those who look for attachment consider friendship with teacher prior to other goals.

This proposes that for both supervisors and teachers, no matter they are source or recipient of feedback, and the judgmental nature of feedback could be of more importance than particular aspects of feedback. According to Baron (1988) feedback could be of two aspects: Constructive and Destructive.

### ***Constructive Feedback***

Constructive feedback sounds to be a careful well-thought-out one which aims to help the workers to have a more detailed look at their own performance and their effects on others. According to Baron, constructive feedback is supposed to be explicit, thoughtful, and relates employees' poor performance to uncontrollable peripheral issues which inevitably affect the performance. Constructive feedback attributes good performance to internal factors like employees' effort, determination and aptitude. In a study, Martocchio and Dulebohn (1994) stated that new workers

whose simply controlled performance was evaluated and their received feedback was based on that, showed higher level of efficacy in their work and better learning.

#### *Destructive Feedback*

Destructive feedback seems to be the one which is delivered in a subjective way and harms feeling of the receiver; hence there must be no chance for the information provided to be considered as a useful and effective one. Doing various studies, Baron (1988) claimed that those who receive destructive feedback have lower degree of self-efficacy on their following responsibilities than those who receive constructive feedback. He added that destructive feedback not only prevents compromise and collaboration with the source but also provides feeling of resentment and distress and lead the recipient to show disagreement, resistance and avoidance.

### **RESEARCH QUESTIONS**

- 1) Do supervisor's feedback-giving techniques have any effect on teachers' level of self-efficacy?
- 2) Is the effect of supervisor's feedback-giving techniques on female and male teachers' self-efficacy the same?
- 3) Can supervisors' feedback-giving techniques affect self-efficacy of teachers' of different experiences similarly?

### **METHODOLOGY**

#### *Participants*

To gather the necessary data for this research, the researcher selected 50 EFL teachers who worked in an English Institute in Mashhad, Iran. The participants' age ranged from 25-55. They all had bachelors or masters degrees but not necessarily in English. Participants were selected from both novice teachers and experienced ones and were both male and female. They taught different levels from Elementary to Advance. They were asked to answer a questionnaire on self-efficacy. Thirty of the respondents to the questionnaire were observed by the supervisor and received feedbacks from him but in different predetermined ways. After they received comments from the supervisor, they were asked to fill the previous questionnaire again.

#### *Instruments*

One questionnaire on self-efficacy was used in this study, but for two times. The questionnaire applied in this study was a researcher-made one based on Tschannen-Moran and Woolfolk-Hoy's self-efficacy questionnaire (2001), Bandura's Teacher Self-efficacy Scale (1997), and Murdoch's Good Teacher's questionnaire (1997). However, the inventory was a researcher-made questionnaire which was localized based on the Iranian EFL teachers' specifications. There were 30 items in the questionnaire which were grouped within five subscales: (1) efficacy to influence decision-making -2 items (2) instructional efficacy-15 items, and (3) disciplinary efficacy-2 items, (4) efficacy to enlist parental and community involvement -3 items (5) efficacy to create a positive school climate-8 items. The reliability of the questionnaire was calculated by Cronbach's alpha which was 0.90 and the participants were expected to only mark the questions.

#### *Procedure*

In this study it was decided to select participants who were new at work in order to be compared with the experienced ones. Therefore, it could be possible for the researcher to confirm the idea that new teachers feel more positive while they receive feedback from supervisors (Chester & Beaudin, 1996). Regarding the experience, teachers were divided into 3 groups: the ones with less than a year of experience, those who had worked more than a year but less than 5 years and those with more than 5 years of teaching experience. Also, the researcher aimed to discover whether there was any difference between male and female teachers' sense of self-efficacy after receiving feedback from the supervisor.

The required data for this study was collected from teachers through one questionnaire which included questions to which participants were required to indicate their opinions. Later on, during the same term, supervisor observed the classes of some of them randomly (the required number of participants for this study is 30). Normally only the observed teachers remained as the participants of the current study. Having received feedback, the observed teachers were requested to fill in the previous questionnaire which was on self-efficacy, so that the researcher could find if the techniques supervisor manipulated for giving feedback had any effect on teachers' feeling of self-efficacy. The techniques supervisor used to give his ideas to the teachers were as follows: a group of teacher got a short friendly and informal feedback through SMS or E-mail. They received feedback in one or two days after being observed. Some others received feedback in person. All of them received feedback on the following day of being observed. And the third group received supervisors' comments through a form containing some questions marked by supervisor. The forms were given to them within utmost 2 days after being observed. The number of teachers in each

group was 15. And the comments of supervisor fell in the same fields for all of them. The whole process of investigating the level of teachers' self-efficacy and the degree to which it was affected by supervisors' feedback-giving techniques which was the purpose of this study lasted about 3 months because there were some intervals between observations. However, the estimated time required for answering the questionnaire for each participant was less than 10 minutes.

## RESULTS

A paired-sample t-test was conducted to calculate the impact of the feedback on teachers' self-efficacy. As it is shown in Table 1, there is a positive significant effect of supervisor's feedback on teachers' sense of self-efficacy ( $\text{sig} < 0.05$ ).

Table 1: General Effect of Feedback on Self-Efficacy

		Paired Differences			95% Confidence Interval of the Difference		t	df	Sig. (2-tailed)
		Mean	Std. Deviation	Std. Error Mean	Lower	Upper			
Pair 1	Total Self-Efficacy - TSE2	-5.400	12.912	2.357	-10.222	-.578	-2.291	29	.029

There was a statistically significant increase in self-efficacy of teachers from Time 1 which was before receiving feedback ( $M=103.87$ ,  $SD=15.909$ ) to Time 2 which is after receiving feedback ( $M=109.27$ ,  $SD=21.089$ ),  $t(29)=-2.291$ ,  $p < .05$  (two-tailed). The mean increase in self-efficacy was -5.4 with a 95% confidence interval ranging from -10.222 to -.578.

2.

3. Table 2 shows that the effect of feedback among teachers who received it through SMS/Email and Formal Form was significant and positive. It seemed that regardless of positivity or negativity of the comments, teachers preferred indirect receiving of feedback ( $\text{sig} < 0.05$ ). Sense of efficacy is not very different among male and female teachers and gender by itself does not affect sense of efficacy.

4.

5. Generally, the more experienced the teachers, the higher sense of efficacy they have. Also, the table shows that efficacy of naïve teachers had been reduced after receiving feedback from supervisor, however it was not significant.

Table 2: Feedback-giving Techniques

			Paired Differences			95% Confidence Interval of the Difference		T	df	Sig. (2-tailed)
			Mean	Std. Deviation	Std. Error Mean	Lower	Upper			
sms/mail	Pair 1	Total Self-Efficacy - TSE2	-8.700	9.821	3.106	-15.726	-1.674	-2.801	9	.021
formal form	Pair 1	Total Self-Efficacy - TSE2	-9.600	12.249	3.874	-18.363	-.837	-2.478	9	.035
Inperson	Pair 1	Total Self-Efficacy - TSE2	2.100	14.019	4.433	-7.929	12.129	.474	9	.647

Also, in this study, participants were grouped into 4 ranges of age in order to find the effect of feedback-giving techniques on teachers' self-efficacy: 20-25, 26-30, 36-45 and above 45. The results showed that receiving feedback from supervisor, self-efficacy of those aged between 20- 25 has reduced, though not significantly. In the other groups, efficacy has enhanced but not significantly. There is a significant effect of age on sense of self-efficacy only among those aged more than 25 and less than 30 ( $\text{sig} < 0.05$ ).

Since the observed teachers were of different levels of qualifications, university degree was another variable to be checked to find the effect of which on teachers' self-efficacy. Self-efficacy of teachers with M.A degree was higher than teachers whose university degree was B.A and self-efficacy of teachers of groups enhanced after receiving feedback from supervisor, though not significantly.

To sum up, regardless of positivity or negativity of feedback; it seemed as if feedback had significant effect on teachers' sense of efficacy. As cited in Yang, 2011, in the area of English teaching, there has been not enough attention to teachers, while teachers, apart from the techniques and resources they might use, have significant role in developing English language teaching (Freeman, 1991). The results also revealed a significant role of supervisor in the process of education. However, factors such as age, gender and experience could reduce or enhance this influence. And there seemed more emphasis was required to the role of both teachers and supervisors.

## DISCUSSION

The present study aimed to find the effect of supervisor's comments on sense of efficacy of Iranian EFL teachers working in English institutes. According to the obtained data of the current study, teachers are influenced by supervisor's feedback-giving techniques, regardless of positivity or negativity of the feedback. As in a study on feedback, Pekkanli (2011) stated:

Communication and the quality of the feedback are important factors because the ways they are presented can determine its acceptance by the teacher candidate. It is claimed that "when supervisors deliver critical feedback to subordinates, it is hoped that the recipients will focus on the content of the message to gain information about ways of improving job performance.(p.1157)

Teachers seemed to be in favor of having their performance being complemented and their negative points ignored by the supervisor. Teachers also seemed to give value to the way they received feedback from supervisor. In other words, even if the comments they received were negative and critical, they were not very affected unless they find the tone of feedback insulting. Therefore, as the results of the study proved, teachers prefer receiving feedback through indirect techniques rather than direct way of meeting supervisors in their rooms.

However, analysis of the obtained data of current study revealed that other factors such as age, gender, years of experience and level of qualification of teachers interfere the way they perceive supervisor's feedback. The results of the current study vindicated that feedbacks provided by supervisor could generally enhance teachers' self-efficacy, though men were more open to the comments and despite the fact that they might have received negative comments, they took the comments less critical. Also, results lead us to consider experience as an effective factor in the way teachers took the comments, regardless of technique through which they received feedback. Furthermore, despite the varying range of age among teachers, obtained data revealed that age does not interfere in the way teachers take comments from supervisor. Also teachers' university degree did not seem to be effective on teachers' self-efficacy after receiving feedback from supervisor.

To summarize, the data analysis revealed that teachers are vulnerable to the way they receive feedback from supervisor. However, there might be different factors which could intensify or decrease the effect of feedback-giving techniques applied by supervisor. All the findings of this study imply that there is a need to have more careful attention to the affairs between supervisor and teachers of an English school and their cooperation might affect teachers' performance and consequently students' improvement.

## CONCLUSION

The purpose of this research was to investigate the effect of supervisor's feedback-giving techniques on EFL teachers in an English school. The whole process of observing teachers by supervisor and providing them with feedback took a semester. The results analyzed by SPSS software (version 16) proved a significant effect of feedback-giving techniques on sense of efficacy among teachers. The idea that teachers are influenced by supervisor's feedback is presented in a study by Tschannen-Moran and Hoy (2007):

Vicarious experiences are those in which the target activity is modeled by someone else. The impact of the modeled performance on the observer's efficacy beliefs depends on the degree to which the observer identifies with the model. When a model with whom the observer closely identifies performs well, the self-efficacy of the observer is enhanced. When the model differs, for example in terms of the level of experience, training, gender, or race, then even witnessing a very competent performance may not enhance the self-efficacy beliefs of the observer.(p. 6)

The results of the current study vindicated that teachers' sense of efficacy was influenced by feedback-giving techniques applied by supervisor. Significant positive change in teachers' self-efficacy after receiving feedback was noticed and the results proved enhancement in self efficacy of teachers. It seems supervisors provide teachers with

feedback with the hope that teachers will merely focus on the content of their comments and make benefit of their comments in order to improve their performance (Pekkanli, 2011). However, findings of this study highlighted the effect of feedback-giving techniques claimed that teachers as recipients of feedback do not merely pay attention to the content of feedback; and the way they receive feedback is of crucial importance, either. Also, based on the findings of this study teachers were not in favor of receiving feedback in person and in privacy of supervisor's room, no matter the content of feedback was positive or negative. It seemed possible to state that indirect techniques applied by supervisor to give feedback were more constructive and approved by teachers.

This study was conducted to investigate the effect of feedback on variables of age, gender, experience, and university degree of teachers for each of which different effect of feedback was noticed. According to the results of the study, there is no significant difference between self-efficacy of male and female teachers after receiving feedback from supervisor. The findings of the current study on general self-efficacy of experienced and inexperienced teachers is in accordance with the study of Tschannen-Moran and Hoy (2006) who expected that less experienced teachers were of lower self-efficacy. However, the study revealed significant positive effect of experience on self-efficacy of teachers whose experience was between 1 to 5 years. In case of age, teachers who aged 25-30 showed higher self-efficacy after receiving feedback from supervisor. It should be added that supervisor's age is in the same range. And finally, teachers' level of qualification has no significant effect on their sense of efficacy. However, according the gathered data, teachers of higher university degrees seem more efficient than the ones of lower university degrees.

The results of this study, in line with many other studies, suggest more attention to teachers' satisfaction with the school environment which could affect their whole performance within the classroom. It is required to conduct studies on teachers' perceived sense of efficacy in relation to their attitude toward students and parents. Further research is required to find the effect of supervisor's comments on teachers' performance within the classroom. The results of this study invite further exploration into comparing the effect of direct feedback-giving techniques applied in this study with indirect feedback-giving techniques such as providing teachers with constructive messages on school's bulletin board or in school's journal. Furthermore, it would be of desirable value to attempt to find the possible effect of human relationship between supervisor and teachers and whether it affects teachers' performance. Lastly, replication of the current study within public schools could be helpful for the pedagogical purposes.

### **ABSTRACT**

The present study was an attempt to investigate types of language learning strategies as predictors of L<sub>2</sub> idioms comprehension. The participants were 112 male and female Iranian undergraduate B.A. and M.A. students majoring in Teaching English as a Foreign Language, English Translation, and English Literature at the University of Qom; Islamic Azad University, Takestan Branch; and Mofid non-profit University. Data were gathered through the Michigan Test of English Language Proficiency (MTELP), an idiom comprehension test, and the Strategy Inventory for Language Learning (SILL) and analyzed using multiple regression procedure. The results showed that cognitive and affective learning strategies were the best predictors of L<sub>2</sub> idioms comprehension. In other words, cognitive and affective learning strategies together could account for approximately 43% of the total variance in L<sub>2</sub> idioms comprehension. These findings may have implications for language learners, teachers, researchers, syllabus designers, and materials developers. Since cognitive learning strategies were found to be the most commonly used strategies by successful idiom learners in this study, they should be taken into account more in L<sub>2</sub> idiom comprehension. At the same time, teachers should make learners aware of affective and social strategies because they have not received much attention in classrooms.

**KEYWORDS:** Idioms, idioms comprehension, language learning strategies

### **INTRODUCTION**

Over the last two decades, vocabulary has received a great deal of attention in language learning and teaching. During the nineties, the focus shifted from single words to word strings, phrases, and idioms (Mäntylä, 2004). It is believed that lexicon is not only single words but a dynamic system which includes larger lexical items, language chunks, or word strings (Read, 2000). Consequently, idioms have become important not only to language researchers but also to language teachers. Pollio, Barlow, Fine, and Pollio (1977), and Cooper (1999) emphasize the importance of idioms in foreign language learning and hold that most English speakers produce 10 million novel metaphors and 20 million idioms in their lifetime of 60 years. Surprisingly, Anglin, Miller, and Wakefield (1993) postulate that more than half of the compound entries are idioms. In addition, Levorato (1993) and Levorato and Cacciari (1992) coined the term “figurative competence” to focus on the production and comprehension of idioms. This type of competence refers to the ability to decode and encode figurative expressions.

However, idioms are not defined clearly and comprehensively. This lack of clear and exact definition of idioms causes teachers and learners some difficulty dealing with idioms (Grant & Bauer, 2004). Idioms should be defined more clearly to remove this difficulty. Irujo (1986) defines an idiom as a conventionalized expression whose

meaning cannot be determined from the meaning of its parts. One clear, specific, and systematic definition is Fernando's (1996, p. 38) definition that "conventionalized multi-word expressions are often, but not always non-literal". Lennon (1998) asserts that idioms are the colorful side of language used while we are communicating our thoughts and feelings. They are used to make language much livelier and richer. However, according to Akbarian (2012), studies in psycholinguistics (Gibbs, 1993) and in applied linguistics (Boers & Demecheleer, 2001; Kövecses & Szabo, 1996) have revealed that many idioms are not as arbitrary as they are traditionally thought to be. It means that those learners who are aware of the lexical components of unfamiliar idioms are sometimes able to guess the meaning correctly.

Another concern of the present study is language learning strategies. Over the past decades, a gradual shift from the teacher-centered classes to more learner-centered classes has resulted in more focus on learners and learning. One consequence of this shift is focus on the use of language learning strategies (LLS) by learners and teachers in L<sub>2</sub> learning and teaching (Lessard-Clouston, 1997). Cohen and Weaver (1998) suggest that interest in language learning strategies started with the publication of papers mainly concerned with the "good language learner". Consequently, language learning strategies have become an integral part of various theoretical models of language proficiency (Bachman & Palmer, 1996). As Holec (1981) and Wenden (1998) claim, language learning strategies not only enable learners to learn an L<sub>2</sub> effectively and efficiently, but also help develop their abilities of independent and autonomous learning, which are believed to be another important factor leading to successful learning. Oxford (2002) also argues that using language learning strategies makes learning quicker, easier, more effective, and more fun.

Language learning strategies have been variously defined by various researchers such as O'Malley and Chamot (1990), Oxford (1990), and Ellis (1995). One of the most comprehensive definitions, among many others, is proposed by Oxford (1990), based on which learning strategies are specific actions taken by the learner to make learning easier, faster, more enjoyable, more self-directed, more effective, and more transferable to new situations. Ellis (1995) argues that strategies refer to some kind of mental activity or behavior that can occur in a particular phase of the learning or communication process.

Griffiths (2004) offers language learning strategy theory, which asserts that other things being equal, the strategies which different learners use may account for at least part of their differential success rate. Chamot and O'Malley (1987) argue that research in language learning strategies in the second language acquisition literature has put much emphasis on the patterns of learning strategies used by successful language learners. Then, less successful language learners may benefit from applying the same strategies in their own learning, and successful language learners become better by taking advantage of strategies which are available to them (Naiman, Frohlich, Stern, & Todesco, 1978; Rubin, 1975).

Although idioms are considered as an integral part of each language and many researchers have worked on idioms, there is a paucity of research on the effectiveness of language learning strategies in the comprehension of L<sub>2</sub> idioms. The purpose of the present study is to fill part of the existing gap in this area. It aims to investigate the contribution of language learning strategies to L<sub>2</sub> idioms comprehension.

## REVIEW OF LITERATURE

### *Idioms*

In the past, when language was studied through its structure rather than meaning, idioms were studied on the basis of their form, and form was on the basis of idioms' definition. Idioms were considered as frozen and multi-word expressions that have little or no structural variation. Idioms were also seen as dead expressions because there was no relationship between their meaning and origin. But after the emergence of the functionalist approach to the study of language, the focus shifted from idiom structures to idiom meanings (Mäntylä, 2004).

Cooper (1999) asserts that although L<sub>2</sub> idioms comprehension is very difficult, learning idioms is essential for second or foreign language learners because idioms are used in all forms of discourse. According to Ellis (1997), the knowledge of idioms and the ability to know how to use idioms in a second language are important indicators of language learners' communicative competence.

Moon (1996) and Mäntylä (2004) classify idioms into four major groups according to their level of lexical transparency or idiomaticity: transparent idioms, semi-transparent idioms, semi-opaque idioms, and opaque idioms. Idioms are considered as one of the most difficult areas of L<sub>2</sub> learning for both teachers and learners (see, for example, Cieslicka, 2006; Kövecses & Szabo, 1996; Zarei & Rahimi, 2012). There are different factors involved in idioms comprehension that should be taken into account. However, three major factors influencing idioms

comprehension are proposed by Rohani, Ketabi, and Tavakoli (2012). They are semantic transparency, familiarity, and context. Another factor affecting L<sub>2</sub> idioms comprehension is learners' knowledge of their first language. This factor is also called *transfer*. Irujo (1986) examined whether second language learners use knowledge of their first language to comprehend idioms in the second language. Findings revealed that identical idioms were the easiest to comprehend. Similar idioms were comprehended almost as well, but showed interference from language learners' L<sub>1</sub>. Different idioms were the most difficult to comprehend, but showed less interference than similar idioms.

### ***Language Learning Strategies (LLS)***

Researchers have started to study language learning strategies since 1960s. The cognitive approach to language learning has affected language learning strategies research (Williams & Burden, 1997). Zarei and Elekaei (2012) argue that the effect of language learning strategies on language learning is undeniable. Many researchers have conducted research on the relationship between language learning strategies and language proficiency. Major findings have revealed that the use of appropriate language learning strategies helps language learners to improve their language proficiency or achieve general or particular language skills (e.g., Akbari & Talebinenezhad, 2003; Bremner, 1999; Chamot & Kupper, 1989; Cohen, 1990; Wenden & Rubin, 1987; and Wharton, 2000). As an example, Akbari and Talebinenezhad (2003) conducted a study on the relationship between language learning strategies by Iranian learners of English and their foreign language proficiency. They found a positive relationship between the use of language learning strategies by the subjects and their proficiency.

Brown (2007) points out that some learners are successful and others are not regardless of teaching methods. At the same time, it is undeniable that learners' learning is influenced by their abilities, techniques, or strategies used during learning. There is a high correlation between language learning strategies and successful language learning. However, not all language learning strategies are effective for all second language learners. As Cotterall (2000) argues, learners are different, so they choose different strategies based on their understanding of which strategies can possibly contribute to their learning.

Like the various definitions of learning strategies, there are also different classifications of learning strategies (Bremner, 1999). One of the most comprehensive classifications of language learning strategies was proposed by Oxford (1990) suggesting that language learning strategies contain six categories of L<sub>2</sub> learning behaviors. Based on Oxford's (1990) classification, language learning strategies can be generally divided into two main categories: direct and indirect strategies. Memory, cognitive, and compensation strategies are considered as direct strategies. Metacognitive, affective, and social strategies are indirect strategies. Unlike direct strategies, indirect strategies do not have a direct effect on the target language, but have a significant effect on language learning. Brown (2007, p. 141-142) offers a similar classification.

The present study uses Oxford's (1990) and Brown's (2007) classification because, as Ellis (1994, p. 539), and Rausch (2000, p. 2) claim, this classification is the most comprehensive, multi-leveled, and theoretically well-conceived classification with a hierarchical ordering of language learning strategies.

There is a wide variety of factors influencing the selection of language learning strategies. Among these, biological, cognitive, affective, socio-cultural factors, and also level of proficiency are strongly correlated with the selection of language learning strategies (Ames & Archer, 1988; Lucas, Pulido, Miraflores, Ignacio, Tacay & Lao, 2010; Oxford & Burry-stock, 1995; Vandergrift, 2005).

Language learning strategies used by learners can be assessed through various procedures like interviews, students' diaries, think-aloud procedures, and questionnaires. Among the above procedures, questionnaires have been used mostly for assessing learners' strategies (Green & Oxford, 1995; Oxford & Nykios, 1989). One of the most common and standardized questionnaires was developed by Oxford (1990). This questionnaire is called the Strategy Inventory for Language Learning (SILL).

Many studies have also been conducted on both language learning strategies (LLS) and idioms. Cooper (1999) studied the on-line processing strategies used by nonnative speakers of English who were asked to give the meaning of idioms presented in a written context. The findings showed that most of the participants engaged in a heuristic approach to idioms comprehension. Bulut and Celik-Yazici (2004) investigated the strategies used by learners in processing L<sub>2</sub> idioms. They reported that L<sub>2</sub> learners recalled the strategies acquired during first language acquisition

to construct L<sub>2</sub> idiom meanings. Other findings showed that learners made a guess to interpret L<sub>2</sub> idiom meanings and moved from context. Cooper (1999, p. 246) identified a number of other strategies, used by learners to understand the meaning of L<sub>2</sub> idioms, including the following: (the frequency of use is mentioned in parentheses)

- Guessing from context (28% of the time)
- Discussing and analyzing the idioms (24%)
- Using the literal meanings of idioms (19%)
- Using background knowledge (7%)
- Repeating or paraphrasing the idioms (7%)
- Connecting L<sub>2</sub> idioms to L<sub>1</sub> idioms (5%)
- Other strategies like personal discussion and meta-analysis of the idiom (2%)

Cooper's results showed that guessing from context (28%) was mostly used by learners which led to a correct answer 57% of the time. The least used strategy was referring to an L<sub>1</sub> idiom (5%) which led to a correct answer 8% of the time. According to the study, successful strategies respectively were:

- Guessing from context (57% of the time),
- Using the literal meaning (22%),
- Using background knowledge (12%), and
- Referring to an L<sub>1</sub> idiom (8%).

Based on Cooper's findings, it can be concluded that L<sub>2</sub> learners used compensation and cognitive learning strategies the most.

Meanwhile, Mäntylä (2004, p. 87-89) also suggests that there are many techniques that can be used for comprehending and learning idioms:

- Using images and imagination
- Making a relation between meaning and form
- Using actions, objects, and pictures
- Using guessing or inferencing strategies
- Using contextual clues
- Using keyword method

On the whole, despite the relative plethora of research on various aspects of both idioms and language learning strategies, there seems to be a paucity of research on the direct relationship between language learning strategies and idioms. This study aims to bridge part of the existing gap. It attempts to investigate the relationship between language learning strategies and idioms and examine which learning strategies contribute best to L<sub>2</sub> idioms comprehension.

## RESEARCH QUESTION

The present study addresses the following research question to fill the above mentioned gaps:

Which language learning strategies are better predictors of L<sub>2</sub> idioms comprehension?

## METHODOLOGY

### *Participants*

The participants of the present study were initially 118 male and female Iranian B.A. and M.A. students majoring in Teaching English as a Foreign Language, English Translation, and English Literature at the University of Qom; Islamic Azad University, Takestan Branch; and Mofid non-profit University. The age of the participants ranged from 20 to 30 years old. A general proficiency test (MTELP) was administered to homogenize the participants' level of English language proficiency. After the administration of the Michigan Test of English Language Proficiency and taking the results into account, the number of participants was reduced to 112. Six participants were excluded from the study because they had a different level of proficiency.

### *Instruments*

To collect data for the present study and answer the research questions, the following instruments were utilized:

a) *Michigan Test of English Language Proficiency (MTELP)*: In order to homogenize the participants, the vocabulary subtest of the Michigan test of English language proficiency was administered. MTELP is one of the

popular tests for measuring ESL or EFL learners' level of language proficiency. The test is a three-part, 100-item multiple-choice test containing 40 grammar items in conversational format, 40 vocabulary items requiring the selection of a synonym or completion of a sentence, and reading passages followed by 20 comprehension questions.

*b) L<sub>2</sub> idiom comprehension test:* In order to assess the participants' comprehension of idioms and their receptive knowledge of idioms, a multiple choice test containing 30 items of L<sub>2</sub> idioms was used. All of the idioms used in this test were selected from the *American Heritage Dictionary of Idioms*.

*c) Already established L<sub>2</sub> idiom comprehension test:* Since the idiom comprehension test was developed by the researcher, its validity had to be established. To this end, an already established L<sub>2</sub> idiom comprehension test was also used.

*d) Strategy Inventory for Language Learning (SILL) Version 7.0:* In order to assess the general language learning strategies used by second language learners, the Strategy Inventory for Language Learning (SILL) version 7.0 was used. SILL refers to a self-scoring questionnaire developed by Oxford (1990) based on her strategy taxonomy with 50 strategy items on a five-point Likert scale from 'Never' to 'Always'. This version of SILL is designed to collect information about language learning strategies used by non-native speakers of English who are learning English as a second or foreign language. By the use of this instrument, the following six types of strategies proposed by Oxford (1990) could be examined: memory (items 1-9), cognitive (items 10-23), compensation (items 24-29), metacognitive (items 30-38), affective (items 39-44), and social learning strategies (items 45-50). It is worth noting that a number of studies using SILL for collecting their data have found reliability indexes ranging from 0.91 to 0.95 (Oxford, 1996).

### ***Procedures***

The procedures followed in this study were divided into five main stages. First, 118 participants majoring in Teaching English as a Foreign Language, English Translation, and English Literature at the University of Qom; Islamic Azad University, Takestan Branch; and Mofid non-profit University were selected. In the second stage, the 40-item multiple-choice vocabulary subtest of the Michigan test of English language proficiency was used to make sure that there were no significant differences among the participants in terms of their vocabulary knowledge. The time allocated to this test was 45 minutes. Data from those who scored more than one standard deviation above or below the mean were excluded from all subsequent analyses. As a result, the number of participants was reduced to 112.

Next, the L<sub>2</sub> idiom comprehension test was administered; the participants were asked to answer a 30-item multiple choice test of L<sub>2</sub> idioms in 30 minutes. In the fourth stage, an already established L<sub>2</sub> idiom comprehension test was administered to check the validity of newly developed tests. The time allocated to this test was also 30 minutes.

At the end, the Strategy Inventory for Language Learning (SILL) was administered to collect data about types of second language learning strategies used by the participants. They were asked to choose from the five-point Likert scale for every statement from 'Never' to 'Always'. The collected data were organized and prepared for further statistical analyses.

Since the idiom comprehension test was developed by the researcher, its validity and reliability had to be established. To this end, KR-21 formula was used to estimate the reliability of the test. The reliability index of the idiom comprehension test turned out to be 0.84 (see Appendix). A correlation procedure was used to check the validity which the scores of the participants on the idiom comprehension test were correlated with their performance on the idiom comprehension test of which the validity was already established. The validity index of comprehension test turned out to be 0.82 (see Appendix). To analyze the collected data, the multiple regression analysis procedure was used.

## **RESULTS AND DISCUSSION**

### ***Results***

The study sought to investigate which types of language learning strategies are predictors of L<sub>2</sub> idioms comprehension. A multiple regression procedure was used to answer this question. To do so, initially a correlation

procedure was run to see the degree of the relationship between L<sub>2</sub> idiom comprehension scores and types of language learning strategies, the results of which are presented in Table 1.

Table 1: Correlations among L<sub>2</sub> idiom comprehension scores and language learning strategies

		Idiom comp.	memory	cognitive	compensation	metacognitive	affective	social
Pearson Correlation	Idiom comp.	1.000	.288	.608	.419	.495	-.197	-.004
	memory		1.000	.626	.338	.519	.321	.249
	cognitive			1.000	.674	.659	.127	.137
	compensation				1.000	.398	.061	.189
	metacognitive					1.000	.082	.210
	affective						1.000	.470
	social							1.000
Sig. (1-tailed)	Idiom comp.	.	.001	.000	.000	.000	.018	.483
	memory		.	.000	.000	.000	.000	.004
	cognitive			.	.000	.000	.090	.075
	compensation				.	.000	.262	.023
	metacognitive					.	.194	.013
	affective						.	.000
	social							.

As Table 1 shows, L<sub>2</sub> idiom comprehension has the highest correlation with cognitive strategies (i.e., .608) and the lowest correlation with social strategies (i.e., -.004). A stepwise multiple regression was run (Table 4.2) which showed that cognitive and affective strategies entered into the regression equation (stepwise criteria: probability of  $F \leq 0.050$ ).

Table 2: Variables Entered/Removed<sup>a</sup>

Model	Variables Entered	Variables Removed	Method
1	Cognitive	.	Stepwise (Criteria: Probability-of-F-to-enter $\leq .050$ , Probability-of-F-to-remove $\geq .100$ ).
2	Affective	.	Stepwise (Criteria: Probability-of-F-to-enter $\leq .050$ , Probability-of-F-to-remove $\geq .100$ ).

a. Dependent Variable: idiom comprehension

Based on model summary (Table 3), it can be seen that cognitive strategies and L<sub>2</sub> idioms comprehension share 36% of the variance. Cognitive and affective strategies together share 43% of the variance with L<sub>2</sub> idioms comprehension. In other words, cognitive and affective strategies explain 43% of the total variance in L<sub>2</sub> idioms comprehension.

Table 3: Model Summary<sup>e</sup>

Model	R	R Square	Adjusted Square	R Std. Error of the Estimate	Change Statistics				
					Square Change	F Change	df1	df2	Sig. F Change
1	.608 <sup>a</sup>	.370	.364	5.11253	.370	64.654	1	110	.000

2	.669 <sup>b</sup>	.447	.437	4.81238	.077	15.149	1	109	.000
---	-------------------	------	------	---------	------	--------	---	-----	------

a. Predictors: (Constant), cognitive

b. Predictors: (Constant), cognitive, affective

c. Dependent Variable: idiom comprehension

The ANOVA procedure was used to test the null hypothesis that the predictive power of the models is not significant. The results of the ANOVA performed on the model are shown in Table 4.

Table 4: ANOVA<sup>a</sup> on L<sub>2</sub> idiom comprehension test

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	1689.934	1	1689.934	64.654	.000 <sup>a</sup>
	Residual	2875.173	110	26.138		
	Total	4565.107	111			
2	Regression	2040.773	2	1020.386	44.060	.000 <sup>b</sup>
	Residual	2524.334	109	23.159		
	Total	4565.107	111			

a. Predictors: (Constant), cognitive

b. Predictors: (Constant), cognitive, affective

c. Dependent Variable: idiom comprehension

Based on Table 4, significant results were shown.

To find out how strong the relationship between L<sub>2</sub> idioms comprehension and each of the six predictors is, the standardized coefficients and the significance of the observed t-value for each predictor were checked. Table 5 shows the results.

Table 5: Coefficients<sup>a</sup> of language learning strategies

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	-4.199	2.639		-1.591	.114
	cognitive	.429	.053	.608	8.041	.000
2	(Constant)	4.636	3.365		1.378	.171
	cognitive	.454	.051	.644	8.969	.000
	affective	-.572	.147	-.280	-3.892	.000

a. Dependent Variable: idiom comprehension

Based on Table 5, cognitive and affective strategies, among six types of language learning strategies, account for a statistically significant portion of the variance in L<sub>2</sub> idioms comprehension. Cognitive strategies are the best predictors of L<sub>2</sub> idioms comprehension; for every one standard deviation change in the cognitive strategies score, there will be .60 of a standard deviation change in idiom comprehension score. Affective strategies are another predictor of L<sub>2</sub> idioms comprehension; every one standard deviation increase in one's affective strategies score will cause .28 of a standard deviation decrease in one's idiom comprehension score. It can be concluded that cognitive strategies are positive predictors and affective strategies are negative predictors of L<sub>2</sub> idioms comprehension. Therefore, the null hypothesis that there are no significant differences in the predictive power of the language learning strategies in idiom comprehension is rejected.

## DISCUSSION

The present study attempted to investigate types of language learning strategies as predictors of L<sub>2</sub> idioms comprehension. One of the findings of the present study was that cognitive learning strategies were the best predictors of L<sub>2</sub> idioms comprehension. The participants employed more cognitive learning strategies for L<sub>2</sub> idioms comprehension compared to other categories of language learning strategies. This result is in line with that of Chamot and O'Malley (1987), Oxford (1990), Lachini (1997), Bremner (1999), and Khabiri and Azaminejad (2009), who argue that the most popular strategies with language learners are cognitive learning strategies. This finding also supports Ehrman and Oxford's (1995) finding that cognitive learning strategies had a significant correlation with the participants' speaking and reading proficiency. In addition, the finding of the study also lends support to Tajeddin's (2004) findings; he studied the relationship between language learning strategies and performance on the cloze test (passage). He found that the cloze had a significant correlation with only cognitive language learning strategies. Meanwhile, it corroborates the findings of Cooper (1999), showing that L<sub>2</sub> learners employed cognitive learning strategies to comprehend L<sub>2</sub> idioms the most. It is also in line with one finding of Mäntylä (2004), which showed that non-native speakers used 3 main strategies to comprehend L<sub>2</sub> idioms. The most frequent strategy was a direct translation equivalent in L<sub>1</sub>. The second one was looking for links between literal and figurative interpretations. The third most popular strategy was guessing. The first and second most popular strategies are related to cognitive strategies.

However, this finding of the present study contradicts Klassen's (1994) finding that compensation learning strategies were the most frequently used category by learners. It is also in conflict with Park's (1994) result, which revealed that cognitive learning strategies were minimally used by learners. The finding also differs from that of Vossoughi and Ebrahimi (2003), who found that the most commonly used learning strategies by both monolingual and bilingual groups were metacognitive and social learning strategies. The finding of the present study is in conflict with Rezaei and Almasian's (2007) finding, which indicated that metacognitive learning strategies were the most preferred category of strategies for both high and low creativity groups. Finally, the finding is different from that of Takeuchi (2003), who reported that successful language learners tended to employ more metacognitive learning strategies than other categories.

Another result of the present study was that affective learning strategies were also a significant predictor of L<sub>2</sub> idioms comprehension. However, they had a significantly negative correlation with L<sub>2</sub> idioms comprehension. Moreover, the participants made use of affective learning strategies for L<sub>2</sub> idioms comprehension the least. This finding corroborates the findings of Park (1994), Oxford and Ehrman (1995), Mochoizuki (1999), Wharton (2000), Vossoughi and Ebrahimi (2003), and Khabiri and Azaminejad (2009), that affective learning strategies were used the least. It also provides support for Rezaei and Almasian's (2007) finding that both high and low creativity groups and both high and low proficiency groups used affective learning strategies the least.

There could be two reasons why learners used affective and social learning strategies minimally: first, L<sub>2</sub> researchers may have used some methods to identify language learning strategies that failed to measure learners' affective and social learning strategies properly. Second, successful learners might hesitate to consider these as real strategies (Oxford, 2002). Another possible reason for these results is that many English language teachers were trained in the use of direct strategies such as cognitive strategies when they were younger learners; now they feel that these strategies require more emphasis than affective learning strategies. Consequently, students are taught how to use cognitive strategies and are not well aware of affective learning strategies. Since the participants of the study were Iranian, one possible reason for these findings may be related to the Iranian educational system where classes are more teacher-centered. In these classes, students' affective factors are not taken into account and direct strategies such as translating, analyzing, or reasoning, which are categorized as cognitive learning strategies, are focused on more by teachers and students.

Unlike the above results, this result of the study contradicts that of Sedaghat (2001), who showed no significant correlation between affective learning strategies and attitude. This study is also not in line with some non-L<sub>2</sub> research which indicated that a number of the best learners used affective and social learning strategies (McCombs, 1988). Meanwhile, it is different from Nikoopour and Amini Farasani (2010), who found that from among six categories of language learning strategies, metacognitive learning strategies were used frequently and EFL learners minimally used memory learning strategies.

The observed discrepancy between the findings of the present study and those of the above-mentioned studies could be partially attributed to the following factors. It is worth noting that the cultural differences might be one reason for differences between the results of the present study and the above studies. The participants of the present study were Iranian learners. Iranian learners are rarely given opportunities to raise their awareness of affective learning strategies. They do not feel comfortable discussing their feelings and attitudes with others. Moreover, Iranian

learners are given little (if any) opportunity to take risks. As a result, they tend to learn language through practicing formulas and patterns. This reason lends a support to the present study in which cognitive learning strategies were used the most in L<sub>2</sub> idioms learning.

The differences in the learners' level of proficiency might affect language learning strategy use. In this study, the participants were intermediate level. As a result, they may not have been able to apply indirect strategies such as metacognitive, social, and affective strategies. They may not have been proficient enough to self-monitor and self-evaluate. Sex differences may be considered as another factor contributing to such differences in the findings. Sex differences were not taken into consideration in the present study although they might have affected the learning strategy use and choice.

One of the possible reasons that may justify why learners used cognitive strategies the most and affective learning strategies the least is that learners preferred to use more familiar strategies and had an inclination to avoid trying less familiar ones. On the other hand, in the Iranian learning context, cognitive learning strategies are more focused on at the expense of affective and social learning strategies. In addition, teachers usually provide learners with Persian equivalents of L<sub>2</sub> idioms. It motivates them to use analyzing, reasoning, transferring, and translating strategies. Iranian learners are also trained to summarize, take note, and highlight important information. These strategies are mainly categorized as cognitive learning strategies.

## **CONCLUSION**

The present study attempted to investigate types of language learning strategies as predictors of L<sub>2</sub> idioms comprehension. The research question sought to investigate types of language learning strategies as predictors of L<sub>2</sub> idioms comprehension. The multiple regression analyses indicated that cognitive and affective learning strategies were significant predictors of L<sub>2</sub> idioms comprehension. Participants who made more use of cognitive learning strategies had better performance on the L<sub>2</sub> idioms comprehension test. In other words, cognitive and affective learning strategies together could account for approximately 43% of the total variance in L<sub>2</sub> idioms comprehension. This significant relationship can be accounted for on the basis of two considerations. First, cognitive learning strategies are direct strategies and involve the mental processing of language directly. Language learners need to have the direct mental processing of language to comprehend L<sub>2</sub> idioms. Second, cognitive learning strategies include information processing strategies like analytic, bottom-up skills, and synthesizing skills. They might be more closely related to L<sub>2</sub> idiom learning (Tajeddin, 2004). In addition, based on the results of previous studies and those of the present study, strategies like reasoning, analyzing, translating, and transferring, which are referred to cognitive learning strategies, help learners to comprehend L<sub>2</sub> idioms better.

On the other hand, it can be concluded that affective learning strategies including strategies to control learners' feelings (e.g., I feel relaxed when I cannot understand L<sub>2</sub> idioms) have a significantly negative correlation with L<sub>2</sub> idioms learning. This is probably due to lack of awareness of these strategies on the part of the learners, which is in turn because the educational system focuses on the cognitive and metacognitive learning processes, and ignores the affective and interpersonal factors involved in the learning process. As a consequence, learners do not consider this category of language learning strategies as real strategies leading to successful learning (Rezaei & Almasian, 2007). Another possible reason is teacher-centered classes in which learners are not allowed to employ more affective learning strategies.

In short, it is believed that language learning strategies are a new area of research in English language learning and teaching (for example, Green & Oxford, 1995; Nyikos & Oxford, 1993; Oxford & Cohen, 1992). More research studies are required to explore the effectiveness of six categories of language learning strategies in different English language tasks.

To sum up, the findings showed that language learning strategies can be significant predictors of L<sub>2</sub> idioms comprehension. At the same time, the findings suggested that there are differences among the various language learning strategies as predictors of L<sub>2</sub> idioms comprehension.

## ***Pedagogical implications***

The present study can have implications for learners, teachers, syllabus designers, material developers, and researchers. Teachers can share their experiences and language learning strategies with learners while doing language tasks. They should provide students with a rationale for why they need to learn how to use language learning strategies. They can also integrate different language learning strategies with each other. However, they should begin training students to adopt the most successful learning strategies rather than all possible ones. Learners should be given opportunities to discuss language learning strategies which they use to do different language tasks. They should be provided with language learning strategies and an awareness of how and when to use them to make their language learning better and faster. Particularly, they should be given an awareness of the effective language learning strategies to better comprehend L<sub>2</sub> idioms.

Since the focus has shifted from teacher-centered classes to learner-centered classes, material developers should develop materials which:

1. teach different categories of language learning strategies to learners,
2. specify which language learning strategies may be more effective in doing a particular task,
3. explain how and when language learning strategies can be used,
4. provide tasks and exercises which allow learners to make use of different language learning strategies, and
5. give a degree of freedom to learners and teachers to use their own preferred language learning strategies.

In addition, since many English language materials ignore idioms and/or introduce them in vocabulary lists (Irujo, 1986), materials developers should provide sections and exercises focused on idioms independently. These exercises should motivate learners to apply various effective language learning strategies.

Researchers should also conduct more studies on the effect of language learning strategies on different aspects of language and provide learners, teachers, syllabus designers, and materials developers with information about effective and less effective language learning strategies.

On the whole, since cognitive learning strategies were found to be the most commonly used strategies by successful idiom learners in this study, learners, teachers, researchers, syllabus designers, and materials developers should put more emphasis on this category of learning strategies. For example, they may develop and use activities which promote memory-enhancing strategies (e.g., mnemonic technique). At the same time, teachers, syllabus designers, and materials developer should make learners aware of affective and social strategies because they have not received much attention in classrooms. Activities for teaching L<sub>2</sub> idioms should provide students with different categories of language learning strategies.

### LIMITATIONS OF THE STUDY

There are some limitations which are involved in the present study:

1. The participants were both females and males at different ages; therefore, the age and sex of the participants were not taken into account.
2. There were only 120 participants. So, the generalizability of findings must be treated cautiously.
3. The level of proficiency of the participants was limited to intermediate and upper-intermediate levels.
4. The participants' background knowledge may have affected their use of language learning strategies and idiom comprehension; however, it was not the concern of this study.

### ABSTRACT

This study aims at investigating the relationship between the EFL intermediate students' self-concept and their academic achievement (grammatical knowledge). Accordingly, two groups of university students were selected as the low and high self - concept participants. This was done by their responses given to a questionnaire developed by Marsh (1990), to measure self - concept. After selecting the participants, the researcher utilized a standard Oxford Proficiency Test (OPT), measuring grammatical knowledge in the case of conditional sentences to evaluate some aspects of academic achievement of the participants at the end of the study. By analyzing the data were gathered from the participants. That is, to say the high self- concept students were found to be more inclined to proficient in grammatical aspect of English. It was found that there is a statistically significant correlation between the students self -concept and their academic achievement. Based on the findings of this study and many other studies conducted on this issue, foreign - language teachers should consider academic self - concept as a powerful motivating force that can optimize language learning processes and more importantly consider enhancing student self -concept as one of the primary goals of language education.

**KEYWORDS:** Self-concept, Academic achievement, Grammatical knowledge

### INTRODUCTION

One's self-concept (also called self-construction, self-identity or self-perspective) is a collection of beliefs about oneself that includes elements such as academic performance, gender roles and sexuality, racial identity, and many others. Generally, self-concept embodies the answer to "Who am I?".

Carl Rogers (1959) believes that the self concept has three different components:

- The view you have of yourself (Self image)
- How much value you place on yourself (Self esteem or self-worth)

- Would you wish you were really like (Ideal self)

Psychologist Carl Rogers also paved the way for this concept. According to Rogers, everyone strives to become more like an "ideal self". The closer one is to their ideal self, the happier one will be. Rogers also claimed that one factor in a person's happiness is unconditional positive regard, or UPR, from others. Evidence of UPR in self-concept research is apparent in studies by Benner and Mistry (2007) and Tiedemann (2000). Research has indicated that adolescents whose mothers and teachers had high expectations for their future educational attainment experienced more academic success than those whose adult influences have lower expectations.

Despite a lack of clear distinction among self-related perceptions, current researchers agree that self-concept has a multidimensional nature (Bong & Skaalvik, 2003; Marsh, Byrne & Shavelson, Hubner & Stanton, 1976). Researchers also agree that self-concept is not innate, but rather it is formed through an individual's experiences and interaction with the environment (Bong & Clark, 1999; Bong & Skaalvik, 2003; Marsh & Shavelson, 1985), where "significant others" play an important role (Shavelson, Hubner & Stanton, 1976; Sanchez & Roda, 2003). Sanchez and Roda (2003) defined self-concept as a component of human personality development.

An important theory related to self-concept is the self-categorization theory (SCT), which states that the self-concept consists of at least two "levels," a personal identity and a social identity. In other words, one's self-evaluation relies on both one's self-perceptions and how one fits in socially. The self-concept can alternate rapidly between the personal and social identity. Research by Trautwein et al. (2009) indicates that children and adolescents begin integrating social comparison information into their own self-concept in elementary school by assessing their position among their peers. Gest et al.'s (2008) research findings reveal that peer acceptance has a significant impact on one's self-concept by age 5, affecting children's behavior and academic success. Both of these research examples demonstrate the social influences on a person's self-concept.

Academic Self-concept (ASC) refers to the personal beliefs someone develops about their academic abilities or skills. A person's ASC develops and evolves as they age. Some research suggests that ASC begins developing in early childhood, from age 3 to 5, due to parental/family and early educators' influence, while other research contends that ASC does not develop until age 7 or 8, when children begin evaluating their own academic abilities based on the feedback they receive from parents, teachers and their peers.

There are a variety of social factors that contribute to development of an ASC and developing a positive ASC has been related to people's behaviors and emotions in other domains of their life, influencing happiness, self-esteem, and anxiety levels to name a few. Due to the significant impact ASC has on a person's life, it has been argued that educational systems should foster positive self-concept development in children. These research findings are important because they have practical implications for parents and teachers. Research indicates that parents and teachers need to provide children with specific feedback that focuses on their particular skills or expressed abilities in order to increase ASC. Other research suggests that learning opportunities should be conducted in a variety of mixed-ability and like-ability groupings that down-play social comparison because too much of either type of grouping can have adverse effects on children's ASC in the way they view themselves in relation to their peers.

Academic self-concept has been shown to be an important affective variable that has a reciprocal relation with academic performance in a large number of studies (Guay, Marsh, & Boivin, 2003; Marsh, Hau, & Kong, 2002). Many researchers have reported a positive correlation between student academic self-concept and performance in the language learning class (Liu, 2008; Marsh, Relich, & Smith, 1983; Muijs, 1997).

Ireson, Hallam and Plewis (2001) reported that ability grouping in English setting fostered the English self-concept of lower-performing students and lowered the English self-concept of higher-ability students, whereas the grouping practice in mathematics and science settings had no effect on the corresponding academic self-concepts. Liu, Wang, and Parkins (2005) established that the academic self-concept of lower-performing secondary students was lower than that of their higher-ability counterparts immediately after being grouped. However, three years later, these students had a more positive academic self-concept than their high ability peers, while a more pronounced decline in academic self-concept was found for highly able students.

Consistent findings were reported in another study by Kulik and Kulik (1992) that the effects of ability grouping on student' self-concept are negligible overall. However, they also concluded that homogeneous grouping tends to have slightly positive effect on below-average students and students and slightly negative effect on high-group students.

Various studies have examined the effects that success and failure can have on an individual's self-concept. Individuals often form their self-concept based on past experiences of success or failure, attributing the outcome to their own personal worth. By doing this, individuals can commit the fundamental attribution error. In this case, the error may arise when the person falsely believes that a specific aspect of who they are determined the positive or negative outcome. By attributing a negative outcome to oneself, self-concept can be unnecessarily harmed. However, attributing positive outcomes to oneself can increase self-concept. These attributions can even have an effect on self-perception, achievement behaviors in the future, and expectancies. Austin and Vispoel (1998) found strong links between where an individual attributed success or failure and, specifically, musical self-concept.

Changes in self-concept can be mediated and predicted by various factors. One important factor in academics is evaluation of performance by peers, or peer academic reputation (PAR). Gest, Rulison, Davidson, and Welsh (2008) found evidence for the predictive ability of PAR with regard to students' in upper grades academic self-concept. If a student has a reputation for success or failure in the academic setting, the student may develop a negative self-concept. This shows that it is may not only be the actual success or failure that has an effect, but may also be the secondary effects of poor academic reputation among peers that influence students' self-concept.

Liu and Wang (2005) suggested that student' academic self-concept tends to decline from early to mid-adolescence as this can be a difficult phase of self-questioning and adjustment. A similar finding was obtained by Marsh (1989), who suggested that self-concept reaches its lowest point in middle adolescence. However, he also found that self-concept increases through early adulthood. Guay et al. (2003) contended that as elementary students grow older; their academic self-concept becomes more stable.

## REVIEW OF LITERATURE

Self-concept research has attracted the interest of researchers in various disciplines because numerous research studies conducted over the past decades have suggested that academic self-concept and academic performance are interrelated. Some studies have shown that academic self-concept functions as a significant predictor of students' academic performance (Choi, 2005; Liu, 2008; Muijs, 1997). Other studies intended to examine the causal relationships between the two variables (Barker, Dowson, & McInerney, 2005; Helmke & van Aken, 1995; Marsh, Trautwein, Ludtke, Koller, & Baumert, 2005). Most studies have supported the contention that academic self-concept and achievement have a reciprocal relationship. Changes in one variable may lead to changes in the other.

The academic achievement/self-concept relationship has been reported in numerous studies by Marsh and his colleagues (Marsh et al., 1988; Marsh & Yeung, 1998; Marsh et al., 2001). Nevertheless, they rarely focused on the relation between English self-concept and language-related ability. Rather they were more interested in examining the relationship among self-concepts in specific content areas and different academic achievement measures, e. g., math achievement and English achievement, to see how they correlate with each other. As an example, Marsh et al. (1983) found that math achievement had a higher correlation with math self-concept (.55) than with self-concept in reading (.21). They also found a correlation of .22 between reading achievement and self-concept in the corresponding area. In a study conducted by Liu (2008) in the Taiwanese EFL context, there was a correlation of .41 between student English self-concept and language proficiency, with a higher correlation (.46) for females than for males.

Byrne (1988) noted that social comparison plays a vital role in the development of self-concept. Students are inclined to form their perceptions of selves using their classmates or schoolmates as a reference group. Trautwein, Ludtke, Marsh, Koller, and Baumert (2006) suggested that academic self-concept may differ as a function of not only their own academic achievement but also the achievement of their reference group. Researchers found that academic self-concepts of students may be enhanced when they are placed in a high-achieving group and "assimilation effects" occur in this case (Marsh, Kong, & Hau, 2000; Trautwein et al., 2006). To the contrary, when students' academic self-concepts are negatively affected by the above-average performance of their high-achieving group members, "contrast effects" occur. Marsh and his collaborators (Marsh, 1991, 1994., Marsh & Hau, 2003; Marsh & Parker, 1984) proposed the Big-Fish-Little-Pond effect (BFLPE) to explain these frame-of-reference effects and contended that academic self-concept is positively correlated with academic performance; however, the average ability level of students' peers in class or school can have a negative effect on the formation of specific academic self-concepts.

According to the self-concept model posited by Shavelson, Hubner, and Stanton (1976), the construct was hierarchical and multifaceted in nature such that self-concepts in specific domains such as English, math, history, and science are the subcomponents of one general academic self-concept. Considerable studies have been conducted to test and support the multidimensionality of the construct (Lau, Yeung, & Jin, 1998; Marsh, 1994; Marsh, Byrne, & Shavelson, 1988; Marsh, Relich, & Smith, 1983).

Since it has become a universal practice to group college students for English instruction, it is important to conduct more in-depth investigation into the variables that affect student learning in the homogeneously grouped setting. The current study analyzes one of the important affective factors, the academic self-concept, which has been shown to be correlated with foreign-language achievement, and examines whether and how it changes in ability-grouped classes' context. The objective of this research is to provide foreign language instructors with more information about the role of this variable in foreign-language performance with the hope that this can benefit student learning in the English setting in the long run.

### **RESEARCH QUESTIONS**

The main question to be addressed in this research is as follow:

Is there any correlation between EFL students' self-concept and their academic achievement in EFL classrooms?

### **RESEARCH HYPOTHESES**

The purpose of the present research is to investigate correlation between EFL students' self-concept and their academic achievement in EFL classrooms. The result will confirm one of the following hypotheses:

H<sub>1</sub>: There is correlation between EFL students' self-concept and their academic achievement in EFL classrooms.

H<sub>0</sub>: there is no any correlation between EFL students' self-concept and their academic achievement in EFL classrooms.

### **METHODOLOGY**

#### ***Participants***

To gather the necessary data for the study an intact EFL intermediate class of about 30 students were selected. The age range and the sex of the students as the moderator variables were not accounted for. In terms of their English proficiency all the participants were homogeneous. This is determined by conducting a pre-test on the grammar. The test was given to the participants to check their knowledge of grammatical structures.

#### ***Instrumentation***

In This study, Marsh Academic self-concept questionnaire and Oxford Placement Test (OPT) are as measures of students' self- concept and English language proficiency respectively. The questionnaire was developed by Herbert Marsh (1990), and includes 30 questions about academic self-concept which perceived by students themselves. The questionnaire items were selected from the established instrument guided by a general understanding of the students' and their cultural background knowledge. The original academic self-concept questionnaire (ASCQ) consisted of two 15 items subscales: academic confidence (15 items), and students' academic effort (15 items). The academic confidence (AC) subscale assessed students' feeling and perceptions about their academic competence in general. The academic effort (AE) subscale assessed students' commitment to and involvement and interest in school works. The questionnaire items are presented in Appendix.

The next instrument was OPT. It was a Standard English language test which was administered to check the grammatical knowledge of students. It was administered to determine the proficiency level of the students. The OPT was administered by two university EFL professors to check for the homogeneity of the General English proficiency level of the participants. This was done to insure that all the students participating in the research were at roughly the same level of English Language proficiency. The reliability of the test was calculated afterwards which happened to be 0.89. All the students were administered the proficiency test in a single testing session. The 30 items test included grammatical questions about conditional sentences.

#### ***Procedure***

The study was conducted at the beginning of the term. In order to determine the participants' level of language proficiency, an OPT was administered. Right from the beginning of the course, the self –concept questionnaire was distributed among a group of 65 students to select the required participants of the research. The participants were required to fill the questionnaires out. The questionnaires then were collected for the purpose of analysis.

The purpose of the researcher was to group the participants into two groups, including those who were found to be the students having a high degree of self-concept based on their responses to items in the questionnaire, and those who indicated a low degree of self-concept. That is, the questionnaire was distributed among a population of 65 EFL students taking the same course. From among these students, 15 were selected as the ones having the highest degree of self-concept (HSC) and 15 others as the lowest self-concept (LSC). This was done based on the scores they obtained from answering the self-concept questionnaire.

After dividing the participants into two groups of 15, the researcher who have taught English language as a general course in university, divided the participants into two groups, one of them was control group (LSC) which had not received any teaching of grammatical knowledge in the case of conditional sentences which were the focus of this research as an important part of academic achievement in English language curriculum in Iranian university, and the second class or experimental group(HSC), which they have received teaching about conditional sentences as a part of grammatical knowledge, and after 4 weeks of treatment( teaching grammatical knowledge), the post test was administered. In order to determine if there was a significant relationship between the students' obtained scores on the final exam in the form of OPT and the subjects' level of self-concept determined by the self-concept questionnaire, the researcher calculated the correlation coefficient of the scores obtained on the OPT.

## RESULTS AND DISCUSSION

In order to see if there is a significant relationship between the performance of the students on the OPT and their academic self-concept, the researcher run a t-test on the results obtained by the high self-concept students on the OPT and that of the low self-concept subjects on the same test. The following table provides the results obtained from the t-test.

### T-Test

*Tables 1 & 2: one sample t – test results on the OPT*

**One-Sample Statistics**

	N	Mean	Std. Deviation	Std. Error Mean
OPT,LSCA= Placement Test Low Self-Concept A	15	7.5000	3.59092	.80296
OPT,LSCB= Placement Test High Self-Concept B	15	15.9000	2.22190	.49683

**One-Sample Test**

	Test Value = 0					
						95% Confidence Interval of the Difference
	T	df	Sig. (2-tailed)	Mean Difference	Lower	Upper
OPT,LSCA= Placement Test Low Self-concept A	9.340	19	.000	7.50000	5.8194	9.1806
OPT,LSCB = Placement Test High Self-concept B	32.003	19	.000	15.90000	14.8601	16.9399

Based on the results given in table one, the mean and the standard deviation of the scores obtained from the Oxford Placement Test (OPT) given to the low self- concept students were 7.50 and 3.59. The mean and the standard deviation for the high self - concept group on the same test (OPT) were 15.90 and 2.22 respectively. At the 95% confidence interval of difference one can conclude that as P is less than 5% ( $P < .05$ )  $p = 0$ , the difference between the means obtained from the t-test is statistically different. That is to say, the means of the OPT given to the low and high self-concept students were 7.50 and 15.90 respectively. There is a difference value of 8.40 of the mean of the two groups on the same test. Based on the data provided in tables one and two, it can be concluded that it is highly likely that the students' self-concept influences their grammatical knowledge in the form of conditional sentences. To see if there is a significant correlation between the participants' self-concept and their proficiency in their English classes Pearson correlation statistics was also run on the results obtained from their responses to the items in the questionnaire distributed among them and their scores obtained from the OPT. Based on the results represented

in the following tables , one can come to the conclusion that there is a high correlation between the participants self - concept and their performance on the OPT. Put it another way, the correlation is significant at the %5 level. One can compare the results given in the following two tables to come to the same conclusion provided above.

*Tables 3 & 4: Correlations between the students' self-concept and their academic achievement*

**Correlations**

		LSCA=Low Self -concept	OPTLSCA= Placement Test Low Self -concept A
LSCA=Low Self -concept	Pearson Correlation	1	-.192
	Sig. (2-tailed)		.417
	N	15	15
OPTLSCA= Placement Test Low Self -concept A	Pearson Correlation	-.192	1
	Sig. (2-tailed)	.417	
	N	15	15

Table three: **Correlations**

**Correlations**

		HSCB=High Self -concept	OPTLSCB= Placement Test High Self -concept B
HSCB=High Self -concept	Pearson Correlation	1	-.497*
	Sig. (2-tailed)		.026
	N	15	15
OPTLSCB=Placement Test High Self -concept B	Pearson Correlation	-.497*	1
	Sig. (2-tailed)	.026	
	N	15	15

\*, Correlation is significant at the 0.05 level (2-tailed).

These findings are in part in line with the findings of Liu (2008). He found that the more successful learners regarding the academic achievement had higher self - concept than less successful ones in academic achievement tasks. To sum up concerning the main question raised in this study one can be safe to conclude that there is a significant relationship between self - concept and academic achievement in EFL classrooms.

In the same line many experts believe that one main area of concern should be the attitudes and self-concept of students to learn and use L2. Byrne (1988) noted that social comparison plays a vital role in the development of self-concept. Students are inclined to form their perceptions of selves using their classmates or schoolmates as a reference group. Trautwein, Ludtke, Marsh, Koller, and Baumert (2006) suggested that academic self-concept may differ as a function of not only their own academic achievement but also the achievement of their reference group. Researchers found that academic self-concepts of students may be enhanced when they are placed in a high-achieving group and “assimilation effects” occur in this case (Marsh, Kong, & Hau, 2000; Trautwein et al., 2006). To the contrary, when students' academic self-concepts are negatively affected by the above-average performance of their high-achieving

group members, "contrast effects" occur. Marsh and his collaborators (Marsh, 1991, 1994., Marsh & Hau, 2003; Marsh & Parker, 1984) proposed the Big-Fish-Little-Pond effect (BFLPE) to explain these frame-of-reference effects and contended that academic self-concept is positively correlated with academic performance; however, the average ability level of students' peers in class or school can have a negative effect on the formation of specific academic self-concepts.

The findings of the present study are yet in line with another two studies carried out by Shavelson, Hubner, and Stanton (1976); the construct was hierarchical and multifaceted in nature such that self-concepts in specific domains such as English, math, history, and science are the subcomponents of one general academic self-concept. Considerable studies have been conducted to test and support the multidimensionality of the construct (Lau, Yeung, & Jin, 1998; Marsh, 1994; Marsh, Byrne, & Shavelson, 1988; Marsh, Relich, & Smith, 1983).

## CONCLUSIONS AND SUGGESTIONS

This study aimed at investigating the relationship between self - concept and academic achievement of the intermediate EFL students. For this purpose, two groups of intermediate EFL Persian students were selected as the participants of the study. There were fifteen students in low self- concept group and 15 in high self - concept group. Their level of self- concept was determined based on their responses given to a self - concept scale questionnaire developed by Marsh (1990). Based on the results obtained from the participants' responses to the self-concept questionnaire and their performance on a standard oxford placement test, it was concluded that there was a high correlation between the participants self - concept and their academic achievement. Based on the findings of this study and many other studies conducted on this issue, foreign - language teachers should consider academic self - concept as a powerful motivating force that can optimize language learning processes and more importantly consider enhancing student self -concept as one of the primary goals of language education. However, the researchers do not claim the results obtained from this study are absolutely conclusive. Put it another way, as people come to learn a new language in a foreign context, not only their self-concept may influence their academic achievement in general and their grammatical knowledge in particular but also many other factors including their motivation, attitudes towards the language they are going to learn, the context in which they are going to master the new language are extremely influential in this regard. So the story of second language acquisition is interestingly comparable to the story of the elephant which was supposed to be described by a group of people in a dark room. And they all came to different descriptions of the whole body because they just touched parts of the body. The same story still is the case for SLA. As it is the case with almost all studies done in the field of teaching English as a foreign language, this study is not free of limitations. That is to say, because of the eluding nature of self - concept which is defined differently by different people one cannot claim to provide all inclusive criteria to list the problems with which EFL teachers wish to come to a conclusion in evaluating self - concept as an approach in EFL contexts. Therefore, the authors of this paper have not intended to come to an absolute conclusion about the perceived problems with which EFL teachers might face in using self – concept's measurement in their real classes. ALL in all, it is hoped that this survey be of use for all colleagues. All defects of this paper are of ours. That is, no fault is to the participants in this study.

#### *Appendix*

1. English is one of my best subjects.
2. I am hapless in English classes.
3. People come to me for help in most schools, subjects.
4. I often need help in English.
5. I look forward to English classes.
6. I am too stupid at school to get into a good university.
7. I look forward to English classes.
8. I do badly on tests that need a lot of reading ability.
9. If I work really hard I could be one of the best students in my school; year.
10. I have trouble understanding anything with English in it.
11. Work in English classes is easy for me.
12. I get bad marks in most school subjects.
13. I enjoy studying for English.
14. I am not very good at reading.
15. I learn things quickly in most school subjects.
16. I do badly in tests of English.
17. English is one of my best subjects.
18. I am stupid at most schools subjects.
19. I get good marks in English.
20. I hate reading.
21. I do well in tests in most school subjects.
22. I never want to take another English course.
23. I get good marks in English.
24. I have trouble with most school subjects.
25. I have always done well in English.
26. I have trouble expressing myself when I try to write something.
27. I am good at most school subjects.
28. I hate English.
29. I learn things quickly in English classes.
30. Most school subjects are just too hard for me.

**ABSTRACT**

The purpose of the present study was to shed light on the issue of vocabulary strategy training. We have investigated the effect of Using Mechanical Techniques as a direct vocabulary learning strategy and Discussing Your Feelings with Someone Else as an indirect vocabulary learning strategy instruction on the development of lexical knowledge of Iranian English as a foreign language (EFL) students. To reach the goal of the study, two groups of EFL language learners at pre-intermediate language proficiency level were randomly assigned into two groups of A and B. The group (A) was taught vocabulary through Using Mechanical Techniques as a direct vocabulary learning strategy and the group B was taught Discussing Your Feelings with Someone Else as an indirect vocabulary strategy for developing their vocabulary storage in reading comprehension. Data analysis was conducted through samples t-test statistics. It demonstrated that the group A outperformed the group B. To summarize, teachers are encouraged to implement using Mechanical Technique vocabulary strategies because of their easy and effective application particularly at the early stages of vocabulary learning.

**KEYWORDS:** Vocabulary Learning Strategy, Using Mechanical Techniques Strategy, Discussing Your Feelings with Someone Else Strategy

**INTRODUCTION**

Vocabulary is absolutely vital to language as it labels objects, actions, ideas, emotions with which people can convey the intended meaning. Calls for helping learners improve the way they go about learning vocabulary have been made on a number of grounds. Sokmen (1997: 225) argues for helping learners learn how to acquire vocabulary on their own, noting that it is "not possible for students to learn all the vocabulary they need in the classroom". Second language (L2) acquisition depends crucially on the development of a strong vocabulary. In the second language acquisition (SLA) sub-discipline known as second language vocabulary acquisition (SLVA), researchers have

focused their attention on the need for second language learners to optimize their vocabulary knowledge (Singleton, 1999; Schmitt, 2000).

In order to communicate well in a foreign language, students should acquire adequate words and should know how to select and perform them accurately. Word knowledge makes a learner to deeper and better understanding meaning of a concept. Word knowledge is an essential component of communicative competence and it is important for both production and comprehension in a foreign language. (Reese, 1984) stressed the importance of vocabulary learning in second language acquisition. Unlike native speakers, second language learners (L2) go through a more conscious and demanding process of acquisition of vocabulary. They experience lexical gaps, the words they read which they simply do not understand or concepts that they cannot express as adequately as they could in their first language (L1). Sokoli, Stravoli (2006) believes vocabulary learning to be a vital part of each student's life.

To facilitate vocabulary learning, EFL learners gear a number of strategies that share some traits with the overall language learning strategies; however, some others remain very characteristic of vocabulary learning alone (Coady, 1997; Zimmerman 1998; Nation, 2001; Chamot, 2001; Thornbury 2002). Cunningsworth (1995: 38) regards helping learners develop their own vocabulary learning strategies as "a powerful approach", which can be based on sensitization to the systems of vocabulary, encouragement of sound dictionary skills and reflection on effective learning techniques. Vocabulary learning strategies (VLS) are a part of language learning strategies which are receiving more attention since the late 1970s and their investigation has advanced our understanding of the processes learners use to develop their skills in a second or foreign language. Language learning strategies have received much attention in the studies that were conducted by Chamot (1987), Cohen (1998) and Oxford (1990).

According to Schmitt (1997), vocabulary learning strategies are even more important in second language learning with the increasing nature of vocabulary acquisition and its emphasis on large exposure to the language. In order to learn and use English efficiently, learners need to expand proper learning strategies for long-term learning. Language learning strategies are directly or indirectly connected to the self-direction to a great extent. They are seen as the conscious choices of learners to solve problems and organize knowledge and skills (Cohen, 1998; McDonough, 1999), and according to Oxford (1990, 2001), they are often said to contribute to autonomous learning. Wenden (1991) believes that one of the characteristics of autonomous learners is their ability to apply learning strategies properly and independently. Furthermore, utilization of vocabulary learning strategies has been found to affect students' performance in language learning (Sarani and Kafipour, 2008).

#### **DIRECT AND INDIRECT VOCABULARY LEARNING STRATEGY**

There are many and various classifications of language learning strategies. O'Malley et al. (1985) declared the use of 24 strategies employed by learners of English as a second language in the United States. They divided these strategies into three main categories: "Metacognitive", "Cognitive", and "Socio-affective" strategies. In fact, there is another accepted classification as suggested by (Oxford, 1990). She distinguished between the direct and indirect strategies. In L2 lexical teaching and learning, there are two types of vocabulary learning: Indirect learning and direct learning. Indirect or incidental learning is defined as the type of learning that is a byproduct of doing or learning something else; whereas, direct or intentional learning is defined as being designed, planned for, or intended by teacher or students. In terms of vocabulary learning, indirect learning always means the approach of learning vocabulary through texts, working on tasks or doing other activities that are not directly related to vocabulary. In contrast, the direct learning always focuses on vocabulary itself, and combines with all kinds of conscious vocabulary learning strategies and means of memorizing words. Vocabulary form, collocation, parts of speech are mainly the results of incidental learning, while the sense of a word, meaning symbolizing and innuendo between words need intentional learning (Nation, 1990).

#### **VOCABULARY AND READING COMPREHENSION**

The role of vocabulary in reading comprehension is a complex one. To understand text meaning, one must be able to decode the printed message (Adams 2004, Alderson 2000, Day & Bamford 1998). The presence of high density of unknown words in a text may seriously hinder comprehension (Curtis 1987, Nation, 2001). Fast and efficient word recognition, word encoding and lexical access are necessary for a higher level of meaning construction (Adams

2004, Just & Carpenter 1987, Lesgold & Perfetti, 1978). The main difference between skilled and less skilled readers lies in slower and inefficient lexical access and semantic processing (Bernhardt 2005, Grabe & Stoller 2002, Nassaji 2003, Segalowitz et al. 1991).

A number of studies have revealed consistent correlations between vocabulary and comprehension (Laufer 1992a, 1992b, Qian 1999, 2002, Nation 2001). Stahl (2003: 246) contends that studies from readability formulae have 'found that the most important factor in determining the difficulty of a text is the difficulty of the words.' Vocabulary size is thus a strong predictor of reading comprehension. Within the context of L2 research in reading, findings on the reading processes and vocabulary threshold have consistently indicated the importance of vocabulary knowledge in reading comprehension (Fukkink et al. 2005, Garcia 1991, Koda 1994, Laufer, 1997, Zhang 2000, 2002a, 2002b; see Alderson 2000, Bernhardt 2005, Koda 2005 & Nation 2001, for reviews).

## REVIEW OF THE RELATED LITERATURE

Research by Coady et al. (1993) with 79 students studying English in a university academic preparation program found that two experimental groups, which had received special training in high frequency vocabulary, achieved better ESL reading comprehension at the end of the experiments than did a control group which had not received such a treatment. The study was carried out to verify the proposition that 'there is a positive and significant relationship between knowledge of high-frequency words and reading proficiency. Based on the results of their study, Coady et al. (1993) argued that special training in the 2000 most frequent English vocabulary items could improve learners' reading proficiency.

Sarani and Kafipour (2008) stated psycholinguistic strategy is the most frequently used strategy for the purpose of retaining new words while current training setting is communicative approach. They stated that the current communicative university training setting which depends relatively little on the requirement to memorize a lot of materials is not followed and practiced correctly by lecturers and students in Iran. Hamzah, Kafipour, and Abdullah (2009) conducted a research study entitled "vocabulary learning strategies of Iranian undergraduate EFL students and its relation to their vocabulary size". They found that Iranian EFL learners are medium users of VLS. However, they discussed that it may be due to the study skills course, they pass in the first semester of their studies. According to them, this course makes freshmen familiar with different learning techniques and strategies in order to have a better learning.

Seddigh and Shokrpur (2012) explored the use of VLS by Iranian medical students and noticed that female students used more VLSs than male ones and the difference was especially noticeable and significant in the case of guessing and note-taking strategies. Their results indicated that guessing and dictionary strategies had the highest frequency usage, while social and study preferences represented the lowest frequency use.

## SIGNIFICANCE OF THE STUDY

Investigating EFL Iranian learners' vocabulary learning strategies may help in identifying many aspects about their foreign language learning. Additionally, recognizing proficient EFL learners' best practices may help in delineating them for less proficient ones in an attempt to improve their opportunities and overcome their difficulties in learning the foreign language. The focus on vocabulary learning strategies comes from the importance of vocabulary for their language performance. Identifying aspects of EFL Iranian learners' linguistic self-image centers attention on how they generally feel about their language performance and how their feelings empower them in their learning; something which can be of absolute significance for EFL teachers to know of. Recognizing EFL Iranian learners' perceptions of their learning environment may also provide some additional insight for teachers and course designers into how to stand up to its challenges.

## RESEARCH QUESTION

Which one of two strategies, using Mechanical Techniques versus Discussing Your Feelings with Someone Else Vocabulary Learning Strategies is more effective on developing the Iranian's reading comprehension skill?

## METHODOLOGY

### *Participants*

The original participants in the current study were 120 EFL university students studying general English course that students of non-English major should pass, from Omidiyeh Islamic Azad University (mostly in the second semester) based on non-random judgment sampling. The age of the participants ranged from 20 to 25. . Both genders were

represented in the classes comprising 30 male and 34 female students, altogether. The participants were all Iranian, Farsi native speakers, homogeneous in respect of nationality, mother tongue and both cultural and educational background. They participated voluntarily in a homogeneity test adapted from Objective Placement Test (Lesley, et al 2005) as a homogeneity test and finally, sixty four students whose scores were one standard deviation above and one standard deviation below the mean ( $M = 30$ ) were selected. Then they were randomly divided into two groups; group A (18 female and 14 male) received direct vocabulary learning strategy (Using Mechanical Technique), while group B (12 female and 20 male) were taught through indirect (Discussing Your Feelings with Someone Else) vocabulary learning strategy.

### ***Instruments***

Three instruments were used to measure the variables of this study. Initially, in order to arrive at dependable, reliable and valid measurement of the participants' reading comprehension proficiency, the subjects in the two groups took the Objective Placement Test of Interchange (Lesley, Hanson & Zukowski- Faust, 2005), which was used as a standardized measurement to check the homogeneity level of the subjects in terms of language proficiency. The test contained 40 multiple-choice of vocabulary items. In order to verify the reliability of the test, the researchers selected 40 students from different departments in Omidyeh Islamic Azad University to participate in test. Calculating the reliability coefficient of the test through KR-21 formula, the researchers found the reliability of the homogeneity test at ( $r = .74$ ).

A second test including also 40 items was administered to both groups at the end of treatment period after ten sessions. This test indicated 40 multiple-choice items of vocabulary achievement test which was developed by the researcher based on the materials taught in the classrooms. The vocabulary items in the test were selected mainly from the new lexical items of reading comprehension texts. The reliability of the test was  $r = .89$  based on KR-21 formula. Another instrument was the reading tasks and activities as the course materials which the researchers were afforded to both the group A and group B. These reading tasks and activities were extracted from the *Select Readings* (pre-intermediate level) written by Lee and Gunderson (2002).

### ***Procedure***

For collecting the data of this study, 120 Iranian university students from different majors but non English major studying English course from Omidyeh Islamic Azad University in Iran, were selected. In this study, the treatment period lasted for ten sessions and in both classes the three instruments were administered. On the first session, the students in group A received introduction on *Using Mechanical Technique* and for students in group B *Discussing Your Feelings with Someone Else* vocabulary learning strategy was explained in the first session. The instruction was conducted by the corresponding researcher (teacher) for both classes. The next sections introduce the treatment period of the two strategies briefly.

#### ***Using mechanical techniques***

To remember what has been read, according to Oxford (1990), mechanical techniques were adjusted as a helpful technique in manipulating, flashcards, with the new word written on one side and the definition written on the other, are both familiar. To contextualize a new expression and get writing practice, learners wrote the new expression in a full sentence on a flash cards. Flashcards were moved from one pile to another depending on how well the learner knew them. Separate sections of the language learning notebook were used useful for words that have been learned and words that had been not reviewed by the learners. Following Oxford (1990), recommendations, the researcher asked students to read and practice the words when they had some free time. For example, they were required to read them on the bus, in lines, etc.

#### ***Discussing your feelings with someone else***

According to Oxford (1990), language learning is difficult, and learners most of the times need to discuss this process with other people. So learners like to speak and negotiate their daily events with other people. In this study, students used diaries to understand and kept track of their thoughts, attitudes, and vocabulary learning strategies, and if they felt at ease enough, they shared their diary entries during group discussion by dividing learners in several groups in class once or twice a week. Discussions of feelings could also took place outside of class and continued it with a friend, a family, and so on (Oxford, 1990).

## RESULTS

After the treatment, to find out the answer of research question, that is, the effectiveness of Using Mechanical Techniques and Discussing Your Feelings with Someone Else vocabulary learning strategies on reading comprehension of the two groups and compare their probable improvement, both groups took part in the vocabulary and reading comprehension test as posttests after completing the course. In this way, the study compared the role of the Using Mechanical Techniques versus Discussing Your Feelings with Someone Else vocabulary learning strategy through using independent-samples t-test, in order to find out whether these strategies influence vocabulary knowledge of Iranian EFL university students at the pre-intermediate level of English reading proficiency or not. Therefore, an independent sample t-test analysis was run on the mean score of the two groups. The results of t-test analysis for the effect of these two strategies in reading comprehension as an independent variable indicated statistically significant differences that are shown in Table 1. The data obtained through post-test (Table 1) were analyzed (using SPSS 11.5 software) in different steps.

*Table 1: result of the t-test (of both groups)*

Group	N	Mean	SD	T	df	p
A	32	35.42	1.98	5.89	49	.00
B	32	30.64	2.91			

The results of the post-test in the two groups compared through t-test showed that the mean scores of group A ( $M = 35.42$ ,  $SD = 1.98$ ) was significantly different from group B ( $M = 30.64$ ,  $SD = 2.91$ ). In other words; group A outperformed group B on the post-test. Also, critical  $t$  ( $t = 2.000$ ) was less than observed  $t$  ( $t = 5.89$ ) based on  $df = 49$ . Therefore, there was a significant difference between direct and indirect group in developing vocabulary learning at pre-intermediate level. In other words, Using Mechanical Techniques strategy was more effective than Discussing Your Feeling with Someone Else in vocabulary improvement of Iranian EFL learners at intermediate level.

According to the findings of the study during the research, the students were satisfied in applying and using Mechanical Techniques strategy which was used more by the participants in Group A. In comparison to the students in Group A, the students in Group B who were taught by Discussing Your Feelings with Someone Else could not considerably develop their vocabulary learning.

## CONCLUSION AND IMPLICATION

The purpose of this study was to investigate the effectiveness of two vocabulary learning strategies; namely, Using Mechanical Techniques and Discussing Your Feelings with Someone Else on reading comprehension performance of the Iranian EFL students. To achieve this goal, the researchers conducted a study, consisting of 64 participants from two classes of male and female. The results of the  $t$ -tests demonstrated statistically significant difference between the group (A) and group (B) in reading comprehension achievement post-test of the two groups at the end of instruction. It indicated that the Using Mechanical Techniques vocabulary learning strategy is more effective in improving EFL vocabulary storage and reading comprehension achievement of university students with pre-intermediate proficiency.

Stemming from the above conclusions, this study identified a number of implications beneficial to pedagogical contexts, especially the ones in which EFL learners and teachers are involved. Teachers should help students in selecting the most appropriate strategy for developing skills. Using Mechanical Techniques strategy is suitable and effective in first stages of developing vocabulary of EFL learners as compared to Discussing Your Feelings with Someone Else strategy because of easy application as we experienced it in this study. The results indicated that generally there is a great difference between the learners who are instructed to use Using Mechanical Techniques strategy and Discussing Your Feelings with Someone Else vocabulary learning strategy.

Given the impact of Using Mechanical Technique vocabulary learning strategy on reading comprehension, vocabulary learning strategy should receive much more attention in L2 classrooms. To do so, teachers can use materials including graded readers, word lists, vocabulary cards, definitions, and all pedagogically sound vocabulary activities to expand EFL learners' vocabulary storage to assist their reading comprehension.

Concerning the implications related to curriculum developers and material producers, it can be stated that they should definitely work in cooperation with both teachers and students decide what learning strategies they need to identify. It should be the curriculum developers' responsibility to allocate enough time in the curriculum for teachers to conduct strategies research in their classes. As for materials writers, they are recommended to pay more attention

to word power sections in designing their textbook and find more fascinating ways to acquaint learners with new words. As the final word for this section, doing all the above-mentioned tips requires that educators and materials writers implement changes in classroom teaching, curriculum design, assessments, and educational policies. Only then can we claim that we have attained what we have intended.

### **LIMITATION OF THE STUDY**

The participants of the current study were adult, pre-intermediate learners studying General English at university; replications should be made using participants of diverse age groups and proficiency levels. The same basic design could also be carried out using tests of other versions and even learners of other languages. The significant effect of vocabulary learning strategy especially Using Mechanical Techniques on reading comprehension found in the current study calls for a more comprehensive investigation of the reasons behind. Such investigations may also help educators understand some of the major causes behind the poor reading habits of many EFL learners. Future research should also consider carrying out other studies exploring the effects of other vocabulary learning strategies on reading comprehension or on other language skills. In addition, gender differences seem to be another virgin area to be investigated in relation to vocabulary learning strategy. Such investigations will help EFL teachers and materials writers at the university level to provide their students with tools they need to succeed in their future career as English teachers, translators, or whatever future job they may take on.

**ABSTRACT**

The purpose of carrying out this research was to find out if English for specific purposes knowledge of the students affects their reading comprehension and recall. The study was conducted in two phases. First, about 120 students studying computer science in Islamic Azad University of Sabzevar took a placement test and based on that about 76 students at intermediate level were chosen for this study. All these subjects had already passed a general course in English for a semester. All of them were taught computer texts in an ESP course for about one semester. In the second phase of study which was carried out almost at the end of the ESP course, six reading comprehension texts – two general, two computer and two engineering- were given to subjects on separate sessions. They were supposed to read the texts and write their recalls in Persian. Finally, all recall protocols were analyzed. The result of two paired t-tests showed that ESP Knowledge had effects on reading comprehension and recall of the texts. The subjects did remember the computer texts better than general and engineering texts. Overall, the results supported the role of background knowledge in reading comprehension and recall in EFL and ESP situations.

**KEYWORDS:** ESP knowledge, Reading Comprehension, Recall, Background Knowledge, ESP Reading

**INTRODUCTION**

***The Definition of Reading***

As the most important language skill (Carrell 1988a; Grabe & Stoller 2001), Richards and Renandya (2002:273) point out that reading receives special focus in foreign language teaching. In fact, there are two important reasons for this emphasis. First, reading comprehension is one of the most important goals in most foreign language settings. Second, reading texts help learners to accomplish various pedagogical purposes.

There are various definitions of reading, among which are the following; Grabe and Stoller (2002: 9) defined reading as “..... the ability to draw meaning from the printed page and interpret this information appropriately”.

***Reading Process***

Goodman (1988: 11) believes in two views on reading. The first view accepts reading as “..... matching sounds to letters”, and the second view states that “nobody knows how reading works”. MacLeish (1968: 43) suggests that “[t]he readers of all written languages are “getting sounds from the printed page”. He believes that this is the writer who encodes meaning to sound and then from sound to orthography. In this view, the reader is the one who decodes from orthography to sound and later from sound to meaning.

Harmer (2001) states that a reader is able to see what is beyond the literal meaning of words since he uses a variety of clues to understand what the writer is suggesting. Schema, which is defined as background knowledge that enables the reader to make predictions for more successful interaction play a vital role in the interpretation of the written texts since successful interpretation relies heavily on shared schemata.

Chastain (1988) believes that the reading process means as active cognitive system operating on printed material in order to comprehend the text. He states that during the reading process, the writer tries to activate background knowledge and linguistic knowledge to create meaning and then the reader's task is to activate background knowledge and linguistic knowledge to recreate the writer's intended meaning. Then the reader should go beyond the printed material to get the writer's intended meaning.

### ***Models of Reading***

#### ***Bottom-Up Models***

According to Grabe and Stoller (2002), the reader makes a piece-by-piece mental transition of the information in the text. Anderson (1999) states that, the reader recognizes letters first and then recognizes the words, and in the end the reader gets the meaning intended by the writer by combining the words that were recognized earlier. In other words, according to (Parsan 1997; Alderson 2000), the bottom-up process of reading is defined as a serial model where the reader begins with the printed word, recognizes graphics stimuli, decodes them to sound, recognizes words, and decodes meaning.

#### ***Top-down Models***

Contrary to bottom-up models, in top-down models it is expected that the reader brings her background knowledge to the text. Grabe and Stoller (2002) stress that top-down models assume that reader goals and expectations direct the reading and that accounts for why top-down model assume the readers someone who has a set of expectations about the text information from the text to confirm or reject the expectations.

In top-down approaches the importance of schemata, the reader's contribution to the text is emphasized (Alderson 2000). Schema theory concerns with what readers bring to text while they read and play an important role in bottom-up processes. Schema theory attempts to describe the efficiency of prior background knowledge. Prior knowledge of the readers affects the comprehension of the text.

#### ***Interactive Models***

Since there were some criticism against bottom-up and top-down models, the theorists were led to develop a new approach, the interactive model. Interactive models combine the characteristics of both bottom-up and top-down models (Anderson 1999). In interactive models, readers should be fast and efficient in recognizing letter and words. Harmer (2001) states the difference between top-down and bottom-up models this way. In the former, the reader looks down on something from above, while in the latter, the reader tries to understand the text by being in the middle of it.

### ***Schema Theory***

Schema theory was developed by Gestalt psychologist Bartlett "..... who observed how people, when asked to repeat a story from memory, filled in details what did not occur in the original but conformed to their cultural norms" (Cook 1997: 86). Schema theory stresses that readers are expected to combine their previous experiences with the text they are reading.

Carrell and Eisterhold (1983) consider the role of background knowledge in language comprehension as schema theory, and state that any text either spoken or written does not itself carry meaning. Carrell and Eisterhold (1983: 556) claim that "..... A text only provides direction for .... Readers as to how they should retrieve or construct meaning from their own, previously acquired knowledge."

The very important role of background knowledge on reading comprehension is noted by Carrell and Eisterhold (1983) and Anderson (1999), that a reader's comprehension depends on her ability to relate the information that she gets from the text with her preexisting background knowledge.

### ***Schema***

Background knowledge-prior knowledge- consist of two main components: "our assimilated direct experiences of life and its manifold activities, and assimilated verbal experiences and encounters" (Swales 1990: 83).

Schemata are accepted as interlocking mental structures representing readers; knowledge (Perkins 1983; Zaker 1987; Anderson and Pearson 1988; Cook 1997; Alderson 2000; Brown 2001; Harmer 2001). In the reading process, readers integrate the new information from the text into their pre-existing schemata (Nattall 1996, Wallance 2001). Schemata influence how they recognize information and how they store it. According to Harmer (2001), only after the schema is activated is one able to see or hear, because it fits into patterns that she already knows.

#### *Schema Types*

Carrell and Eisterhold (1983), Carrell (1987; 1988b) and Alderson (2000) distinguish between schemata types. By formal schema, they point to background knowledge relating to the formal and rhetorical organizational structures of different types of texts. Carrell (1985) says reading comprehension is affected by the reader's formal schemata .

Content schemata is defined as background knowledge of the content area of the text that a reader brings to a text (Carrell & Eisterhold 1983; Carrell 1987; Alptekin 1993; 2002; 2003; Singhal 1998; Stott 2001) such as knowledge about people, the world, culture, and the universe (Brown 2001). According to Alderson (2000), readers need knowledge about the content of the passage to be able to understand it.

#### *ESP*

ESP is an approach to language teaching which aims to meet the needs of particular learners. In recent years there has been a growing demand for ESP which is essential for professional development. Different theorists such as Dudley-Evans, St John (1999), Strevenza (1988), Anthony (1997) and a lot more have defined ESP. here, we take some of the definitions into consideration. Hutchason and Waters (1987) theorize, "ESP is an approach to language teaching in which all decisions as to content and method are based on the learner's reasons for learning (p.19). Anthony (1997) states that many non-specialist ESL instructors use an ESP approach based on analysis of learner needs and their own personal experience of using English for real communication.

Lorenzo Fiorilo (2005) states the students' abilities in their subject-matter fields improve their ability to acquire English. Since their subject matter they are associated with is expressed in English, their knowledge gives them the context they need to understand English. So, this is the teacher's responsibility to make the most use of students' knowledge of subject matter to help them understand and learn English.

### **RESEARCH QUESTIONS AND HYPOTHESES**

The study aims to investigate the effects of background knowledge –ESP knowledge- on reading comprehension of a ESP students. So, the following research questions and hypotheses were considered.

#### ***Research Questions***

1. Do computer science students comprehend and remember reading texts of their own field of specialty better than general English texts?
2. Do computer science students comprehend and remember reading texts of their own field of specialty better than engineering reading texts?

#### ***Research Hypotheses***

H1: computer science students comprehend and remember computer texts better than general texts.

H2: Computer science students comprehend and remember computer texts better than engineering texts.

### **METHODOLOGY**

#### ***The subjects***

The study was conducted in Islamic Azad University of Sabzevar at computer branch. 120 ESP students studying computer science took part in this study. All these participants had already passed a general English course in the previous semester. And this term all were going to pass an ESP course in computer science. At the beginning of the term all students took a placement test and based on the placement test 76 students at intermediate level were chosen for this study.

#### ***Instrumentation***

##### ***Placement test***

As it was stated before, Oxford placement test was used to choose the students at the same level for this study. The test has about 90 questions and the time allowed is 45 minutes. The grade between 21 and 30 is considered as

intermediate level. The reliability of the test is 0.809 as reported by Brian Winstler, SAKAI Hideki and ABE Mariko (2009).

#### *Six reading Comprehension texts*

Six reading comprehension texts –two general reading comprehension texts (GTs), two computer specific reading texts (CTs) and two engineering specific reading tests (ETs) were chosen from some original books. The length and readability of these texts were almost the same (see table 1. Below). Many factors have been established to measure the readability but in fact their aim, construction and validity are not very different (Anderson & Urquhart, 1984). One typical readability is the Fog Index whose formula is:

$$\frac{\text{No. word}}{\text{No. sentences}} + \frac{\text{no. 3syllable words}}{\text{no. words}} \times \frac{100}{1} \times 0.4$$

And the result is interpreted as 12- = easy, 13-16 = undergraduate, 16+ = postgraduate. This formula is based on the number of words in a sentence.

The subjects were asked to read and recall the texts.

*Table 1: The readability and length of the texts.*

Texts	Text length	Readability
GT 1	110 Words	11.3
GT 2	83	11.4
CT 1	71	12.4
CT 2	63	11.3
ET 1	96	11.8
ET 2	93	11.3

#### **Procedure**

In the first phase of the study, a placement test was given to about one hundred twenty ESP students who studied computer science in Islamic Azad University of Sabzevar. Before the exam, the students were provided with enough information about the test. They were informed that there were 90 questions in the test and they are supposed to finish it according to the time limit announced. Then each subject was provided with an answer sheet and a booklet of questions. The answer sheets were collected and were graded. The purpose of this exam was to decide the level of the subjects in the study. The students with the score among 21 to 30 were considered intermediate learners. 76 subjects among the total number of 120 participants were chosen for this study.

In the second phase of this study which was also held on separate days almost at the end of semester, the subjects were supplied with two general reading texts (GTs), two computer texts (CTs) and two engineering texts (ETs). Empty sheets were also given to them to write their recalls on. They were already informed of what they were supposed to do. The subjects were asked to consider the following points when writing the recalls.

- (1) The students should not read the text longer than ten minutes and they should not go back to the text while they are writing the recalls.
- (2) The subjects should write their recalls on a separate sheet.
- (3) They should write their recalls in full sentences.
- (4) They should write their recalls in Persian.
- (5) They should write whatever they remember about the text.
- (6) They have enough time to write their recalls.

The same procedure was followed for the rest of the texts. Then, all recall protocols were collected. And two separate raters corrected the papers.

As put forward by Alderson (1987), the idea unit is the unit of text analysis and widely used in reading comprehension oriented research. Thus, as a test of comprehension students can be asked to write a recall protocol of a text they have read, which in turn is scored in terms of the number of idea unit it contains. So in

order to correct the recall protocols, each text was parsed into idea units. For the ease of scoring, an effort was made to establish a unit in which there was only one bit of information expected to be significant for the analysis as recommended by Alderson (1984). It was also set that every parallel or paraphrased sentence is to be accepted. So all recall protocols were analyzed and graded based on these idea units, the length and the number of idea units for each text is shown in table 2. These idea units were verified by two independent judges.

*Table 2: The number of Idea Units in Each Text*

Texts	Length	Number of Idea Units
GT1	110	16
GT2	83	14
CT1	63	11
CT2	71	10
ET1	93	10
ET2	89	10

Examples of idea units are given as follows.

*Table 3: Examples of idea units*

Computer text (2 idea units)

The program and the number must be stored in main memory/ while the program runs./ (As illustrated above the sentence contains 2 idea units as separated off by two virgules.)

General text (1 idea unit)

/Children do not always practice good hygiene./

Based on this criterion, any sentence presented in this way but in Persian was given a point. Two scorers scored the recall protocols and using Pearson Product-Moment Correlation, the inter-rater reliability was found to be .88.

### **Data Analysis**

In order to analyze the data, the researcher made use of the SPSS. As stated already, the main aim of this study was to confirm that the background knowledge of the subjects –here their ESP knowledge about their specific course of study- has a role in their reading comprehension and recall protocols. To get the appropriate results the application of two paired t-tests was necessary. The first t-test was used to compare the means of the GTs with CTs and secondly to compare the means of CTs with ETs. The values of t-observed for the comparisons of means and that of t-critical were calculated and tested for the significance of the comparisons.

### **RESULTS AND DISCUSSION**

The data gathered were analyzed using the SPSS statistical software. At first, descriptive data for the study group on general texts, computer texts and engineering texts were computed. As stated earlier, the main aim of this study was to confirm that the background knowledge –ESP knowledge- has a role on their reading comprehension and recall protocols. In order to confirm the hypotheses the application of two paired t-tests was necessary. The first t-test was used to compare the means of GTs and CTs and the second to compare the means of CTs and ETs. The values of t-observed for the comparison of means and that of t-critical were calculated and tested for the significance of the comparisons. This section presents and describes the data collected for the study group. Means and standard deviations of the variables will be followed by the results obtained through t-tests.

*Table 4: Descriptive statistics for study group on GTs*

	Discipline	Statistic	Std. Error
General English Test	Mean	7.4331	.20033
	5% Trimmed Mean	7.5638	
	Median	7.5625	
	Variance	3.050	
	Std. Deviation	1.74639	
	Range	8.44	
	Interquartile Range	2.12	
	Skewness	-1.198	.276
	Kurtosis	1.622	.545

Figure 1: The frequency of scores on GTs

Descriptive statistics for study group in general texts is presented in table 4 and illustrated in Figure1. As it is indicated in Table 4 the mean is 7.4 and standard deviation is 1.7.

Table 5: Descriptive statistics for study group on CTs

	Discipline	Statistic	Std. Error
Computer	Mean	8.2878	.23485
	Median	8.7500	
	Variance	4.192	
	Std. Deviation	2.04736	
	Interquartile Range	2.28	
	Skewness	-1.277	.276
	Kurtosis	2.796	.545

Figure 2: The frequency of scores in CTS

Table 5 and figure 2 presents and illustrates the descriptive statistics for the study group on CTs. As it is clear in the table the mean is 8.2 and the standard deviation is 2.04.

Table 6: Descriptive statistics for study group on ETs

Discipline		Statistic	Std. Error
Engineering English Test	Mean	4.2611	.39875
	Median	2.8125	
	Variance	12.084	
	Std. Deviation	3.47624	
	Range	16.75	
	Interquartile Range	3.16	
	Skewness	1.930	.276
	Kurtosis	3.459	.545

Figure 3: The frequency of scores in ETs

The descriptive statistics for study group on ETs is presented in Table 6 and illustrated in Figure 3. The mean is 4.2 and the standard deviation is 3.4.

Table 7: T-test result for GTs and CTs, CTs and ETs

			Paired Differences				T	df	Sig. (2-tailed)	
			Mean	Std. Deviation	Std. Error Mean	95% Confidence Interval of the Difference				
						Lower				Upper
Pair 1	GT1T2T CT3T4T	-	-.85477	2.05005	.23516	-1.32323	-.38631	-3.635	.001	
Pair 2	CT3T4T ET3T4T	-	4.02673	4.13657	.47450	3.08148	4.97197	8.486	.000	

To investigate the probable effects of background knowledge –ESP knowledge- on reading comprehension of Iranian ESP students in computer science, six texts –two (GTs), two (CTs), and two (EGs) texts- were assigned to students. Their comprehension was assessed through recall protocols. The first hypothesis says computer science students comprehend and remember computer texts better than general texts. As it is seen in table 7 the observed –t for GTs and CTs is -.38631 with degree of freedom of 75 which is significant at .001. This finding is in line with what has been previously stated regarding the role of background knowledge in enabling the readers to make predictions for successful interaction and interpretations of written texts since successful interpretation heavily relies on shared schemata.

The second hypothesis states that computer science students comprehend and remember computer texts better than engineering texts. As it is indicated in table the observed-t for CTs and ETs is 8.486 with degree of freedom of 75 at 0.000 level. So, computer science students did comprehend and remember CTs better than ETs. In other words, the background knowledge of the content area of the text that A READER brings to a text (Carrell & Eisterhold 1983) such as knowledge about people, the world, culture, and the universe helps better comprehension of the texts.

Overall, as it is stated by Lorenzo Fiorilo (2005), students' abilities in their subject-matter fields improve their ability to acquire English. Their knowledge about the content area gives them the context they need for understanding

English. It seems that the students in this study did make use of their knowledge of subject matter to understand the texts since they understood and remembered CTs better than both GTs and EGs.

## CONCLUSIONS

Due to the importance of reading in EFL, a lot of studies have been carried out to find out what variables may influence this skill. The studies have generally shown that a host of factors ranging from linguistic knowledge to and extra-linguistic knowledge can crucially affect the rate and amount of reading (Grabe, 1991; Perffetti, 1985; Smith, 1978). Of all the factors, the role of background knowledge in reading comprehension has been the focus of attention for many researchers (Bransford & Johnson, 1972, 1973; Kintsch & Van Dijk, 1975; Rumelhart, 1977; Kintsch, 1977; Thorndyke, 1917; Mandler & Johnson, 1977; Carrell, 1983). Most of these studies have shown that background knowledge plays a significant role in the ease of comprehension.

One research method which is frequently employed in this regard is recall protocols. Bernhardt (1991) and Swaffaret *al.* (1991) suggest the use of recall protocols as a measure of holistic or overall reading comprehension. The technique of summarizing a text is widely used as a research measure as well as for assessing reading comprehension in both first and second language acquisition.

In line with foregoing studies, in this study recall protocols were used. About seventy six students attended the experiment. A placement test was assigned to 120 students and based on this test seventy six students at intermediate level were chosen for this study. To gain this aim, six texts –two GTs, two CTs and ETs- were given to the subjects in both groups to be read and recalled. The purpose was to see if the ESP knowledge had any effect on the subjects' recall.

Table 4, 5 and 6 shows the descriptive statistics for the recall of the GTs, CTs and ETs. The mean differences are 7.4, 8.2 and 4.2 respectively. The small difference of means in GTs and CTs shows that there is not a big difference in performance of this group in these two texts but as you see the mean of ETs is 4.2 which show a great difference in the performance of subjects in these texts in comparison with GTs and CTs.

Turning back to the two hypotheses of this study it can be seen that the first hypothesis concerns the effect of background knowledge on computer science students reading comprehension and their recall. As indicated in Table 7, the observed *t* which is -3.6 with the d.f. of 75 is significant at 0.001 level; therefore, this hypothesis is confirmed. The computer students comprehended and recalled computer texts better than general texts.

The second hypothesis is related to the effect of background knowledge on computer learners' reading comprehension and their recalls. Again as can be seen in Table 7, the observed *t* (8.4) with the d.f. of 75 is significant at 0.000 level. So, the second hypothesis is confirmed too. In other words, computer students also comprehended and recalled computer texts better than the engineering ones. These findings are in line with the previous findings regarding the role of background knowledge in reading comprehension and their recall of the texts. Previous research has shown that the better a reader is to access background knowledge about either the content area of text (Bransford & Johnson, 1972, 1973) or the rhetorical formal structure of a text (Kintsch & Van Dijk, 1975; Kintsch, 1977; Rumelhardt, 1977; Thordike, 1917; Mandler & Johnson, 1977), the better he or she will be able to comprehend the text, to store it in long term memory, and to recall it.

## LIMITATIONS OF STUDY

This study is only a scratch on the surface of the role of background knowledge in comprehension and student's recall. Of course further studies can be done related to the present hypothesis. Here are some suggestions.

In this study we examined how much information was remembered. We must also examine how much of what kind of information is remembered, and what kind of information is further created from the repeated reading. In the present study, students were above eighteen years old and of different ages. Other studies can be done regarding the age of the students to see whether the factor of age has any roles in recall protocols of students.

In this study, the students' field of study was computer. The same study can be carried out with students from other fields of ESP. Still, we do not know if the results would be different with other ESP fields.

In the present study, the readability and content familiarity were considered; still we do not know if formal schemata have had any effects on recalls. Further research can be carried out regarding the role of formal schemata in reading comprehension and recall protocols.

To make sure of the findings of this research, it is advisable to replicate this study implementing another scoring procedure known as tree diagram construction (Mousavi, 1999) for recall protocols analysis. Furthermore, one can work on the analysis of recall protocols in terms of the kind of information retrieved and the number of correct and incorrect recalls.

**ABSTRACT**

This paper identifies the Nominal Ellipsis obtainable in the narratives: novel. Some reasons to select this genre: (1) novel is a routine and creative language always read by people not limited amongst the ages; (2) novel has certain features in social location, social function, and schematic features; and (3) novel offers a wide range of opportunities to analyze different types of Ellipsis; it offers a plentiful spoken and written textual data. The Ellipsis analysis involves: (1) Deictics; (2) Numeratives; and (3) Ephitets. In the three chapters-92.082 words of the novel, there are 41 Nominal Ellipsis. The results reveal that the Deictics occupy the first rank. It is dominated by the Specific deictic; The second rank is Ephitets. It is dominated by the Adjectives; and the last one is the Numeratives. It is dominated by the Cardinal. The study adopts the grand theory of cohesive relationship as provided by Halliday and Hassan (1989). It explains the Ellipsis relationship within the novel. The theory has classified the data visible so that different types of the Ellipsis can be understood in their use. It is certainly beneficial for researchers for further analysis.

**KEYWORDS:** Cohesion, Nominal Ellipsis, Narrative Text: Novel

**INTRODUCTION**

Novel is one type of the narratives. Ann (2001:21) explains that the narratives can be classified based on: (1) *social location*; (2) *social purpose*; and (3) *schematic feature*. The *social location* of the the narratives is found across all aspects of culture life in **novels**, short stories movies, sitcoms, and radio dramas; the *social function* is to entertain and instruct via reflection on experience. It deals with problematics events which individuals have to resolve for better or worse; and the *schematic feature* is Orientation, Complication, Evaluation and Resolution.

The paper presents analysis of Ellipsis in the novel because: (1) Novel offers a wider range of opportunities analysis. The novel provides linguistic phenomena with their authentic co-texts and contexts; (2) Grammatically the concept of tie within sentences in ellipsis is linguistic features which are required for the production of a text. Halliday (1989:4) states that the concept of a tie makes it possible to analyze a text in terms of its cohesive properties, and give a systematic account of its patterns of texture. Halliday and Hassan (1989) and van Dijk (1992) are concerned with the principles of connectivity which bind a text together and force co-interpretation. Thus, it can be identified that features of the texts can be presupposed and interpreted as a coherent and cohesive unit; (3) Ellipsis in the novels is a unique thing. Here the Ellipsis can be identified, such as: types of Ellipsis; the occurrences of Ellipsis presupposing and presupposed to the antecedent. Burton (1997) says that when a sentence is actually used by a speaker (i.e. when a speaker actually utters it), almost anything can be omitted, provides that the omitted elements can be understood from text in which it is used. Based on this, the omission from sentences of required elements capable of being understood in the context of their use is called Ellipsis. Here are some examples:

*Kim's car had broken down and mine had too.* (Gunther, 2013)

The word *mine* is a possessive form. The elliptical element is a countable noun. It functions as a Head substituting *my car* in the antecedent. It refers anaphorically to the word *car*.

*'I didn't know you'd written a novel. I hope you'll write another [novel]?' (Thompson, 2004)*

The word *another* is categorized as a post-deictic. The elliptical element is in a countable noun - a *novel*. It refers anaphorically to the previous sentence. Through modification, *another* acts as a Head substituting *another novel*. Based on the reasons above, the researcher conducted a research for the novel entitled: Ellipsis in The Novel *The Lord of The Rings: The Hobbit* by J.R.R. Tolkien. This research focuses on analyzing Ellipsis. There are three formulations of the research which deal with, which are as follows:

1. What types of Ellipsis are used in the novel?
2. What elements does the Ellipsis presuppose in the novel?
3. What is the Nominal Ellipsis frequently used in the Novel?

## NOMINAL ELLIPSIS

*Nominal Ellipsis* means ellipsis within the nominal group. When the *Nominal Ellipsis* occurs, it is possibly referred to the antecedent nominal group. There are multivariate structures of the nominal group. On the logical dimension the structure of the nominal group is that of a Head or Thing with optional modifying elements. Here in the nominal group, the modifying elements can precede the Head and follow it, and these are referred to as Premodifier and Postmodifier. Halliday and Hasan (1989) give an example: *those two fast electric trains with pantographs*. The elements are arranged in structures as follows:

<i>those</i>	<i>two</i>	<i>fast</i>	<i>electric</i>	<i>trains</i>	<i>with</i>	<i>pantographs</i>
Deictic	Numerative	Epithet	Classifier	Thing	Qualifier	
					Process	'Range'
						Thing
Premodifier				Head		Postmodifier

The Head is *trains*, the Premodifier is *those two fast electric* and the Postmodifier is *with pantographs*. The modifiers consist of: *Those* (Deictic), *two* (Numerative), *fast* (Epithet), *electric* (Classifier), and *with pantographs* (Qualifier).

Halliday (1985) describes that nominal group involves a measure of something. 'Measure' nominals include collectives, e.g. *a pack of cards*; partitives, e.g. *a slice of bread*; and quantitatives, e.g. *a yard of cloth*. Here is an example in structures:

<i>a</i>	<i>pack</i>	<i>of</i>	<i>cards</i>
Numerative			Thing
Modifier	Head		Postmodifier

The measure word *pack* is a Head with the *of* phrase as Postmodifier. However, the Thing is not the measure word but the thing being measured: the *cards*.

In similar way to the measure type are nominal groups expressing a facet, of a thing: e.g. *the back of the house*, *my side of the bed*, *the north face of the Eiger*. The facet word (*back*, *side*, *face*) is the Head; it would be possible to interpret these also as Thing (i.e. Head = Thing), but they could be considered as embedded Deictics, with the faceted noun (*house*, *bed*, *Eiger*) as Thing. Here is an example in structures:

<i>The</i>	<i>front</i>	<i>of</i>	<i>the</i>	<i>house</i>
Premodifier	Head	Postmodifier		
Pre-Deictic			Deictic	Thing
Deictic	Thing (Facet)			

In the experiential structure, Numerative is made a Head of the logical structure, as in

	<i>three</i>		<i>of</i>	<i>those</i>	<i>enormous</i>	<i>spiders</i>
--	--------------	--	-----------	--------------	-----------------	----------------

<i>Another</i>	<i>two</i>	<i>cups</i>	<i>of</i>	<i>that</i>	<i>Good strong</i>	<i>tea</i>
<i>Pre-Numerative</i>				<i>Deictic</i>	<i>Epithet</i>	<i>Thing</i>
<i>Deictic</i>	<i>Numerative</i>	<i>Measure (Thing)</i>				

Here the Numerative is embedded; and since it is embedded, it comes to the front and may be followed by a fully structured nominal even beginning with a Deictic. Based on these, the Deictic is normally a determiner, the Numerative is a numeral or other quantifier, the Epithet is adjectives and the Classifier is a noun, and the Qualifier is normally a relative clause or prepositional phrase. (Halliday & Hasan, 1989). The explanation above is the same as what Gerot and Wignell (1995) state “A nominal group is a group of words which has a noun as its Head word and includes all additional information related to that noun”, and Bloor and Bloor (2004:31) say “A nominal group with a noun (or pronoun) as its Head and that noun may be modified”. The noun in the nominal group has function referred to as the ‘Thing or Head, and it is normally served by the *Common noun*, *Proper noun* or *Personal pronoun*. *Personal pronoun* is a reference item; *Proper nouns* designate individuals. Bloor and Bloor (2004) traditionally describe they are as individual names of persons (e.g. *Picasso*, *Shakespeare*, etc), and they may sometimes be accompanied by descriptive modifiers; *Common noun* usually refers to a class of entities (e.g. *cities*, *planets*, *persons*, *corporations*), or non-unique instances of a certain class (e.g. *a city*, *another planet*, *these persons*, *our corporation*). Bloor and Bloor (2004:20) defines that a *Common noun* might be described as an item that may be preceded by *the*. And Halliday and Hasan (1989) say that *Common nouns* designate classes; they are often further specified, and this is the function of the elements: Deictic, Numerative, Epithet and Classifier.

*Common Noun* may be omitted and the function of Head is taken on by one of these other elements. Bloor and Bloor (2004:97) state that the grammar of Nominal Ellipsis permits the omission of Head nouns in a nominal group, and Lobeck (1987a) defines that ...restrictive modifiers in Noun Phrase can be optionally included in the ellipted constituent. Based on this, *Nominal ellipsis* involves the upgrading of a word functioning as Deictic, Numerative, Epithet or Classifier from the status of Modifier to the status of Head. Halliday and Hasan (1989) give an example, as follows:

[1] *Four other Oysters followed them, and yet another four.*

Here the word *four*, which is a Numerative acts as Modifier, is upgraded to function as Head. Similarly in

[2] *Which last longer, the curved rods or the straight rods? - The straight are less likely to break.*

The word *straight* is an Epithet, functioning as Modifier in the question but as Head in the response. Both *another four* and *the straight* are elliptical nominal groups. If we want to fill out an elliptical nominal group, there are two ways of doing so. One way is to ‘push down’ the element functioning as Head in Modifier, and add the ‘missing’ Head in its place. So this process *another four* in the sentence above would become *another four oysters*. The other way of doing it is to keep the elliptical group as it is and add a partitive Qualifier; this would give *another four of the oysters*. This is called *Partitivity*.

### THE NOTION OF PARTITIVITY

There are several definitions to be found within each of the approaches that resort to the partitive notion. Lobeck (2005) states that *Partitivity* is combinable with a partitivity Prepositional Phrase (PP). Jackendoff (1977:110ff) says that the partitive construction contains a silent nominal element (see also Olsen 1987; Sauerland & Yatsushiro 2004; Fitzpatrick 2006). Jackendoff (1977) assumes a structure such as the following for partitivity constructions: *ART/Q PRO of NP* as in *Those / few PRO of the men*. Halliday and Hasan (1989) say that the partitive is possible only under certain conditions: generally, when the elliptical group designates some aggregate - *a subset, fraction, quantity or collective* - that is different from that designated by the presupposed group, such as: *one of the three*, *any of Fred's*.

A different view, Sleman (1996:34) states that Partitive does not necessarily have to mean combinationable with a partitive Prepositional Phrase (PP). She makes reference to specificity by pointing out a link between a set and contextually active superset is established. For example:

[3] *Have you read all his books? No, I have only read the third.*

In this example, the elliptical noun phrase (or rather its referent) is a subset of a previously evoked set, that is, the *books*.

### PRESUPPOSITION

Presupposition is treated as a relationship between two propositions, (Yule, 1998:26) as in *Mary's dog is cute*. It presupposes *Mary has a dog*. The identity of a presuming reference item (presupposition) may be retrievable from a number of different contexts. (Egins, 2004:34). For example, *She did not hear the story as many women have heard*

*the same*. Here we presuppose the referent *the same* refer back to *the story*. It refers back to the whole of the preceding paragraph. Besides that, the presupposition may be cataphoric as in *Because Alice won't; Mary has to dust the furniture*. Here the elided elements in an antecedent refer cataphorically to the presupposed words *dust the furniture*. Occasionally, the presupposition may be exophoric as in *if a housewife on seeing the milkman approach calls out: Two please !* She is using exophoric ellipsis. Halliday and Hasan (1989:144) state that it is the context of situation that provides the information to interpret this. An elliptical nominal group is cohesive. It points phorically to another nominal group which is presupposed by it. There may be other elements in the presupposed group which likewise do not occur in the *elliptical one*; Halliday and Hasan (1989) give example, as follows:

[4] *Here are my two white silk scarves. I can lend you one if you like.*

Here *one* presumably presupposes not only *scarves* but also the garnishings *white* and *silk*; it could be filled out as *one white silk scarf*, or *one of my white silk scarves*. The word *scarves* is the thing. In ellipsis, the Thing is always presupposed. See another example:

[5]

*Here are my two white silk scarves* }  
 a. *Where are yours?*  
 b. *I used to have three.*  
 c. *Can you see any black?*  
 d. *Or would you prefer the cotton?*

In [5a] *yours* (Deictic) is Head, an s (Thing) but also *silk* (Classifier), *white* (Epithet) and possibly *two* (Numerative): The word *three* in [5b] presupposes *scarf*, *silk* and *white*. In [5c] the elliptical group is *any black*; this presupposes *scarf* and *silk*. Finally, in [5d] only *scarf* is presupposed. Based on this, the range of possible presuppositions is dependent on the structure of the nominal group. It extends over that part of the presupposed group which could follow the element acting as Head in the elliptical group.

## TYPES OF NOMINAL ELLIPSIS

Halliday and Hasan (1989) classify types of Nominal Ellipsis in the words or words classes that function as Head in the elliptical group. Those are (1) Deictics; (2) Numeratives; and (3) Epithets.

### DEICTICS

The deictic element indicates whether or not, some specific subset of the Thing is intended; and if so, it is either (1) Specific; (2) Non-specific; or (3) Post-deictic.

**(1) Specific deictic.** Specific deictic indicates some specific subset of the thing. Gerot and Wignell (1995) say that it has the function of stating 'which thing'. It specifies how the thing in question can be identified in relation to the context. For example, if someone says '*the snake*', he or she can be referring either to a particular snake which is in the near context or to all snakes in the generic sense (*the snake is a reptile*). The deictic occurs first in the nominal group. Halliday and Hasan (1989) state that the words functioning as specific deictic are mostly of the class of determiner; with the demonstrative, possessive and indefinite determiners forming a network of systemically related categories ... to be part of a wider system, and those functioning as Post-deictic are adjectives. Payne and Huddleston (2012:412) point out that most determiners can occur in elliptical noun phrase. According to Lobeck (1995), Sleeman (2003), and Lombart Huesca (2002), the singular demonstrative cannot license noun ellipsis. Based on this, in the class of the determiner in the nominal group, the Specific deictics consists of (i) *demonstratives* and *the*, and (ii) *possessives*. The demonstratives include *this*, *that*, *these*, *those*, and *which*, and the possessives functioning as pronominals include *my*, *your*, *etc.*, as Head includes *mine*, *yours*, *ors*, *his*, *hers*, *[its]*, *theirs*, and as nominals includes *smith's*, *my father's*, *etc.* Then, most determiners can occur in elliptical noun phrase, except the singular demonstrative, such as *this* and *that* can not license noun phrase. Payne and Huddleston (2012:412) give an example:

[6] *Those cards are Kim's; these are yours.*

The word *these* is a demonstrative element licensing noun ellipsis. It refers anaphorically to *Those cards*.

Halliday and Hasan (1989) explain that the demonstratives all occur elliptically, with very great frequency. Since they are themselves reference items, they are often anaphoric; but wherever the nominal group could be ‘filled out’ with a noun Head, or by the substitute one(s), a demonstrative functioning as Head is ellipsis. Look at another example by Halliday and Hasan (1989) as in

[7] Just ask **Janet** how to polish **the brassware**. **Hers** sparkles.

The word *hers* is a possessive pronoun as Head referring anaphorically to Janet and the *brassware*. Here there is a double cohesive tie. the word *hers* presupposes both a person *Janet* as possessor, and a thing possessed *the brassware*.

**(2) Non-specific deictics.** Non-specific deictic is unspecified sub-set of the thing is being identified. (Gerot and Wignel:1995). Non-specific deictic conveys the sense of all, or none, or some unspecified subset. (Halliday, 1985). The Non-specific deictics are *each, every, any, either, no, neither, a, and some*, as well as *all* and *both*. (Gerot and Wignel, 1995; Halliday and Hasan, 1989; Gunther, 2013). These deictics occur as Head of an elliptical nominal. Jackendoff (1971) defines with a different term, ellipsis in noun phrase (nominal group) must include the projection immediately dominating noun and its complements, such as *The students attended the play but [some/all/each/etc[e]] went home disappointed*; However, the ellipted complement is not allowed here, such as *Few students of foreign languages attended the play but [all [e] of chemistry] showed up*. This is an ungrammatical feature, the ellipsis in noun phrase doesn't immediately dominate Noun and its complements. Halliday and Hasan (1989) give some examples:

[8]

a. **His sons** went into business. **Neither** succeeded.

b. The flat has **a sitting-room, a dining-room and one bedroom**. **Each** has a window overlooking the park.

The words *neither* is presupposing the antecedent *his sons*, and *each* is presupposing two or more sets expressed through a coordination.

**(3) Post-deictics.** The words functioning as Post-deictic element in the nominal group are not determiners but adjectives. Halliday and Hasan (1989) state that the Post-deictic identifies a subset of the class of thing by referring to its fame or familiarity, its status in the text, or its similarity or dissimilarity to some other designated subset. (Gerot & Wignel, 1995; Halliday, 1985). For example: *Those are the identical two boys*. The word *identical* is as post-deictic. It means the same boy as before. Here the Post-deictic may be followed by a numerative, unlike adjectives in their normal function as Epithet which must follow any numerative elements. Halliday (2004) states among the words most frequently occurring as Post-deictic are: *other, same, different, identical, complete, entire, whole, above, aforementioned; certain, famous, habitual, necessary, normal, etc.*

The adjectives used regularly and elliptically in deictic are *same* and *other* as in *I'll do the same*. Here *the same* is an elliptical nominal group as a Head. Besides that, the Post-deictic *other* combines either with Specific deictic (e.g. *the other, that other, etc*) or with Non-specific (e.g. *any other, another, etc*), and in plural form (e.g. *others*). Halliday and Hasan (1989) give examples:

[9] I've used up these **three yellow folders** you gave me. Can I use **the other**?

The phrase above does not mean ‘*the other three*’. With a Specific deictic, *other (s)* refers to the last remaining member(s) of a set, and therefore it presupposes that all others must have been specified.

[10] **A group of well-dressed young men** suddenly appeared on the stage. **One of them** bowed to the audience; **the others** stood motionless.

The item above is semantically plural. It must refer to more than one set. Here *one of them* and *the others* both presuppose *well-dressed young men*.

The elliptical use of *other* illustrates very well the indeterminacy which may arise in the extent of presupposition. For example:

[11] I see you've sold **those two large red china dogs**. Have you **any others** ?

The absence of further evidence we could not tell whether to presuppose as *china dogs, red china dogs or large red china dogs*.

Finally we may note that elliptical nominal groups with Deictic as Head may also be exophoric, either in the generalized sense or specifically to the context of situation. For examples:

- [12] a. *Some say one thing, others say **another**.*  
 b. *I'll have **the usual**, please.*

## NUMERATIVES

The elliptical Head noun is permitted in English when the Head noun follows certain closed-class items, like numbers, quantifiers, and my own. (McShane, 2005:8). The Numerative indicates some numeral feature of the subset: either quantity or order, either exact or inexact. The Numerative tells us 'how many'. For example: Quantity: *the two snakes, lots of snakes*; Order: *the second snake, a subsequent snake*. (Gerot & Wignell, 1995). Numeratives can be realized by numerals such as *two or second*, or by such expressions as *many, several, few, and lots of*. (Bloor & Bloor, 1995). Numerative element functions regularly as the Head in ellipsis. The Numerative element in the nominal group is expressed by numerals or other quantifying words, which form three subcategories: *Ordinals*, *Cardinals*, and *Quantifiers*. The *Cardinals* are such as: *one, two, etc.*, and the *Ordinals* are such as *first, next, last, second, etc.* They are often used elliptically, generally with *the* or *a possessive* as deictic. The *Quantifiers* are such as *all, many, some, most of, a lot of, etc.* (Halliday & Hasan, 1989; Wiese, 2004). Halliday and Hasan (1989) describe Numerative' function in elliptical forms, as follows:

The Ordinals are often ellipsed, generally with *the* or *a possessive* as deictics, as in

- [13] *Have another chocolate. - No thanks; that was **my third**.*

The Ordinals are often cataphoric to a Qualifier which indicates the domain of the ordering, for example, to *leave* in

- [14] *Smith was the first person **to leave**. I was **the second**.*

The Numerative like Deictics in elliptical use may be exophoric, for example: *Smith was the first **to leave***. Here a person understood. The presupposed item will be assumed to be a general category of which the item referred to, here *Smith*.

Cardinal numerals are also frequent in ellipsis, and may be preceded by any Deictic that is appropriate in number, eg: *the three, these three, any three, all three*, and also by Post-Deictic adjectives as in *the usual three, the same three*. Here are in sentences:

- [15] *Have **another chocolate**. — No thanks; I've had **my three**.*

The indefinite Quantifiers are items such as *much, many, more, most, few, several, a little, lots, a bit, hundreds, etc.* Like other items with a numerative function, they are very frequently used in ellipsis; being indefinite, they are usually not accompanied by a deictic. For example:

- [16] *Can all cats climb trees? - They all can; and **most** do.*

## EPITHETS

Epithet indicates some quality of the Head, e.g. *old, long, blue, fast* (Arnold 1985:163). It can answer two main questions: "What do you think of the head?" and "What is the head like?" (Thompson 2000:183). The Epithet can be in *attitudinal Epithet (subjective ones)* and *experiential Epithets (objective one)*. (Gerot and Wignell, 1995). The *attitudinal Epithet* is an expression of the speaker's subjective attitude towards the Head, e.g. *splendid, silly, fantastic, etc.*, and the *experiential Epithets* has interpersonal dimension, or the speaker's objective attitude towards the Head, e.g. *old, big, small, etc.* Halliday (1995) explains that the principal difference between the two is that *experiential Epithets* are potentially defining, whereas *attitudinal ones* are not. Take the example of *long* in *long train*. If I say *a long train*, you cannot tell which particular train I am talking about, because the deictic *a* is not-

specific; but if I say *the long train*, the Specific deictic - *the* indicates that you can tell, and that the necessary information is contained in *the experiential Epithet* - *long*. Besides that, it tends to find that *the attitudinal one* comes first before *the experiential*; however, this is a tendency not a rule. Here is an example of Epithet: *those two loathsome, big snake*. The adjective - *loathsome and big* are Epithet.

The function of Epithet is typically fulfilled by an adjective, The most usual adjectives found in ellipsis are in comparative and superlative forms. (Halliday and Hasan, 1989). They describe Epithets' function in elliptical forms, as follows:

The superlative adjective precedes other epithets and, like ordinal numerals, it is usually accompanied by *the* or *a possessive deictic* as in

[17] Apples are **the cheapest** in autumn.

Here *the cheapest* is an elliptical group presupposing some item such as fruit.

The superlative is elliptical, the presupposed group may still be within the clause. This only happens in equative clauses of the identifying type, which are probably the most frequent environment for elliptical superlatives as in

[18] a. **That clown is the finest** I've ever seen.

b. They are **fine actors. That clown is the finest** I've ever seen.

In [18a] we assume that the presupposed item is *clown*, so although *the finest* is elliptical the presupposition is within the clause, but in [18b] *the finest* is ambiguous; it may mean '*the finest actor*' or '*the finest clown*'. The superlative may also take the form of a *mass noun*, with the interpretation *the ...-est kind of*, as in

[19] 'I told you **butter** wouldn't suit the works.' 'It was **the best** (butter).'

A superlative repudiates all numeratives, including cardinal, in the presupposed group. It may itself be singular or plural, and if plural may be preceded by its own cardinal as in *the three youngest*.

Comparative adjective doesn't take *the*. It is not identifying but attributive, as in

[20] a. Mary is **the cleverer**.

b. Mary is **cleverer**.

The word *the cleverer* in [20a] is not common and the word *cleverer* in [20b] is not an elliptical clause. It presupposes by reference, but not by ellipsis; it cannot be 'filled out' by a noun Head or a noun substitution. look at the three clauses here. *apples are cheap*, *apple are cheaper* ('*than pears*') and *apples are cheapest* ('*in autumn*'). Those are all attributive clauses. Here those consisting of adjectives (*cheap*, *cheaper*, and *cheapest*) are not elliptical forms. A nominal group with a true comparative as Head is elliptical under conditions; these are less common than elliptical superlatives, The presupposed nominal group may be count singular, count plural or mass as in

[21] I'll buy you some **prettier**.

Superlative and, less often, comparatives may presuppose exophorically, as in *you take the biggest* ('*of the things in front of you*').

Finally, other items functioning as Epithets are adjectives that are neither superlative nor comparative. These items do not very often occur as Head in ellipsis, as follows:

[22] a. **The green** suits you very well

b. **Green** suits you very well.

In [22a] *the green* is elliptical. Here we could have *the green one*, with substitution instead of ellipsis, and in [22b] *Green* is noun.

## METHODOLOGY

The research is using a qualitative-quantitative descriptive method. Good (1963) states that descriptive studies may include

present facts or current conditions concerning the nature of a group of persons, a number of objects, or a class of events, and it may involve the procedures of induction, analysis, classification, enumeration, or measurement. The data taken from the novel *The Lord of The Rings: The Hobbit* by J.R.R. Tolkien. It is published by Houghton Mifflin company, USA in 1982. It is selected because the novel gives a plentiful spoken and written data for Ellipsis analysis; it covers a wide range of different types from informal to formal conversations. The researcher analyzed three chapters in the novel. The first chapter is **An Unexpected Party** 8.636 words, the second chapter is **Roast Mutton** 5.254 words, and the third chapter is **A Short Rest** 2.876 words. Thus, the whole data analyzed was 92.082 words. Then the data of the Nominal Ellipsis were sorted in: (1) Deictics (Specific, Non-specific and Post-deictic), (2) Numerative (Cardinal, Ordinal and Quantifier) and (3) Epithet (Comparative, Superlative and Adjective). These are coded as the tabel 1.

*Tabel 1: Types of Nominal Ellipsis*

Type of Ellipsis Analysis	Coding
Nominal Ellipsis	E
(1) Deictic as Head	1
i. specific deictic	11
ii. non-specific deictic	12
iii. post-deictic	13
(2) Numerative as Head	2
i. ordinal	21
ii. cardinal	22
iii. quantifier	23
(3) Epithet as Head	3
i. superlative	31
ii. comparative	32
iii. adjective	33

The data is also classified in the Distance in sentences cataphorically or anaphorically. These are cohesive items intervened or not intervened by other sentences or phrases. These can be classified: (1) 'Immediate' (Presupposing an item in a contiguous sentence); and (2) 'Not immediate'. The Not immediate consists of: (1) 'Mediated' (having one or more intervening sentences that enter into a chain of presupposition); and (2) 'Remote' (having one or more intervening sentences nor involved in the presupposition), or both. These are Coded: Immediate (o), Mediated (M), Remote Non-Mediated (N), Cataphoric (K), Anaphoric (A). Most of the data are anaphora (A), so the researcher writes only cataphora (K) put in Type column in Table 2.

## RESULTS AND DISCUSSIONS

The three chapters of the novel-92.082 words were sorted and classified in the Nominal Ellipsis functions: (1) Deictics, (2) Numeratives, and (3) Epithets. It resulted in the tabel 2 below.

*Tabel 2: The Nominal Ellipsis Data*

Sentence	Cohesive	Type	Distance	Presupposed
Number	Item			item
<b>Deictics</b>				
1	these	E.11	o	The best rooms
2	those	E.11	o	such particularly excellent fireworks
3	yours	E.11	o	your service
4	At yours and your family's	E.11	o	your service
5	my father's	E.11/K	o	my grandfather's escape
6	those	E.11	o	trolls
7	William's	E.11	o	a voice
8	These	E.11	M2	Moon-letters are rune-letters
9	William's	E.11	o	a voice
10	Tom's	E.11	o	a voice

11	William's	E.11	o	a voice
12	William's	E.11	o	a voice / 18
13	Any	E.12	o	some cake-seed cake
14	Some four	E.12	N1	the four dwarves
15	each	E.12	o	the twelve dwarves
16	None	E.12	o	The dwarves
17	most of all	E.12	o	some elves
18	each	E.12	M2+N1	The dwarves
19	None	E.12	o	any more writing
20	none	E.12	N2	the very sight of dwarves
21	another	E.13	o	an uninvited dwarf
24	another	E.13	o	one side
23	others	E.13	o	white stones
24	another	E.13	N5	a beautiful grey ring of smoke
25	all the same	E.13	o	Expert Treasure-hunter instead of Burglar
26	the like	E.13	o	the most marvellous and magical toys
<b>Numeratives</b>				
27	Two	E.22	o	three angry trolls
28	One	E.22/K	o	two of the songs
29	Two	E.22	o	an inn
30	FIVE	E.22/K	o	another dwarf
31	four more	E.22	o	more dwarves
32	Lots	E.23/K	o	Lots of dwarves
33	the last green	E.21	o	the trees
<b>Ephitets</b>				
34	more	E.32	o	the very sight of dwarves
35	one of the best	E.31	o	funny queer fits
36	the feet of the nearest	E.31	o	the great mountains
37	a nasty, dirty	E.33/K	o	wet hole
38	his solid	E.33/K	o	comfortable father
39	secret once	E.33	N2	the secret entrance.
40	a small	E.33/K	o	curious key
41	Yellow	E.33	N2	The one with the yellow stockings

Then, the data are classified in the (1) Types of Nominal Ellipsis used; (2) Elements of the Ellipsis presupposed the antecedent; and (3) What Nominal Ellipsis frequently used in the Novel, the results are indicated and discussed in the Table 3 below.

*Tabel 3: Data Analysis of the Nominal Group*

Deitics			Total	Numeratives			Total	Ephitets			Total
specific deitics	Non-specific deitics	Post-deitics		Ordinals	Cardinals	Quantifiers		Superlatives	Comparatives	Adjectives	
12	8	6	26	1	5	1	7	2	1	5	8
46,2%	30,7%	23%	63,4%	14,3%	71,4%	14,3%	17%	25%	12,5%	62,5%	19,5%

**DEICTICS.** The data indicates that the novel involves three sub-sets of the Deictics: (1) *Specific deictic*, (2) *Non-specific deictic*, and (3) *Post-deictic*. The *Specific deictic* dominates in the novel. There are 46,2% data indicating *Specific deictics*. This is followed by 30 % *Non-specifics* and 23 % *Post-deictics*. The *Specific deictics* occupy the highest rank. Those are dominated by possessive pronouns and demonstrative forms, such as: *these, those, yours, my father's, william's, etc.*, and other sub-sets: *Non-specific deictics* spread as in: *any, some four, each, and none*, and *Post-deictics* are dominated by *another/others*. Besides that, the *Anaphoric* forms are more dominant than the *Cataphoric* ones (The data are showed in the Table 2). There are only one data showing the Cataphora (K). This becomes the deictics' elliptical features. Here are some examples:

[23]

- *The best rooms* were all on the left-hand side (going in), for *these* were the only ones to have windows, deep-set round windows looking over his garden and meadows beyond, sloping down to the river. (HBT.1)
- He hung his hooded cloak on the nearest peg, and "Dwalin at *your service!*" he said with a low bow. "Bilbo Baggins at *yours!*" (HBT.3)

(The words *these* and *yours* refer anaphorically to the elements in the group *the best rooms* and *your service*).

The cohesive items based on the Distance are most frequently used in *Immediate* and some are found in *Mediated* and *Remote-non mediated* forms as in

#### Immediate

[24]

*"Kili at your service!" said the one. "And Fili!" added the other; and they both swept off their blue hoods and bowed. "At yours and your family's!" replied Bilbo, remembering his manners this time. (HBT.4)*

The words *"At yours and your family's!"* are Deictics. Those refer anaphorically to the elements *your service*. The cohesive elements are not being intervened by other sentences (*Immediate*); The complete elements are *At your [service]* and *your family's [service]*.

#### Mediated

[25]

*"Moon-letters are rune-letters, but you cannot see them," said Elrond, "not when you look straight at them. They can only be seen when the moon shines behind them, and what is more, with the more cunning sort it must be a moon of the same shape and season as the day when they were written. The dwarves invented them and wrote them with silver pens, as your friends could tell you. These must have been written on a midsummer's eve in a crescent moon, a long while ago." (HBT.8)*

The word *these* refers to the elements *Moon-letters*. There are two intervening sentences that enter into a chain of presupposition (*Mediated*); The complete elements are *these [moon-letters]*. The element *moon-letters* is ellipsed as it has already been recovered at the antecedent.

#### Remote-Non-Mediated

[26]

*Trolls simply detest the very sight of dwarves (uncooked). Bert and Bill stopped fighting immediately, and "a sack, Tom, quick!" they said, before Balin, who was wondering where in all this commotion Bilbo was, knew what was happening, a sack was over his head, and he was down. "There's more to come yet," said Tom, "or I'm mighty mistook. Lots and none at all, it is," said he. (HBT.20)*

There are two intervening sentences not involved in the presupposition (*Remote*). The *none* refers anaphorically to the elements *the very sight of dwarves*. Although the elements *of the dwarves* are ellipsed, it can be understood because the word *none* refers to the *dwarves*. Thus, The complete elements are *none [of the dwarves]*.

**NUMERATIVES.** The data indicates that Numeratives involves three sub-sets: (1) *Ordinals*, (2) *Cardinals* and (3) *Quantifiers*. The *Cardinals* occupy the first rank amongst the other sub-sets. It has 71,4% and both the *Ordinals* and *Quantifiers* have the same percentages 14,3%. The *Cardinals* are rather contrastive than the other sub-sets. Here are examples: *three angry trolls – two (HBT.27)*, *two of the songs – one (HBT.28)*, *an in – two (HBT.29)*, *another dwarf – five (HBT.30)*, and *more dwarves – four more (HBT.31)*, and the *Ordinals* and *Quantifiers* are such as: *the trees – the last green (HBT.33)*, *lots of dwarves-lots (HBT.32)*.

Besides that, the data indicates that the *Anaphoric* forms are more dominant than *Cataphoric* ones. In the seven elliptical numerative forms, there are three data indicating *Cataphoric* forms as in *...one or two of the songs (HBT.28)*, *another dwarf had...- it was five (HBT.30)* and *lots of dwarves-lots (HBT.32)*. Those are in *Cardinal* and *Qualifier*; Based on the Distance amongst sentences, the data indicates that the whole sentences/phrases' ties are *Immediate* forms or not in *Mediated* or *Remote (Non-Mediated)* ones. For examples:

#### Immediate

[27]

*At first they had passed through hobbit-lands, a wild respectable country inhabited by decent folk, with good roads, an inn or two, and now and then a dwarf or a farmer ambling by on business. (HBT.29)*

The *two* is a *Cardinal*. It presupposes elements *an inn*. Here the elements *an inn* presupposed in a contiguous phrase. It is not being intervened by other sentences. The complete elements are *an inn or two [inns]*.

[28]

"There's more to come yet," said Tom, "or I'm mighty mistook. Lots and none at all, it is," said he. "No burra-hobbits, but lots of dwarves. That's about the shape of it!" (HBT.32)

The word *lots* is a *Quantifier*. It presupposes elements *lots of dwarves*. Here the elements *dwarves* presupposed in a contiguous sentence. It is not intervened by other sentences. The complete elements are *lots of dwarves*.

**EPHITETS.** The data indicates that in the Ephitets involve three subsets: (1) *Superlatives*, (2) *Comparatives*, and (3) *Adjectives*. The *Adjectives* dominate in each sentences' tie. There are 62,5% data indicating *Adjectives*. This is followed by 25% *Superlatives* and 12,5 % *Comparatives*. The *Adjectives* are such as: *wet hole – a nasty, dirty* (HBT.37), *comfortable father – his solid* (HBT.38), *the secret entrance – secrete once* (HBT.39), *curious key – a small* (HBT.39), *the one with yellow stockings – yellow* (HBT.41); the *Superlatives* are such as: *funny queer fits – one of the best* (HBT.35), *the great mountains – the feet of the nearest* (HBT.36), and the *Comparatives* are such as: *the very sight of dwarves – more* (HBT.34). In the eight Ephitets, There are four data showing the *Cataphora* (K) such as: *wet hole - a nasty, dirty* (HBT.37), *comfortable father - his solid* (HBT.38), and *curious key - a small* (HBT.40). Besides that, the ties amongst sentences/phrases (Distance) are most frequently used in *Immediate*, and some are found in a *Remote-non mediated*, and a *Mediated* form. For examples:

#### Immediate

[29]

"Also," went on Gandalf, "I forgot to mention that with the map went a key, a small and curious key. Here it is!" he said, and handed to Thorin a key with a long barrel and intricate wards, made of silver. "Keep it safe." (HBT.40)

The word *a small* is an *Adjective* and the ellipsed element is the *key*. Here the *key* presupposed in a contiguous sentences / phrase or it is less being intervened by other sentences. The complete elements are *a small [key] and curious key*.

#### Remote (Non-mediated)

[30]

... that is the secret entrance. You see that rune on the West side, and the hand pointing to it from the other runes? That marks a hidden passage to the Lower Halls. "It may have been secret once," said Thorin. (HBT.39)

The word *the secret* is an *Adjective*. It is upgraded in its status to be a Head. It refers to the elements *the secret entrance*. It is intervened by two sentences not involved in the presupposition. The complete elements are *secrete entrance once*.

#### Mediated

[31]

"The one with the yellow stockings," said Bert. "Nonsense, the one with the grey stockings," said a voice like William's. "I made sure it was yellow," said Bert. "Yellow it was," said William. (HBT.41)

The word *yellow* is an *Adjective*. It is upgraded in its status to be a Head. It refers to the elements *the one with the yellow stockings*. It is intervened by one sentence that enters one presupposition *the grey stocking*. The word *the yellow* presupposes the elements *The one with the yellow stockings*.

#### CONCLUSSIONS

The Nominal Ellipsis presupposes the antecedent. The presupposed elements are in cataphora or anaphora. Most of the Nominal Ellipsis occur anaphorically. There are six data indicating cataphoras.

The Nominal Ellipsis immediately dominates the noun and its complements as the presupposed elements. Here the upgraded identity/status occurs e.g. the elements-the Deictics, Numeratives, or Ephitets to be a Head.

In analysis of the three chapters - 92.082 words, there are 41 Nominal ellipsis in the novel *The Lord of The Rings: The Hobbit*. The data indicates that the *Deictics* are 63,4%; the *Epithets* are 19,5%; and the *Numeratives* are 17% (Tabel 3).

The *Deictics* occupy the first rank. These are dominated by *Specific deictics*: the possessive pronoun and demonstrative forms. In the twenty six cohesive items based on Distance, there are only one indicating *Mediated* and three *Remote-non mediated* and the remains are in *Immediate*.

The *Ephitets* occupy the second rank. These are dominated by Adjectives. In the eight cohesive items of the *Ephitets* (Distance), There are two indicating *Remote-non mediated* and the remains are in *Immediate*.

The *Numeratives* occupy the third rank. The *numeratives* are dominated by *Cardinals*. It is contrastive. The data got is 71,3%, and the other subsets: *Ordinal* and *Quantifier* are only 14,3%. In the seven cohesive items of the *Numeratives* based on Distance), The whole are in *Immediate*. It indicates that cohesive items in sentences are not intervened by other sentences.

## APPENDIXES

1. The best rooms were all on the left-hand side (going in), for these were the only ones to have windows, deep-set round windows looking over his garden and meadows beyond, sloping down to the river. (HBT.1)
2. Not the man that used to make such particularly excellent fireworks! I remember those! Old Took used to have them on Midsummer's Eve. (HBT.2)
3. He hung his hooded cloak on the nearest peg, and "Dwalin at your service!" he said with a low bow. "Bilbo Baggins at yours!" (HBT.3)
4. "Kili at your service!" said the one. "And Fili!" added the other; and they both swept off their blue hoods and bowed. "At yours and your family's!" replied Bilbo, remembering his manners this time. (HBT.4)
5. "I have often wondered about my father's and my grandfather's escape. I see now they must have had a private Side-door which only they knew about. (HBT.5)
6. Yes, I am afraid trolls do behave like that, even those with only one head each. After hearing all this Bilbo ought to have done something at once. (HBT.6)
7. "Dawn take you all, and be stone to you!" said a voice that sounded like William's. But it wasn't. (HBT.7)
8. "Moon-letters are rune-letters, but you cannot see them," said Elrond, "not when you look straight at them. They can only be seen when the moon shines behind them, and what is more, with the more cunning sort it must be a moon of the same shape and season as the day when they were written. The dwarves invented them and wrote them with silver pens, as your friends could tell you. These must have been written on a midsummer's eve in a crescent moon, a long while ago." (HBT.8)
9. "No good roasting 'em now, it'd take all night," said a voice. Bert thought it was William's. "Don't start the argument all over-again. Bill," he said, "or it will take all night." (HBT.9)
10. "No good boiling 'em! We ain't got no water, and it's a long way to the well and all," said a voice. Bert and William thought it was Tom's. HBT.(10)
11. "The one with the yellow stockings," said Bert. "Nonsense, the one with the grey stockings," said a voice like William's.(HBT.11)
12. "No good roasting 'em now, it'd take all night," said a voice. Bert thought it was William's. (HBT.12)
13. "A little beer would suit me better, if it is all the same to you, my good sir," said Balin with the white beard. "But I don't mind some cake-seed cake, if you have any." (HBT.13)

14. He had only just had a sip-in the corner, while the four dwarves sat around the table, and talked about mines and gold and troubles with the goblins, and the depredations of dragons, and lots of other things which he did not understand, and did not want to, for they sounded much too adventurous-when,ding-dong-a-ling-dang, his bell rang again, as if some naughty little hobbit-boy was trying to pull the handle off. "Someone at the door!" he said, blinking. "Some four, I should say by the sound," said Fili. (HBT.14)
15. Thereupon the twelve dwarves-not Thorin, he was too important, and stayed talking to Gandalf-jumped to their feet and made tall piles of all the things. Off they went, not waiting for trays, balancing columns of plates, each with a bottle on the top, with one hand, while the hobbit ran after them almost squeaking with fright: "please be careful!" and "please, don't trouble! I can manage." (HBT.15)
16. The dwarves rushed out of their great gate; but there was the dragon waiting for them. None escaped that way. The river rushed up in steam and a fog fell on Dale, and in the fog the dragon came on them and destroyed most of the warriors-the usual unhappy story, it was only too common in those days. (HBT.16)
17. For some elves tease them and laugh at them, and most of all at their beards. (HBT.17)
18. Elves know a lot and are wondrous folk for news, and know what is going on among the peoples of the land, as quick as water flows, or quicker. But the dwarves were all for supper as soon 'as possible just then, and would not stay. On they all went, leading their ponies, till they were brought to a good path and so at last to the very brink of the river. It was flowing fast and noisily, as mountain-streams do of a summer evening, when sun has been all day on the snow far up above. There was only a narrow bridge of stone without a parapet, as narrow as a pony could well walk on; and over that they had to go, slow and careful, one by one, each leading his pony by the bridle. The elves had brought bright lanterns to the shore, and they sang a merry song as the party went across. (HBT.18)
19. "That remains to be seen," said Gandalf. "Is there any more writing?" "None to be seen by this moon," said Elrond, and he gave the map back to Thorin; and then they went down to the water to see the elves dance and sing upon the midsummer's eve. (HBT.19)
20. Trolls simply detest the very sight of dwarves (uncooked). Bert and Bill stopped fighting immediately, and "a sack, Tom, quick!" they said, before Balin, who was wondering where in all this commotion Bilbo was, knew what was happening, a sack was over his head, and he was down. "There's more to come yet," said Tom, "or I'm mighty mistook. Lots and none at all, it is," said he. "No burra- hobbits, but lots of these here dwarves. That's about the shape of it!" (HBT.20)
21. And what would you do, if an uninvited dwarf came and hung his things up in your hall without a word of explanation? They had not been at table long, in fact they had hardly reached the third cake, when there came another even louder ring at the bell. "Excuse me!" said the hobbit, and off he went to the door.(HBT.21)
22. The tunnel wound on and on, going fairly but not quite straight into the side of the hill - The Hill, as all the people for many miles round called it - and many little round doors opened out of it, first on one side and then on another. (HBT.22)
23. Bilbo was astonished. The only path was marked with white stones. Some of which were small, and others were half covered with moss or heather. (HBT.23)
24. Then Bilbo sat down on a seat by his door, crossed his legs, and blew out a beautiful grey ring of smoke that sailed up into the air without breaking and floated away over The Hill. "Very pretty!" said Gandalf. "But I have no time to blow smoke-rings this morning. I am looking for someone to share in an adventure that I am arranging, and it's very difficult to find anyone." "I should think so - in these parts! We are plain quiet folk and have no use for adventures. Nasty .disturbing uncomfortable things! Make you late for dinner! I can't think what anybody sees in them," said our Mr. Baggins, and stuck one thumb behind his braces, and blew out another even bigger smoke-ring. (HBT.24)
25. Burglar wants a good job, plenty of Excitement and reasonable Reward, that's how it is usually read. You say Expert Treasure-hunter instead of Burglar if you like. Some of them do. It's all the same to us. (HBT.25)
26. Altogether those were good days for us, and the poorest of us had money to spend and to lend, and leisure to make beautiful things just for the fun of it, not to speak of the most marvellous and magical toys, the like of which is not to be found in the world now-a-days. (HBT.26)
27. But just at that moment William came up behind and popped a sack right over Thorin's head and down to his toes. And so the fight ended. A nice pickle they were all in now: all neatly tied up in sacks, with three angry trolls (and two with burns and bashes to remember) sitting by them, arguing whether they should roast them slowly, or mince them fine and boil them, or just sit on them one by one and squash them into jelly: (HBT.27)
28. I wish I had time to tell you even a few of the tales or one or two of the songs that they heard in that house. (HBT.28)
29. At first they had passed through hobbit-lands, a wild respectable country inhabited by decent folk, with good roads, an inn or two, and now and then a dwarf or a farmer ambling by on business. (HBT.29)
30. It was not four after all, it was five. Another dwarf had come along while he was wondering in the hall. (HBT.30)
31. Bilbo rushed along the passage, very angry, and altogether bewildered and bewuthered-this was the most awkward Wednesday he ever remembered. He pulled open the door with a jerk, and they all fell in, one on top of the other. More dwarves, four more! And there was Gandalf behind, leaning on his staff and laughing. (HBT.31)
32. "There's more to come yet," said Tom, "or I'm mighty mistook. Lots and none at all, it is," said he. "No burra- hobbits, but lots of dwarves. That's about the shape of it!" (HBT.32)
33. The trees changed to beech and oak, and hire was a comfortable feeling in the twilight. The last green had almost faded out of the grass, when they came at length to an open glade not far above the banks of the stream. (HBT.33)
34. Trolls simply detest the very sight of dwarves (uncooked). Bert and Bill stopped fighting immediately, and "a sack, Tom, quick!" they said, before Balin, who was wondering where in all this commotion Bilbo was, knew what was happening, a sack was over his head, and he was down. "There's more to come yet," said Tom, "or I'm mighty mistook. (HBT.34)
35. "Excitable little fellow," said Gandalf, as they sat down again. "Gets funny queer fits, but he is one of the best, one of the best-as fierce as a dragon in a pinch." (HBT.35)
36. The far bank was steep and slippery. When they got to the top of it, leading their ponies, they saw that the great mountains had marched down very near to them. Already they I seemed only a day's easy journey from the feet of the nearest. (HBT.36)
37. In a hole in the ground there lived a hobbit. Not a nasty, dirty, wet hole, filled with the ends of worms and an oozy smell, nor yet a dry, bare, sandi hole with nothing in it to sit down on or to eat: it was a hobbit-hole, and that means comfort. (HBT.37)
38. Still it is probable that Bilbo, her only son, although he looked and behaved exactly like a second edition of his solid and comfortable father, got something a bit queer in his makeup from the Took side, something that only waited for a chance to come out. (HBT.38)
39. "There is a dragon marked in red on the Mountain, said Balin, "but it will be easy enough to find him without that, if ever we arrive there." "There is one point that you haven't noticed," said the wizard, "and that is the secret entrance. You see that rune on the West side, and the hand pointing to it from the other runes? That marks a hidden passage to the Lower Halls. "It may have been secret once," said Thorin. (HBT.39)
40. "Also," went on Gandalf, "I forgot to mention that with the map went a key, a small and curious key. Here it is!" he said, and handed to

Thorin a key with a long barrel and intricate wards, made of silver. "Keep it safe!" (HBT.40)

41. "The one with the yellow stockings," said Bert. "Nonsense, the one with the grey stockings," said a voice like William's. "I made sure it was yellow," said Bert. "Yellow it was," said William. (HBT.41)

The next issue will be published in November 2013

## AIMS AND SCOPE

The international journal of language learning and applied linguistics world performs as a platform for the new scholars to share their insights with other scholars in the form of original papers.

The international journal of language learning and applied linguistics world is a double-blind peer-reviewed international journal dedicated to promoting scholarly exchange among teachers and researchers in the field of language teaching and applied linguistics. Papers submitted to the journal will immediately be sent to two related reviewers who are responsible to provide feedback on the content and the language use.

The journal is published monthly in online and print versions. The scope of the journal includes, but not limited to, the following fields:

*Theory and practice in English*

*Language teaching & learning*

*Teaching English as a second or foreign language*

*Applied linguistics*

*Discourse studies*

*Syllabus design*

*Language learning problems*

*Computer assisted language learning*

*English for specific purpose*

*English for academic purpose*

*Language teaching & testing*

*Translation studies*

## ABSTRACT

One of the most dramatic changes English Language Teaching has witnessed is the demise of the concept of method and its replacement by Kumaravadivelu's post-method based pedagogy free from the constraints of methods. However, the emergence of this principled teaching practice, which is founded upon the parameters of particularity, possibility, and practicality, has not been unanimously certified by all the scholars. That's why this research attempts to verify its actual appearance in Iran as an EFL context by means of a questionnaire and an interview. The reliability of the instrument was calculated using Cronbach alpha reliability estimation calculations. The participants were 254 male and female teachers of English in the English language institutes all over Shiraz, Iran. The findings of the study raised doubts about the feasibility, possibility or practicality of a fully post-method based teaching pedagogy and questioned its emergence into Iranian context. The study proved that there is a long distance to the actual manifestation of post-method principles, especially its possibility and practicality parameters. The findings also showed that Iran's teaching is mainly based on eclectic teaching. The results of the present study can be beneficial to teaching theorizers to re-modify their theories. Besides the policy makers of the Iranian educational system can benefit from this study to adapt their educational needs to the reality of classrooms and hasten the emergence of current paradigms in accordance with the international practices.

**KEY WORDS:** Post-method condition, method, principled approach, possibility, practicality, particularity, macro-strategies, micro-strategies.

## INTRODUCTION

Nowadays it has been admittedly certified both by the educational system of Iran, and the society or population at large that English has gained an integral role among the Iranian nation. The proof to this claim is the escalating demands on behalf of the nation for learning the language which has come to be used as medium of instruction and source of updated knowledge in many schools, institutes and universities, libraries and educational places. Also with the emergence of the issue of globalization, the need to learn English as the international language has been more widely recognized as urgent. English is known as the language of international transaction, trade, negotiation and communication as well. In spite of the awareness of its importance, our educational system has not been totally successful at keeping up with the international competition. A case in point is our students' inability to suit themselves to the international

competition forced by globalization (Yarmohammadi, 2000; see also Bagheri, 1994; Rahimi, 1996). We might have also been behind schedule regarding the modifications that the second language teaching profession has been undergoing.

The second language teaching field has been always experiencing changes throughout history as the nature of science justifies and, in effect, necessitates such changes. According to Akbari (2008), one dramatic recent shift which has not been unanimously agreed upon among scholars is the emergence of the “*post-method condition*” (Kumaravadivelu, 1994). This condition has pronounced “The Death of the Method” (Allwright, 1991) and emergence beyond the dark ages of methods (Brown, 2002, p. 17), as the search for the best method was in practice futile (Allwright, 1991; Brown, 1994; Kumaravadivelu, 1994; Nunan, 1991; Prabhu, 1990; & Pennycook, 1989), and has defined new roles and relationships for all involved in the process of learning or teaching the language, among them, learners and teachers (Kumaravadivelu, 1994).

Teachers and learners have been assigned some specific and mainly fixed roles and demands in line with the underlying assumptions of the feeder method according to method-based language teaching curricula. These roles have been prone to change with the introduction of new teaching methods, to suit the particular demands of the method in vogue. Accordingly, context-sensitive post-method pedagogy ‘demands a re-visioning of their roles as post-method practitioners’ (Kumaravadivelu, 2001) in accordance with the parameters of practicality, particularity and possibility. However, the actual and practical existence or emergence of such rectified roles, traits, and behaviors, integral for any pedagogy to be called post-method, is open to debate (see, e.g., Akbari, 2008; Bell, 2003, 2007; Larsen-Freeman, 2005; & Liu, 1995), and central to the purpose of this study.

### ***Statement of the problem***

There have been opposing ideas about the actual manifestation of this transition from method to post-method pedagogy and the real practicality of post-method based instruction, and some studies have been carried out to prove or disprove either side’s claims (see, for instance, Akbari, 2008; Bell, 2007; Larsen-Freeman, 2005; & Liu, 1995). But have we really stepped into the post-method era? This article aims at exploring into the nature of activities, roles and characteristics of English teachers and learners undertaken in an EFL context to see to what extent the basic features of a post-method pedagogy have been actualized or are on the way to implementation in Iran.

### ***Significance of the study***

Due to the importance of English language teaching in the eye of both the educational system and the society in Iran, the findings of the present study can be significant from theoretical and practical perspectives. Theorizers, policy makers, language-planners, curriculum designers, textbook developers, language instructors, teachers, and also learners and their parents can benefit from the information obtained from this study. In other words, the issue addressed in this study might be of use to two groups of people. This study can provide us with informative insight into aims and objectives, content and material, methods and activities, books and textbooks, and tests regarding language teaching and learning in Iran. New measures can also be taken in near future to pave the way so that the transition might be possible or accelerated to enable us make up

for any imperfections compared to the international trend i.e. socio-political awareness raising and learner or teacher empowerment. This study can also sensitize us to the exigencies of adoption of a more context-specific approach toward teaching English and making our academia more and more aware of the most recent fashions in the realm of teaching. On the other hand, it could make scholars in the field halt to rethink, and reconsider or re-substantiate their hunches and claims by providing information about an EFL context.

## LITERATURE REVIEW

### *An overview of language teaching methodologies in Iran*

Teaching English in a country like Iran, which belongs to the expanding circle of Kachru's World Englishes Model (1990), is a laborious task. Learning English deems necessary in Iran due to several reasons. To put it in a nutshell, English is the language of international technological and scientific information, commerce, negotiation, communication, and economic or cultural transaction e. g. via the Internet. In Iran English is mainly taught in two different educational contexts: Public schools and language institutes (Razmjoo & Riazi, 2006). A brief look at the latter one, which is the setting of this study, is in order here.

### *Teaching English in private institutes*

Farzin-nia reported, as cited in Razmjoo and Riazi (2006), the first formal English language institute which was founded in 1925 in Iran as Iran-America society. After the revolution, it was known as ILI, the three letters standing for: Iran Language Institute, which is still probably the most rooted and powerful one in the region. The main reason for the prevalence of institutes has been the inefficacy of public schools in meeting the demands of the huge number of English learners. In fact, the educational system of Iran, though being able to recognize the exigency of providing students with English competence, has actually acted inefficiently, and all the ambitions of learners have not been fulfilled at schools. That's why almost in all families, there are pupils who have taken their chances on learning English optimally in language institutes. The teaching materials, mainly including textbooks used worldwide are offered in these institutes in three different levels of age range: Kids, young adults or teenagers, and finally adolescents or adults. The applicants attend classes two to four times a week, each time two hours, based on the nature of a course, whether it is normal or intensive. Newcomers are evaluated by means of placement tests and oral interviews to determine their exact level of proficiency. Course assessment is carried out based on midterm and final exams and also class activity. Here the syllabus is prepared beforehand and the procedures of its implementation are explicated in teacher training courses conducted by the institutes. Of course, the malleability of guidelines and their range of application procedures differ from institute to institute depending on the management board. Some grant teachers more freedom to practice their work but in a constrained way within the bounds of the frameworks ruled out by the institutes. But some other set strict rules and niggle at teachers for unscrupulously practicing the prescribed material.

### *Method and post-method concepts*

In 1963, Edward Anthony-in his hierarchical three-partite model consisting of *approach*, *method*, and *technique*-defined method as an overall plan for the orderly presentation of language material. Richards and Rogers (2001, p. 20) modified the definition of method by assigning it an umbrella term which encapsulates the concepts of approach, design, and procedure. The definition adopted by most researchers is what Brown (2002) puts as: "A set of theoretically unified classroom techniques thought to be across a wide variety of contexts and audiences" (p. 9). The criticisms against the concept of method began in the 1960s, by Kelly (1969), and

Mackey (1965). These criticisms reached their peak in 1980s, paradoxically when scholars were busy searching for the *best method* or what Richards & Rodgers (2001) call “the language teaching problem” (p. 244), a search which began approximately a century ago. The futility of this search was explicated in detail by Prabhu (1990) in the erudite article: “There Is No Best Method”. Labels such as “century old obsession”, and “misguided” (Stern, 1985, p. 251), and “interested knowledge” (Pennycook, 1989), were used to demonstrate the limits of method. “The Death of the Method” (Allwright, 1991) was an article published on the wake of criticisms which revealed growing dissatisfaction with ephemeral methods.

Acclaiming the demise of the concept of method, Kumaravadivelu (1994) announced the emergence of what he calls “*post-method condition*”. In fact the alternative to method (Kumaravadivelu, 1994) was a method-neutral approach or in Brown’s words “a principled approach” (2002). Efforts to devise method-free frameworks has resulted in appearance of Stern’s three dimensional framework (1992), Allwright’s Exploratory Practice (2000, 2003a, & 2003b), Kumaravadivelu’s macro-strategic framework (1992, 1994, 2001, 2003a, 2003b, and 2005), and Brown’s principled teaching (2001, 2002, & 2007). The framework adopted by the researchers in the present study is Kumaravadivelu’s framework based on three pedagogical principles of *practicality*, *particularity*, and *possibility* (1994, 2001, 2003a, 2003b, 2005). The first parameter (practicality), assumes a dialectical relationship between theorists having their professional theories and practitioners generating their personal theories, and enables teachers to construct their own theory of practice embarking on what Prabhu (1990, p.172) calls teachers’ *sense of plausibility* (emphasis original). The second one accentuates the need for a context-sensitive language education which takes into account local linguistic, socio-cultural, and political particularities. The last principle addresses the empowerment of both teachers and students to facilitate the process of identity formation and social transformation.

To implement these pedagogic principles in classroom, Kumaravadivelu has proposed the macro-strategic framework which consists of 10 macro-strategies and numerous micro-strategies. (Kumaravadivelu, 1992, 1994, 2003a, 2003b, 2005). Post-method pedagogy has also tried to modify the roles of both learners and teachers (Kumaravadivelu, 2001, 2003a, 2005). Learners-formerly as passive recipients of knowledge-are becoming active and autonomous players (Kumaravadivelu, 2003a, p. 176), and teachers who were just transmission models or passive technicians are assuming the role of reflective practitioners or even transformative intellectuals (Kumaravadivelu, 2003a, pp.16-17). The issues of social justice and transformation are dealt with by embarking on critical pedagogy through exposing the politically discriminatory foundations of education (Giroux, 1983). However, on its way to implementation, post-method pedagogy will face two sorts of barriers: Pedagogical-concerning the eradication of deeply rooted transmission model of teaching-and ideological- dealing with issues such as marginalization and self-marginalization (Kumaravadivelu, 2001, 2003a).

### ***Empirical studies done***

Liu (2004) chose a sample of 448 EFL teachers randomly to explore the degree of their familiarity with methods, degree of their method use, and degree of their preference to a special method. Based on the findings, a multidimensional theoretical framework was proposed to conceptualize language teaching methods in post-method era. In another study, Hazratzad &

Gheitanchian (2009) selected 594 Iranian EFL teachers to explore any probable relationship between teachers' positive or negative attitudes towards post-method and their students' achievement. The results revealed that while it was expected that the positive attitudes of teachers towards post-method pedagogy would cause better achievement among their students, there existed no such correlation.

### ***Contribution of related literature to the present study***

Although there seems to exist enough evidence in favor of the existence of post-method condition, some prominent figures have expressed doubt regarding its emergence. Claims have been made so as: Methods are not dead in teachers' opinions (Bell, 2007), rather method and post-method are complementary (Bell, 2003), proposed frameworks are just "addition to method, not an alternative to method" (Liu, 1995), and "these macro-micro strategies constitute a method" (Larsen-Freeman, 2005). Akbari (2008) has also criticized post-method for being far from reality and staying at the level of discourse or theory. He believes that post-method, by being inordinately demanding for teachers, has defeated its own purpose of achieving parameters of practicality and possibility. Based on what was mentioned so far, ambivalence has been observed about the actual representation of post-method in real lives of the academia, and main body of research has so far concentrated on theoretical aspects of post-method. The present study tries to delve into the extent to which post-method has been able to penetrate into pedagogical settings, e.g. an EFL context like Iran. Because little attempt has been devoted to practicing aspects of post-method pedagogy, the present study tries to "become more practical in adopting the language of practice" (Akbari, 2008) by conducting an empirical research on this issue, and moving beyond lip-service to practice.

### **OBJECTIVES OF THE STUDY**

This study tries to probe into the current situation of Iran's English language learning and teaching context to see to what extent the claimed transition from method-based pedagogy to post-method has been in practice witnessed in this EFL context. This study fulfils its aims in two perspectives. First, it investigates the representation of post-method teaching according to learners' roles and in learners' lives. Second, it attempts to explore the manifestation of post-method characteristics in teachers' lives and also in teachers' opinions.

### **RESEARCH QUESTIONS**

1. To what extent do our teachers in private institutes bear the traits necessary for a teacher to be called a post-method teacher?
2. To what extent are our English learners real post-method learners?
3. To what extent have the principles of post-method based pedagogy including the parameters of practicality, particularity, and possibility emerged in Iran's private language institutes?
4. What is Iranian teachers' perception of their teaching practice? Do they teach based on one specific method, a number of eclectic methods, or general principles?

### **METHODOLOGY**

#### ***Participants***

The participants of the study were 154 English teachers from private institutes in Shiraz (a large city southern Iran) on the basis of their availability. There were 95 female and 59 male teachers.

They range in age from 22 to 35 with a mean age of 28. They had from 1 to 12 years of teaching experience with an average of 5.57. 42 teachers held an M.A. degree and the rest had a B.A. in English Linguistics, Teaching and Literature.

### ***Instruments***

#### ***Questionnaire***

A questionnaire consisting of the main tenets of post-method pedagogy namely the principles of particularity, practicality, possibility, the role of teachers, and the role of learners was constructed by the researchers for the study. It consists of 22 items (11 favorable and 11 unfavorable) which follow the Likert scale.

The maximum score that can be obtained, which implies the highest degree of conformity to tenets of a post-method based pedagogy, equals 110. The minimum score indicating the lowest degree of conformity to post-method principles amounts to 22. Thus the participants' responses falls between the range of 22 to 110 and the neutral score is 66.

#### ***Validity of the questionnaire***

In order to determine the validity of the instrument, in a pilot study, the researchers randomized all the items of the questionnaire and distributed them among 154 teachers of institutes. After collecting the data, the researchers conducted the data analysis to calculate the validity coefficients in terms of factor analysis (see Table 1).

*Table 1: Confirmatory Factor Analysis of the Questionnaire*

1	The parameter of particularity (4 statements)
2	The parameter of practicality (4 statements)
3	The parameter of possibility (6 statements)
4	The role of teacher in post-method based pedagogy (4 statements)
5	The role and contribution of learners in the learning process (4 statements)

#### ***Reliability of the questionnaire***

The reliability of the questionnaire was calculated by the researchers using Cronbach alpha (CA). Based on the data which was gathered for the study, the overall internal consistency of the questionnaire turned out to be 0.888. Using SPSS, Cronbach alpha was employed to calculate the reliability index of the present scale in this administration. To compute the reliability index of the present questionnaire, the scale was given to 154 participants of the study.

#### ***Interview***

The second instrument was an interview comprising of three questions conducted to investigate the exact nature of teaching practice in Iran's language institutes. The researchers interviewed 60 teachers by asking the following questions:

1. Is your teaching practice based on one specific method for instance Audio-Lingual Method or Communicative Language Teaching?
2. Is your teaching practice fed by an eclectic selection of a number of methods?
3. Is your teaching practice grounded on a number of general principles, e.g. your own or some other scholars' theories of practice, free from the constraints of method?

Before conducting the interview the researchers explained the difference between post-method based pedagogy and method based one and explicated the exact meaning of principled teaching and theories of practice to eradicate any doubts or misunderstandings. The results of the interviews were analyzed in the form of qualitative content analysis. The content of the interviews were scrutinized to categorize the factors that were stated by the interviewees.

### ***Data Collection and Analysis***

Data collection was arranged at times suggested by the management of the institutes' permission by administering the questionnaire. All participants were encouraged to ask questions so that they did not have any problems with respect to the content and language of the questionnaire. Moreover, the observed principles were discussed with the teachers to eradicate any doubts about the originality of the data. The data collected through language teachers' questionnaire were analyzed through descriptive statistics utilizing minimum, maximum, mean, and standard deviation. The interview was also analyzed based on the frequency measures of the responses.

## **RESULTS AND DISCUSSION**

In this section the results of the study are presented and explained. The items of the questionnaire were examined in percentage to demonstrate teachers' belief about the principles representing post-method pedagogy. To have a better picture or idea of the respondents' answers to the items, the first two (strongly agree and agree) and the last two (disagree and strongly disagree) were added up together (see Table 2). Of course items number 1, 3, 4, 7, 8, 10, 12, 17, 19, 20 and 21 are negative and for interpretation their results should be reversed. The mean of the questionnaire items mounted to 70.35 and the standard deviation was 14.51. Because the mean is less than half the standard deviation over the neutral point, one can't conclude that teachers have a positive attitude toward post-method principles.

As to teachers' claim, post-method tenets are not greatly appreciated or implemented in Iran. For instance almost one third of teachers agree with the following items representing principles of post-method (see table 2): "I give learners institutional, political, social and cultural awareness" (Item 2), "I generate my own theory of teaching" (Item 14), "My teaching is in line with the notion that every class context is unique" (Item 5), "I have a fair degree of autonomy in pedagogic decision making" (Item9), "My learners are active and autonomous" (Item 18).

*Table 2: Teacher Attitude in Terms of Frequency (F) and Percentage (P)*

Items	SA+A		U		D+SD	
	F	P	F	P	F	P
1. My role is to transmit knowledge without altering the content.	33	21%	34	22%	87	57%
2. I give learners institutional, political, social and cultural awareness.	46	30%	46	30%	62	40%
3. I can't generate my own theories to teach in class.	52	34%	55	36%	47	30%
4. I am not interested in the sociopolitical context and its power dimensions.	53	35%	59	38%	42	27%
5. My teaching is in line with the notion that every class context is unique.	70	45%	53	35%	31	20%
6. My role is to help students gain a sense of ownership of education.	77	50%	45	29%	32	21%
7. My teaching does not vary from context to context.	29	19%	59	38%	66	43%
8. My learners don't have a role in pedagogic decision making.	35	23%	56	36%	63	41%

9. I have a fair degree of autonomy in pedagogic decision making.	65	42%	44	29%	45	29%
10. I'm not interested in sociopolitical issues in my classes.	58	38%	48	31%	48	31%
11. I observe, analyze, and evaluate my teaching to generate my own theories.	47	31%	47	30%	60	39%
12. My learners don't search for language beyond the classroom.	39	25%	51	33%	64	42%
13. My teaching is sensitive to a particular group of learners in a particular institutional or socio-cultural context.	74	48%	51	33%	29	19%
14. I generate my own theory of teaching.	51	33%	43	28%	60	39%
15. I try to tap the sociopolitical consciousness of learners as change agents.	51	33%	49	32%	54	35%
16. I try to bring about social, cultural, and political change and transformation.	57	37%	50	32%	47	31%
17. I don't adjust my teaching to the particular conditions of different contexts.	16	11%	48	31%	90	58%
18. My learners are active and autonomous.	60	39%	52	34%	32	27%
19. I'm not interested in making my own theory of practice.	49	32%	47	30%	58	38%
20. I don't encourage learners to investigate how language as ideology serves vested interests.	56	36%	59	38%	39	26%
21. The system doesn't recognize my role to teach autonomously within constraints of institutions, curricula, and textbooks.	47	30%	47	30%	60	40%
22. My learners explore the Internet and bring to class their own topics.	32	21%	58	38%	64	41%

Table 3 demonstrates teachers' attitudes regarding the five principles of post-method based pedagogy. The parameter of particularity, which deals with the importance of context, is recognized by at least half of the Iranian private institute teachers. This also certifies for the roles adopted by post-method teachers. Almost half of Iranian teachers admit that the roles they assume are in line with those of a post-method teacher. There is no unanimous agreement over existence of post-method learners, as the statistical percentages are evenly distributed among the opponents, proponents, and abstainers. Another point worth mentioning is teachers' reluctance to bring about socio-political change or transformation (30% agree with possibility parameter), or to put it more exact, to get involved in issues which might jeopardize their life or status. Here one can infer that the two principles of particularity and possibility contradict but not complement each other. In fact, by claiming to localize or contextualize teaching practice, the parameter of particularity is paradoxically defeating its own purpose, because contextualization of the prescribed parameter of possibility is at times odd and impossible in many contexts, hence it might not be localized at all. The parameter of practicality which stresses the importance of involving teacher generated theories of practice in pedagogy has also received little acceptance, maybe because this is much demanding necessitating that the teachers be proficient, experienced or skillful enough to be able to make up their own theories or due to the constraints imposed upon institutions or textbooks.

Table 3: Teacher Attitude Regarding the Five Principles of Post-method

Principles	SA+A		U		D+SD	
	F	P	F	P	F	P
1. Particularity (Items 5, 7, 13 & 17)	75	49%	53	34%	26	17%
2. Practicality (Items 3, 11, 14 & 19)	51	33%	48	31%	55	36%
3. Possibility (Items 2, 4, 10, 15, 16 & 20)	47	30%	52	34%	55	36%
4. Teacher role of (Items 1, 6, 9 & 21)	72	47%	43	28%	39	25%
5. Learner role (Items 8, 12, 18 & 22)	55	35%	54	35%	45	30%

An interesting proof to the previous criticisms leveled at post-method due to its heavy reliance on profuse proficiency and experience of teachers is the statistical analysis of correlation between teachers' experience and their agreement with the five principles of post-method. The relationship between the principle of practicality and teacher experience was investigated using Pearson product-moment correlation coefficient. There was a strong positive correlation between the two variables,  $r = .74$ ,  $n = 154$ ,  $p < .0005$ , with high level of teaching experience leading to an ability or propensity for generating theories of practice.

The results also lend support to Akbari's claim that only teachers who are at the third stage of Fuller's three stages of teacher development will have the capability of but not necessarily the willingness to act in line with post-method pedagogy (2008). In fact it is experience that endows the teachers with the ability to generate their own theories of practice which are ongoingly modified and re-modified based on their teaching analyses and evaluations of classroom teaching acts using their own sense of plausibility.

The findings of the study raise doubts on the emergence of some principles of post-method, and reaffirm the criticisms on post-method regarding its practicality. The advocates of post-method are summoned once again to halt to reconsider some of the main tenets of their theories and think deeper about their theories feasibility according to the constraints and needs of actual language classrooms and the wider institutional, social, cultural, and political context.

### ***Interview***

According to the results of the interviews which have been scrutinized and analyzed by the three researchers, all the interviewees unanimously believed that they didn't make use of one specific method in their language teaching practice except for scarce occasions when they had to resort to just one special method due to the specific needs of the particular learner. Rather they drew upon eclectic methods to practice their act of teaching based on particular contextual needs or conditions. Almost 10 teachers claimed that they utilized general principles guiding their teaching action in a rather sporadic manner sidelined by the prioritized principles of eclectic based teaching due to institutional constraints. Teachers attributed their non-adherence to principled teaching to, above all their reluctance or lack of proficiency and confidence needed for making a comprehensive theory of practice, and also to the limitations imposed on them by institutions, classroom conditions, time and budgetary issues, and textbooks. All in all, one can conclude that the impediments on the route to the realization of post-method based pedagogy are much more onerous than one can conceive.

### **CONCLUSION**

This study tried to verify the emergence of post-method pedagogy and its degree of materialization in English institutes of a prominent city of Iran, i.e. Shiraz. The present study

raised uncertainty about the actual emergence or practice of post-method based pedagogy and the immaculate fulfillment of all its principles. In fact existence of post-method based on the principles of particularity, practicality, and possibility (and especially the last two principles) in the EFL country of Iran seems far reaching, impractical if not impossible. A high degree of contextualization or exclusion of some parts is needed perhaps at the expense of distorting the whole principles or tenets. While the current study focused on English teachers in Iran, a sample of the expanding circle of Kachru's World Englishes (1990), the issues touched on can also be witnessed in many other parts of the world. The insights gained from this study are also beneficial to the educational systems, policy makers, language planners, and a host of other academic entities involved in or affecting language teaching practice. Teachers and theorizers can also rely on the findings of this research. The former by becoming informed on new currents in language teaching practice and re-visioning their teaching acts based on new paradigms, and the latter by revisiting the rationales and foundations of their theories to make modifications and adaptations necessary to facilitate and hasten a more sensible transition. Among the limitations we can refer to the reluctance or unwillingness or perhaps fear that most teachers had before volunteering to participate in the study especially when conducting the interview. They just consented to being interviewed as soon as the researchers reassured them that the questions were not politically laden and that they were going to be left unanimous so that their lives were not at all at risk.

### ABSTRACT

The present study was an attempt to compare the effect of peer metalinguistic corrective feedback on elementary and intermediate EFL learners' speaking ability to find out which level benefits more from this type of feedback. To this end, 117 female EFL learners at Grade 3, Al-zahra High School in Kermanshah, Iran were non-randomly chosen. The homogeneity of the participants was attained through a piloted Preliminary English Test (PET). Then, based on their scores, two groups with different levels of language proficiency (35 elementary and 32 intermediate students) were chosen as the target groups of the study. The participants' performance on the speaking part of the PET test was considered as the pre-test scores. The students were given the routine instructions while peer metalinguistic corrective feedback was practiced in the two classes. After the instructional period that lasted for a semester, the researchers used another PET speaking test as the post-test. The scores of both groups were rated based on the speaking rating scale of PET which was used for the pre-test, too. The analyzed results through an ANCOVA test showed that intermediate learners benefited more significantly from the treatment than the elementary group. Therefore, the null hypothesis was rejected.

**KEYWORDS:** Metalinguistic Corrective Feedback, Peer Feedback, Proficiency level, Elementary Learners, Intermediate Learners, Speaking.

### INTRODUCTION

With the growing need for international communication in the information age, many language learners seemingly attend language classes to improve their speaking ability. According to Folse (2006), for most people, the ability to speak a language is synonymous with knowing that language since speech is the most basic means of human communication. Even though many students have mastered basic speaking skills, some students seem to be much more effective in their oral communication than others. And those who are more effective communicators experience more success in school and most probably in other areas of their lives. Celce-Murcia (1991) states that, "today, language students are considered successful if they communicate effectively in their second or foreign language" (p. 125).

According to Thornbury (2007), spoken interaction involves producing and negotiating language rather differently from the way it is used in writing. Speakers and listeners are simultaneously involved in both producing and processing spoken interactions. They are under time-constraints, meaning that they must process language as they go, with no opportunities to go back and make changes. Speakers must also take account of relationships with others, adjusting their language according to the meanings they wish to get across, and responding to verbal or non-verbal signals from their listeners.

It is believed that during classroom interactions learners receive comprehensible input, opportunities to negotiate for meaning, and opportunities to produce modified output (Oliver, 1995; Swain, 1995). Meanwhile, research reveals that exposure to input alone is not sufficient for learners to acquire the target language items to a high level of proficiency (e.g., Long, 1996; Long & Robinson, 1998; Norris & Ortega, 2000). This especially applies to those features which are semantically redundant, syntactically complex and cognitively demanding. To compensate for learners' failure to notice some aspects of input, researchers have attempted to direct learners' attention to some linguistic features in the input which are problematic for learners. Corrective feedback is among the techniques which are believed to facilitate L2 development by providing learners with both positive and negative evidence (Long, 1996).

The term corrective feedback is defined by (Russell & Spada, 2006) as "any feedback provided to a learner, from any source, that contains evidence of learner error of language form" (p. 134). An influential study on the use of different types of corrective feedback by Lyster and Ranta (1997, pp. 46-48) has shown that teachers generally use six different feedback types when correcting learners' errors: 1) explicit correction: "the explicit provision of the correct form" where the teacher clearly indicates that what the student has said is incorrect (e.g., "Oh you mean", "You should say"); 2) recasts: "the teacher's reformulation of all or part of the student's utterance, minus the error"; 3) clarification requests: "indicate to students either that their utterance has been misunderstood by the teacher or that the utterance is ill-formed in some way; 4) metalinguistic feedback: "comments, information or questions related to the well-formedness of the students' utterance, without explicitly providing the correct form"; 5) elicitation: "teachers elicit completion of their own utterance by strategically pausing to allow students to *fill in the blank*"; 6) repetition: "the teacher's repetition, in isolation, of the student's erroneous utterance" (usually with adjusted intonation).

Although traditionally students received different types of corrective feedback mostly from their teachers, by the advent of new approaches in language teaching teachers try to train students to give feedback to each other to increase opportunities for students' intragroup interactions. Celce-Murcia (1991) lends support to student-to-student interaction by saying, "it is important to strive for a classroom in which students feel comfortable and confident, feel free to take risks, and have sufficient opportunities to speak" (p. 126). Other researchers and teachers suggest some effects on adopting peer feedback in class. They believe that it provides diversity with teaching compared with the traditional way of giving teacher feedback. Also, they mention that in peer

feedback session, students do not just listen to teachers' instructions, but work with their peers to do more practices; therefore, students' anxiety becomes lower and learning motivation can be higher. Moreover, they believe that peer feedback equips students with social affective strategies such as listening carefully, speaking at the right moment, expressing clearly, and appreciating others (Atay & Kurt, 2007).

However, according to Ellis (2009, p. 106), "there is no corrective feedback recipe" for all students and teachers cannot generalize one specific method to all learners. Also, Tedick and de Gortari (1998) suggest that teachers should practice a variety of feedback techniques as different techniques might appeal to different students in terms of their needs, proficiency level, age, and classroom objectives. As learners are progressing in the process of language learning, their proficiency level changes from time to time. These changes range from novice level to intermediate, advanced, higher advanced, and superior level. Considering these changes, it seems useful to use different types of corrective feedback which suit that particular level of proficiency. In fact, it seems to be the case that knowing learners' level and previous knowledge is necessary for teachers to avoid discouragement on the learners' side. Allwright (1975, as cited in Cohen, 1990) maintains that, "level of proficiency takes an important role in error correction because if the explanation of errors is beyond their level of proficiency, it will bring limited or no advantages" (p. 60).

### ***Speaking Skill***

Speaking as an active and productive language skill seems to be of most people's interest these days. People who know a language are referred to as speakers of that language, as if speaking included all other types of skills, and many, if not most foreign language learners are primarily interested in learning to speak (Ur, 2006).

Speaking is an interactive process of constructing meaning that involves producing, receiving and processing information (Brown, 2001; Burns & Joyce, 1997). Its form and meaning are dependent on the context in which it occurs, including the participants themselves, their collective experiences, the physical environment, and the purposes for speaking. Speaking requires that learners not only know how to produce specific points of language such as grammar, pronunciation, or vocabulary, i.e. linguistic components, but also understand when, why and in what ways to produce language, i.e. sociolinguistic competence (Cunningham, 1999).

Levelt (1989) identified three autonomous processing stages in speech production: (1) conceptualizing the message, (2) formulating the language representation, and (3) articulating the message.

Wilson (1997) claims that those who can translate their thoughts and ideas into words are more likely to succeed in school. Students who do not develop good listening and speaking skill will have life-long consequences because of their deficit. He also pointed out that speaking skills do not need to be taught as a separate subject. These skills can easily be integrated into other subject matters. This is because, students learn talking, clarify thoughts by talking, comprehend better with discussion of reading, write better after talking during writing conferences, develop confidence by speaking in front of peers, and provide a window to their own thinking through their talk.

Speaking in L2 has occupied a peculiar position throughout much of the history of language teaching, and only in the last two decades has it begun to emerge as a branch of teaching, learning and testing in its own right, rarely focusing on the production of spoken discourse (Bygate, 2002).

Graham-Marr (2004) mentions many reasons for focusing on listening and speaking when teaching English as a foreign language, not least of which is the fact that we as humans have been learning languages through our ears and mouth for thousands upon thousands of years, far longer we as humans have been able to read. Although not a set curriculum in most schools, speaking skills have been found to be a fundamental skill necessary for a child success in life.

Brown and Yule (1983) draw a useful distinction between two basic language functions. These are the transactional function, which is primarily concerned with the transfer of information, and the interactional function, in which the primary purpose of speech is the maintenance of social relationships.

Nunan (1999) mentions another basic distinction when considering the development of speaking skills: distinguishing between dialogue and monologue. The ability to give an uninterrupted oral presentation is quite distinct from interacting with one or more other speakers for transactional and interactional purposes. While all native speakers can and use language interactionally, not all native speakers have the ability to extemporize on a given subject to a group of listeners. Brown and Yule (1983) suggest that most language teaching is concerned with developing skills in short, interactional exchanges in which the learner is only required to make one or two utterances at a time.

The interactional nature of language was examined by Bygate (1996). He distinguishes between motor-perceptive skills, which are concerned with correctly using the sounds and structures of the language, and interactional skills, which involve using motor-perceptive skills for the purposes of communication. Motor-perceptive skills are developed in the language classroom through activities such as model dialogues, pattern practice, and oral drills and so on. Bygate (1996) suggests that, in particular, learners need to develop skills in the management of interaction as well as in the negotiation of meaning. The management of the interaction involves such things as when and how to take the floor, when to introduce a topic or change the subject, how to invite

someone else to speak, how to keep a conversation going and so on. Negotiation of meaning refers to the skill of making sure the person you are speaking to has correctly understood you and you have correctly understood him.

Nunan (1996) claims that a successful oral communication should involve developing some features which can be summarized as follows:

- The ability to articulate phonological features of the language comprehensibly;
- Mastery of stress, rhythm, intonation patterns; an acceptable degree of fluency;
- Transactional and interpersonal skills;
- Skills in taking short and long speaking turns;
- Skills in the management of the interaction;
- Skills in negotiating meaning;
- Conversational listening skills (successful conversations require good listeners as well as good speakers);
- Skills in knowing about and negotiating purpose for conversations.

### ***Feedback***

According to Williams and Burden (2000), behavioral psychologists were the first to recognize the power of feedback as a motivating influence. Any action or lack of action by another significant person may be interpreted as a form of feedback. Thus feedback can be given by means of praise, by any relevant comment or action or even silence. According to Lyster and Ranta (1997) feedback is how a speaker reacts to the errors of a language learner's utterance. Ur (1996) defines feedback as information that is given to the learner about his or her performance of a learning task, usually with the objective of improving this performance. Chastain (1988) states that teacher should be aware of giving feedback to the students. Any kinds of feedback can be negative or positive, but it is the teacher's task to choose that type of feedback that leads to positive students' attitudes.

Over the past few decades, language teachers and language learning researchers have been attempting to discover what is needed in order for a language student to be successful in the learning of the target language. According to Krashen (1985), one requirement for success in language learning is input of the target language, or what is called positive evidence, but as Long (1990) argues, exposure to the correct form of language is not enough for language learning, because the learners do not necessarily notice what is correct.

In all our interactions with others or even within ourselves, we receive information about our actions. In educational settings, teachers provide feedback to help students to be prepared for future tasks, improve performance and correct erroneous actions. Furthermore, students may generate their own internal feedback through their learning activities. Feedback is vital to any

effective learning environment if it addresses specific goals or outcomes and affords opportunity for learners to change.

### ***Corrective Feedback***

Although the provision of corrective feedback in the foreign language classroom seems natural in the process of learning a language, the role that corrective feedback plays in the classroom and the attitudes language teachers have towards it have not been the same through the years, or even from one teacher to another. On the other hand, in the theoretical ground, corrective feedback has also been an area of research and discussion in language acquisition and learning over the last decades, which has contributed to the debate about this issue.

For the sake of clarity, one of the first definitions of corrective feedback is that of Chaudron (1977) who considers it as "any reaction of the teacher which clearly transforms, disapprovingly refers to, or demands improvement of the learner utterance" (p. 31). Other synonyms of corrective feedback more commonly used are "error correction", "negative evidence", and "negative feedback". However, Han (2008) suggests that error correction implies an evident and direct correction, whereas corrective feedback is a more general way of providing some clues, or eliciting some correction, besides the direct correction made by the teacher. Ellis, Loewen and Erlam (2006) describe corrective feedback as follows:

"Corrective feedback takes the form of responses to learner utterances that contain error. The responses can consist of (a) an indication that an error has been committed, (b) provision of the correct target language form, or (c) metalinguistic information about the nature of the error, or any combination of these" (p. 340).

### ***Participants in the Corrective Feedback***

Considering the participant(s) in the corrective feedback interaction, according to Lyster and Ranta (1997), there are the following possibilities:

**Self-correction** is possible when the learner realizes that he has committed a mistake and repairs it by providing a correct form in place of the wrong one. Self correction seems to be preferred to correction provided by others: it is face-saving and allows the learner to play an active role in the corrective event.

**Peer-correction** occurs when one learner corrects another one. This kind of correction is appreciated for a number of reasons. Its most important advantages are the following: both learners are involved in face-to-face interaction; the teacher obtains information about learners' current abilities; learners co-operate in language learning and become less teacher-dependent; peer correction does not make errors a public affair, which protects the learners' ego and increases their self-confidence.

**Teacher-correction** occurs when the person who corrects the errors is the teacher. The teacher knows the problem and the solution, and can define and put things simply so that the student can understand the mistake. The student should trust and respect his/her place as a fluent speaker of English.

### ***Metalinguistic Corrective Feedback***

According to Ligthbown and Spada (2006), "metalinguistic corrective feedback contains comments, information, or questions related to the correctness of the student's utterance, without explicitly providing the correct form" (p. 126). Metalinguistic corrective feedback generally indicates that there is an error somewhere. Metalinguistic corrective feedback information generally provides either some grammatical terminology that refers to the nature of the error, for example 'is it masculine?', or a word definition.

Metalinguistic corrective feedback points to the nature of the error but attempts to elicit the information from the student. The following example from Ellis, Loewen, Elder, Erlam, Philip, and Reinders (2009) represents a metalinguistic feedback:

"Learner: He kiss her.

Researcher: Kiss- You need past tense.

Learner: He kissed" (Ellis et al., 2009, p. 319).

In other words, the teacher does talk about the student's utterance, but without explicitly telling the student where the error is, or what the correct form should be. Teacher simply tells the student that the sentence is not quite right, leaving the student to rethink and find the correct answer. Teacher may also give a hint. When it comes to the discussion of learners' uptake, which according to Ligthbown and Spada (2006) is "how students immediately respond to the corrective feedback" (p. 125). Lyster and Ranta (1997) found that metalinguistic corrective feedback as a kind of corrective feedback, along with elicitation, not only resulted in more uptake, they were also more likely to lead to a corrected form of the original utterance.

### ***Definition of Language Proficiency***

There is not a universally agreed-upon definition of language proficiency, but there are some scholar's idea about it at hand. Gasparro (1984, cited in Chastain, 1988) advocates proficiency as a goal and defines it as "the ability to use the language outside classroom independently of the materials and activities of the course" (p. 108). According to Clark (1972, as cited in Farhady et al., 2001) language proficiency is "the use of language for real life purposes without regard to the manner in which that competence was acquired" (p. 26). Bachman (1995) states that the distinguishing characteristic of language proficiency is its recognition of the importance of context beyond the sentence to the appropriate use of language" (p.

82). Cummin (1981, cited in Oller, 1983) believes that a communicative approach toward teaching and testing better reflects the nature of language proficiency than one which emphasizes the acquisition of discrete language skills. Hadley (2003) defines proficiency as "an idealized level of competence and performance attainable by experts through extensive instruction" (p. 2). Lee and Schallert (1997) also believe that theoretically, the construct of language proficiency is not a simple one as it relates to language competence, metalinguistic awareness, and the ability to speak, listen, read, and write the language in contextually appropriate ways.

### ***Levels of Language Proficiency***

When one wants to categorize something or put something in different levels, a criterion is needed. Language proficiency is not an exception. A criterion is needed to categorize language proficiency into different levels. Hadley (2003) mentions that as early as 1970, Woodford coined the term 'common yardstick', which was later on referred to a project to define language proficiency levels for academic contexts. The work begun by the common yardstick project was continued in 1981 by the ACTFL to find a design for measuring and communicating foreign language proficiency. Along with ACTFL rating scales of language proficiency, there was another scale called ILR (Interagency Language Roundtable), which was formed by cooperation of FSI (Foreign Service Institute), Britain and German organizations, representatives of U.S.A., and academic groups (pp. 9-12).

ACTFL defines and measures language ability in speaking, listening, reading, and writing. The guidelines set by ACTFL provisional proficiency guidelines describe four proficiency levels: Novice, Intermediate, Advanced, and Superior. The ILR scale contains eleven proficiency levels, from zero to five as it was shown in the previous page. When considering these two rating scales, two points should be taken into account. First, it should be remembered that moving from intermediate level to advanced level is much more difficult than moving from novice level to intermediate. The second point can be better described by the findings of Abbasian (1997). According to his findings, language proficiency possesses a 'level dependent' nature; that is, the skills and components of language proficiency are much more discrete at the lower levels than they are at higher levels at which they are integrated.

Omaggio (1986) states that there are three interrelated assessment criteria of language proficiency: global tasks/functions, context/content, and accuracy (as cited in Chastain, 1988). Huges (2003) describes these criteria further. He says that global tasks /functions are considered as different functions that a learner uses the language for. They can range from narrating objects, or basic greeting for novice level to describing a person or place for intermediate level, narrating in different time frame for advanced level or finally having discussion and argument in superior level. Context as the second criterion refers to circumstances or setting in which a person uses the language. Novice level learners are able to use present tense and only in predictable situations and settings. Higher-level learners can be flexible and are able to use the language in unpredictable situations and can even discuss political issues. Learners at superior level can handle unexpected problems in culture as well. Content

refers to the topic or themes of conversation. The content for novice level can be giving autobiography information and personal experiences, and for higher levels, the range of content is as wide as those of native speakers.

Accuracy is the next criterion for assessing language proficiency. Accuracy refers to the acceptability, quality, and precision of the message. When assessing accuracy, one should consider the following factors: fluency, grammar, pronunciation, vocabulary, pragmatic competence, and sociolinguistic competence. The degree to which the speaker relies on the listener for filling in the gaps in the message due to imperfect control of the language is one way to assess accuracy. Huges (2003) also adds another criterion to the aforementioned ones. He introduces 'text type' as another criterion in assessing language proficiency. He says that this criterion refers to the structure of discourse. Novice level learner can produce isolated words or phrases, while sentence-length discourse can be the product of intermediate level learners, and those in advanced level produce paragraph-length text type.

## **RESEARCH QUESTIONS**

Given the importance of speaking skill as part of language learning by EFL learners and the role of corrective feedback in language learning, this study intended to answer the following question:

Is there any significant difference between the effect of peer metalinguistic corrective feedback on elementary and intermediate EFL learners' speaking ability?

## **METHODOLOGY**

A thorough description of the participants, procedure, and instrumentation carried out for this study are presented in this section.

### ***Participants***

This study was conducted with 117 female EFL learners at Grade 3, Al-zahra High School in Kermanshah, Iran. They were selected non-randomly. They ranged from 16 to 18 years old and were at different levels of language proficiency. Based on the scores obtained from a PET test, 67 learners were chosen to be the main participants of the study and were put into the two experimental groups. Moreover, thirty other students who shared the same characteristics with the intended participants were chosen to participate in the piloting of the proficiency test (PET). It is worth mentioning that there were two raters who were EFL teachers with 7 and 10 years of English teaching experience at language schools and had MA TEFL degree.

### ***Instrumentation***

In order to obtain measurable data with which the results of the present study could be statistically analyzed, the following instruments were utilized:

**Preliminary English Test (PET):** This test which is a language proficiency test designed for people who can use everyday written and spoken English at an intermediate level was administered for homogenizing the participants at the beginning of the study. PET is one of the standardized tests among the series of Cambridge ESOL. This test is divided into three sections: Reading and Writing, Listening, and Speaking. All sections were administered in this study and each question carried one mark. The allocated time for this test was around two hours: 1 hour and 30 minutes for reading and writing, 30 minutes for listening, and 10-12 minutes for speaking.

**Text books:** The text books utilized in this study were the New Interchange books (3rd ed.) designed for elementary and intermediate students. Each book consists of 16 units. In this study, students studied the first 5 units. Although the speaking activities were the focus of this study, other skills were covered as well as their routine requirement of their course.

**Treatment:** Providing peer metalinguistic corrective feedback on learners' spoken utterances, i.e. learners were trained to provide some comments, information, or questions related to the correctness of their classmates' utterance, without explicitly providing the correct form.

**Post-test:** At the end of the treatment, the researcher used the speaking section of another PET test, with exactly the same characteristics discussed above under PET, as the speaking post-test.

**Rating scale:** The analytic rating scale of the PET speaking test was used in order to rate the participants' pre-test and post-test performances. The rating scale included five criteria each carrying three marks i.e., from 0 to 3. The criteria included grammar and vocabulary, discourse management, pronunciation, interactive communication, and global achievement.

### ***Procedure***

The following procedures were carried out to conduct the research:

First, the PET test was piloted on a sample of 30 students similar in characteristics to the target group of the study. Then, Item Analysis including Item Facility (IF) and Item Discrimination (ID) of all the items in the PET test was done and the reliability of the test was estimated. The analyses showed that there were six malfunctioning items; therefore, to make the test more reliable, those malfunctioning items were removed from the test. The reliability of the test was estimated both before and after removing the six malfunctioning items. Accordingly, the researchers considered the PET test as an appropriate instrument to homogenize the participants.

After that, the piloted PET test was administered to 117 participants of the study. It is worth mentioning that the participants' scores on the speaking section of PET were used for the pre-test. Once the administration of the proficiency test was done, the total scores obtained by the participants were calculated out of 100; so that based on the existing norms of the PET test, the researcher could choose the main participants of the study and put into the two experimental groups, each containing a distinct level of language proficiency: 35 students who obtained the

overall score between 45 and 69 were selected as the elementary group, and 32 students whose scores fell between 70 and 89 were considered as the intermediate group to take part in the study. Before the course started, the researchers held a briefing session in which the content as well as the learning activities and tasks and the objectives of the course, along with the nature of Peer Metalinguistic Corrective Feedback (PMCF) were discussed with the students. Then, the two classes underwent the same treatment which was providing PMCF on speaking errors. This was done by providing some comments, information, or questions related to the correctness of their classmates' spoken utterances, without explicitly providing the correct form. For example, when one of the students said, "I visit my friend yesterday", her partner only asked her, "what is the correct form of the verb in past tense?". In other words, she talked about her partner's utterance, without explicitly telling her where the error was, or what the correct form should be. The peer simply told her partner that the sentence was not quite right, leaving her to rethink and find the correct answer. The teacher also gave a hint whenever it was necessary.

The learners attended the classes twice a week for about four months that is to say for one semester. The allocated time for each session was one hour and forty-five minutes. Throughout the semester, besides teaching other skills, speaking activities of the text books were focused and PMCF was applied in both experimental groups.

After applying the PMCF as the treatment for one semester, an oral interview was administered to both groups. This was the speaking section of a PET test with the same characteristics of the one used for the pre-test. The students' interviews in both groups were recorded to be rated by the same raters and the same rating scale used for homogenizing the participants at the onset of the study. Finally, the pre-test and post-test speaking scores of the two groups were compared through an ANCOVA test and analyzed to test the null hypothesis of the study.

## **RESULTS**

This study was aimed to determine whether PMCF affects EFL learners' speaking ability at different levels of language proficiency to the same degree or not. In this study, the researcher deliberately manipulated one variable which is considered to be the independent variable; that is PMCF, to compare its effect on speaking achievement of intermediate and elementary EFL learners. So, the study enjoyed two-experimental-groups posttest only design.

### ***Testing the Null Hypothesis***

To test the research hypothesis which states that there is no significant difference between the effect of peer metalinguistic corrective feedback on elementary and intermediate EFL learners' speaking ability, the researcher had to run ANCOVA to control for the initial difference between

the two groups prior to the treatment. Firstly, the assumption of normality of the distribution had to be checked. The following table shows the descriptive statistics of the four sets of scores:

*Table 1: Descriptive Statistics of the two experimental groups' scores*

	N	Minimum	Std. Deviation	Mean	Maximum
intermediate pretest scores	32	6.00	1.55543	10.8750	13.50
elementary pretest	35	4.50	1.04379	6.8857	9.00
elementary posttest	35	4.50	1.11860	7.1857	9.50
intermediate posttest	32	7.50	1.36700	11.2969	13.50
Valid N (listwise)	32				

Quite expectedly, both groups improved their speaking after the treatment which is a logical result of the treatment (intermediate: 10.87 vs. 11.29, elementary: 6.88 vs. 7.18). The following table shows the result of the normality check:

*Table 2: Tests of Normality*

	Kolmogorov-Smirnov <sup>a</sup>			Shapiro-Wilk		
	Statistic	df	Sig.	Statistic	Df	Sig.
intermediate pretest scores	.131	32	.179	.939	32	.072
elementary pretest	.144	35	.065	.968	35	.398
elementary posttest	.137	35	.093	.971	35	.485
intermediate posttest	.103	32	.200*	.965	32	.363

As depicted above, the Kolmogorov-Smirnov sig values for the four sets of scores are above .05 level of significance. The same result is observed by Shapiro, Wilk test. Hence, the four sets were reasonably normally distributed.

The second assumption concerns homogeneity of variances, which was checked through Levene's test. The following table shows the result:

*Table 3: Levene's Test of equality of error variances<sup>a</sup>*

Dependent Variable: posttest scores			
F	df1	df2	Sig.
2.152	1	65	.147

Tests the null hypothesis that the error variance of the dependent variable is equal across groups.

a. Design: Intercept + pretest + proficiency grouping

As shown in the above table, the variance of the dependent variable was equal across groups ( $p = .147 > .05$ ). Therefore, the assumption was met.

There are two assumptions for ANCOVA that were checked: linearity of the relationship between the dependent variable and the covariate, and homogeneity of regression slopes. The following graph shows the linearity of the relationship.

Figure 1: Scatter plot showing the relationship between the pretest and posttest scores of the two groups

As displayed above, the relationship was linear for both groups, with all the cases spread along a straight line. So, the assumption was not violated. The second assumption can be checked both visually and statistically. Shown in the above figure, the two slopes are very similar. If the two lines were noticeably different in their orientation, that might suggest an interaction between the covariate (the pretest scores) and the treatment. Therefore, the assumption is met. Homogeneity of regression slopes was checked statistically as well. The following table shows the result:

Table 4: Tests of between-subjects effects  
 Dependent Variable: posttest scores

Source	Type III Sum of Squares	df	Mean Square	F	Sig.
Corrected Model	361.804 <sup>a</sup>	3	120.601	358.341	.000
Intercept	4.171	1	4.171	12.392	.001
Proficiency grouping	.570	1	.570	1.693	.198
Pretest	71.921	1	71.921	213.697	.000
Proficiency grouping * pretest	.104	1	.104	.309	.580
Error	21.203	63	.337		

Total	5991.500	67			
Corrected Total	383.007	66			

As the above table manifests, the interaction between grouping variable and pretest scores turned out to be non-significant ( $F=.309$ ,  $p=.58>.05$ ). Therefore, the second assumption is met statistically. The main results of ANCOVA are reported in the following table:

Table 5: Tests of between-subjects effects

Dependent Variable: posttest scores

Source	Type III Sum of Squares	Df	Mean Square	F	Sig.	Partial Eta Squared
Corrected Model	361.701 <sup>a</sup>	2	180.850	543.223	.000	.944
Intercept	4.392	1	4.392	13.191	.001	.171
Pretest	79.166	1	79.166	237.791	.000	.788
Proficiency grouping	2.845	1	2.845	8.547	.005	.118
Error	21.307	64	.333			
Total	5991.500	67				
Corrected Total	383.007	66				

a. R Squared = .944 (Adjusted R Squared = .943)

What is intended to be checked is whether the two groups were significantly different in their posttest scores. The sig value corresponding to proficiency grouping variable turned out to be less than .05 ( $F=8.54$ ,  $p=.005<.05$ ). Therefore, the difference between the two groups was significant after controlling for the pretest scores of the groups, with effect size as big as .118 implying that 11.8 percent of the variation in the dependent variable is explained by the independent variable, which is a medium size according to the Cohen's (1988) guidelines (.01=small, .06=medium, .14=large). The conclusion, hence, is that the hypothesis is rejected.

In the above table, the influence of the covariate is assessed as well. The corresponding sig value came out to be  $.000<.05$ , with the effect size .788 which is a large effect. It means that 78 percent of the variance in the dependent variable is explained by the covariate.

The following table shows the adjusted means on the dependent variable for each of the groups:

Table 6: Estimated marginal means

Dependent Variable: posttest scores

Proficiency grouping	Mean	Std. Error	95% Confidence Interval	
			Lower Bound	Upper Bound
Elementary	8.787 <sup>a</sup>	.142	8.503	9.072
Intermediate	9.545 <sup>a</sup>	.153	9.240	9.850

a. Covariates appearing in the model are evaluated at the following values: pretest scores = 8.7910.

As illustrated above, the depicted means are closer after being adjusted. By virtue of the mean scores and the significance of the difference, the conclusion is that the intermediate learners benefited significantly more from the treatment than the elementary level learners.

## **CONCLUSION**

The results of this study revealed that PMCF had a positive effect on EFL learners' speaking performance. Although the results of the present study confirmed the effectiveness of PMCF, as a type of corrective feedback, researchers have conflicting ideas regarding the efficacy of feedback. This means that students can learn from their mistakes, but this depends on adopting an appropriate feedback method. Thus, a substantial amount of research has been done over the last two decades into the value of different kinds of response offered to students' errors, both in L1 and increasingly in L2 (e.g., Doughty & Varela, 1998; Long, Inagaki & Ortega, 1998; Mackey, 1999; Muranoi, 2000; Havranek & Cesnik, 2003; Ellis et al., 2006; Lightbown & Spada, 2006).

The findings of this study support the claims made by those researchers who supported the idea of providing different students with different kinds of feedback e.g., Tedick and de Gortari (1998) suggest that teachers should practice a variety of feedback techniques as different techniques might appeal to different students in terms of their needs, proficiency level, age, and classroom objectives. In other words, the findings of this study showed that students at different levels of proficiency do incorporate metalinguistic suggestions to improve their speaking skill, but intermediate students benefited more from this strategy than elementary learners. Therefore, although teachers can take advantage of applying metalinguistic feedback in their speaking classes, this procedure would be more helpful for intermediate students. The result of the present study is similar to previous studies conducted by other researchers. In 1993, Carroll and Swain conducted a study with 100 Spanish-speaking learners of English as an L2 at intermediate level. The design had five groups with group (A) receiving direct metalinguistic feedback, performing significantly better than all the other groups. Similarly, Ellis et al. (2006) found that metalinguistic corrective feedback was more effective than other types of feedback on lower-intermediate EFL learners.

According to Elexy and Dennick (2004), feedback is effective if the students can hear it, understand it, and most important, act upon it in order to improve what they do. Therefore, based on the above-mentioned results, it can be concluded that metalinguistic corrective feedback procedure is more understandable and tangible to be acted upon by learners at higher levels of proficiency.

On the other hand, one point suggested in the literature is that if students are trained and given guidance and support, the interaction in the peer response would be useful and the given comments can be constructive. As Berg (1999) stated, "training is important for successful peer response" (p. 230); otherwise, most of the peers cannot give feedback to their classmates' errors appropriately due to the lack of understanding the subject matter and their proficiency level. Due to this fact, the researcher held a briefing session for the students before the treatment and provided them with necessary guidance throughout the procedure of treatment. Although all the participants could improve their speaking ability, the findings of the present study showed that the students with higher proficiency level demonstrated greater improvement than their class counterparts. Their higher level of English proficiency might have enabled them to better internalize what they had learned in the peer training session as well as in the peer feedback sessions and to use this internalized knowledge in the post-test more successfully than those in lower level of proficiency.

Moreover, one of the main aspects of peer feedback is communication. As Han (2002) mentioned, in communicative language teaching, corrective feedback remains an important vehicle for facilitating L2 knowledge construction and enhancing knowledge use. In fact, this aspect of the research treatment might have been another reason for the students' speaking improvement. Also, it can be concluded that intermediate students benefited more from this procedure because due to their higher language proficiency, they have been more successful communicators of English, hence they benefited more from this procedure. Rabiee (2006) mentioned in her research that the 120 students participating in the study, after receiving peer feedback and teacher feedback, found peer response activities more beneficial and interesting and they believed that peer feedback interactions provided them with an opportunity to work together in small groups.

Consequently, this study can be considered as another experimental evidence for the effectiveness of providing metalinguistic corrective feedback on EFL learners' errors which is in line with some other researchers' findings.

However, what the findings of this study offered to the literature was that peers could provide metalinguistic corrective feedback on their classmates' speaking errors at higher proficiency levels more efficiently than lower levels of language proficiency. The results of this study support the ideas by Rollinson (2005) who found peer feedback a collaborative group response as a potentially rewarding option. In his research, he discovered that peer feedback can be beneficial if there are considerations of age, cultural background, class size, and interlanguage level which may significantly influence overall outcomes.

## **LIMITATIONS**

The limitations imposed to the present study were as follows:

1. The participants of this study were limited to female learners because the researcher is female and is not allowed to teach in male schools. Therefore, the results may not be generalized to male population.
2. Another limitation was that, as there were a limited number of students in the classes assigned to the researcher, random selection of the participants was not possible.
3. In order to homogenize the participants, the researcher administered the Preliminary English Test. Although it was more appropriate to have all the subsections of the test administered in one session to keep factors influencing test performance controlled, due to the time limitation in each session and also the regulations of the school, the researcher was not able to administer the entire PET package in one session and this might have influenced the examinees' performance.

### ABSTRACT

One of the essential issues in second language acquisition which has been the focus of many studies in the last three decades is language input and its role in SLA. While the importance and the role of language input have been advocated by various theories of language learning, there has been a controversy over the extent of its importance. Krashen (1982) claimed that language acquisition can happen in formal and informal language learning settings only if language learners are directly involved in intensive exposure to a type of input which is comprehensible. In contrast to this claim, other researchers also considered comprehended input (Gass, 1988, 1997) incomprehensible input (White, 1987), and comprehensible output (Swain, 1985) to provide the necessary language input for SLA. In the same line, the present paper aims at providing an overview with regard to the importance of language input from different theories of SLA.

**KEY WORDS:** Language input, Second language acquisition, Comprehensible input, Incomprehensible input

### THE ROLE OF INPUT IN SECOND LANGUAGE ACQUISITION

There are many internal as well as external factors which influence SLA. Among them, the language input that learners receive in SLA is one of the external factors which plays a fundamental role. Corder (1967) is one of the pioneers among SLA researchers who underscored the importance of language input for SLA by drawing a distinction between input and intake. According to Corder, language input refers to what is available to be utilized by language learners for SLA which should be differentiated from intake which is that part of the input which is comprehended by the language learners.

The question of the role of language input in SLA has been of prime importance in much SLA research and theory. In fact, the review of the related literature on language input and SLA reveals that much work in this area of research has been concerned with the importance, the role, and the processing of linguistic input (Doughty & Long, 2003; Grady & Lee, 2011; Long, 1982; Nassaji & Fotos, 2011; Patten & Benati, 2010; among others). From this large pool of research, it

can be deduced that SLA simply cannot take place in a vacuum without considering having exposure to some type of language input (Gass, 1997).

However, while the importance and the role of language input has been advocated by various language learning theories, there has been a controversy in the field of language acquisition between those theories that attribute a small or no role to language input and those attributing it a more important role. According to Ellis (2008), theories of SLA attach different importance to the role of input in language acquisition process but they all acknowledge the need for language input. In many approaches to SLA, input is considered as being a highly essential factor while in other approaches it has been neglected to a secondary role. In fact, what has been changed in relation to the role of input in language learning from the viewpoint of various language learning theories is the conceptualization of how language input is processed by language learners (Doughty & Long, 2003).

In this relation, Ellis (2008) considered the role of language input in SLA based on behaviorist, mentalist, and interactionist theories of language learning. The behaviorists view language learning as environmentally controlled by various stimulus and feedback that language learners are exposed to as language input. Indeed, the behaviorists consider a direct relationship between input and output. They ignore the internal processing of the mind for language acquisition. For the behaviorists, language acquisition is controlled by external factors among which language input which consists of stimuli and feedback is central (Ellis, 2008). Mentalist theories also claim that input is needed for SLA but because the learners' brains are equipped to learn any language with innate knowledge, language input is merely considered as a trigger that activates the internal mechanism (Ellis, 2008). Interactionists theories of SLA highlight the importance of both input and internal language learning processing. They view language acquisition as the result of an interaction at the discourse level between the learners' mental abilities and the linguistic environment and input as the role of affecting or being affected by the nature of internal mechanisms (Ellis, 2008).

Other theories that underscore the important role of language input in SLA are the information processing and skill-acquisition theories (Nassaji & Fotos, 2011). According to Nassaji and Fotos (2011), the role of language input in information processing theories is important because it is the information embedded in the input and its frequency that help language learners acquire the target language. Moreover, language input is essential in skill-acquisition theories because it forms learners' initial declarative knowledge which refers to the knowledge about the language. Other researches in spoken languages also indicate that the amount of language in the input and its frequency are indeed highly relevant for the acquisition of language (Hart & Risley, 1995).

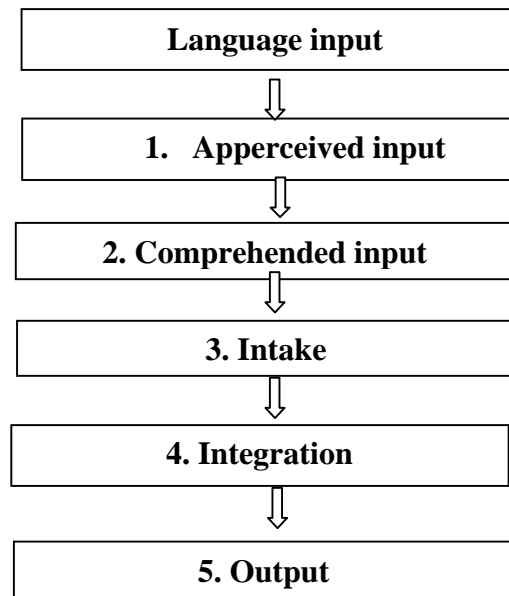

Gass (1997) also considered the role of language input in the input-interaction model, the input hypothesis, the universal grammar model, and the information processing model which treat the role of language input in different ways. In the input-interaction model, the language input that language learners receive is strengthened by the manipulation of the input through interaction which forms a basis for SLA. Within Krashen's comprehensible input hypothesis, SLA takes place merely by means of comprehensible input which the language learners receive. That is, only the language input that is a little beyond the learners' language competence is useful for SLA. The third model is the universal grammar which asserts that language input is important but there must be something in addition to language input. This is the innate capacity which helps language learners acquire the second language. The last model is the information processing model in which the learner must first notice that there is something to learn. Then, the learner's

attention is drawn to those parts of the input which do not coincide with the internalized competence. In this model, language input is necessary for providing information for language construction (Gass, 1997).

The role of input in SLA has been highlighted as constituting the primary data for SLA (Long, 1982; Pica et al., 1987; VanPatten & Williams, 2007). Patten and Benati (2010) have emphasized that language input is a major source of data for language learners to construct their competence or mental representation of the language based on the examples embedded in the input. Grady et al. (2011) also highlighted the role of input in SLA by noting that in some cases of SLA there are indications that at least some features such as lexical development are directly shaped by the input. In other words, the language acquisition process is dependent upon the availability of appropriate language input.

Besides the role of language input in SLA which has been considered from the perspectives of different language learning theories and models, language input has also been given the initial role to provide the necessary data for SLA in some frameworks. Among the researchers who have studied the role of language input in SLA, Gass and Selinker (1994) proffered a framework which indicates the importance of input in SLA process.

Within the framework introduced by Gass and Selinker (1994), there are five levels for turning input into output: apperceived input, comprehended input, intake, integration, and output which account for SLA process. According to their model (Figure 1), language input refers to various sources of second language data which the learners are exposed to.

*Figure 1: Gass and Selinker's model (1994) for second language acquisition*

The first stage of the SLA model which is concerned with input utilization is called apperceived input. In this stage, some of the language input is noticed by the language learner because of some particular features such as frequency, affect, prior knowledge, and attention (Gass &

Selinker, 1994). The second stage is the comprehension of that bit of language input which is apperceived. Then, in the third stage which is a mental activity, the language input is comprehended and internalized by the language learners which refers to intake. The fourth stage is the integration of the intake with the prior knowledge to arrive at the fifth stage which is the output in the form of written or spoken language.

Likewise, Ellis (1997) introduced a basic computational model of SLA with an initial focus on language input. In this model, language learners are first exposed to language input which is then processed in two stages. First, some parts of the input that are comprehended by the language learners turn into intake. Second, some of the intake which finds its way to the long term memory is then turned into knowledge which results in spoken or written output. While Gass and Selinker's (1994) and Ellis's (1997) theoretical frameworks for SLA attach the initial importance to language input, they differ from each other in the number of stages that language input is processed in the minds of language learners.

In a nutshell, comparing the theories and theoretical frameworks for SLA based on the role of language input reveals that the importance of language input is highlighted by various theories and theoretical frameworks for SLA. In the same line, one of the most influential SLA hypothesis concerned with the role and importance of language input in SLA is the input hypothesis (Krashen, 1981, 1982, 1985). As a matter of fact, most of the studies on the type of language input and SLA have been developed to either support or criticize Krashen's input hypothesis which first claimed the important role of comprehensible input for SLA. Indeed, input hypothesis triggered numerous studies in the investigation of issues related to the type of language input for SLA (Ying, 1994).

### **KRASHEN'S INPUT HYPOTHESIS AND SECOND LANGUAGE ACQUISITION**

One of the important psychologically oriented theories of language learning was established by Krashen (1981, 1982, 1985). He proposed a 'monitor model' of second language learning including five hypotheses: the input hypothesis, the natural order hypothesis, the acquisition-learning hypothesis, the monitor hypothesis, and the affective filter hypothesis. The hypothesis related to this study is the input hypothesis which is put forth.

As was discussed above, language input is considered as a highly essential factor in the SLA process. In this relation, the input hypothesis continues to make strong claims regarding the role of language input and the necessity of exposure to comprehensible input in SLA. The input hypothesis claims that for SLA to take place, language learners must have exposure to a type of second language data which they can comprehend. Krashen identified comprehensible input as "the only causative variable in SLA" (Krashen, 1981, p. 57). According to Krashen, for SLA to take place, language learners must have exposure to comprehensible input which contains language structures that are beyond their current level (I+1). Based on Krashen's claims regarding language input and SLA, the basic assumptions of the input hypothesis can be summarized as follows: (1) access to comprehensible input as a potential type of language input is the main characteristic of all cases of successful SLA, (2) greater quantities of comprehensible input seem to result in faster or better SLA, and (3) lack of access to comprehensible input results in little or no SLA.

Few researchers (Long, 1982; Ellis & He, 1999; Gass & Varonis, 1994) have advocated the input hypothesis by suggesting modified input, interactionally modified input, and modified output as

three potential sources of comprehensible input for SLA. Accordingly, modified input refers to a type of language input which has been modified or simplified in some ways before the language learners are exposed to it, interactionally modified input originates from input modification that occurs when language learners experience difficulty comprehending a message in interaction with interlocutors, and modified output refers to language learners' efforts to modify their output to make it more comprehensible to the interlocutor (Long, 1996).

Another aspect of the input hypothesis in relation to acquiring the language in informal setting (out of the classroom environment) is the importance of direct exposure to a source of language input. According to Krashen (1981), language acquisition can take place in informal environment if language learners are directly involved in intensive exposure to language input. Later, it will be discussed that this aspect of the input hypothesis which emphasizes the necessity of exposure to language input for language learning to occur has also been emphasized by Krashen's critics. Nevertheless, empirical evidence related to the sources of language input, quality, and quantity of the input has not been provided neither by Krashen nor his critics.

### **CRITIQUES OF THE INPUT HYPOTHESIS**

Despite the significant influence that the input hypothesis has had on the researches around the role of language input in SLA, it has received strong criticisms from several researchers.

Serious concerns regarding the input hypothesis were expressed by McLaughlin (1987). McLaughlin claimed that the concept of a learner's level is extremely difficult to define which limits the application of this rule in the classroom since individual differences come into play when determining the learners' current levels. In fact, determining the current level of each language learner and providing  $i+1$  language input for each of them separately in the classroom seems to be very difficult to fulfill. Krashen did not provide solutions regarding this issue. There are also some problems regarding how to provide language learners with language input which matches their  $i+1$  level.

The input hypothesis has also been challenged by many researchers particularly because it has made a large number of claims about the type and the qualitative aspect of the necessary language input in a wide array of SLA phenomena without providing solid empirical evidence. In other words, because Krashen's input hypothesis limits SLA to merely exposure to comprehensible input, the criticisms directed at the input hypothesis are mainly around the nature and the type of language input that can constitute the primary data for SLA. In fact, although second language researchers and the critics of Krashen's input hypothesis highlight the important role of input in SLA and agree on the fact that language input is a necessary ingredient in SLA (Salaberry, 2003), they claim that SLA is not achieved merely through comprehensible input. Other types of language input such as incomprehensible input, comprehended input, and

comprehensible output are also considered to enhance the process of SLA through providing the necessary input.

White (1987) considered the necessary language input which constitutes the primary data for SLA to be either comprehensible or incomprehensible. In his incomprehensible input hypothesis, White underscored the point that it is the input incomprehensibility or comprehension difficulties which can provide important negative feedback to the learner that is necessary for the constitution of SLA. When language learners encounter language input that is incomprehensible because, for example, their inter-language rules cannot analyze a particular second language structure, they have to modify those inter-language rules to understand the structure (White, 1987). In this way, the incomprehensible input enhances the process of SLA. It can be concluded from what White (1987) has put forth in relation to comprehensible or incomprehensible input that when an aspect of the language input is comprehensible, the acquisition of the missing structures would not occur. In fact, the incomprehensibility of some aspects of the given language input to the language learners draws their attention to specific features to be acquired.

Gass (1988, 1997) also emphasized that crucial importance should be given to the concept of comprehended input rather than comprehensible input. According to Gass, only that part of the language input which is comprehended is involved in the SLA process. In other words, the primary language input which is necessary for SLA may be beyond the boundaries of comprehensible input. In the same line and as was discussed earlier, in Gass and Selinker's (1997) and Ellis's (1994) theoretical models for SLA, language input which is apperceived by the language learners and then is turned into comprehended input and intake is not limited merely to language data (input) which should necessarily be comprehensible. Indeed, language learners are exposed to a body of second language input which may or may not be within the range of  $I+1$ . Out of this initial body of language input, some of the input is noticed by the language learners because of frequency, affect, prior knowledge, and attention (Gass & Selinker, 1997). Hence, the qualitative aspect of language input in Gass and Selinker's (1997) and Ellis's (1994) theoretical models for SLA is not limited to language input that is necessarily at the language learners'  $i+1$  current language proficiency level.

In addition to incomprehensible input and comprehended input, Swain (1985) also argued in her comprehensible output hypothesis that in addition to comprehensible input, comprehensible output can also provide the necessary data for SLA. The comprehensible output hypothesis states that language learning takes place when the language learner faces a gap in his/her linguistic knowledge of the second language. By noticing this gap, the language learner tries to modify his/her output. This modification of output may end in learning a new aspect of the language which has not been acquired yet. Although Swain does not claim that comprehensible output is solely responsible for all or even most parts of the language acquisition, she highlights the point that under some conditions, comprehensible output facilitates SLA in ways that it can provide the necessary input. As a matter of fact, although Swain (1985) acknowledged that without comprehensible input language learners are not able to make connections between forms and meanings for SLA development, she provides evidence of the immersion programs in which comprehensible input alone does not lead to SLA. This view contrasts sharply with Krashen's input hypothesis where the role of production, or output, is minimized.

The input hypothesis maintains that increased comprehensible input will result in more language acquisition, and that increased output will not. However, no clear empirical evidence has been provided for this assumption. In this regard, Romeo (2000) showed support to Swain's

comprehensible output hypothesis when he indicated that output of some kind is seen as a necessary phase in language acquisition. On the one hand, teachers need students' output in order to be able to judge their progress and adapt future materials to their needs. On the other hand, learners need the opportunity to use the second language because when faced with communication failure, they are forced to make their output more precise. These arguments suggest that if comprehensible input is necessary, then so is comprehensible output which can be utilized as a source of input in SLA process. This view goes against Krashen's input hypothesis.

To come to the point, what can be concluded and summarized from Krashen's input hypothesis and his critiques' concerns is that the importance of language input for SLA is not questioned and some type of language input is required for SLA. Accordingly, in addition to modified input, interactionally modified input, and modified output which are considered as various types of comprehensible input for SLA, comprehended input, incomprehensible input, and comprehensible output can also provide the necessary language input for SLA. Hence, without debating on the right or wrong of Krashen's theory which is beyond the scope of this study, the premise taken is that some types of language input is necessary for the study without delving into the psychological aspects of the language input.

## **CONCLUSION**

There are many internal as well as external factors which influence SLA. Among them, the language input that learners receive in SLA is one of the external factors which plays a fundamental role. However, according to Ellis (2008), although SLA theories attach different importance to the role of language input in language acquisition, they all acknowledge the need for language input.

In view of the above, the present paper was set to provide an overview regarding the role of language input in SLA. As it is concluded, SLA, cannot simply take place in vacuum without having exposure to some sort of language input. While comprehensible input might be the best type of language input for the low level language learners, language learners with higher language proficiency levels may best benefit from incomprehensible language input.

In a nutshell, the controversial issues in relation to language input are the type and the amount (quantity) of language input necessary for SLA which have also been highlighted by Gass (1997). As a matter of fact, although the importance of input in SLA has been emphasized by the majority of the researchers, little has also been written about the type and amount of language input for SLA. In fact, the studies on the role and importance of language input in SLA fall short of providing evidence of the sources of language input which can provide the necessary language input for SLA.

His field of interest is mainly related to the use of technology and second language acquisition. He has recently been selected as the international examiner for an M.A thesis from the University of Newcastle, Australia (2013).

## **DEVELOPING ESL STUDENTS' ACCENTS: AMERICAN ENGLISH VS. BRITISH ENGLISH**

**Esmail Hassannejad**

*Department of English Language, Dezful Branch Islamic Azad University, Dezful, Iran*

*E-mail: myhonor504@yahoo.com*

### **ABSTRACT**

For many years, English as a Second language (ESL) students have been subject to different puzzling audio books and software with American and British English accents on one hand, and a variety of the teachers' non-native and native-like accents inside the classrooms on the other. The paper aims at investigating the relationship between General American accent defined by Shitara (1993) as the most "neutral" accent of American English which is free of regional characteristics and Received Pronunciation (RP) stated by Wells (2008) as the standard British English accent and pinpointing the extent of ESL students' tendency to one of the two mentioned accents in order to help teachers select the most appropriate methods for teaching listening and speaking in ESL classrooms. To fulfill these purposes, sixty freshmen undertaking a full-course of study in Lang. Lab. 2 in Islamic Azad University of Dezful were selected and through a standard proficiency test derived from NTC's TOEFL Test, it was observed that the students were homogeneous. Then, they were given a common text to recite so that their tendency to one of the two Standard English accents could be realized. Afterward, the specific sounds features of General American and RP were elicited and the students' recordings were rated based on the articulation of those features. Based on the frequency, One sample T-test and the Mean Ranks posed by Hatch and Farhady (1982), it was observed that the students were more capable of articulating American features rather than the British ones. Hence, the null hypothesis which stated "There is no relationship between American and British English accents." was rejected, and the first hypothesis was verified. That is, the ESL students are more talented to utilize American English accent than the British English accent. The pedagogical implications of the present study are 1) recognizing the ESL students' tendency to American English accent inherited from the students' past experience including their former instructors, course books and other materials; 2) providing the students with an academic atmosphere wherein American English system including the related course books, audio and visual materials and efficient instructors is dominant.

**KEY WORDS:** General American, British English, Received Pronunciation.

### **INTRODUCTION**

The ESL students get, more or less, involved in some puzzling issues rooted in the differences between American and British English accents. This is exacerbated by their exposition to a whole

variety of written literature in the forms of textbooks and software recommended by their teachers. Likewise, the teachers' unreal and non-native accents would not be helpful either. In other words, unwitting tendency of teachers to intermingle the two accents is bound to yield a non-native model as a result. There are various ways via which one can go through with tackling the issue. One is to take an informative approach by enlightening ESL students about the appropriateness of each accent on the basis of his or her academic ability and other intrinsic considerations.

### ***The Importance of Research***

Recognition and proper understanding of the tendency of ESL students to one of the two main English accents (American English and British English) is crucial for identifying the most appropriate textbooks and other learning materials to lay the foundation for effective learning. This has to be complemented by provision of service from experienced and knowledgeable teachers having a native-like pronunciation and accent. The effective performance of such teachers is likely to be instrumental in motivating the learners to follow a set pronunciation pattern that is as closed to a native (near-native) accent as the circumstances allow. By the same token, it might help enhance the learning efficiency and learning curve by adjusting the whole activities to suit the ESL students' accent preference. Such an approach is thought to make a crucial psychological impact on the ESL students which is expected to enhance their academic performance and interests.

### ***Objectives***

To assess the quality of present teaching method for the ESL students' vis-à-vis the use of American English and British English accents in the classrooms.

To consider the tendencies of the ESL students' in using one or the other accent for the best result.

## **REVIEW OF LITERATURE**

According to Lippi-Green (1997, pp.12, 251-285), when a group defines a standard pronunciation, speakers who deviate from it are often said to "speak with an accent". However, everyone speaks with an accent. Accents such as BBC English or General American or Standard American may sometimes be erroneously designated in their countries of origin as "accentless" to indicate that they offer no obvious clue to the speaker's regional or social background. Based on Matsuda (1991, pp.100, 1329-1407), People from the United States would "speak with an accent" from the point of view of an Australian, and vice versa. Furthermore, Morley (1996, pp. 140-160) believes that many teachers of English as a second language neglect to teach speech/pronunciation. Many adult and near-adult learners of second languages have unintelligible speech patterns that may interfere with their education, profession, and social interactions. Inadequate instruction in speech/pronunciation can result in a complete breakdown in communication.

Crawford (2008) states that English has been given official status by 28 of the 50 state governments. The use of English in the United States was a result of English colonization. The first wave of English-speaking settlers arrived in North America in the 17th century. Since then,

American English has been influenced by the languages of the Native American population, the languages of European and non-European colonists, immigrants and neighbors, and the languages of slaves from West Africa. According to Safer (2006), General American is the accent typically taught to people learning English as a second language in the United States, as well as outside the country to anyone who wishes to learn "American English," although in much of Asia and some other places ESL teachers are strongly encouraged to teach American English no matter their own origins or accents.

Based on Tolkien (1955), English is a West Germanic language originated from the Anglo-Frisian dialects brought to Britain by Germanic settlers from various parts of what is now northwest Germany and the northern Netherlands. The resident population at this time was generally speaking Brythonic—the insular variety of continental Celtic which was influenced by occupation by the Romans. This group of languages (Welsh, Cornish, Cumbric) cohabited alongside English into the modern period, but due to their remoteness from the Germanic languages, influence on English was notably limited. Initially, Old English was a diverse group of dialects, reflecting the varied origins of the Anglo-Saxon Kingdoms of England.

Based on Fowler (1996), the form of English most commonly associated with the upper class in the southern counties of England is called Received Pronunciation (RP). It derives from a mixture of the Midland and Southern dialects which were spoken in London in the early modern period and is frequently used as a model for teaching English to foreign learners. It may also be referred to as "the Queen's (or King's) English", "Public School English", or "BBC English" offered by Roach (2006) as this was originally the form of English used on radio and television, although a wider variety of accents can be heard these days.

## RESEARCH QUESTIONS

In order to fulfill the purpose of this study which is to consider the extent of the ESL students' tendencies to one of the two major English accents (American English and British English), one is expected to focus on the following questions:

Are there any relationships between American English and British English accents?

Is American English accent more widespread than British English accent among ESL students?

## HYPOTHESES

Hypothesis 1: ESL students are more talented to utilize American English accent than British English accent.

Null Hypothesis: There is no relationship between American English accent and British English accent.

## METHODOLOGY

### *Participants*

The investigation of the ESL students' attraction to American or British English accent was intended for 60 typical intakes in Islamic Azad University, Dezful in Iran, undertaking a full-course of study in Lang. Lab. 2. The criterion for selecting this population sample was a

proficiency test consisting of grammar, reading comprehension and vocabulary in English. Sixty students graduated from high school and entered the university as freshmen were selected for this study. Each student was told separately to recite a short given text based on what they had learnt earlier. The selected sample was drawn from the intakes without a prior knowledge of the investigation. This meant performing lectures and rehearsals with a minimum distraction. The researcher who was simultaneously acting as a teacher recorded the whole process. This meant recording of recitation and the voices to draw as authentic picture of the reality as possible.

### ***Instruments***

To use necessary items for proficiency test, 20 vocabulary questions 20 grammatical items and 10 questions on reading comprehension were elicited from NTC'S Practice for the TOEFL provided by Broukal and Nolan-Woods (1997) . It is to be noted that due to the limitations of the study which might have affected the result of the study, the mentioned sample TOEFL test was not verified in terms of reliability. All together, the proficiency test consisting of 50 questions, each of which had a two- point mark with the total of 100 points. Regarding the results of the proficiency test on 60 students, the Mean was 83.45. The Minimum and maximum score ranged between 72 and 97 respectively. Likewise, the Mode was equal to 84, the Standard Deviation 6.82, and the Kurtosis offered by Kurtz (1983), referring to the degree to which scores congregate in the tails of the distribution, was - 0.784. Therefore, homogeneity and normal distribution were apparently observed among the participants' scores and the presented data.

### ***Procedure***

Based on Rogers (2000), the term accent is used to refer solely to *phonetic* aspects of a dialect. Likewise, an accent is shaped by the phonetic ability to produce certain sounds and features and the inability to produce certain sounds due to the fact that they are not present in the speakers' native language phonetic inventory (Ben Said, 2006). Hence, having observed the homogeneity existing among the selected subjects' proficiency levels, the researcher provided them with a short text so that he could check the phonetic features articulated by them on the basis of what they had acquired subconsciously from their instructors, course books and related audio and visual materials. It should be stipulated that the way he asked them to rehearse the text was expected to be as implicit and authentic as possible. In other words, students were not allowed to access the hints about how to shift their accents to one of the two mentioned Standard English accents while articulating the given text based on their own accents. The suggested text included the words having distinctive speech sounds regarding American and British English accents. Hence, the articulation of speech sounds could determine the students' tendency to one of the two mentioned accents. According to Shitara (1993), General American is a notional accent of American English perceived by Americans to be the most "neutral" and free of regional characteristics and to lack certain non-standard features. Based on her findings, General American includes nine phonetic features: 1) rhotic which maintaining the coda [r] in words like pearl, car, and court; 2) flapping which involves a rapid movement of the tongue tip from a retracted vertical position to a horizontal position, during which the tongue tip brushes the alveolar ridge regarding /t/ and /d/ ; 3) reduction of vowel contrasts before historic /r/; 4) yod dropping that is the elision of the sound [j] in most varieties of English like juice, chew, rude, blue; 5) Split which has to do with /ɔr/ sound in some words like origin, Florida, horrible, quarrel, warren; 6) Daniel Jones's /oʊ/ in some words like go, so, know; 7) h-dropping in some

words like head or horse; 8) Mary-marry-merry merger; 9) father-bother merger. Conversely, Received Pronunciation (RP) which was defined by Wells (2008) as the standard accent of Standard English in England, with a relationship to regional accents similar to the relationship in other European languages between their standard varieties and their regional forms includes twelve phonetic features: 1) lot-cloth split in words like *often* (the Queen's speech to President Sarkozy, 2008); 2) horse-hoarse distinction with an extra diphthong /ɔə/ appearing in words like hoarse, force, and pour offered by Wright (1905); 3) "GOAT" vowel with the transcription /əʊ/ presented by Wells (1997) instead of Daniel Jones's /oʊ/, reflecting a change in pronunciation since the beginning of the century; 4) foot-strut split in pairs like put/putt presented by Wells (1982); 5) non-rhotic presented by Wells (1982); 6) non-h-dropping offered by Wells (1982); 7) no weak vowel merger pinpointed by Wells (1982); 8) no Mary-marry-merry merger presented by Wells (1982); 9) no father-bother merger mentioned by Roca and Johnson (1999); 10) non-yod-dropping presented by Wells (1982); 11) no flapping offered by Wise (1957); 12) /rV/ in some words like origin, Florida, horrible, quarrel, warren, borrow, tomorrow, sorry and sorrow provided by Pointon (2010). In addition to the mentioned differences between the two standard types of English accents, there are still other differences in accordance with the articulation of some vocabulary items in American and British English accents some of which were used in the text given to the students. The pronunciation of some words like *laboratory*, *castle* offered by Wise (1957) and *going to* are considered as such. After finding the mentioned American and British features from the students' recordings, the researcher was reported to determine a scale for scoring those phonetic features and then to insert them in a list. Accordingly, their recordings were rated on the basis of PTE Academic Score Guide (2012, p.21) in such a way that 2 indicated **Satisfactory**, 1 represented **Average**, and 0 meant **Weak**. Since all participants were non-native and their recordings were not like those of the native or near native speakers, no more scores could be allocated to each uttered speech sound feature. Based on the rated *General American* speech sounds features among 60 students, 51 students had satisfactory accents which equaled 85 percent; 4 participants' recordings were average which equaled 6.7 percent, and 5 students had weak accents comprising 8.3 per cent. Regarding the General American speech sound features, they were reported to be satisfactory except "laboratory" and "gonna". In other words, the students were capable of articulating most of the General American speech sounds. "Laboratory" was the most frequent variable uttered in the average level, and "gonna" had the maximum frequency for weak level.

## RESULTS AND DISCUSSION

Having finished all calculations, the researcher was expected to analyze and interpret the results of each calculation deliberately. It is to be noted that 60 freshmen studying *Lang. Lab 2* were selected so that their existing accents and tendencies could be checked separately. In order to show homogeneity among the participants, the researcher held a proficiency test designating the students' general knowledge. Then, they were given a common text to rehearse as authentically as possible so that their accents could be analyzed. Having recorded their voices separately, the researcher was recommended to utilize an analytic scale comprising three levels each of which was shown through a specific score for scoring General American and Received Pronunciation specific sound features. Accordingly, the satisfactory level was shown by 2, Average level by 1 and Weak level was illustrated by 0. Afterwards, the audios were rated based on the mentioned scale by the researcher. In order to see if the mean of each General American speech sound feature was satisfactory, the researcher was expected to utilize a One-sample T-test posed by Hatch and Farhady (1982). Likewise, *Daniel Jones's* /ou/, *father-bother-merger*, *castle* and *can't* had the maximum mean, 1.83, which was so close to satisfactory level among all

General American specific features. So it could be realized that the students were more efficient in applying these speech sounds features, but not in uttering “gonna” whose mean was 0.33. Similarly, in order to hold a One-sample T-test, he was supposed to get the means related to the variables. It was observed that all variables were more than average and close to satisfactory level except for “gonna” since  $t$  was positive for each variable except “gonna”. It is to be noted that  $\alpha=0.05$  and sig. was lower than 0.05 for each variable, so the mean was more than 1 for each variable. In accordance with the rated **RP British** speech sounds among the same students, just 5 students had satisfactory accents including 8.3 per cent, and 55 participants’ recorded accents were weak which equaled 91.7 per cent. No one’s accent was average. Regarding the above figure, most RP speech sound features were reported to have weak frequency. In other words, the students were not capable of uttering most of the RP speech sounds. With regard to the mentioned data, the means of all features, except “no flapping” were close to 0.5 or lower than 0.5 which represented almost weak level. So it could be deciphered that students were not capable of articulating RP British speech sounds features properly. Moreover, in order to hold a One-sample T-test, the researcher was committed to get the means related to the mentioned variables. It was noticed that all variables were lower than average and close to weak level. It is to be noted that  $\alpha=0.05$  and sig. was lower than 0.05 for each variable, so the mean was lower than 1 for each variable. In addition, since  $t$  was negative in each variable, it was realized that the variables were weak. In order to prove that there is a meaningful difference between the means of General American and RP English specific speech sounds features ranks, the researcher was suggested to use Friedman test. It should be stipulated that the mean of each speech sound feature rank would determine the priority of the mentioned feature to other speech sound features. That is, the higher the mean of each rank was, the superior it could be considered to other features. Accordingly, among all General American and RP specific phonetic features, the *Mean Rank* of *can’t* (*AmE*) was the highest, 25.97, and it meant that the rater had been more satisfied with the articulation of this specific feature than that of other features. Likewise, the *Mean Rank* of *laboratory* (*BrE*) was the lowest, 10.67. So it meant that the students were not capable of uttering this feature appropriately, and the rater was dissatisfied with its articulation among all participants rather than the articulation of other speech sounds. In addition, *gonna* had the lowest *Mean Rank* among all General American phonetic features. It meant that the rater was dissatisfied with its articulation, and the participants were not able to utter this feature. Furthermore, the *Mean Rank* of *no flapping* was the highest among all RP specific speech sounds features. Concerning the data resulted from Friedman test, as  $\alpha=0.05$  and Sig. was lower than 0.05 for the comparison of Mean Ranks related to General American English features, RP British English features and also the Mean Ranks of all mentioned American and British features, it was realized that the Mean Ranks were not equal. In other words, there was a meaningful difference among the Mean Ranks of General American features; similarly, there was a meaningful difference among the Mean Ranks of RP features. In addition, there was a meaningful difference between the Mean Ranks of General American and RP phonetic features.

Table 1: General American and RP Features Ranking by Friedman test

Test Statistics American		Test Statistics British		Test Statistics Total	
N	60		60		60
Chi-Square	339.002		190.155		1123

Df	15	17	33
Asymp. Sig.	0.001	0.001	0.001

To show the meaningful difference between the Mean Ranks of General American and RP specific features, the researcher applied a Mann-Whitney test presented by Fay et al (2010), and then he utilized a T-test by all General American and RP specific features.

*Table 2: General American and RP Features Mean Ranks*

Ranks				
	Group	N	Mean Rank	Sum of Ranks
Accent	General AmE	60	85.33	5120.00
	RP	60	35.67	2140.00
	Total	120		

The above table indicates that the Mean Rank of General American accent equals 85.33 which is higher than that of RP accent which equals 35.67. Hence, the students' American accent efficiency has been superior to their British accent capability.

*Table 3: Illustrating the Meaningful Difference Between the Mean Ranks of General American and RP Using Mann-Whitney Test*

Test Statistics	
	Accent
Mann-Whitney U	310.00
Wilcoxon W	2140.00
Z	-8.89
Asymp. Sig. (2-tailed)	0.001

Based on the above table, as  $\alpha=0.05$  and Sig., 0.001, is lower than 0.05, it can be realized that the students' articulation of American and British accents has not been the same, and since the Mean Rank of General American specific phonetic features is higher than that of RP features, it can be stated that their American English accent efficiency seems more satisfactory in comparison with their British English accent.

*Table 4: Descriptive Data for T-test*

	Group	N	Mean	Std. Deviation	Std. Error Mean
Accent.sum	American	60	25.3333	7.75617	1.00132
	British	60	4.5500	8.97534	1.15871

*Table 5: Consideration of American and British English Accents Mean Ranks Equality Based on a T-test*

		T	df	Sig. (2-tailed)	95% Confidence Interval of the Difference	
					Lower	Upper
Accent	Equal variances assumed	13.571	118	0.001	17.75070	23.81596

The above table shows that the variances of American and British English accents are equal, and based on that, the mentioned T-test has been implemented. As  $\alpha=0.05$  and Sig. is lower than 0.05, the means of the two accents cannot be equal, and, of course, there is a meaningful difference between them. Apparently, the mean of American accent is higher than that of British one. So the students' American English accent is reported to be stronger than their British English accent.

To be aware of the certainty of the collected data and the rated recordings, the researcher was expected to let another interrater score the audios on the basis of the presented analytic scale for the recorded voices. In accordance with the rated **General American** speech sounds features among 60 students by the second rater, 49 students had satisfactory accents which equaled 81.7 percent; 5 participants' recordings were average which equaled 8.3 percent, and 6 students had weak accents comprising 10.0 per cent. Based on this figure, all General American speech sounds features were satisfactory except "laboratory" and "gonna". As a matter of fact, the students were capable of uttering many General American speech sounds. "laboratory" was the most frequent variable articulated in the average level, and "gonna" had the weakest frequency level. In order to see if the mean of each General American speech sound feature was satisfactory, the researcher was expected to utilize a One-sample T-test. Apparently, *Daniel Jone's /ou/*, *father-bother-merger*, *castle* and *can't* had the maximum mean, 1.80, which was so close to satisfactory level among all General American specific features. So it was realized that the students were more efficient in applying these speech sounds features, but not in uttering "gonna" whose mean was 0.33. Similarly, in order to hold a One-sample T-test, he was supposed to get the means related to the variables. It could be observed that all variables were more than average and close to satisfactory level except for "gonna" since  $t$  was positive for each variable except "gonna". It is to be noted that  $\alpha=0.05$  and sig. was lower than 0.05 for each variable, so the mean was more than 1 for each variable. In accordance with the rated **RP British** speech sounds by the second rater among the same students, just 5 students had satisfactory accents including 8.3 per cent, and 55 participants' recorded accents were weak which equaled 91.7 per cent. No one had an average accent. Most RP speech sound features were reported to have weak frequency. In other words, the students were not capable of uttering most of the RP speech sounds. According to the mentioned data, the means of all features, except "no flapping", "non-rhotic" and "travel" were close to 0.5 or lower than 0.5 which represented almost the weak level. So it was observed that students were not able to articulate RP British speech sounds features properly. In order to hold a One-sample T-test, the second interrater was committed to get the means related to the mentioned variables. Based on the One-sample T-test, all variables were lower than average and close to weak level. It is to be noted that  $\alpha=0.05$  and sig. was lower than 0.05 for each variable, so the mean was lower than 1 for each variable. In addition, since  $t$  was negative in each variable, it could be realized that the variables were weak.

To elucidate that there is a meaningful difference between the means of General American and RP English specific speech sounds features ranks, the second interrater was recommended to use Friedman test. It is to be noted that the mean of each speech sound feature rank determined the priority of the mentioned feature to other speech sound features. Accordingly, among all General American and RP specific phonetic features, the *Mean Rank* of *Daniel Jone's /ou/* and *father-bother merger* was the highest, 25.98, and it means that the second rater was more satisfied with the utterance of this specific feature than that of other features. In addition, the *Mean Rank* of

laboratory (*BrE*) was the lowest, 10.67. So it meant that the students were not capable of uttering this feature appropriately, and the rater was dissatisfied with its articulation among all participants rather than the articulation of other speech sounds. In addition, *gonna* had the lowest *Mean Rank* among all General American phonetic features. It meant that the rater had been dissatisfied with its articulation, and the participants were unable to utter this feature. Furthermore, the *Mean Rank* of *no flapping* was the highest among all RP specific speech sounds features. Concerning the following table resulted from Friedman test, as  $\alpha=0.05$  and Sig. was lower than 0.05 for the comparison of Mean Ranks related to General American English features, RP British English features and also the Mean Ranks of all mentioned American and British features, it could be grasped that the Mean Ranks were not equal. It meant that there was a meaningful difference among the Mean Ranks of General American features; besides, there was a meaningful difference among the Mean Ranks of RP features. In addition, there was a meaningful difference between the Mean Ranks of General American and RP phonetic features.

Table 6: General American and RP Features Ranking by Friedman test

Test Statistics American		Test Statistics British	Test Statistics Total
N	60	60	60
Chi-Square	300.217	213.745	1147
Df	15	17	33
Asymp. Sig.	0.001	0.001	0.001

To reveal the meaningful difference between the Mean Ranks of General American and RP specific features, the second interrater applied a Mann-Whitney test and a T-test including General American and RP specific features.

Table 7: General American and RP Features Mean Rank

Ranks				
	Group	N	Mean Rank	Sum of Ranks
Accent	General AmE	60	84.79	5087.50
	RP	60	36.21	2172.50
	Total	120		

It was evident that the Mean Rank of General American accent equaled 84.79 which was higher than that of RP accent which equaled 36.21. Hence, the students' American accent efficiency seemed better than their British accent capability.

Table 8: Representing the Meaningful Difference Between the Mean Ranks of General American and RP Using Mann-Whitney Test

Test Statistics	
	Accent
Mann-Whitney U	342.500
Wilcoxon W	2172.500
Z	-8.676
Asymp. Sig. (2-tailed)	0.001

Concerning the above table, as  $\alpha=0.05$  and Sig., 0.001, was lower than 0.05, it should be stated that the students' American and British accents were not identical, and since that the Mean Rank of General American specific phonetic features was higher than that of RP features, it could be stated that their American English accent efficiency was more satisfactory rather than their British English accent.

*Table 9: Descriptive Data for T-test*

	Group	N	Mean	Std. Deviation	Std. Error Mean
Accent.sum	American	60	24.4000	8.26715	1.06728
	British	60	6.4500	8.77096	1.13233

*Table 10: Consideration of American and British English Accents Mean Ranks Equality Based on a T-test*

					95% Confidence Interval of the Difference	
		T	Df	Sig. (2-tailed)	Lower	Upper
Accent	Equal variances assumed	11.536	118	0.001	14.868	21.031

The above table shows that the variances of American and British English accents are equal, and based on that, the mentioned T-test was implemented. As  $\alpha=0.05$  and Sig. was lower than 0.05, the means of the two accents could not be equal, and, of course, there was a meaningful difference between them. The mean of American accent was higher than that of British one. So the students' American English was better than their British English accent.

## CONCLUSIONS AND SUGGESTIONS

Whatever was discussed up to now, was the consideration of the students' tendency to one of the two standard English accents. Needless to say that the students' interest to American or British English accent will be determined by checking General American and RP specific phonetic features in each participant's recording. In accordance with General American, it should be considered as a notional accent of American English perceived by Americans to be the most "neutral" and free of regional characteristics and to lack certain non-standard features. RP, conversely, is the standard accent of Standard English in England, with a relationship to regional accents similar to the relationship in other European languages between their standard varieties and their regional forms. Likewise, according to the null hypothesis, no relationship exists between American English accent and British English accent, and regarding H1, ESL students are more talented to utilize the American English accent than the British English one. In order to start the survey, the researcher was expected to let the participants rehearse a common text with no hint by the teacher. To actualize it, sixty freshmen who were in the same level were selected, and through a common proficiency test, it was proved that the students' proficiency levels were almost the same. Then, they were given a common text to recite so that their tendency to one of the two Standard English accents could be realized. According to General American as one of the two Standard English accents, some of its specific sounds features were elicited and the students' recordings were rated based on the articulation of those features. Similarly, the specific sound features related to RP were scored. Based on the frequency, One sample T-test and the Mean

Ranks, it was observed that the students were more capable of articulating American features rather than the British ones. Regarding the above result, it can be concluded that the ESL students are more talented to utilize American English accent than British English accent.

The researcher could realize the ESL students' tendency to one of the two Standard English accents, American English, which was inherited from the students' past experience including their former instructors, course books and other materials. However, there have been some pitfalls in performing the mentioned accent. In other words, the students couldn't implement well-formed American English accent absolutely due to the fact that remained a few unsolved problems such as the articulation of *gonna* or *laboratory* that should be taken account. Accordingly, the students are recommended to profit by an educational system on the basis of their tendency and current efficiency of applying American English accent, particularly, while dealing with listening and speaking skills. In other words, they are supposed to be provided with an academic atmosphere wherein American English system is dominant. If so, the course books, audio and visual materials will be selected based on their taste, American English, and they benefit from those instructors who are quite efficient in applying American English system appropriately and have a near American English accents while rehearsing different texts as ideal models. Even those teachers who are not capable of articulating a proper American English accent can be trained specifically to prepare for attending the mentioned synapses. No doubt, being exposed to such an ideal situation, students will never intermingle the accents since there is a united educational system which has been designed on the basis of their interest and real ability. Likewise, they will abide by this system automatically in such a way that they can speak like natively American speakers.

# THE INVESTIGATION OF FACTORS AFFECTING THE ADOPTION OF ICTS AMONG ENGLISH LANGUAGE TEACHERS IN ESL CONTEXT

**Behnam Hashemi**

*Assistant professor, Islamic Azad University, Roudehen Branch  
behnamhashimi@yahoo.com*

## ABSTRACT

As language and technology are two major focuses of reform in education, teachers of English language have to cope with the challenge of technological and pedagogical shifts occurring in the teaching profession. Extracted from his PhD thesis the purpose of the researcher in the present study is to investigate the factors affecting the adoption of Information and Communication Technology (ICT) among English teachers in English as a Second Language (ESL) context by means of a quantitative study. First, using a validated and reliable questionnaire consolidated and inspired by other researches done in the field, the researcher elicited the point of view of 217 English teachers about the mentioned factors. The data collected from the questionnaire was entered into SPSS software for further analysis. One sample t-test, multiple regression and ANOVA were used for analysis and testing of the hypotheses. The results demonstrated that three factors proposed by the researcher were confirmed as active on the adoption of ICTs among teachers. The priority of the factors based on their views was: perceived usefulness, ICT knowledge to use and support language teaching and learning, respectively. Finally, based on the findings of the study and other reviewed guidelines, the researcher proposed some useful suggestions for English teachers and English Language Teaching (ELT) policy makers in the context to implement ICT tools in English classes.

**KEYWORDS:** Information and Communication Technology, English Teaching, ICT Adoption

## INTRODUCTION

English Language Teaching (ELT) is an area that has changed over the years, moving from a very teacher - centered approaches to learner-centered ones (Richards, 1985). This indicates that the teacher should create a situation in the class where the teacher is like a facilitator, not a director. The teacher should act as a resource person in order to meet the expectations of individual learner styles using a variety of methods which suit different personality types, socio-economic backgrounds, proficiency levels, etc. Kaushik and Bajwa (2009) mention that teachers need to make learners link classroom instruction with their home environment. Somewhere else Sindkhedkar (2012) states that the objective of teaching English in India should not be 'producing bookworms' or 'linguistic robots'. Sarwal (2011) states that in India, the greatest challenge in the field of English teaching remains the teaching of language skills. He adds that after studying English for 12-15 years, the students fail to correctly express themselves in both writing and speech. He identified several major problems facing English classes: large classes, an

examination system that promotes product-oriented learning, lack of learner-centered teaching, non-use of **multimedia** in English classes, etc. To begin with, what is important is to motivate the students by creating awareness among them regarding the importance of English and then gradually helping the students to achieve their goals. The basic objective should thus be to make the students independent. It has rightly been said, if you give an individual a fish you feed him for a day, but, if you teach him to fish you feed him for life. It is up to the teacher to make the student realize that by gaining competence in English he will hold the master-key to success in the contemporary world. In other words, learning a second language is not looked at as an urgent requirement unless the learners have strong motivating factors (Tilfarlioglu & Öztürk, 2007). In close relationship with this aspect of learner psychology is the development of revolutionary ideas in the English language teaching profession as it moves from traditional methods towards more humanistic methods like CLT and integrative approach to language teaching and blended teaching; in an attempt to illustrate the movement of English teaching, Warschauer (2002) made a table in which the movement is shown very well as it starts from behaviorist Computer Assisted Language Learning (CALL) and moves towards integrative CALL. As is shown in the behaviorist CALL, the mainframe computers were used for drill making, repetition, etc and this can be named as instructional technologies. In, the next era of communicative CALL, they were used to create some offline software and programmes to present the material for the learners communicatively which can be called information technologies. And the last column in the Table belongs to integrative CALL in which the online programmes and software are at the service of learners for interaction so that all skills are integrated which is related to Information and Communication Technologies (ICT). Drills, practices, repetitions and feedback are all among the benefits for mainframe computers whereas tasks and inferential practices are for micro computers; and, finally, social contexts and real materials which are available on the net and computers. ELT as an area has evolved a great deal over the years, moving from teacher-centered approaches to learner-centered ones (Richards, 1985). ELT projects have been introduced throughout different parts of the world (Markee, 1997). Innovations have brought about changes in materials such as the supplementary materials, the self-study materials, the authentic materials, etc and technology devices such as language laboratories, tape recorders, video recorders, computers, etc. More recently, the use of technology as a tool to develop the different language skills has received great attention (Melor, 2011) so that ELT teachers are frequently exposed to new practices. Apart from curricular changes that come officially- usually from the Ministry of Education in various countries- workshops and short training programmes introduce new techniques and activities and promote new materials.

Apart from those mentioned above, the education authorities in India are aware of the development and are active in promoting educational reforms. The government of India has framed certain policies and proposals and as per them the use of ICTs is to be encouraged in elementary and secondary school education. Within these Acts, there are also programmes like SarvaShikshaAbhiyan (SSA), GyanDarshan, GyanVani, EDUSAT and many others which sponsor the inclusion of ICTs in schools by teachers. In fact, since the 1950s, Indian policy documents have identified the need to use different forms of media to promote learning. At the beginning it was Radio broadcasting, gradually progressing towards more technologically developed ICTs like broadband and computers. Meanwhile, the government of India has initiated various ICT- based programmes for promoting primary and secondary education (Vyasulu,

2010). So, a teacher not trained in technology will feel inadequate in terms of practical teaching. This means the role of an English teacher in the government school has significantly changed in the digital era.

As a teacher of English for several years the researcher has observed teachers resisting technologies as well as teachers accepting technologies. For listening lessons, conversation practice, formal speaking sessions and other laboratory related lessons, some of the teachers welcomed technologies while others avoided them. It is realized at times that despite being aware of the fact that by using technologies they can easily visit websites, download authentic material and use it in the class; some of the teachers resist them while some adopt them as an aid during their teaching. Therefore, discussing ICTs with the practicing teachers in the field is very important. Despite the developments in educational technologies, coming across a standardized English classroom equipped with new technologies is a distant dream. Over the years, some distinction is being established between teachers already comfortable with ICTs and those still cultivating interest in them. Prensky (2001) identifies the difference between a digital-native and a digital-immigrant in the words that for the former technologies are completely natural and easy, but for the latter they are very strange and sometimes intolerable. As an example a digital native teacher can easily bookmark a favorite site and even have a kind of backup for the future follow up in a personal computer; but, an immigrant digital has to print out the pages he is interested in. In the field of ELT it is not enough to have an ICT-integrated classroom with facilities and equipment to ensure that the teachers will be prepared to use them. There are some key factors which English teachers need to accept related to the use of technology, namely the ICTs in their classrooms.

Ability, knowledge and attitudes are among those important factors which are emphasized and discussed for the adoption of ICT. As Baylor and Ritchie (2002) state: “regardless of the amount of technology and its sophistication, technology will not be used unless faculty members have the skills, knowledge and attitudes necessary to infuse it into the curriculum” (p.398). Teachers should become effective agents to be able to utilize ICT tools in the classroom, which is possible via positive teacher attitude thereby **adopters** feel more comfortable with using them and usually integrate them into their teaching (Bullock, 2004). Positive attitudes often stimulate teachers with less technology knowledge to learn the required skills for employing ICT-based tasks in the classroom setting. Otherwise, a lack of technology knowledge and skills may give rise to anxiety and lack of confidence; consequently, teachers may feel uncomfortable with technology (Finley and Hartman 2004, Groves and Zemel 2000). In brief, for teachers to take initiative in curricular change and to effectively apply technology for meaningful instruction, teachers’ attitudes are one of the most significant internal **factors** described by researchers (Ertmer 1999).

## REVIEW OF LITRATURE

The theoretical framework of the present study to some extent is based on the Technology Acceptance Model (TAM). TAM (see Figure 1) was specifically designed to explain individual technology acceptance and use across a wide range of organizational contexts, computer technologies, and user populations (Davis, 1989). TAM postulates that two particular beliefs, perceived usefulness and perceived ease of use, are of primary relevance for computer acceptance behaviors. Also more recently, Legris, Ingham and Colletette (2003) pointed to the fact that though TAM has been a useful model to examine ICT usage, it needs to include other variables as well.

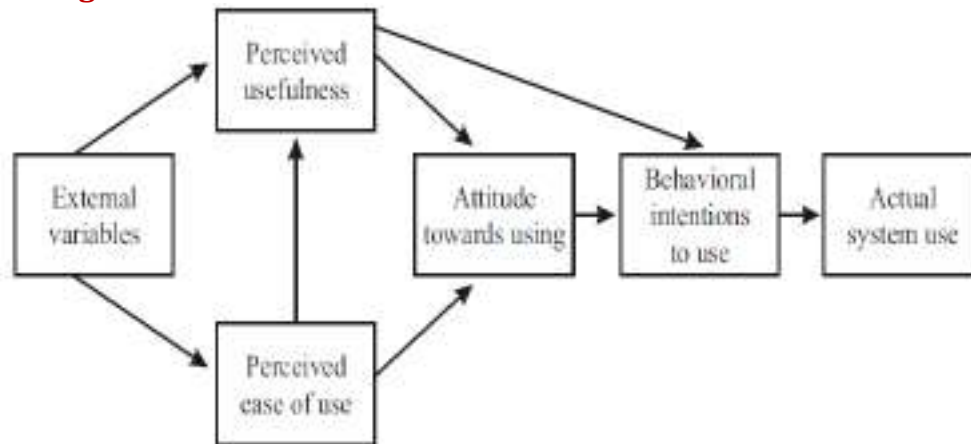

Figure1: Technology Acceptance Model (TAM) by Davis et al. (1989)

Before a new idea or technology can be used, it must first be adopted, but when a new product, technique or technology becomes available in education this does not mean that educators, trainers or students will automatically flock to adopt and use it. Even if its developer can show through a wealth of evidence that this innovation will greatly improve the learning process, there is still no guarantee that it will be used, as many curriculum designers and educational technologists have discovered. To investigate the issues concerned with adoption of new technology or ideas it is useful to think of these as innovations and then to consider them through the lens of innovation theory.

Rogers (1995) believes that people's attitudes toward a new technology are a key element in its diffusion. His *Innovation Decision Process theory* states that an innovation's diffusion is a process that occurs over time through five stages: Knowledge, Persuasion, Decision, Implementation and Confirmation. Accordingly, the innovation-decision process is the process through which an individual (or other decision-making authorities) passes (1) from the knowledge of an innovation, (2) through forming an attitude toward it, (3) through a decision to adopt or reject it, (4) to the implementation of the new idea, and finally (5) to the confirmation of that decision (Rogers, 1995, p. 161). Personal characteristics such as educational level, age, gender, educational experience, experience with the computer for educational purpose and attitude towards computers can influence the adoption of a technology, observes Schiller (2003). To successfully initiate and implement educational technology in a school's programme depends strongly on the teachers' support and attitudes. It is believed that if teachers perceived technology programmes as neither fulfilling their needs nor their students' needs, it is likely that they will not integrate the technology into their teaching and learning. According to Berner (2003), Na (1993) and Summers (1990) as cited in Bordbar (2010), teachers' computer competence is a major predictor of integrating ICT in teaching. Evidence suggests that a majority of teachers who reported negative or neutral attitude towards the integration of ICT into teaching and learning processes lacked knowledge and skills that would allow them to make "informed decision". If there is no technical support for teachers, they become frustrated resulting in their unwillingness to use ICT (Tong & Trinidad, 2005).

It is believed that if teachers perceived technology programmes as neither fulfilling their own needs nor their students' needs, it is likely that they will not integrate the technology into teaching and learning. Evidence suggests that teachers' attitudes and beliefs influence successful integration of ICT into teaching (Hew & Brush, 2007; Keengwe & Onchwari, 2008). If teachers' attitudes are positive toward the use of educational technology, then they can easily provide useful insight about the adoption and integration of ICT into teaching and learning processes.

Woodrow (1987) points out that integrating technologies in to the educational curriculum has the potential to change the process of education drastically. He also suggests that any successful change in educational practice necessitates the development of positive user attitudes towards the new technologies: integrator, who manipulates the ILS sequence so that it better matches the classroom instruction. In his model Woodrow sees the actual use of the technology depends on several things: attitude towards use, ease of use and usefulness. Teachers' development of ICT literacy has been first revealed by educators and experts, such as Davis et al, (1989) emphasized by government initiatives involving increasing investments in ICT facilities and professional training projects. ICT literacy is "using digital technology, communication tools, and/or networks to access, manage, integrate, evaluate and create in order to function in a knowledge society" (ETS, 2002). Most ICT training projects accent teachers' development in technical capabilities in isolation and fail to link teachers' technical capabilities to integrate ICT as a pedagogical tool across curriculum. Fewer training projects aim at developing their cognitive ICT-related capabilities of problem solving and information processing. Constructivism believes that ICT literacy is built and developed when the use of concrete representations of ICT knowledge is made and best performance can be induced in a supportive environment. In order to balance teachers' confidence with ICT as a technological and that with ICT as a pedagogical tool for quality teaching and learning, teachers shall be placed in an ICT-demanding environment. When teachers as competent and confident ICT users and teachers as less competent and confident ICT users work out pedagogical content and method using ICT, they all can construct their individual ICT literacy upon their prior knowledge and knowledge structure and their everyday experience. In integration of ICT and English courses, teachers' professional and personal experience of use of ICT and knowledge of English content are two most important factors toward the construction of their pedagogical beliefs. These beliefs, in turn, will justify their decisions on the role of ICT in English teaching and learning and finally lead to changes of their instructional practices. Teachers as less competent and confident ICT users are expected to improve their professional performance upon ICT-integrated problem-solving tasks and pedagogical reasoning on such tasks. Once their Knowledge of content Topics and ICT-related cognitive and technical capabilities increase, they need to blend their experience with the capabilities and apply appropriate ICT to their pedagogical approaches and hence are more likely to contribute constructively and efficiently to English Teaching.

Dudeney and Hockly (2007) mentioned the term "technophobe" (p.8) referring to teachers who have hesitations towards utilizing new technologies. In their view, "a large part of the negative attitudes teachers have towards technologies is usually the result of a lack of confidence, a lack of facilities or a lack of training, resulting in an inability to see the benefit of using technologies in the classroom" (p.9). As stated by Garrett (1991), "conservative teachers fear that the technologies will weaken or interfere with their control of the class are willing to consider only those technologies-based materials which perform electronically the most traditional teaching tasks" (p.92). On the other hand, skillful, knowledgeable, confident and enthusiastic teachers may face some external restrictions concerning technologies integration such as lack of technical support,

curriculum restrictions or lack of the suitable technological means in their schools (Usluel, Mumcu, & Demiraslan, 2007).

A study carried out with 150 English teachers on their attitudes to educational technologies showed that in spite of teachers' awareness of the importance of using educational technologies, they are not willing to use it in their classes (Gömleksiz, 2004). A recent study in Cyprus with 100 science teachers indicated that only a small number of teachers have integrated educational technologies resources in their lessons (Isman, Yaratana & Caner, 2007).

## **STATEMENT OF THE PROBLEM**

Reviewing all these factors and considering the factors which are important for the field of ELT in the world and namely in this city, the researcher chose the aforementioned factors for the investigation of the study. But, in this case he included the items related to the field of English teaching because the ICTs used for ELT are different from those used in other fields like Math and Science. Moreover, the studies conducted up to now are in other fields of education like math and science which are far from the purpose of this study.

Finally, unlike the previous studies which have relied only on the data qualitatively extracted from the participants and have focused only on frequency counts and descriptions, the present study goes for a deeper analysis of the main causes by doing a thorough study through a hypothesis testing research. Based on the above problem to be investigated by the researcher the main objectives for the entire work were determined.

## **RESEARCH QUESTIONS**

Regarding the above mentioned problems and the main objectives determined by the researcher, the following research questions arise:

1. Is 'perceived usefulness' one of the factors affecting ICT adoption among English language teachers?
2. Is 'supporting the teachers to use ICT' in English classes a factor affecting ICT adoption among English teachers?
3. Is 'ability to use ICT' one of the factors affecting ICT adoption among English language teachers?
4. What are the proportions for each of the factors affecting ICT adoption to determine English teachers attitude towards ICT?

## **METHODOLOGY**

### ***Participants***

The population of the present study comprises English language teachers in ESL context who are teaching English at the Secondary and Senior Secondary schools in Chandigarh city in 2011 and 2012 academic calendar. In order to choose an appropriate sample from among the population, the researcher used Morgan sampling table and chose 217 English teachers in his study. To

choose an appropriate sample from the population the researcher decided to use cluster sampling. For this, the researcher initially divided Chandigarh city into five different geographical locations: north, south, west, east and central city. Finally, he distributed the questionnaires among the English teachers in these areas.

### ***Instrument***

Using previous literature and data, a 35 item, 5-point Likert-scale ranging from completely agree to completely disagree questionnaire was constructed and validated by the researcher. The scale asked the teachers to describe their attitudes towards the factors affecting the adoption and use of ICTs in ELT. During preparation of the Questionnaire, the researcher used Dornyei (2007) as a resourceful guideline.

### ***Procedure of the study***

The researcher went through the following steps to determine the results of the study:

Firstly, thanks to the experience the researcher had about the concerns in ELT, he made a non-participant observation of those secondary and senior secondary schools which were the focus of the study in order to eliminate the availability factor from the next part of the study.

Secondly, in order to prepare the second step i.e. the questionnaire, the researcher planned a valid and reliable questionnaire. Using the data elicited from the teachers and the administrative wings, the researcher combined this information with the previously done studies on the factors affecting ICT adoption in ELT and education. Next, the outcome was given to a panel of experts for confirming the validity of the instrument. The questionnaire was given to a small pilot sample in order to remove or modify some weak items to make it reliable. To calculate Cronbach's alpha for the whole questionnaire, the reliability icon in SPSS software was used. All the items in the questionnaire were entered into the software and 0.872 was the output for Cronbach's alpha which shows the questionnaire is highly reliable.

Thirdly, male and female teachers were chosen randomly to respond to the prepared questionnaire. There was no treatment during the research and by conducting a survey the researcher just finds out the relations and differences between the variables; then, describes the findings according to the reality elicited from the respondents.

Fourthly, the researcher entered the obtained data into SPSS software in order to analyze them and come to a logical end. During the manipulation of the data, some special methods and procedures were used.

Finally, based on information drawn from the respondents and other similar studies done, the researcher suggests some solutions and guidelines to overcome the problem.

# DATA ANALYSIS

To analyze the first hypothesis one sample t-test was run according to the following table.

Table 1: One-Sample t-test for the first question

	Test Value = 45					
	t	df	Sig. (2-tailed)	Mean Difference	95% Confidence Interval of the Difference	
					Lower	Upper
perceived.usefulness	38.082	216	.000	15.75115	14.9359	16.5664

As can be noted from table number 1, the level of significance ( $\alpha = 0.000$ ) for the test and for it is less than 0.05 ( $p < 0.05$ ); hence, we can conclude that the test is meaningful.

So, it means that there is a significance difference between the means for perceived usefulness of ICT in English teaching among English teachers of Chandigarh city and the population means (45); hence, it can be concluded that the responses ticked by the teachers for perceived usefulness of ICT in English language teaching are different among them statistically.

Table 2: Descriptive Statistics for the first question

	N	Mean		Std. Deviation
	Statistic	Statistic	Std. Error	Statistic
Perceivedusefulness	217	60.7512	.41361	6.09286
Valid N (listwise)	217			

As reported in the tablenumber 2 and obtained mean (60.751), and for it is bigger than the population mean (45), it can be stated that from the point of view of English teachers in Chandigarh, Perceived usefulness for the ICT adoption is one of the factors affecting the ICT adoption and use in English language teaching. So, the first hypothesis for the research is confirmed and the null hypothesis is rejected.

Supporting and motivating the teachers to adopt and use ICT in English classes is a factor affecting ICT adoption among English teachers.To test the second hypothesis, one sample t-test was used and brought in the following table.

Table 3: One-Sample t-test for the second question

	Test Value = 45					
	t	df	Sig. (2-tailed)	Mean Difference	95% Confidence Interval of the Difference	
					Lower	Upper
support	31.376	216	.000	11.225	10.520	11.931

Based on the table number 3 in which the significance level of the test ( $\alpha = 0.000$ ) is less than 0.05, we can conclude that the test is meaningful so that we can conclude that there is a

significant difference between the mean of their attitude towards the effect of supporting English teachers to use ICT in English teaching among them in Chandigarh city and the population mean; hence, it can be stated that the responses toward the effect of supporting English teachers to use ICT in English teaching are statistically different.

Table 4: One-Sample Statistics

	N	Mean	Std. Deviation	Std. Error Mean
support	217	35.2258	5.27043	.35778

As shown in table number 4 and the obtained mean (35.225) and for it is bigger than the mean for the population (24), it can be stated that from the point of view of English teachers in Chandigarh city, supporting the teachers to use ICT in their English classes is a factor affecting ICT adoption in English classes. So, the research second hypothesis is confirmed and the null hypothesis is rejected.

Ability to use ICT is one of the affective factors for ICT adoption among English language teachers. To analyze the third hypothesis one sample t-test was run according to the following table.

Table 5: One-Sample Test for Ability

	Test Value = 45					
	t	df	Sig. (2-tailed)	Mean Difference	95% Confidence Interval of the Difference	
					Lower	Upper
Ability	15.242	216	.000	14.322	13.634	15.010

As the data indicated in table number 5 in which the significance level of the test ( $\alpha = 0.000$ ) is less than 0.05, we can conclude that the test is meaningful so that we can conclude that there is a significant difference between the mean of their attitude towards the effect of English teachers' ability to use ICT in English teaching among them in Chandigarh city and the population mean; hence, it can be stated that the responses toward the effect of English teachers' ability to use ICT in English teaching are statistically different.

Table 6: One-Sample Statistics

	N	Mean	Std. Deviation	Std. Error Mean
Ability	217	50.3226	5.14396	.34919

Based on the table number 6 and the obtained mean (50.322) and for it is bigger than the mean for the population (36), it can be stated that from the point of view of English teachers in Chandigarh city, English teachers' ability to use ICT in their English classes is a factor affecting ICT adoption in English classes. So, the research third hypothesis is confirmed and the null hypothesis is rejected.

The proportion for each of the considered factors to determine their attitude towards ICT adoption in English teaching is different. To test the above hypothesis, a multiple regression can be use based on the following table.

Table 7: One-way ANOVA

Model	Sum of Square	df	Mean Square	F	Sig
Regression	8333.912	3	2777.971	73.910	0.000
Residual	8074.650	213	37.909		
Total	16408.562	216			

Based on the data obtained in table number 7 and the level of significance ( $p < 0.000$ ) which is less than 0.05 ( $p < 0.05$ ) it can be concluded that from the point of view of English teachers in Chandigarh city, statistically, there is a significant relationship between the considered factors and their effect to determine their attitude and the proportion for each of the factors can be different; So, running the regression to analyze them is possible.

Table 8: The coefficients related to the fourth derivational hypothesis

	Unstandardized Coefficients		standardized Coefficients	t	Sig
	B	Std. Error	Beta		
( Constant )	0.949	0.452		2.101	0.037
Perceived usefulness	1.036	0.009	0.474	121.384	0.000
Support	0.827	0.010	0.327	82.913	0.000
Ability	0.988	0.010	0.381	95.818	0.000

Based on the data presented in the table number 8 and the degree of beta coefficient entered to the regression, it can be observed that the proportion of each factor to determine the attitude towards the use of ICT in English language teaching is: perceived usefulness of ICT in English language teaching (0.474), supporting and motivating the teachers to use ICT in English classes (0.327) and the ability of the teachers to use ICT in their English classes (0.381).

In other way, for the level of significance in the test is less than 0.05 ( $p < 0.05$ ), we can say that the above relationships are significant. Because the degree of the relationships is positive, it can be stated as much as the teachers' attitude in perceived usefulness of ICT in English teaching, supporting and motivating the teachers to use ICT, and the ability to use ICT in English teaching increase, their attitude toward using it also increases.

So, the hypothesis of the study was confirmed and the null hypothesis was rejected. Also, for the beta coefficient in perceived usefulness of ICT in English teaching is bigger than other factors, we can state that this factor has the highest proportion to determine the teachers' attitude towards the adoption of ICT in English teaching in Chandigarh city; and, supporting the teachers to use ICT in their classes which has the lowest beta coefficient comparing to other factors has the

lowest proportion among the factors to determine the English teachers attitude towards using ICT in their classrooms.

## **CONCLUSION**

The rise of technologies has complicated its adoption and integration by teachers in classroom. The effective integration of technology into classroom practices poses a challenge to teachers than connecting computers to a network. For successful integration of ICT into teaching, the review highlights factors that positively or negatively influence teachers' use of ICT. These are personal, institutional and technological factors. Research has revealed that these factors are related to each other. On a personal level, there are numerous factors that influence teachers' use of ICT. Teachers' feelings, knowledge and attitudes influence their use of ICT in teaching. Research has shown that teachers' attitudes towards technology influence their acceptance of the usefulness of technology and its integration into teaching. If teachers' attitudes are positive toward the use of educational technology then they can easily provide useful insight about the adoption and integration of ICT into teaching and learning processes. At the school level, factors such as support, funding, training and facilities influence teachers' adoption and integration of technologies into their classrooms. Teachers' professional development is a key factor to successful integration of computers into classroom teaching. ICT-related training programmes develop teachers' competences in computer use, influencing teachers' attitudes towards computers and assisting teachers to reorganize the task of technology and explaining them how new technology tools are significant in student learning . On the technological level, for successful adoption and integration of ICT into teaching, teachers must perceive technology as better than previous practice; consistent with their existing values, past experiences and needs; ease to use, can be experimented with a limited basis before making a decision to adopt. Finally, the results of the innovation become visible to the others. Many teachers are hesitant to change an existing programme to something they only know through discussion and reading and not through observation. These three characteristics or attributes of teachers' adoption and integration of ICT into teaching provides information of factors supporting their use of technology as well as barriers to ICT integration. The key factor in the studies is teachers' attitudes toward technology or intentions to use technology in their classrooms. If teachers have negative attitudes toward technology, providing them with excellent ICT facilities does not guarantee ICT adoption.

## **PEDAGOGICAL IMPLICATIONS FOR INDIAN CONTEXT**

In the light of its findings, this study has several useful implications and suggestions and future research. However, the remarks thereof are not meant to be viewed as conclusions rather suggestions which are based on the researcher's understanding and the conclusions of the investigation.

Due to the government-driven ICT policy, most Indian secondary and senior secondary schools have computers with Internet access in each classroom, as well as multimedia labs that are equipped with computers, LCD projectors, and other technology for education. Despite this well-developed technology infrastructure, however, teachers are lacking guidelines on how they can make the best use of the present technology for their class use. Through the literature review, I attempted to learn more strategies on how technology can be wisely used to enhance student language learning that is more interactive and at a higher level of thinking based on diverse cases of technology-integrated classrooms.

Examining the uses of technology in the ESL/EFL classroom through a literature review, I had assumed that more research on the effective uses of technology in the classroom could be conducted to guide EL teachers to improve their teaching. Based on what I realized during the literature review, I would like to suggest the following for future practices in the Indian EL classroom.

First, technology integration should always go with a firm theoretical base that carefully considers the effectiveness of language teaching and learning. Reviewing the cases of other countries, I noticed that the technology uses in the EFL classes had gradually changed with the paradigm shift from the behaviourists' to the constructivist's way of looking at pedagogy. That is, technology has been the medium supporting the educational shift; first, an educational paradigm shift, followed by technology application. Therefore, from most of the studies, I saw the theories consistently reflected on the overall application the technology uses. On the contrary, in Indian government initiative, technology advancements have led educational innovation before theoretical discussions become mature. Accordingly, there are some teachers in the field who cannot keep up with the new teaching and learning theories. Projecting the copy of the textbook through the latest project cannot be called an educational innovation. The Indian government should invest as much money they have invested on technology innovation on teacher re-training programmes.

Second, the number of teacher-researchers should be increased to improve teaching and learning in real EL classes. I recommend that more teachers be given opportunities to be trained through systematic programmes cultivating their skills in ICT use. Schools are the very places where educational reform starts, and the teachers should be the first in line of the new movement by researching how students in the real field can best learn with technology. This will facilitate balanced matches between theories and practice to bring realistic innovations into EFL classrooms.

Third, technology use in the classroom should encourage students to develop higher levels of thinking skills. EL classes focusing only on the college entrance examination cannot provide students with enough opportunities to practice authentic language uses. EL classrooms should be the places where students can enjoy thinking and creating their own interactions based on meaningful contexts, not the places where students cram fragmented knowledge through rote memorization.

The teacher has an important role to play in the teaching/learning paradigm shift, with ICT facilitating the development of a higher level of cognitive skills in evaluating arguments, analyzing problems and applying what is learnt.

Although teachers play an important role in the learning environment, they are often not consulted regarding changes to teaching learning procedures (Bangkok, 2004). In fact, the teachers' needs under changing conditions have to be continuously assessed and activities to satisfy these have to be developed. So, professional development is necessary for teachers to enable them to effectively use technology to improve student learning. Staff development should

be collaboratively created, based on faculty input and school needs. It must prepare teachers to use technology effectively in their teaching.

According to Fullan (1992), teachers who have a strong engagement towards their own professional development are more motivated to undertake activities, which lead to a better understanding of the goals of an innovation. Similarly, Fullan pointed out that teachers who are actively involved in their own professional development are more able to implement changes in their teaching.

Hence, having a recognition system for innovative and effective use of ICT integration in schools will motivate teachers to use ICT in teaching. For example, formal certification of in-service professional development that leads to diplomas or degrees could provide an incentive for teachers to upgrade and update their skills in and knowledge of ICT integration.

Another study done by Ahluwalia and Gupta (2011) shows that English teachers are not ready to adopt ICTs in Panjab, India. English teachers need to not only possess such basic ICT skills as word processor, PowerPoint, video editor and access to the Internet, but also develop pedagogical knowledge to efficiently integrate ICT into English curriculum. The integration of ICT will lead to diversification not only in English content, contexts and pedagogical methods, but also in teaching environment. ICT will extend the boundary of English teaching and characterize it as interactive, flexible and innovative.

School heads and committees should focus on special cooperative sessions for ICT use to be held on a regular basis during English teachers' free time and encourage the teachers to resolve their problems and issues facing in the class regarding ICTs.

At least, one knowledgeable and active ICT expert should be present all the time when teachers are using the technologies in order to assist them. It is much more effective when the expert provides the teachers with some predetermined useful websites for English teaching recommended by any valid source.

***Some websites for downloading audio and video files:***

• [www.youtube.com](http://www.youtube.com) • <http://teachertube.com> • [www.engvid.com](http://www.engvid.com)  
• [www.bbclearningenglish.co](http://www.bbclearningenglish.co) • [www.britishcouncil.org/kids.htm](http://www.britishcouncil.org/kids.htm) •  
[www.britishcouncil.org/central.htm](http://www.britishcouncil.org/central.htm) • [www.bestofgooglevideos.com](http://www.bestofgooglevideos.com)

Besides, enough time allotted to use of ICTs in the school calendar for English teachers will motivate them to use ICTs enthusiastically

*M.A., Islamic Azad University, Takestan, Iran*

### ABSTRACT

The present study examined the effects of selected collaborative techniques on second language (L2) vocabulary comprehension and production. The participants of the study were 86 adult pre-intermediate level English learners in institutes in Qazvin. They were in five groups and each group received instruction through one of the following collaborative techniques for 21 sessions. The collaborative techniques included Jigsaw, Rotating Circles, Snowball, Think-Pair-Square, and Word Webbing. Two separate one-way ANOVA procedures were used to analyze data. The results showed that word webbing was the most effective technique on both vocabulary comprehension and production. The findings of the present study may have theoretical as well as practical implications.

**KEY WORDS:** collaborative learning, vocabulary learning, jigsaw, rotating circles, snowball, think-pair-square, and word webbing.

### INTRODUCTION

Mankind is social and likes to learn in a social context; thus, collaborative learning is a proper response to this tendency in human nature. Dillenbourg (1999) defines collaborative learning as "a situation in which two or more people learn or attempt to learn something together and solve a problem" or "mutual engagement of participants in a coordinated effort to solve a problem together" (p. 6).

Collaborative learning has many advantages. It increases self-esteem and motivation among students, improves complex and cognitive thinking, creates positive feelings among students and about school, and makes responsible students. Most teachers have the same point of view. They believe that students learn better in collaborative groups than in traditional classroom settings (Jacobs, Power, & Loh, 2002).

However, some teachers believe collaborative method is problematic for several reasons. They do not like missing their traditional role in the classroom. Others insist that collaborative learning is not suitable for students. They believe that students learn at different speeds, some of them take

over the group. This study investigates the role of collaborative leaning techniques on reading comprehension to see which techniques are effective on reading comprehension.

Another side of this study is vocabulary learning through collaborative techniques. Collaborative activities facilitate vocabulary learning. Many language teachers are aware of the significant role of collaborative interaction in vocabulary learning. They present more than one technique and strategy in the classroom. What is less obvious is which of the collaborative techniques is more conducive to vocabulary comprehension and production. The present study addresses this issue.

## **LITERATURE REVIEW**

Vygotsky (1986) places great emphasis on the value of social interaction. Vygotsky (1978) notes that human is social in nature; so his cognitive skills develop in a group setting. He argues that “learning awakens a variety of internal developmental processes that are able to operate only when the child is interacting with people in his environment and in cooperation with his peers” (p. 90).

Johnson, Johnson, and Smith (1991) add that students work together in small groups to maximize their own and others’ learning. Students work in a group where each member has a different level of knowledge and skill. Students would be able to convey their knowledge to the other members of the group if their work was based on a specific learning purpose.

To Barkley, Cross and Major (2005), “collaborative learning has come to mean students working in pairs or small groups to achieve shared learning goals” (p. 4). Three features of collaborative learning are intentional design, co-laboring, and meaningful learning. In intentional design, teachers divide students into different groups and may use pre-structured activities or design a new structure of their own. Co-Laboring is a Latin meaning of collaboration, it means that all students in the group must engage in an activity as a team. The last feature is meaningful learning in which all students work together on a collaborative assignment, so they increase their knowledge and information during collaborative activities. These three features are important and vital to collaborative meaning (Barkley, Cross, & Major, 2005).

Collaborative learning is rooted in Piaget’s theory, Zone of Proximal Development (ZPD) Theory, Communicative Language Teaching, and Input Hypothesis. Apple (2006) defines ZPD as the limit to which someone can learn something with others’ help. Hiep (2007) recommends the use of cooperative learning activities in Communicative Language Teaching (CLT). CLT activities are based on pair or group work. He points out that CLT is a learner-centered approach, so it is collaborative learning in nature and wants students to learn together in pairs or in groups.

There are various advantages to collaborative and cooperative learning. They have different effects on the learning process of which most are beneficial. According to ZPD Theory, group work increases social skills. Older children help younger ones and practice how to learn as a team. Vygotsky (1978) believes that children learn together and increase their individual skills in group activities.

Gokhale (1995) adds that interest and critical thinking rise among collaborative groups. Students can become critical thinkers. Students become able to share their knowledge and be responsible for their own learning. Pair and small group activities give more time to students for speaking in the target language. In addition, learners feel more comfortable and less anxious when they interact with peers in the group. Their self-confidence increases through group activities

(McDonough, 2004). Wills (2007) refers to some of the psychosocial advantages of cooperative learning. He holds that group working reduces the fear of failure among students. Students can access the stored information much easier and quicker during a cooperative learning situation. DelliCarpini (2009) adds that “cooperative learning creates multiple opportunities for comprehensible input and output” (p. 44).

Despite the advantages of collaborative learning, there are also arguments against collaborative learning. According to Tinzmman, Jones, Fennimore, Bakker, Fine, and Pierce (1990), teachers do not like collaborative learning because they know that a collaborative classroom is noisier than a traditional classroom and they do not want noisy classrooms. Another reason is the preparation time for collaborative learning. Some teachers do not know how to use time appropriately in a collaborative classroom, so they think collaborative learning wastes the time of the class. The third reason is individual differences among students. Some teachers believe students with individual differences cannot be grouped together. They argue that teachers think some students may not accept responsibility in a group.

Tinzmann, et al. (1990) mention several roles for teachers in a collaborative classroom. The first role is as a facilitator. Teachers help students connect new information to their prior knowledge. Teachers can facilitate collaborative learning by designing different tasks. The second role for the teacher is modeling. Modeling may involve thinking aloud and demonstrating. The last role is coaching. Teachers help students to provide a strategy and use it in the learning process. The teacher is a supporter, an observer, a change agent, and an advisor in a cooperative classroom (Wang, 2007). Students also play different roles in collaborative learning such as facilitator, time keeper, checker, encourager, recorder, summarizer, elaborator, and observer in their own groups (Farrell & Jacobs, 2010).

It is believed that there are more than 100 techniques used in collaborative learning. Each of these techniques has different effects and is useful for students and teachers in diverse situations. Using these techniques depends on the task and group size. Teachers should know the goals of the teaching and learning, then select suitable cooperative techniques in their classrooms (Keyser, 2000).

A number of studies have investigated various aspects of collaborative learning and techniques. Pamela (1994) investigated cooperative learning in multicultural university classrooms. The results showed the cooperative learning strategies have positive effects on the learning process, especially in multicultural classrooms. Moreover, the cooperative response technique was more powerful than the other cooperative techniques.

Critical thinking is one of the most important factors in collaborative learning. Gokhale (1995) investigated this factor. He compared individual and collaborative learning, but he also implemented critical thinking in both of these groups. The findings showed that students worked corporately better than individually, and that students in the collaborative group answered critical thinking questions better than the ones in the individual group.

Researchers have investigated different factors which influence a collaborative interaction, like age, gender, high or low ability, motivation, etc. Webb (1991) studied the role of gender in collaborative interaction. The results showed that boys like to receive request for help, but there were no differences in girls' and boys' abilities.

Adeymi (2008) investigated cooperative learning and problem solving strategies with juniors in secondary school. This study investigated three teaching strategies (cooperative learning, problem solving and conventional). The results showed that students like cooperative learning and problem solving strategies more than the conventional strategies.

Kim and McDonough (2011) implemented collaborative learning to different kinds of tasks. They studied the role of pre-task modeling on collaborative learning interaction. They divided students into two groups. One group received videotaped models of collaborative interaction before carrying out the task. The other group did not use pre-task modeling. The findings showed that the first group was more successful in completing the tasks and demonstrated more collaborative pair dynamics modeling.

Wang (2011) studied collaborative learning as a new method for improving college students' autonomy in China. He had two groups of students. The first group included 64 students who worked corporately, whereas the second group included 62 students who were taught in a traditional way. The findings showed that collaborative learning increased autonomy, and students learned better than the traditional way.

There are also a number of studies on vocabulary learning via collaborative interaction. One of these studies is Huong (2006) in Vietnam. Huong (2006) investigated learning vocabulary in collaborative groups at a university. The results showed that learning vocabulary was affected by group work.

Newton (2001) investigated vocabulary learning through communication tasks. One of the options was cooperative learning in pre-task. Students looked for meaning of the words in dictionary corporately. The finding showed that cooperative learning helped to improve vocabulary learning process in pre-task.

This short historical perspective on collaborative learning shows that there are some gaps in research on collaborative learning techniques. Researchers have studied different collaborative techniques in their research, but they have not focused on which technique is more effective in vocabulary learning or reading comprehension. The present study is an attempt to partially fill this gap.

## RESEARCH QUESTIONS

The present research intends to answer the following research questions:

1. Are there any significant differences among the selected collaborative learning techniques (Jigsaw, Rotating Circles, Snowball, Think-Pair-Square, and Word Webbing) on L2 vocabulary comprehension?
2. Are there any significant differences among the selected collaborative learning techniques (Jigsaw, Rotating Circles, Snowball, Think-Pair-Square, and Word Webbing) on L2 vocabulary production?

## **METHODOLOGY**

### ***Participants***

The participants were 86 male and female EFL learners, at language institutes in Qazvin, ranging in age from 17 to 21 years old. The learners' level of proficiency was pre-intermediate to intermediate. Participants were studying in five classes. Each group was randomly assigned to a different treatment condition. These treatments were different kinds of collaborative techniques for reading comprehension and vocabulary.

### ***Instruments***

The following materials and instruments were used in the present study:

The participants were administered a KET (Key English Test) test before the treatment. The test contained 41 multiple-choice items. To minimize the effect of their prior vocabulary knowledge, a vocabulary pretest containing 150 items was administered before the treatment. These lexical items were contextualized in 150 English sentences. Learners were required to write the meaning of the underlined words in Persian. The time allocated to this pretest was 50 minutes. Those words the meaning of which the participants did not know were selected for inclusion in the posttests.

The instructional materials included five units of Top Notch (2 a). The book is used for pre-intermediate learners at language institutes. A total number of 150 vocabulary items and 5 reading texts were presented in 18 sessions, spanning one semester.

At the end of the experimental period, all participants were given two posttests; a 30-item vocabulary test in multiple-choice format was used to measure the participants' receptive lexical knowledge. Another 30-item vocabulary test in fill-in-the-blanks format was utilized to measure the participants' production knowledge.

### ***Procedures***

Initially, the participants were selected based on criteria such as proficiency level and the relevance of the treatment to their main instruction as well as the willingness of their instructors to cooperate. Since the participants were learners at institutes and had been given placement tests before hand, and since they had received the same instruction, their homogeneity was almost certain. Still, before they received the treatment, a KET test was administered to homogenize the participants in terms of their vocabulary knowledge. To make sure that the participants had no prior knowledge of the target words, the vocabulary pretest containing 150 items was also administered before the treatment. The instructional materials included 5 units of Top Notch (2 a). The participants were in 5 groups. Each group was randomly assigned to one of the following treatment conditions:

Group A was instructed through the Jigsaw technique. There were 15 learners in this group. They were divided into four groups. This technique was taught in eight steps:

**Step 1.** A task was divided to different subtasks.

**Step 2.** The class was divided into groups of 3 or 4 members randomly.

**Step 3.** Each group worked on one subtask.

**Step 4.** One student from each Jigsaw group joined the expert group.

**Step 5.** They discussed the subtasks that they worked on. The subtasks were selected randomly.

**Step 6.** The students returned to their Jigsaw groups.

**Step 7.** They presented other subtasks to their groups. They helped other members of the group with the subtasks they had learnt about in the expert group.

**Step 8.** At the end, each group had the whole task; the parts of tasks completed each other like different parts of puzzle by experts.

Group B received instruction through the Rotating Circles technique. Rotating circles technique is based on physical movement. The number of learners was 18 in this group. They were divided into three groups. Each group was subdivided into two groups. There were 3 members in each subdivided group. The participants of this group were taught in five steps:

**Step 1.** The class was divided into groups of 6 members. Each of these groups of 6 was subdivided into 2 groups randomly.

**Step 2.** One subgroup was seated in an inner circle, with each student facing outwards. The other subgroup was seated in an outer circle. Around them each member faced inward towards a member of the inner circle.

**Step 3.** Each member of the inner circle had different subtasks. For about 5 minutes, the inner circle members discussed with the outer circle members opposite them.

**Step 4.** The outer circle was rotated one seat clockwise, so there was a new pair.

**Step 5.** The previous two steps were repeated until the outer circle was rotated by one complete turn.

Group C was instructed through the Snowball technique. Snowball technique is useful when the aim is to generate ideas. There were 20 participants in this group. This technique was taught in four steps:

**Step 1.** Each student received a task. They received the same task. They had to work within a preset period of time (5 minutes, more or less).

**Step 2.** They worked on the task in pairs, they shared ideas.

**Step 3.** Pairs then formed groups of 4 to share their ideas and knowledge.

**Step 4.** Snowball was finished there or was continued to groups of 8, until they solved their problems.

Group D (n = 16) received instruction through the Think-Pair-Square technique. Think-pair-square technique is another collaborative technique for generating ideas. This technique was taught in five steps:

**Step 1.** A task was given to class.

**Step 2.** Each student had a period of time to think about it and write her/his words.

**Step 3.** The student turned to a partner and shared their knowledge and ideas.

**Step 4.** Pairs joined another pair to compare their conclusions.

**Step 5.** They continued with another pair or stopped this process.

Group E was instructed through the Word Webbing technique. Word webbing technique is a graphic organizer strategy that provides a visual of how words or phrases connect to a topic. There were 17 learners in this group. Four students were in each group, but one group contained 5 participants. It was taught in six steps:

**Step 1.** Students were divided into groups of 4 or 5 randomly.

**Step 2.** Each group received a butcher paper and different color markers.

**Step 3.** One student drew a circle in the middle of the paper and wrote the main idea in it.

**Step 4.** Each student added a concept to it with different color markers. They wrote subtopics in the corners.

**Step 5.** Each student selected one corner and wrote her/his words. All students had a chance to add their ideas.

**Step 6.** Papers displayed around the classroom and each group reported their word-web.

At the end of the experimental period, posttests were administered. The 30-item vocabulary test in multiple-choice format was used to measure the participants' receptive lexical knowledge. And the 30-item vocabulary test in fill-in-the-blanks format was utilized to measure the participants' productive vocabulary knowledge. The time allocated to this posttest was 30 minutes. To answer the research questions, two separate one way ANOVA procedures were used.

## RESULTS AND DISCUSSION

### *Investigation of the first question*

The aim of the first question was to investigate the effect of selected collaborative techniques on L2 vocabulary comprehension. To this end, a one-way ANOVA was run. Descriptive statics are given in Table 1.

*Table 1: Descriptive statistics for the ANOVA on Vocabulary Comprehension*

	N	Mean	Std. Deviation	95% Confidence Interval for Mean	
				Lower Bound	Upper Bound
Jigsaw	15	18.46	3.66	16.43	20.49
Rotating circles	18	20.33	3.18	18.75	21.91
Snowball	20	21.95	2.68	20.69	23.20
Think-pair-Square	16	21.81	2.45	20.50	23.12
Word webbing	17	23.11	3.70	21.21	25.02
Total	86	21.20	3.45	20.46	21.94

Based on Table 1, word webbing group has the highest mean, followed by snowball group, think-pair-square group, and rotating circles group. The participants of the jigsaw group have the lowest mean. To see whether or not the observed differences among the groups are statistically significant, a one-way ANOVA procedure was used. The results are shown in Table 2.

*Table 2: The results of the ANOVA on Vocabulary Comprehension*

	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	205.347	4	51.337	5.153	.001
Within Groups	806.886	81	9.962		
Total	1012.233	85			

As it can be seen in Table 2, the F-value and the significance level ( $F_{(4,81)} = 5.15$ ,  $p < .05$ ) suggest significant differences among the collaborative groups. To locate the significant differences between the means, a post hoc Tukey HSD's test procedure was used, the results of which are summarized in Table 3.

Table 3: Multiple comparisons of means on Vocabulary Comprehension

(I) group	(J) group	Mean Difference (I-J)	Std. Error	Sig.	95% Confidence Interval	
					Lower Bound	Upper Bound
Jigsaw	Rotating circles	-1.86	1.10	.445	-4.94	1.212
	Snowball	-3.48*	1.07	.015	-6.49	-.47
	Think-Pair-Square	-3.34*	1.13	.033	-6.51	-.18
	Word webbing	-4.65*	1.11	.001	-7.77	-1.53
Rotating circles	Snowball	-1.61	1.02	.517	-4.47	1.24
	Think-Pair-Square	-1.47	1.08	.652	-4.50	1.54
	Word webbing	-2.78	1.06	.078	-5.76	.19
Snowball	Think-Pair-Square	.137	1.05	1.00	-2.81	3.09
	Word webbing	-1.16	1.04	.795	-4.07	1.73
Think-Pair-Square	Word webbing	-1.30	1.09	.759	-4.37	1.76

\*. The mean difference is significant at the 0.05 level.

A look at Table 3 makes it clear that there are significant differences between jigsaw group and snowball group, between jigsaw group and think-pair-square, and between jigsaw group and word webbing group. It means the jigsaw group is the worst group among these five collaborative techniques in vocabulary comprehension.

#### *Investigation of the second question*

The second research question sought to investigate the effect of selected collaborative techniques on L2 vocabulary production. A one-way ANOVA procedure was used. Descriptive statistics are presented in Table 4.

Table 4: Descriptive statistics for the ANOVA on Vocabulary production

	N	Mean	Std. Deviation	95% Confidence Interval for Mean	
				Lower Bound	Upper Bound
Jigsaw	15	9.86	2.44	8.51	11.22
Rotating circles	18	10.77	2.60	9.48	12.07
Snowball	20	13.05	2.68	11.79	14.30
Think-Pair-Square	16	11.12	1.99	10.06	12.18
Word webbing	17	15.70	2.31	14.51	16.89
Total	86	12.18	3.14	11.51	12.86

Based on Table 4, word webbing group has the highest mean, followed by snowball group, think-pair-square, and rotating circles. The Jigsaw group has the lowest mean. To see whether or not the differences among the groups are statistically significant, the one-way ANOVA was used, which yielded the following results (Table 5).

Table 5: The results of the ANOVA on Vocabulary Production

	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	359.949	4	89.987	15.151	.000
Within Groups	481.074	81	5.939		
Total	841.023	85			

Table 5 shows that there are significant differences among the five groups ( $F_{(4,81)} = 15.15$ ,  $p < 0.05$ ). To locate the differences among the means, a post hoc Tukey HSD' test procedure was used. The results are summarized in Table 6.

Table 6: Multiple comparison of means for the ANOVA on Vocabulary Production

(I) group	(J) group	Mean Difference (I-J)	Std. Error	Sig.	95% Confidence Interval	
					Lower Bound	Upper Bound
Jigsaw	Rotating circles	-.91	.85	.822	-3.28	1.46
	Snowball	-3.18*	.83	.002	-5.50	-.86
	Think-Pair-Square	-1.25	.87	.606	-3.70	1.18
	Word webbing	-5.83*	.86	.000	-8.24	-3.43
	Snowball	-2.27*	.79	.041	-4.48	-.06
Rotating circles	Think-Pair-Square	-.34	.83	.994	-2.68	1.98
	Word webbing	-4.92*	.82	.000	-7.22	-2.62
	Think-Pair-Square	1.92	.81	.139	-.35	4.20
Snowball	Word webbing	-2.65*	.80	.012	-4.89	-.41
Think-Pair-Square	Word webbing	-4.58*	.84	.000	-6.94	-2.21

\*. The mean difference is significant at the 0.05 level.

Table 6 makes it clear that the participants of snowball and word webbing groups have performed significantly better than the participants of both jigsaw and rotating circles groups. In addition, the participants of word webbing group have outperform those of snowball and think-pair-square groups, suggesting that word webbing is the most effective technique in vocabulary production.

## Discussion

There are few studies on the comparisons among collaborative techniques. Most researchers have investigated only one collaborative technique or have compared one technique with the traditional method. One of the techniques used in the present study was jigsaw. It is one of the most popular and well-known collaborative techniques (Jacobs & Hannah, 2004; Littlewood, 2009). Walker and Crogan (1998) reported that jigsaw improves academic performance. Their findings somehow contradict the results of the present study because in the present study jigsaw turned out to be the least effective technique on both vocabulary comprehension and production. Hanz and Berger (2007), however, could not show the positive effect of jigsaw on academic performance. To Moskowitz, Malvin, Schaeffer, and Schaps (1985), jigsaw has no positive effects on students. The findings of the present study support their results. It seems that the use of jigsaw could not improve vocabulary comprehension and production in the present study. Jigsaw is like a puzzle; all students are responsible for completing this puzzle. Expert groups encourage individual accountability among students (Jacobs & Hannah, 2004). However, sometimes one of the students in the expert groups cannot convey information well or does not listen to others correctly, and this affects all his/her teammates and the technique fails. This may be one of the reasons why jigsaw had no positive effect in the present study and was not successful.

Rotating circles is a newer collaborative technique and is not as popular as jigsaw. The rotating circles group did not have good results on vocabulary comprehension and production posttests. This might have been because the teacher and students were less familiar with this technique. The teacher could have failed to apply this technique like other collaborative techniques in the present study. This technique is based on physical movement (Littlewood, 2009). The findings of Littlewood's study are different from the results of the present study. He showed that the rotating circles technique could decrease social loafing and improve the learning process. However, Iranian students are not used to physical movement in their classrooms. They learn to sit without many movements and listen to their teachers. This might explain why the rotating circles group failed in the present study. In addition, physical movement may not be suitable for all levels of students. It may be better for kids but not necessarily for older learners.

In addition, snowball turned out to be the second best technique in vocabulary comprehension and production. This finding lends support to Farrell and Jacobs (2010), who believe that students like this technique and take part in this activity eagerly.

Another collaborative technique used in the present study was think-pair-square. It led to good results, but not as good as snowball and word webbing groups. Littlewood (2009) points out that think-pair-square decreases premature closure in group activities. Walsh and Sanchez (2010) compared think-pair-square with other collaborative techniques for child development. The results were the same as the results of the present study.

The last and one of the best techniques in the present study was word webbing. Pierson, Cerutti, and Swab (2006) believe that word webbing is suitable for developing and reviewing vocabulary. The results of the present study support their opinion. Word webbing had the best effect on vocabulary comprehension and production in the present study. This technique is more visual, so it is useful for vocabulary learning. This technique shows how ideas are connected to other ideas and how they are organized. This technique was new for Iranian students. They liked to try it. So, part of the beneficial effects of this technique could be attributed to its novelty.

There are some factors, which may have affected the results of the present study, like quality of interaction among students, level of proficiency, culture, and so on. Tinzmann, et al. (1990) point out that there are three conditions for collaborative classrooms. They believe without these three conditions collaborative learning fails. First, students should accept their responsibility in their group. Second, they should learn to face to face interact and help their teammates. Third, they need to learn group process skills. Not all these conditions were present for all the five groups in the present study. These conditions were not equal in the five collaborative groups. This may partly explain the differential performance of the participants of these groups on the posttests.

Another possible reason could have been teachers' ability to implement each of the five collaborative techniques. Some of these techniques may have been hard for teachers to implement in class. Jigsaw was probably more familiar for teachers, hence more easily applicable. However, rotating circles was hard for teachers. This could be the reason why the rotating circles group did not produce good results.

Another factor may be interaction among students. The nature of collaborative techniques requires that students be active in their classes. However, some students may avoid group work. All these factors create an unfavorable condition in collaborative classrooms. The present study faced with the last problem, especially in the jigsaw group. This could be one of the reasons why the jigsaw group failed.

Still another factor which could have contributed to the obtained results may have been the learners' proficiency level. As an example, in the course of the treatment, it was observed that rotating circles was not suitable for students' level of proficiency and students were not serious about following this and were not comfortable with this technique. They thought the teacher did not support them. DelliCarpini (2009) is of a similar opinion. Along the same line, Letendre (2009) argues that jigsaw is a collaborative technique useful for advanced learners.

## **CONCLUSION**

To conclude, based on the obtained results it appears that collaborative techniques are not equally beneficial. They seem to have differential effects on various language skills and components. It can also be concluded that there are a multitude of factors which can potentially influence or moderate the effect of each of the aforementioned collaborative techniques on language learning.

The findings of the present study can have implications for teachers and learners. The present study can help teachers and learners to understand the importance of collaborative techniques in language learning. Not only do they help learners to be stronger, but also they make vocabulary learning more enjoyable. Snowball and word webbing are powerful techniques for improving vocabulary learning.

The knowledge of how collaborative techniques affect various language skills and components may enable teachers to find new ways of teaching by collaborative techniques and increase students' motivation and attitude for attending classes. These techniques can increase learners' motivation to learn and make the learning process more meaningful.

The findings can have implication for learners, too. Students can be more active in the learning process by collaborative techniques. They learn more by less effort. They become responsible for their teammates. They also learn how to investigate, solve a problem, make a decision, interact, and share their knowledge and responsibility.

All in all, this study may have shed some light on some of the issues surrounding collaborative learning techniques and the effect they exert on language learning. At the same time, it has to be acknowledged that this study might have had several limitations. For one thing, the four vocabulary tests (KET, vocabulary pretest, vocabulary comprehension, and vocabulary production) were not validated. The reason was that the psychometric characteristics of the KET test were taken for granted because it was used as an already established criterion. The validity and reliability of the three other tests were not checked because they were all directly based on the specific treatment, so they were assumed to be content valid. Nonetheless, the psychometric characteristics of the data collection instruments could have affected the outcome of the study. Another point to be acknowledged is that due to time constraints, the participants received treatment for only a semester. It may be cogently argued that some of these techniques may have long-term effect. So, their effect may not be evident immediately after instruction. This acknowledgment, coupled with the controversies already surrounding this issue, may warrant further research in an area waiting to be further explored.

## ABSTRACT

Nowadays. E-learning is becoming more and more common among students; therefore, the issue in e-learning environments must be given a full attention. Research approves that constructivism learning theory, whose main focus is on knowledge construction based on learner's previous experience and his/her social interaction is a good fit for e-learning and ensures learning among learners. The relationship between technology and constructivism is the complementary one, the employment of each one promoting the other. Constructivism is an approach maintaining that learning takes place in contexts, while technology refers to the designs and environments that involve learners. In this process it is unavoidable that teachers and administrators need to be actively involved in creating e-learning environments. But implementing the proper template to this end is the issue, which has been neglected i.e. teachers have used templates, which are not in line with the accepted approach to learning in digital environment, i.e. constructivism. The most used and advised templates by the teachers and administrators in Iran, TESTA and Hot Potatoes, were selected To examine the extent to which they satisfy the constructivists' learning stipulation. The third template, Wonder Share Quiz Creator, as an unknown template was also added. To this end, Richards' maxims of teaching for language teachers were set as the bases of describing the templates potentialities.

**KEY WORDS:** Constructivism, Smart test templates, TESTA, Hot potatoes, Wondershare quiz creator

## INTRODUCTION

IT technology is being increasingly used in ESL/EFL teaching, and the expanding growth of ESL/EFL websites is a sign to how important IT technology has become. Yet, realizing the potential of this exciting and constantly expanding medium is not a straightforward undertaking. Traditionally, schools have established situations, where individuals "learn how to learn "major learning processes including formulating questions, accessing potential source of information, evaluating and organizing it, and finally, applying the information to answer some questions. The "revolution", originated from humanistic approach and tracked by cognitive theory was brought to a point that is nowadays – constructivism. According to constructivists, learners build their own individual understanding of the world.

In recent years ,Constructivist learning has grown as an eminent approach to teaching as the need for 'deep' as contrasting to 'surface' learning has gained eminence as a characteristic of what is known to be professional competence. Constructivist approaches to modeling the learning

process are based on the assumption that people are active learners and actively construct their knowledge for themselves (or with teachers, peers, etc.). In Constructivist approaches, learning is not viewed as a simple acquisition process based on teacher transmission of information but as a process through which meaningful learning is attained as the learner constructs and reconstructs conceptions of a phenomenon based upon his/her personal existing and previous knowledge or experience. Concepts of self-regulated learning and assessment for learning are also interweaved into constructivist theory. Some researchers suggest that the role of the teacher has changed from the transmitter of knowledge to one which supports self-regulated student learning, more attention ought now to be paid to how this role change might be achieved (Van Eekelon et al., 2005:447-448; Nichol & Macfarlane-Dick 2006:199).

In pedagogies grounded on constructivism, the teacher's role is not only to witness and assess but also to participate with learners while they are carrying out activities and posing questions to the students for deeper commitment and the advancement of constructive reasoning. Learners compare their form of the truth with that of the teacher and peer learners so that to get to a new, socially tested version of the truth. Consequently, it is assumed, the quality of active interaction is serving to determine the extent to which 'deep' or 'higher-order learning' is established.

Nowadays, constructivism is the most accepted approach to language learning and its main influence on educational psychology is the learner-centered approach, which highlights the autonomy of learners in the process of their learning. The approach to teaching and education is often developing as researchers learn more about how students learn and which teaching methods appear to be the most effective. Consequently, the traditional curriculum is also gradually changing. Rote memorization, for example, was once a habitual part of the traditional curriculum and is less frequently seen today.

Education, in Iran, has already been administrator –oriented, which means, it is the administrators who decide on the whole materials, activities and whole process of learning and teaching for all classes in all situations. Teachers and learners sole responsibility is performing the instructions received from the administrators whether or not it satisfies their needs or ambitions. The traditional curriculum contains the presentation of information in the form of blocks or units, which are broken into smaller units of information and offered by the teacher to the students. Traditionally, discussion between learners and teachers are less accepted, and the acceleration of class discussion is also not a part of the traditional curriculum. These are considered inadequate by some educators, who think that students should develop critical thinking, and skills to internalize the information use, from the functionalists' perspectives.

The traditional curriculum can also be deeply standards-based, with testing used to assess fulfillment and achievement. Such curriculum has also been criticized by educators, as standards-based curricula, which are the form of "teach to test" in which students are fed with information, which will only assist them pass a test, but not essentially with information, which they can use in their real life.

### ***Learner Autonomy & Self-directed Learning***

Self-directed learning is regularly recognized as an important educational aim for quite different reasons, from the enhancement of school learning to the critical assessment of the claims of

democracy. Most reasons suggest that self-direction is important in learning during life. Consequently, process-oriented teaching, which aims to promote self-directed long-life learning, requires a comprehensive and multidimensional theoretical basis. The significant role of experiences in the social and cultural environment, prior knowledge, and the emotional aspects of education are highlighted, and linked to self-directed learning in life.

### ***Collaboration in the Constructivists' Context***

Bruner (1986) states that "learning in most settings is a shared activity, a sharing of the culture". Therefore, collaboration is an important notion in constructivist learning settings. Collaboration represents and provides the social aspect of learning: Therefore, learners are enabled to "develop their own strategies and understandings through combined exertion and have the chance to derive new understanding through the give-and-take of interaction, argument and discussion" (Vygotsky, 1978; Watson & others, 1999).

### ***Assessment in Constructivism Paradigm***

Assessment is a multi-perspective phenomenon, with occasional conflicting theoretical and professional perspectives. In recent years online or e-assessment of language skills has developed with the spread of e-learning and online testing within foreign language teaching and learning settings. Although much of the assessment done in online environments is assessment of learning, assessment for learning can help motivate learners by raising their awareness of their strengths and weaknesses, rather than simply measuring them.

Nowadays, we hear and see a lot about the instructions and justifications both in the ministry of education while higher education emits to extend the use of technology in educational settings in Iran. It is a good sign of administrators' understanding the importance and merits of IT implementations in education. But what is actually done in practice is providing the hardwares with no attention to user's ability/capability in applying the new medium in education. As a result, the instruments remain useless because of staff of knowledge in producing and implementing appropriate softwares. Therefore, at first it seems vital to make the users be familiar with both the theoretical basis of computer assisted learning (CAL) and proper templates satisfying those learning and teaching requirements in general and second language acquisition (SLA) in particular. Consequently, to have a good selection of templates, they should be evaluated by the dominant learning approach of the day, constructivism. Richards (1995) as a prominent constructivist, has summarized the constructivism's concepts in eight maxim:

***The Maxim of Involvement:*** Follow the learners' interests to maintain student Involvement

***The Maxim of Planning:*** Plan your teaching and try to follow your plan.

***The Maxim of Order:*** follow the lesson plan"

***The Maxim of Encouragement:*** Seek ways to encourage student learning

***The Maxim of Efficiency:*** Make the most efficient use of class time.

***The Maxim of Conformity:*** Make sure your teaching follows the prescribed method.

***The Maxim of Empowerment:*** Give the learners control.

Since in the constructivism's environment teaching and assessment are not seen separated but integrated, it is believed that the principles of teaching settings ought to be observed in e-assessment environments, created by e-assessment template creators. The purpose of this research is to have a comparative study of three e-assessment creator templates to find the best one, which meets the postmodernist educational necessities based on Richard's (1995) maxims of teaching. To this end, the present study intends to shed some lights on three Smart test templates: Hot

potatoes, J Quizzes and Testa. They are reported to satisfy these basic requirements: They are user friendly, simply available, having easy access by the testers & testees, and proving effective acceptability for teachers, learners and administrators.

## **LITERATURE REVIEW**

### ***Technology and Constructivism***

To comprehend the potential of technology application in improving the teaching-learning process, the effect of constructivism on classroom activities has been studied by many scholars (e.g., Black & McClintock, 1995; Richards, 1998; Brush & Saye, 2000). Other researchers have advocated that constructivist strategies make use of technologies for greatest effect in learning (e.g., Duffy & Cunningham, 1996). Based on Jonassen, Peck and Wilson (1999), technology stands for “the designs and environments that engage learners”. Hence, the focus of both constructivism and technology are on the establishment of learning environments.

### ***Current Constructivist-based Trends in Educational Technology***

There is a great drive toward more of a Constructivist approach in applying instructional technologies. There are many such devotees, and they provide a persuasion dispute. “One way forward is to switch our attention from the design of software packages (which act solely as storehouses of information) to an interactive problem-based environment in which the learner assumes the key role. With this profile in place, the learning task can be tailored to the student’s capabilities rather than the student having to fit in with the software designer’s generalized understanding of how learning should take place. The creation of these rich learning environments will also have to ensure that texts, reference sources, multimedia and communication facilities are fully integrated” (Shield, 2000). Learning, which happens in authentic and real-life settings, and based on the learners' need, is a "primary catalyst of knowledge construction" (Camp & Doolittle 1999). Technology has impacted the pedagogies of Social Constructivism significantly. According to Desai, Hart, and Richards (2008) instructional design is a critical factor in the creation of effective online instruction. “One of the most important steps in creating a successful e-learning environment includes the development of flexible technology-based course content” (Desai et al., 2008). Instructors need to spend a significant time and effort on creating a successful e-learning environment. "Instructors find that e-learning is much more labor intensive and they have to acquire unusual skills, experience, and dedication to be successful than comparable traditional learning" (Desai et al., 2008).

A high degree of interaction between learner and teacher is critical to the success of instruction (Desai et al., 2008). In a traditional setting, classroom communication would have not required much consideration, but technology requires the teacher to keep on active in communicating to learners in order to sustain attention and drive.

Learner participation in group work is a part of social interaction in an online learning environment. Email, texting and instant messaging are common forms of communication practices within virtual group work, all of which provide a “Social Presence” (Desai et al., 2008). Traditionally, a social presence was communicated by discourse and social clues such as facial expressions, non-verbal clues and inflection (Nevgi et al., 2006). Technology requires “a distinct

interaction with learners and high technology devices” providing “a strong interaction between the learner, learner/instructor, and the content as well as other learners” in the distance education environment (Desai et al., 2008).

Since e-learning is becoming increasingly popular among learners, the issue of learning in e-learning environments must be given a full attention. Research approves that constructivism learning theory, which emphasizes on knowledge creation based on learner’s prior knowledge, is a good fit for e-learning because it confirms learning among learners (Harman & Koohang, 2005; Hung, 2001; Hung & Nichani, 2001; Koohang & Harman, 2005). Koohang (2004) states that appropriate instructional design that includes learning theories and principles is critical to the success of e-learning. Broderick (2001) states that “Instructional Design is the art and science of creating an instructional environment and materials that will bring the learner from the state of not being able to accomplish certain tasks to the state of being able to accomplish those tasks.” Instructional design has always relied on learning approaches and theories, namely behaviorism, cognitivism, humanism, and constructivism. In the last two decades, constructivism has been at the center of attention, because it encourages active learning through knowledge construction (Gagne, Briggs, & Wager, 1992). The issue of including learning theories in e-learning instruction design has always been critical, for this reason, it has consistently been reported in the literature (Egbert & Thomas, 2001; Koohang & Durante, 2003; Pimentel, 1999; Randall, 2001). The literature has also constantly acknowledged that constructivism learning theory is a fitting match for e-learning setting (Harman & Koohang, 2005; Hung, 2001; Hung & Nichani, 2001; Koohang & Harman, 2005).

#### ***Assessment-based Instruction***

One of the critical components of the education is assessment. People within the educational community, i.e. policymakers, educators, learners, parents and administrators, have different ideas regarding the application of assessment strategies (Dietel, Herman & Knuth, 1991). Some consider traditional assessment methods more effective, while others believe non-traditional assessment tools superior.

#### ***Constructivists' Assessment-based Stipulation***

Since constructivists claim that each learner construct his/her own learning, they are concerned in assessing learner’s learning process instead of overt knowledge or skills we can easily see (Jonassen, 1992). One principle of assessment in a constructivist design is not to separate evaluation as a single process. Learning in constructivists design is as a cyclical process. As the form of a circle has no start and no end, then the spot of where to assess could become indistinct. Assessment is not as an ending activity in constructivists design, but rather an ongoing process that assistances the students continue to teach themselves how to learn (Holt & Willard-Holt, 2000).

#### ***Templates' required potentialities in constructivism settings***

Aghighi & Motamedi (2013) proposed that, it seems any software, template or application offering learning environment in postmodern digital age should satisfy Richards’ maxims in virtual educational environments. They set these maxims as the base, and also took some other supporting theories and approaches into account to define the characteristics or potentialities of a working template in constructivism’s educational settings. They are presented in the following table.

Table 1: Templates' required potentialities

Template's potentiality	Satisfying the maxims of....	Maxim's weight	Total weight
Providing different forms of feedback	Involvement	2	20
	Encouragement	6	
	Accuracy	6	
	Empowerment	2	
	Relevance	3	
	Efficiency	1	
Inclusion of variety of activities	Relevance	3	7
	Involvement	2	
	Empowerment	2	
Simple manipulation and clear Instruction	Involvement	2	3
	Efficiency	1	
The customized appearance of the template player	Involvement	2	4
	Empowerment	2	
Potentiality to Provide activities and tasks for practicing Language skills and sub skills	Planning	2	2
Potentiality to check learners' understanding in all language skills area	Planning	2	2
Time limiting for each activity	Efficiency	1	3
	Planning	2	
Offering the activities based on the learners abilities	order	6	6
Easy to generate content	Efficiency	1	1
Donating rich results	Efficiency	1	1
Online availability	Efficiency	1	1

## RESEARCH QUESTION

The present research study intends to find an answer to the following question:

Which E-assessment template is more in line with the postmodernist educational concepts such as collaboration, learner-centered (personalized) environment and assessment for learning?

## METHODOLOGY

Descriptive method is preferable, because it involves gathering data that describe events and then organizes, tabulates, depicts, and describes the data collection (Glass & Hopkins, 1984). Indeed, the descriptive component is critical to educational research, because educational events cannot be reduced to a controlled laboratory environment. The types of questions generated in educational research, particularly with respect to the constructivist paradigm and social implications, require descriptions that help explain the data and direct emergent prescriptions for educational events. (Nelson & McLellan 1996). A structured observation method, using a list of required templates' potentialities defined by Aghighi and Motamedi (2013) was implemented.

### ***Materials***

Three smart test templates including TESTA, Hot potatoes and Wondershare Quiz Creator were implemented for creating e-learning environment. The content was brought from a general English book entitled: ESAP.

- *TESTA*

Testa is an online test management system designed for creating multiple choice exams to make it available via URL and on a webpage. Testa helps administrators and teachers prepare and hold the exam faster and easier. Immediate feedback is available for the students by using Testa. The disadvantage of Testa is not being an interactive application. In addition it can be used for one form of test (multiple choice tests) and other forms of activities are not available.

- *Hotpotatoes*

It is not a freeware, but it is free of charge. It is for non-profit educational users who want to make their pages available on the web. This application has six interfaces, which are JMix, JMatch, JCloze, JCross, JQuiz and The Masher. This application will assist you to create interactive multiple-choice, short-answer, jumbled-sentence, crossword, matching or ordering and gap-fill exercises and make them available on a web page. HOT POTATOES uses advanced JavaScript but it does not expect the users to know anything about JavaScript or HTML or any other programming language to get things done.

In brief, HOT POTATOES is a tool that assists the teacher to embrace the technology in classrooms. It will give new opportunities to empower students to reach new heights. It is also believed when the teachers keep students away from technology, they take away the opportunities that are readily available overseas.

- *Wondershare Quiz Creator*

Wondershare Quiz Creator is a multipurpose software tool designed to help teachers and trainers to produce Flash-based, high-quality exams and surveys. The program supports various types of questions, such as multiple choice, multiple response, fill in the blank, sequence, short essay, etc. Questions are created independently and stored in the program's database, allowing teachers to use and reuse them in different quizzes as many times as needed.

### ***Procedure***

Describing the templates needed carefully working them out. To this end, the Help sections of each template were first carefully explored and studied both to have a list of the templates potentialities and get familiar to work them out. The researcher tried to create different qualified activities using the templates potentialities. While creating e-content via selected templates, the researcher described their potentialities for satisfying the related maxims. In the cases templates believed to possess a potentiality, but the researcher seemed to be unable to work them out efficiently, he tried to get help by searching the web. In addition, contacting support center of the templates was also a good idea which only Wondershare Quiz Creator provides such support with nearly immediate response. Then, the described templates were quantitatively evaluated in comparison with each other.

*Table 2: Quantitative description of templates potentialities*

Template's potentiality	Total score of the potentiality	TESTA	Hot Potatoes	Wonder Share
Providing different forms of feedback	20	10	15	20
Inclusion of variety of activities	7	1	5	7
Simple manipulation and clear Instruction	3	2	2	3
The customized appearance of the template player	4	1	2/5	4
Potentiality to Provide activities and tasks for practicing Language skills and sub skills	2	1	2	1/5
Potentiality to check learners' understanding in all language skills area	2	1	1/5	1/5
Time limiting for each activity	3	1	2	3
Offering the activities based on the learners abilities	6	0	0	6
Easy to generate content	1	1	1	1
Donating rich results	1	1	0	1
Online availability	1	.5	.5	1
Total score	50	19/5	31/5	49

As the table clears, TESTA is far from the constructivism idealization of educational settings; therefore, it couldn't be accounted as a template belonging to postmodern era. Hot Potatoes show minimum potentialities to satisfy the digital age stipulation of educational environment. In comparison with the two other templates, Wonder Share indicates more potentialities to be convenient with the idealization of postmodern approaches to learning.

## DISCUSSION

Template's potentiality		Satisfying the maxims of....	Maxim's weight	Total weigh
Providing different forms of feedback		Involvement	2	20
		Encouragement	6	
		Accuracy	6	
		Empowerment	2	
		Relevance	3	
		Efficiency	1	
Templates description				
TEST A	<p>Proper pictures, sounds and links to web pages can be added to the stem of the questions and choices.</p> <p>Providing these forms of feedback by TESTA is not as straightforward as other templates. Since, TESTA uses a web based editor which users who are not familiar with such editors may fail to add desired feedback to the questions.</p> <p>There are two basic ways to add sound and video to the activities: Inserting an object, and adding a link. Adding a link is the simplest approach meaning that the file is separated from the software, so it may results in some problems in playing if the file is missed. Inserting the file means that the file becomes embedded in the software and will be corrupted if the software be corrupted.</p> <p>Links to other Web pages in the exercise provide rich and interesting input that provides an opportunity to comprehend and/or produce meaning.</p> <p>TESTA lets users add link to web pages only to questions and web pages can't be linked to the choices to provide more information. Of course we should be aware that TESTA is a test manager software not learning and teaching template, therefor linking to web pages even from the test stem will violate its purpose.</p>			10
Hot Potatoes	<p>Proper pictures, sound, multimedia and link to web pages are added (not inserted, as illustrated above) to all parts of the activities, including the text, questions, choices and the feedback.</p> <p>A positive point is that a link can be added to the pictures of the activities to web pages or even local files.</p>			15
Wonder Share	<p>Proper pictures sound multimedia and links to web pages are inserted to all parts of the activities, including the questions and choices. It is possible to use pictures for feedback.</p> <p>A positive point is that, wondershare provides the possibility of capturing screen image, so users can easily insert the picture of the screen to their questions.</p> <p>Wondershare lets the users to insert (not add) the sound to questions and feedback sessions. By using wondershare, users are free to insert the pre-prepared sound files or directly record a sound to the software.</p> <p>Videos can be inserted to only the questions part of the activity. They can't be used as an answer or as a feedback.</p> <p>Wondershare also lets the users add link to web pages in all parts of the activities including text, questions, and answers and feedbacks, but adding links to pictures is not allowed.</p>			20
Inclusion of variety of activities		Relevance	3	7

		Involvement	2	
		Empowerment	2	
TESTA	TESTA is limited to provide only one activity, i.e. multiple choice items test format.			1
Hot Potatoes	Hot Potatoes offers a good variety of activities consisting five different exercises useful for practicing some language activities. This application will assist the teachers to create interactive multiple-choice, short-answer, jumbled-sentence, crossword, matching or ordering and gap-fill exercises			5
Wonder Share	Wondershare offers a good variety of activities consisting nine different exercises useful for practicing some language activities. The program supports various types of questions, such as multiple choice, multiple response, fill in the blank, sequence, short essay, etc.			7
Simple manipulation and clear Instruction		Involvement	2	3
		Efficiency	1	
TESTA	TESTA is set up and handled easily. It has a clear and direct control panel which allows the administrator to create and publish his/her test easily. However applying some template facilities such as adding pictures and publishing in the web needs some web knowledge.			2
Hot Potatoes	HotPotatoes is set up and handled easily. It has a clear and direct control panel which allows the users to create and publish their tasks in different types. However, knowing a little programing is needed if one tries to publish his/her activities containing multimedia and sound on the web.			2
Wonder Share	Wondershare is set up and handled easily. It has a clear and direct control panel which allows the users to create and publish their tasks in different types and publish them in different formats involving Publish flash quizzes to Quiz Creator Online; Upload the published Flash quiz to the web; Generate a SCORM quiz package for LMS; Produce stand-alone EXE file for CD and Export to Word or Excel files for paper-based testing. Inserting pictures. Sounds and multimedia needs no programming knowledge, so that everyone can benefit all wondershare facilities.			3
The customized appearance of the template player		Involvement	2	4
		Empowerment	2	
TESTA	The appearance of TESTA is not customizable, i.e. that users can't alter the appearance of the software by changing the size, color, icons and... of the player.			1
Hot Potatoes	HotPotatoes lets the users to personalize the appearance of the software through making changes in color, output font, and size and background picture of the template.			2.5

Wonder Share	Wondershare is a flash format based template; It means that its appearance is attractive and eye-catching. The Wondershare player is highly customizable to meet the styles of the users. It lets the users to customize the size and color of the player with variety of options as well as the size and color of the output font. Users can edit the toolbars and background picture as well as choices and pictures position.			4
Potentiality to Provide activities and tasks for practicing Language skills and sub skills		Planning	2	2
TESTA	<p>This software lacks a special module for reading comprehension activities. However reading comprehension activity can only be presented in the form of multiple choices.</p> <p>Finding correct spelled word, correct order of the Jumbled words and correct order of Mixed-up sentences are the available exercises in TESTA for writing activities.</p> <p>Designing listening activities are thinkable by means of TESTA, but it should be noticed that a link is added to the sound files, so you may miss the task if the file which is located in other place is lost or corrupted.</p> <p>No module of TESTA can be used to design exercises for neither speaking activities in general nor pronunciation in particular.</p> <p>Only multiple choice exercises is available in TESTA for working out vocabulary and grammar.</p>			1
Hot Potatoes	<p>This software possesses a special module for reading comprehension activities which other templates lack such facility.</p> <p>Exercises like completing words with missed letter, in spelling level and sequencing the scrambled words to make a sentence are available but ordering sentences to make a paragraph and free essay writing are not possible by means of Hotpotatoes modules.</p> <p>Designing listening activities are thinkable by means of hot potatoes modules. But it should be noticed that a link is added (not inserted as illustrated above) to the sound files.</p> <p>No module of HotPotatoes can be used to design exercises for neither speaking activities in general nor pronunciation in particular.</p> <p>All five module of this template except J Cross, which is adjusted only for practicing vocabulary activities, are ready to provide variety of activities for practicing and assessing vocabulary and grammar activities.</p>			2
Wonder Share	<p>This software lacks a special module for reading comprehension activities. However other modules can be used for this purpose.</p> <p>Exercises like completing words with missed letter, in spelling level and sequencing the scrambled words to make sentences or ordering sentences to make a paragraph are possible by means of Wondershare modules. Besides free essay witting is the feature is found in wondershare, so users can think of presenting such an interesting activity using this platform.</p> <p>Designing listening activities are possible by means of Wondershare modules. Since, sounds and videos are inserted in the software, the concern of missing the files is reduced. On the other hand inserting the files is very easy and straightforward and doesn't need users to know any programing. Besides, it will be published easily wherever you wish, on the web, on LMS or stand-alone EXE file for CD.</p> <p>The only weak point of this template about presenting listening activities is that the sounds or videos can be presented only in the stem of the question. It would be better if the sound was also presented in choices unit.</p> <p>No module of Wondershare supports designing exercises for neither speaking activities in general nor pronunciation in particular.</p> <p>All module of this template except Short Essay are ready to provide variety of activities for practicing and assessing vocabulary and grammar.</p>			1.5
Potentiality to check learners 'understanding in all language skills area		Planning	2	2
TESTA	<p>Reading and Listening comprehension is checked through selecting correct answers. Checking free writing essays is not possible. Speaking neither can be practiced nor checked by means of this software. Learner's vocabulary and grammar knowledge are also checked through selecting correct answers.</p>			1

Hot Potatoes	Reading and listening comprehension is checked through selecting correct answer, selecting true or false choice and matching and filling in the blanks. Writing, at the level of spelling, can be checked through selecting true choice and filling in the blanks. At the level of sentence writing, correct order of the sentences is checked by means of JMix module. But checking paragraph and free essay writing are not available in this template. Speaking is the skill, which neither can be practiced nor checked by means of this software. Student's vocabulary and grammar knowledge is evaluated through selecting correct answer, selecting true or false choice, matching and filling in the blanks tasks.			1.5
Wonder Share	Reading and listening comprehension is checked through selecting correct answer, selecting true or false choice, matching and filling in the blanks activities. At the level of spelling, it can be checked through selecting and filling in the blanks exercises. In spite of offering writing activities, checking free essay writing is not available in this template. Speaking neither can be practiced nor checked by means of this template. Student's vocabulary and grammar knowledge is evaluated through selecting correct answer, selecting true or false choice, matching, sequencing and filling in the blanks.			1.5
Time limiting for each activity		Efficiency	1	3
		Planning	2	
TESTA	TESTA can set time only once for all questions.			1
Hot Potatoes	Assigning time as much as needed to activities is an essential part of planning. It can set time once for all questions.			2
Wonder Share	This application lets the users have two choices for assigning a time limit. First they can assign a time to all activities, second they can do this for each activity alone based on the activity level of difficulty and learners' abilities.			3
Offering the activities based on the learners abilities		order	6	6
TESTA	To have a successful learning, activities should be presented based on learners' ability. This software lacks such capability. One test is offered for all.			0
Hot Potatoes	This template lacks such a capability.			0
Wonder Share	Offering the activities based on the learners current abilities is the feature hardly found in other template. This is the feature, which more promotes the personalization aspect of learning. This application poses such a helpful potentiality.			6
Easy to be used by the learners		Efficiency	1	1

TESTA	It is easy to be worked out by the learners after a brief explanation.			1	
Hot Potatoes	Learners have no problems engaging in the exercises provided by this template.			1	
Wonder Share	It is highly easy and interesting for the learners to working on the activities provided by this application in flash format.			1	
Donating rich results			Efficiency	1	1
TESTA	TESTA presents almost a complete details about the learner performance on the test for the both test taker and the teacher. The details include the information about number of questions, number of correct answers, number of incorrect answers, number of unanswered questions, total grade, answered and unanswered questions. It also provides information due to the learners' position between the other test takers. But the results were better to be forwarded to parents.			1	
Hot Potatoes	Hotpotatoes provides no detailed result of the work done at the end. It just provides ongoing feedback on the task is being done, since Hotpotatoes is not intended to be as a testing template.			0	
Wonder Share	Wondershare presents details about the performed test for the both test taker and the teacher. The details include the information about total questions, full score, passing rate, passing score, learner score, correct answer, answered questions and elapsed time. However, can be regulated in such a way that to ignore such statistics and play the role of learning template what is desired in constructivism. It also has the potentiality to send an e-mail containing the results to both teacher and learner / parents.			1	
Online availability			Efficiency	1	1
TESTA	It can be easily available online, but containing sound and video may cause some problems.			.5	
Hot Potatoes	It can be easily uploaded on personal blogs or websites to be available online, but added sound and video may cause some problems (as illustrated above).			.5	
Wonder Share	It can be easily published online on personal blogs and web sites or on LMS services. It can also be published as an auto-play exe file for CD delivery.			1	

## CONCLUSION

It goes without saying that each template has its own advantages and disadvantages, and they all have been developed with a rational behind, for instance templates like TESTA have been

developed when cognitivism has been the accepted learning approach and transmission of knowledge has been main process of teaching, but nowadays constructivism is the prominent approach to learning and knowledge is constructed through social interaction, TESTA and similar applications are less qualified for the purpose, simply because they are not capable enough to satisfy the educational requirement of the day such as collaboration. Hence, it is suggested to teachers and everyone who is interested in producing e-content for e-learning environment be familiar, in advance, with rules of the game.

Collaboration, assessment for learning, learner-oriented (personalized learning) and teacher facilitator are main concepts of constructivism, which can be promoted via providing variety of proper feedback: hence, templates' capability to provide variety of feedback in different forms is a critical property of any template. However, the quality of feedback and their effectiveness are the issues depended on teachers and content creators.

The weak point of all templates is that they all are not mature enough to support exercises promoting speaking in an interactive manner, hopping developer find a solution to this insufficiency. But, one word is certain: Wondershare Quiz Creator seems to be more in line with level of idealization in the post-modernists' era.

### **LIMITATION OF THE STUDY**

One of the limitation of the study is that deciding on the criteria of simple manipulation of the templates and easiness of working out by learners, the researcher has evaluated the templates based on his personal understanding of the literature, which are certainly different from those of the others.

While there are a considerable number of templates other than those evaluated, which may possess more noticeable features in line with the dominant approach, this study has focused on restricted number of templates because of certain limitations.

## ABSTRACT

Regarding the huge corpora of studies and theories about the interrelationship between language and culture, choosing more effective texts for teaching culture to English as a Foreign Language (EFL) students to improve their reading skill is the main concern of this paper. In other words, the current study is an attempt to find out whether teaching culture through culture-teaching informative texts as direct channel of teaching culture or short stories as indirect channel of teaching culture in EFL environments can improve ELLs reading skill more effectively. So in a quasi-experimental design consisting of two groups of Iranian EFL students in which direct and indirect cultural texts were used separately, the performance of participants in a multiple choice test of reading general passages was statistically analyzed. The results indicated that teaching culture through direct cultural texts has more positive effect on Iranian ELLs reading skill than teaching it through short stories.

**KEY WORDS:** Culture, direct cultural texts, short stories, reading skill, English Language Learner (ELL), English as a foreign Language (EFL)

## INTRODUCTION

There are many definitions of culture in different disciplines. CARLA (Center for Advanced Research on Language Acquisition) for the purposes of the Intercultural Studies defines culture as "the shared patterns of behaviors and interactions, cognitive constructs, and affective understanding that are learned through a process of *socialization*. These shared patterns identify the members of a culture group while also distinguishing those of another group."

Damen, L. (1987) has cited "Culture: learned and shared human patterns or models for living; *day- to-day living patterns*. These patterns and models pervade all aspects of human social interaction. Culture is mankind's primary adaptive mechanism" (p. 367). Culture in sociological fields can be defined as *the ways of thinking, the ways of acting*, and the material objects that together shape a people's way of life. For Georg Simmel (1858–1918), a major German sociologist, philosopher, and critic culture referred to "the cultivation of individuals through the agency of external forms which have been objectified in the course of history".

According to anthrobase there are two extremes of the definition of culture in anthropology: A) within ecological anthropology culture is described as a "tool" used by society to keep its "adaptation to nature". This "tool" consists of "*concrete, physical tools, but also knowledge, skills and forms of organization*." B) A number of anthropologists have a purely *cognitive* definition of

culture. The idea is that "culture may be limited to *the communicative and meaningful aspects of social life: from language to the meaning carried by symbols, persons, actions and events.*"

Oxford Dictionary defines culture as "The arts and other manifestations of human intellectual achievement regarded collectively; that which is excellent in the arts, manners, etc." It is defined in wiktionary .org as "The arts, customs, and habits that characterize a particular society or nation; The beliefs, values, behavior and material objects that constitute a people's way of life;..." So, in accordance with the above definitions there are various views toward culture like the way for socialization, adaptive mechanisms and tools, the agency of external forms, communicative and meaningful symbols, persons, actions and events.

So, when culture is:

- A) our shared human models for living and interactions, day- to-day living patterns, the ways of acting learnt through socialization;
- B) our cognitive constructs, the ways of thinking, affective understanding, arts, etc.

and when, according to many studies (e.g. Swender&Duncan (1998), Muyale-Manenji. F. (1998)) language and culture are interrelated, it can be hypothesized that if there is a positive effect of culture teaching on EFL learners' reading skill, there will be two ways, among others, through which ELLs reading skill can be improved. According to two categorized definitions of culture in this paper, one might be teaching culture directly through every-day life, informative-comparative texts and the other through literary texts as art.

Regarding culture as the fifth skill beside listening, speaking, reading and writing, Dr. Thomas Garza (2008) in "Foreign Language Teaching Methods" has stated that "It may generally be accepted in the language-teaching community that culture is an integral part of language instruction, but there is little consensus on *what*, much less *how*, we should teach it." Now this study is an attempt to see the effect of culturally informative texts versus short stories on students reading skill.

## **LITERATURE REVIEW**

When language is understood as a social practice rather than mere codes one way in which culture has often been understood is as knowledge that people have about a particular society, about cultural artifacts or works of art, about places and institutions, about events and symbols and in short about ways of living. In other words, it is a framework in which people live their lives and communicate their meanings and feelings. As a sociocultural approach places a large value on learners' experiences, social participation, use of mediating devices (tools and technologies), and position within various activity systems and communities of practice (Gee, 2008), Lantolf (2000) explains,

"Sociocultural theory holds that specifically human forms of mental activity arise in the interactions we enter into with other members of our culture and with the specific experiences we have with the artifacts produced by our ancestors and by our contemporaries. Rather than dichotomizing the mental and the social, the theory insists on a seamless and dialectic relationship between these two domains. In other

words, not only does our mental activity determine the nature of our social world, but this world of human relationships and artifacts also determines to a large extent how we regulate our mental processes.”

There are different models and approaches which investigate the effects of culture and interaction in target language contexts and environments like “Intercultural Interaction Model” (Culhane, S.F. 2004) ,“social interaction model of Vygotsky (socio-cultural theory) and ‘interaction approach in second language acquisition’ (Mackey, 2012 in Williams (Ed.)), ‘optimal distance model’ of second language acquisition (Brown, 1980) and ‘input-interaction-output model’ (Block, 2003). In general, through intercultural language learning, students engage with and learn to understand and interpret human communication and interaction in increasingly sophisticated ways. Intercultural language learning is best understood not as something to be added to teaching and learning but rather something that is integral to the interactions that already and inevitably takes place in (ESL)classrooms and beyond. But in EFL contexts and environment with students of different language and culture background the story is somewhat different, as the distinction between ‘General SLA’ and ‘Instructed SLA’, ‘Naturalistic SLA’ and ‘Instructed SLA’, ‘Acquisition’ and ‘Learning’. So, sociocultural theories must be an amendment for the conventional viewpoint that considers learning as largely uninfluenced by context. It must be a companion for SLA. While in sociocultural theories (SCT) and approaches language learning and teaching are mostly placed in target context and culture, in teaching culture in EFLformal classrooms, it is target culture that must be brought into language learning and teaching context. However, “the fundamental psycholinguistic process of second language acquisition is the same whether learners enter classrooms or acquire language outside of them.” (Gass, 1989, cited in Lantolf,2012). There are many leading researchers like Van Lier(1994), Erlam (2008), Nieto (2009) and many others who try to bridge theory, research and practice gap, though some are “cautious about such direct connection” (Ellis, 2008 cited in Lantolf, 2012), and in almost all books and research papers the final section is devoted to classroom praxis, but in fact teaching culture is a very critical job, firstly for the concept of culture and the practice of teaching and acquisition.

Lantolf (2012) compares SLA with SCT (Social Cognitive theory) and summarizes that “SLA focuses on and privileges learning over teaching. All developmental mechanisms are inside the learner [the container], while SCT focuses on dialectical unity of teaching/learning. Obuchenie is a central mechanism in development”. Obuchenie is Russian and is the noun associated with obuchit' (to teach or instruct) and with obuchit'cya (to learn). Take away the prefix "ob" and you're left with uchit' (which can be translated both as to teach [the first meaning] and to learn or memorize) and uchit'cya (to learn or to study). Besides, Ellis (2008) sates that “Sociocultural SLA proposes that L2 learning occurs intermentally as well as interamentally.... It emphasizes the social and cultural nature of learning while also recognizing that language is a mental phenomenon.” Widdowson (2000) distinguishes two functions of language: as a “subject”; i.e. the language teachers teach, “a pedagogic construct”, “an externalized language the linguist describes”, and an “object”; i.e. what language “users do” with language, “an experienced language that is a reality for the user”.

Culture has also been learned and studied in other disciplines as well. According to Dennis O'Neil (2012), anthropologists can learn about the culture of another society through a combination of five things:

1. Proper mental preparation (including adopting the cultural relativity perspective)
2. Participant-observation

3. Competence in using the host culture's language
4. Long-term residence
5. Luck in being at the right place at the right time."

He further asserts that although there some ways to study another society and its culture like fieldwork and first hand observation, called ethnography, systematic comparisons of similar cultures, called ethnology, the best way to really get to know another culture is participant observation; that is to live in target society as an active participant rather than simply an observer, to physically and emotionally participate in the social interaction of the host society. So, it must be best learned directly. But when it comes to language and culture teaching and learning in EFL classrooms the significance of 'direct' and 'indirect' might be redefined.

It has been said that culture is like an iceberg, that only ten percent of it is visible and the other ninety percent is hidden below the surface. For this reason, ESL teachers must make intentional efforts to teach cultural understanding. Borrowing from Bachmann (1990) there can be two "channels" to teach culture in EFL classrooms; i.e. visual and aural, in two "modes"; i.e. receptive and productive. Different combination of these channels and modes leads to different methods. For instance, EFL teachers can give students some cultural topics and bring a discussion of culture into the classroom and talk about target culture or provide them with videos and cultural internet texts and images or ask students to have a native target English speaker pen pal to write and chat and get to know the target culture in many other ways. But the method used in a formal EFL classroom in this study is to provide students with texts and ask them to read and answer the questions. But what kind of texts?

Culture, as the matter of fact, penetrates every aspect of our beings. Nieto (2009) states that "culture is complex and intricate. It cannot be reduced to holidays, foods or dances, although these are of course elements of culture..... culture is not simply rituals, foods and holidays of specific groups of people, but also the social markers that differentiate that group from others.... This view of culture implies that differences in ethnicity, language, social class and gender need not in and of themselves be barriers to learning. Instead, how these differences are viewed in society that can make the difference in whether and to what extent young people learn." "... [Teachers] they need to first acknowledge student's differences and then act as a bridge between their students differences and the culture of the dominant society.... A bridge provides access to a different shore without closing the possibility of returning home.

Furthermore, teaching culture directly (explicitly) or indirectly (implicitly) has different psycholinguistic mechanism on memory storage. Semantic memory which is kind of explicit memory, is the system for storing knowledge of the world and much of which can be accessed "quickly and effortlessly. It includes our memory of the meanings of words—the kind of memory that lets us recall not only the names of the world's great capitals, but also social customs, the functions of things, and their color and odor. It also includes our memory of the rules and concepts that let us construct a mental representation of the world.

On the other hand, implicit memory which is both unconscious and unintentional, cannot be exploited for "actions and reasoning". It is a memory "to perform events and tasks, or to produce a specific type of response. This type of memory is shown through activation of the sensory and

motor systems needed to perform a certain task. Procedural memory is a kind of implicit memory.

Moreover, Gay (2000) defines culturally responsive teaching as taking advantage of the cultural knowledge, prior experiences, and performance styles of students to make learning more appropriate and effective for them; it teaches to and through the strengths of language learners. So, one of the best ways for teaching culture directly to students can be providing students with informative texts in an EFL classroom and then comparing different aspects of western culture with their native culture. This style of comparison-and-contrast through informative texts can also raise their consciousness, cognitive attention (Tomlina & Villa, 1994) and awareness to cultural differences and culture learning effectively enough. On the other hand, as one aspect of culture refers to art and literature, we can select short stories to teach culture. But since stories essentially have their own literary mission and application and their basic function depending on the genre basically is to narrate a plot or teach a theme, they can be indirectly used for the purpose of culture teaching to EFL students.

## RESEARCH QUESTIONS

The current study has aimed to compare the effect of culture teaching via direct versus indirect cultural texts on EFL learners' reading ability. In other words it tries to see if the Iranian ELLs who are taught target culture by culturally informative- comparative texts outperform or underperform in a general reading test than the ones who are taught culture by short stories.

## METHODOLOGY

### *Method and Design*

The selected research design in this study was quasi-experimental in which two experimental groups, randomly-selected, participated. One group was taught culture through culturally informative-comparative texts and the other group was taught culture through short stories.

### *Participants and Materials.*

From a population of Persian monocultural, Iranian female language learners, aged 20-35, university students, the university graduated or holders of high school diploma, 4 classes of low-intermediate language proficiency level according to International House language level, equal to B1 according to CEF (Common European Framework), in one of the language institutes in an urban area in Isfahan city of Iran were chosen. To determine their level of English language proficiency, students passed a placement test consisting of two parts: a short written test, with a handy answer sheet for quick marking, followed by a more detailed oral test, similar to CEFR (Common European Framework of Reference for Languages) placement test - Cornelsen. Its interview comprises some questions to test their pronunciation, language use and usage, fluency, ability to communicate, vocabulary and grammar. All four classes followed the regular program (with CLT method) of the institute, teaching same units (first three units) of one of EFL series of books (Total English, by Richard Acklam and Araminta Crace) at pre-intermediate level in 20 sessions. Since each group consists of 35 EFL learners and the number of students in each class was less than 35, two classes were selected for each treatment.

The participants in group 1 (two classes out of four) were taught English in the same program as group 2 but were taught cultural points through 10 texts which gave direct cultural information

about shopping, foods, holidays, driving, schooling and education, greeting, entertainment, party holding, exhibitions, child breeding, pet keeping, marriage and some other social family matters of the U.K., and some American culture information texts, from some credible Internet sources like [www.learnenglish.de/britishculture](http://www.learnenglish.de/britishculture) or in comparative style, comparing British culture with some other cultures like oriental and Arabic culture; for example a passage in book 'Paragraph Development' by Martin L. Arnaudet and Mary Ellen Barrett, p. 20. While group 2 were taught cultural points through 10 short stories by some writers like Langston Hughes or Pearl S. Buck from the book 'Oral Reproduction of stories' by Dr. Abbas Ali Rezai and some contemporary shorter stories from websites like [www.eslfast.com](http://www.eslfast.com) or [www.rong-chang.com/eslreadand](http://www.rong-chang.com/eslreadand) <http://www.readtheory.org>.

### ***Procedure***

There are some techniques for teaching culture developed by researchers like Taylor & Sorenson, 1961 (Culture Capsules, based on eight cultural categories, proposed by Taylor and Sorensen, namely Subcultural, Technology, Economic Organization, Social Organization, Political Organization, World View, Esthetics), Meade and Morain, 1973 (Culture Clusters), Fiedler et al., 1971 (Culture Assimilators), Gorden's prototype 1970 (Mini-Dramas, offered as the prototype audio-visual unit of the Cross-Cultural Communication Packet (CCCP)), Helen Wilkes, 1983 (Cultural Consciousness-Raising) and many others such as Kinesics and Body Language, Cultoons, Audio-motor Units, Critical Incidents/Problem Solving Media/Visuals, Celebrating Festivals etc. According to Christine Elmore (1997) in order to put teaching culture into classroom practice, we need to follow specific strategies including:

- "The lecture
- Native informants
- Audio-taped interviews
- Video-taped interviews/Observational dialogs
- Using authentic readings and realia for cross-cultural understanding (a four-stage approach to a cultural reading of authentic materials is very effective to lead students through the process of guided exploration and discovery : 1- Thinking, 2- Looking, 3- Learning, 4- Integrating)"

So, in the present paper the researcher used authentic reading texts and realia, and raised EFL students' cultural consciousness with combination of culture capsule and Cultural Consciousness-Raising. Thus, in addition to the syllabus of the term, on the basis of CLT (communicative language teaching) direct and indirect cultural texts were taught similarly. The teachers first engaged students by asking some related questions to activate their schema and prepare the learners. Then she pre-taught new key words of the text, after that, she asked them to skim if it was direct, if short story, read extensively, in limited time, subsequently she asked some general comprehension questions or called them to tell the plot summary of the story and asked students to look through the text for more details and do the exercises or she asked some more detailed and in-depth questions. Finally, she managed a class discussion about the cultural point of the story with students and highlighted them and asked ELLs to examine and compare with their own national or local culture. And then a 16-item multiple-choice reading comprehension tests of two general passages with culture hue at the level of low-intermediate was given to two groups.

## SCORING AND DATA ANALYSIS

In this study, the input of statistical analysis consisted of scores of students' answers to 16-item multiple-choice reading comprehension questions of two general passages selected from EFL graded tests by ETS on websites like <http://englishteststore.net>. Students received one mark for each correct answer and lose 1/3 mark for incorrect answer. Table 1 below shows the obtained scores of the subjects in reading comprehension of both groups. The frequency of scores is also enclosed in the table.

Table 1: Students' reading comprehension scores

Score	Frequency in Direct Group (G1)	Frequency in Indirect Group (G2)
14.66	3	2
14.33	2	1
14	1	2
13.33	3	2
13	4	2
12.66	3	3
12.33	3	
11.66	1	1
11.33	3	2
11	4	2
10.66	2	2
9	1	2
8.66	2	2
8.33	2	
8		3
7.66	1	3
7		2
6.66		
6.33		3
6		1

Information about the mean, standard deviation and standard error mean of the two groups are shown in Table 2. below

Table2: Group Statistics

Group	N	Mean	Std. Deviation	SEM
SCORES 1.00	35	11.86	1.97	0.33
2.00	35	10.44	2.75	0.47

The higher mean of group 1, with mean difference of 1.41 implies that they have outperformed on reading test over group 2. The mean difference is confident enough, because in the 95%-confidence interval for mean difference is from 0.26 to 2.56. Besides, Direct group's lower standard deviation score shows that their scores are less dispersed from the mean value than that of Indirect group. Then, a t-test was used for assessing the difference between the means of scores obtained by the two groups. The type of utilized t-test is independent or uncorrelated because the two sets of scores come from two different samples. So, it is used to calculate whether the means of two sets of scores taken from Direct and Indirect groups are significantly different from each other. Table 3.illustrates the results obtained from the t-test application.

Table 3: Independent Sample Test

	t	Sig. (2-tailed)	Mean Difference	Std. Error Difference
SCORE Equal variances assumed	2.4591	0.016	1.4155	0.576

The t value for equal variance is 2.4591 and has the two-tailed significance level of 0.0165 which is less than two-tailed probability value; i.e. the two-tailed P value is less than 0.05, by conventional criteria, this difference of two groups' performance is considered to be statistically significant. The mean of reading scores of students taught through direct cultural materials (M=11.8631, SD=1.9742) is significantly higher (t=2.4591, two-tailed p=0.05) than that of students taught through indirect cultural materials (M=10.4476, SD=2.7544) and this fact is demonstrated in graph 1 below.

Graph 1: Mean difference between Direct and Indirect group (G1 and G2)

## DISCUSSION

There would be innumerable factors involved in students' skill to read in EFL. Among these numerous factors, ELLs' culture knowledge of target language has been picked out in the present study to see how we can better improve it in order to take advantage of it for accelerating EFL reading ability of Iranian ELLs. Direct culture teaching may have such effects on the function of ELLs' cognition that leads to more efficient ability to read in EFL.

'Implicit Learning' and 'Explicit Learning' are two terms that are largely investigated and accepted in cognitive psychology (for example, Eysenck, 2001). Implicit learning is learning unintentionally without learner's awareness. For instance, learners are exposed to input data for processing meaning but being investigated for learning any L2 linguistic properties. However, it cannot promise that learning is absolutely without awareness. Since researchers believe that any learning is impossible without some degree of awareness (Ellis, 2008).

Explicit learning, on the other hand, is an intentional conscious process. For instance, learners are given an explicit rule and asked to use it or they are asked to discover an explicit rule from data provided. These two types of learning, as a result, lead to implicit and explicit knowledge. (Ellis,

2008). Learning involves both implicit and explicit knowledge, which interact at the level of performance. Although Ellis (1990), believes that implicit and explicit L2 knowledge are different in kind and are held separately in brain he, Ellis et al. (2009), postulated three different interface kinds between implicit and explicit L2 knowledge:

- “1. According to strong interface position, explicit knowledge can be converted into implicit knowledge when learners practice explicit and declarative rules.
2. According to non-interface position, implicit and explicit knowledge are held separate in brain and each involves rigidly distinct mechanisms and thus cannot be converted to each other.
3. According to the weak interface position, explicit knowledge can assist the acquisition of implicit knowledge by making some aspects of input salient and noticeable to learners.” (Rassaei et al. (2012))

Moreover, according to Richards & Schmidt 2009, the interface hypothesis is a concept in second language acquisition that describes the various possible theoretical relationships between implicit and explicit knowledge in the mind of a second language learner. There are three basic positions in the interface hypothesis: the no-interface position, the strong-interface position, and various weak-interface positions. The no-interface position states that there is no relationship between these two types of knowledge; in other words, knowledge that has been learned explicitly can never become fast, automatic language knowledge. This position has been largely discredited, and the debate has now focused on the strong- and weak-interface positions. The strong-interface position states that explicit language knowledge can always become implicit language knowledge, and that such knowledge becomes implicit through repeated practice. This position is most often associated with skill-building theories of second language acquisition. The weak-interface positions state that explicit language knowledge can become implicit to some extent, but that these are limited by various developmental factors.

According to Ellis et al. (2009), there are four instruments used to assess implicit and explicit *knowledge*. “Measuring Implicit and Explicit Knowledge of a Second Language” Ellis discusses five knowledge tests, namely the Elicited Oral Imitation Test, the Oral Narrative Test, the Timed Grammaticality Judgment Test (TGJT), the Untimed Grammaticality Test (UGJT), and the Metalinguistic Knowledge Test. Ellis explains the test features that distinguish between implicit and explicit knowledge. The experimental results indicate that these tests can be used for measuring either implicit or explicit knowledge. He used EI - and TGJT for measuring implicit, and UGJT and MKT for explicit knowledge of grammar in a study.

Dupuy and Krashen(1993) investigated implicit learning of vocabulary by asking learners to read a book and then test them to see if they learned any new vocabulary in the process. In this study, as well, students were given culturally comparative-informative texts and short stories, used as reading texts for the purpose of teaching target culture. As a consequence, students were investigated for any development of their reading ability in EFL in Iran which is monocultural. As to the interrelationship of language and culture, the outperformance of group 1, treated by direct cultural texts, could result in improving students’ cultural knowledge more effectively than group 2, treated by short stories as indirect cultural texts. Moreover, G 1 students’ better scores on general reading test at the end of the treatment could be due to their more efficient implicit learning than G 2 students’ as well. Besides, we can say students’ explicit learning and knowledge of (learning) culture has stronger interface with their implicit knowledge of (learning) reading in Direct group. That is using direct cultural texts for the purpose of teaching culture to students through reading, can increase EFL learners’ both explicit knowledge; i.e. cultural knowledge, and

implicit knowledge; i.e. knowledge of reading, more successfully than using short stories as indirect cultural texts for the same purpose.

The most well-known of Skill-based theories of second language acquisition is based on John Anderson's adaptive control of thought model (VanPatten & Benati, 2010). In this model, skill acquisition is seen as a progression from declarative to procedural knowledge (Richards & Schmidt 2009). Second language acquisition is seen as a progression through three stages, declarative, procedural, and autonomous (VanPatten & Benati, 2010). So higher development of EFLs' reading skill in G1 can be interpreted as higher progression in these three stages by direct cultural texts than short stories as indirect ones.

## **CONCLUSION AND FURTHER RESEARCH**

In the light of the above findings, the research question posed in the current study can be answered that teaching culture through comparative-informative texts has more positive effect on Iranians EFL learners' reading skill than through short stories. In other words, the findings indicated that teaching culture through direct cultural texts had a distinct advantage over indirect cultural texts in improving EFL reading skill.

The present study can also lead to some more research shedding more light on the underlying cognitive mechanisms by which the students treated by direct cultural texts outperform in reading test in comparison to short stories. Follow-up research can pursue the relationship between teaching cultures through other media like videos or internet chats on other skills like writing. Moreover, due to the limitations of this study like gender, nationality, context and setting, further researches can investigate the same issue on both genders, different levels of language proficiency or on immigrants or recently-immigrated students into an English speaking country with other instructional and instrumental tools. As a matter of fact, SLA studies always merit attention of researchers to develop the art of teaching English to students the best feasible effective way.

## COMMUNICATION OF MULTIPLE IDENTITIES THROUGH AUTOBIOGRAPHICAL WRITING

Richard T. Torto

*Department of Communication Studies, University of Cape Coast, Ghana*

### ABSTRACT

Identities are always in process, constructed across contexts and over time. Who we are is shaped both by various contexts and our perceptions of “self” within those contexts and by how we are perceived or positioned by others (McCarthy & Moje, 2002). “Autobiographical self” is the identity which people bring with them to any act of writing, shaped as it is by their prior social and discursive history. In the current paper, the researcher analysed the autobiographical section of the introduction to a book in order to unveil the writer’s identities. The study was conducted within the social constructionist theory and a combination of literary, linguistic and interpretive approaches were used in analyzing the data. The writer of the autobiography communicated series of identities by varying her linguistic choices. As a result, multiple identities were discovered from the analysis of the data ranging from individual, academic to social roles. The findings of the study were the identities that the writer constructed in her writing. From the analysis, the writer of the autobiographical extract can be identified mainly as: a narrator, an academic, a researcher, a writer, a wife and a mother.

**KEY WORDS:** Identity, Identity construction, Communication, Autobiographical writing, Autobiographical self, Social constructionist theory.

### INTRODUCTION

Generally, writing is not only about presenting content, it also entails representation of self. According to Ivanic (1998), the totality of our writing is influenced by our life-histories. She added that each lexical item we employ in writing reflects our encounters or multiple past experiences. Writing is not some neutral activity which we just learn like a physical skill, but it implicates every fibre of the writer’s multi-faceted being (ibid). As individuals, we write our stories as a way of constructing lives and claiming identities. Thus, identity and language are linked through personal narratives and life stories. Narrative inquiry focuses on lives and lived experiences. It takes as its object of investigation the story itself (Riessman, 1993) and allows for systematic study of personal experience and meaning. Personal stories, though are not merely a way of telling someone about one’s life, but rather they are the means by which identities may be fashioned (Rosenwald & Ochsberg, 1992). In the process of talking about ourselves as writers we are influenced by societal values, and attitudes about what writing is, and who writers are (Brandt, 2001; Clark & Ivanic, 1997). Drawing on their conception of the autobiographical self as one aspect of writer identity, Clark and Ivanic suggest that writing is affected by writers’ life histories and a sense of their roots even as they write. Life histories shape the sense of self-esteem and status with which they approach all aspects of social life, including writing.

The act of telling an autobiographical narrative is a performance that can position the narrator and the audience in various ways. The narrator assumes a particular version of the social world in which he or she exists and positions himself or herself and the audience with respect to each other. Langelier (2001) and MacLean (1988) theorize narrative as performance in a similar way. In the telling of a personal narrative, the teller creates a two-way narrative contact between teller

and audience. The narrator takes the experience of the narrated event and makes it the experience of those listening to the story. There is a constitutive aspect of narrative, referred to by Butler (1990) as a “performativity”. With this concept, the “self” emerges as a person and repeatedly adopts characteristic positions with respect to others and within recognizable cultural patterns in everyday social actions. As the positions that partly constitute the self depend on social contexts that shift over time, and on the unpredictable counter positioning of others, the self is an ongoing, open-ended, and often heterogeneous construction (Wortham, 2001).

The fact is that who we are affects how we write and whatever we are writing, whether it is a letter to a friend, a dissertation or an autobiography. This means the subject positions and social relations which are set up for us as a consequence of our social class, ethnicity, gender, physical build, abilities and disabilities, and the way these are constructed in the socio-cultural context in which we live. These socially-constructed possibilities for self-hood, according to Ivanic (1998), in turn shape our life-history of experiences, events, encounters and opportunities; hopes, fears and disappointments; values, beliefs and allegiances; self-confidence, anxieties and desires, and the tensions and contradictions in our lives (all these have bearing on our writing).

The main claim of this paper is that writing is an act of identity in which people align themselves with socio-culturally shaped subject positions and thereby play their part in reproducing or challenging dominant practices and discourses, and the values, beliefs and interests which they embody.

## **THEORETICAL PERSPECTIVES OF THE STUDY**

The present study is situated within the social constructionist theory. The choice of this theory is appropriate as it incorporates communication, identity construction and autobiographical writing which are pivotal to the study. As social constructionist theorists have convincingly argued, possibilities for self-hood and the patterns of privileging among them shape and constrain actual people writing actual texts. These possibilities for self-hood do not exist in a vacuum but are themselves shaped by individual acts of writing in which people take on particular discursive identities.

Bakhtin (1981) theorized that individuals engage in internal dialogue that may aid in the process of constructing and reconstructing ourselves as we struggle to make meaning of experiences and actions. Giddens (1991) points out that the diversity of socially available options for the self is a characteristic of what he calls “the late modern age”. What Giddens means is that the self, like the broader institutional contexts in which it exists, has to be reflexively made. Yet this task has to be accomplished amid a puzzling diversity of options and possibilities and against the backdrop of new forms of mediated experience, self-identity becomes a reflexively organised endeavour. The reflexive projection of the self, which consists in the sustaining of coherent, yet continuously revised, biographical narratives, takes place in the context of multiple choices. Giddens’ (1991) claim is a powerful way of conceptualizing continuity and change in a person’s identity over time. It locates identity in events and experience, rather than perceiving it as a quality or attribute. According to Giddens, the self consists not of a person’s life-history, but of

the interpretation they are currently making of their life history. Giddens added that the self is in this way doubly socially constructed: both by the socially constrained nature of the life experience itself, and by the social shaping of the interpretation. Ivanic (1998) suggests that writing makes a particularly tangible contribution to the reflexive projection of the self, with a three-way interplay between the writer's life-experience, their sense of self, and the reality they are constructing through their writing.

People who take a social constructionist view of identity reject the idea that any type of identity – political, sexual, emotional – is solely the product of individuals' minds and intentions, and believe that it is the result of affiliation to particular beliefs and possibilities which are available to them in their social context (Gergen & Davis, 1985). But identity is not socially determined but socially constructed (Ivanic, 1998). This means that the possibilities for the self are not fixed, but open to contestation and change.

A critical view of the social construction of identity not only recognizes the powerful influence of dominant ideologies in controlling and constraining people's sense of themselves, but also recognizes the possibility of struggle for alternative approaches. For individuals alone, contestation of damaging constructions of their identities may well be doomed to failure; however, without this possibility of contesting dominant constructions of reality, our social identities, the prospect for humanity would be extremely bleak. These issues of power and power struggle are relevant to all aspects of the social construction of identity, among which language, literacy and writing exist alongside other forms of social action.

Identities are also linked to language and associated with particular discourses (Gee, 1990). Sarup (1996) suggests that identity is constructed in and through language. Gee (1990) has theorized that this linkage may constitute an identity kit that signals we are members of particular groups. For Gee, discourses are ways of being in the world, or forms of life which integrate words, acts, beliefs, attitudes, social identities, as well as gestures, glances, body positions and clothes. Depending on the setting, we can take on different identities, yet the relational nature of identity suggests that there are relationships between our various selves and with groups. Drawing largely on work around writers and academic writing, Clark and Ivanic (1997) suggest that writers bring with them cultural and linguistic elements related to opportunities and life chances that may provide affordability or lead to failures which in turn impact writer identity. Insistence on standardization by society and schools condemns those who have difficulty with mechanical aspects of written language, and it places teachers in the impossible position of having to perpetuate the hold these beliefs have over society (ibid). Thus, viewing oneself as a writer is related to the sense of power and status writers bring with them as part of their life-history. Writers differ in how much they feel themselves to be not just writers but also authors with the authority to say something.

## **LITERATURE REVIEW**

In this section, the writer places the current study in the context of work done by other researchers with the view of showing how the present study is both similar and different from previous ones. Many studies across a wide spectrum of academic disciplines have focused on identity construction. The present paper looks at the issue of identity construction in autobiographical writing. Kehily (1995) is similar to the present work, in that, it looks at the way people use narratives to construct individual identities through the personal narratives of storytelling and autobiography. However, Kehily goes beyond the current study since it draws upon

the work of the gender and sexuality group that met at the Department of Cultural Studies of the University of Birmingham. The group aimed to explore issues of gender and sexuality in relation to identity construction. Group members identified broad themes collectively then wrote stories individually. They also drew upon and used photographs to reconstruct memories of the past in the context of the present. While the present paper focuses on autobiographical writing, Kehily (1995) relies on the use of stories and self-narration in the process of identity construction.

Ros (2004) also uses narrative accounts to explore intercultural experiences and the perception of the self by second language (L2) users. Extracts from the autobiographies of three Chicano writers from the 1980s: Richard Rodriguez's *Hunger for Memory*, Ilan Stavans's *On Borrowed Words* and Gloria Anzaldua's *Borderlands: La Frontera* were used to illustrate the socialization processes that take place when acquiring a second or third language and the creation of bilingual identities. The current paper is similar to Ros (2004) as the former also uses a narrative extract from a writer's work. However, the latter has a different feature as its data analysis follows post-structuralist and post-modern theories of cultural and language identity. The narrative analysis of Ros (2004) was on the one hand based on the theory of language which highlights the unequal relationships of power between different speakers, and on the other, on the premise that identities are multiple and subject to change over time.

Brockmeier and Carbaugh (2001) look at the issue of narrative identity from the perspective of scholars from psychology, philosophy, social sciences, literary theory, classics, psychiatry, communication and film theory. Brockmeier and Carbaugh's work was based on views on the importance of narrative as an expressive embodiment of our experience, as a mode of communication and as a form for understanding the world and ultimately ourselves. Brockmeier and Carbaugh (2001) share some similarity with Kehily (1995) and Ros (2004) in the sense that they all focus on the process of autobiographical identity construction. What all the writers highlight is that the construction of self draws on a particular genre of language usage: narration.

Afful and Mwinlaaru (2010) explored the connection between identity construction and the linguistic features of a Master's Dissertation acknowledgement, written by a student of Literary Studies. The element of similarity between Afful and Mwinlaaru (2010) and the present study is that both writers of the Dissertation Acknowledgement and the autobiographical extract, vary linguistic choices at the lexical, grammatical and discoursal levels, in order to construct numerous and different identities. However, the area of distinction between the current study and Afful and Mwinlaaru (2010) is that while the latter applied identity theory from social psychology and social language from Applied Linguistics in analyzing the data, the former was conducted within the social constructionist theory.

Mpungose (2010) investigated the construction of professional identities of Principals in the education service through life stories. According to him, such identities are constructed and developed over an extended period of time, ranging from the time of the principals' entry into the teaching profession to their appointment as school managers and leaders. While the current study did both literary and linguistic analysis of an autobiographical piece of writing, Mpungose (2010) used a life history approach to collect data from six selected school principals in KwaZulu-Natal in South Africa. Mpungose (2010) discovered that the principals constructed their professional

identities from their personal and professional knowledge. The study also revealed that professional identity involves professional socialization and development which according to Brott & Kays (2001) is a social learning process that includes the acquisition of specific knowledge and skills that are required in a professional role and the development of new values, attitudes and self-identity components.

Mpungose (2010) is similar to Eliot and Turns (2011) in the area of professional identity construction. However, while the former was based on employees in the education service, the later investigated engineering students. Eliot and Turns (2011) explored the process students employed during portfolio construction to identify themselves as engineers and as future professionals. Analysis of the survey responses revealed that participants had two primary frames of reference for the construction of professional identity during portfolio creation. The external frame of reference which focused on students' understanding of the expectations of potential employers and recruiters and the internal frame of reference which focused on students' emerging realizations of their own values and interests as professional engineers.

While Afful and Mwinlaaru (2010) and the current study analyzed written texts, Mieroop (2008) investigated the way speakers constructed their identities as representatives of their companies (institutional identity construction) in relation to the way they projected an identity onto their audiences. The speaker then presented his company in the complementary role of seller of a product and as such a link is established between the identities of the speaker's company and the audience. This discursive co-construction of identities is crucial for the way both identities received meaning. The two cases, on one hand, show similarities in the general pattern of the two identity constructions and the way they are interwoven with one another, but on the other hand also demonstrate that there are many unique and diverging ways of constructing and linking identities.

## DATA SOURCE AND SAMPLE

The data used in the present study is an autobiographical extract from the introduction to the book entitled *Writing and Identity: The discursual construction of identity in academic writing* (Ivanic, 1998). The writer devoted the initial part of the detailed and impressive introduction to her book to communicating her identities before she touched on issues pertaining to the content of her book. The autobiographical segment of the introduction is an exposition of who the writer really is. The autobiographical extract can be seen below:

<sup>1</sup>*Who am I as I write this book?* <sup>2</sup>*I am not a neutral, objective scribe conveying the objective results of my research impersonally in my writing.* <sup>3</sup>*I am bringing to it a variety of commitments based on my interests, values and beliefs which are built up from my own history as a white English woman aged 51 from a middle class family, as an adult educator in multi-ethnic, central London in the 1970s and 80s, as a wife and mother, as someone who only seriously engaged with the academic community in my late thirties, now a lecturer in a department of linguistics, teaching and researching in the field of language, literacy and education.* <sup>4</sup>*I am a writer with a multiple social identity, tracing a path between competing ideologies and their associated discourses.* <sup>5</sup>*I have an idea of the sort of person I want to appear in the pages of this book: responsible, imaginative, insightful, rigorous, committed to making my research relevant to adults who return to study.* <sup>6</sup>*At any rate, that is the sort of person I think I want to be as a member of the academic discourse community.* <sup>7</sup>*I would want to appear responsible, imaginative, insightful, rigorous and committed in most of my social roles, but not all.* <sup>8</sup>*For*

*example, I'm not sure how important it is to me in my role as a mother to be rigorous.<sup>9</sup> There are also parts of my identity as a mother which I do not think I portray in my academic writing, such as being loving.<sup>10</sup> As the coordinator of the Language Support Unit at Kingsway College in London for 11 years, as instructor in developmental education at San Joaquin Delta College, Stockton, California for a year, and as someone involved in the various developments in the UK National Adult Literacy Campaign since 1974, I see the purpose of my professional life—my vocation—as contributing to work which helps adults develop the Literacy Research Group at Lancaster University.<sup>11</sup> My reason for focusing on writing rather than any other aspect of their studying process is that students themselves perceive writing as their main stumbling block.*

The extract above illustrates the writer's autobiographical self which according to Ivanic (1998) is associated with a writer's sense of his roots, of where he is coming from, and that this identity he brings with him to writing is itself socially constructed and constantly changing as a consequence of his developing life—history.

## **ANALYSIS AND DISCUSSION**

Qualitative researchers use the life history approach to gather events and happenings in people's lives as their data and then use its analytical procedures to produce explanatory stories (Polkinghorne, 1995). The present study uses literary and linguistic analysis and interpretive approaches to unearth the identities of the writer of the autobiographical extract under discussion. Generally, writers see themselves to a greater or lesser extent as authors. This aspect of writer identity is associated with the writer's "voice" in the sense of the writer's position, opinions and beliefs. In the written mode of communication, the self as author is particularly significant since writers differ considerably in how far they claim authority as the source of the content of the text, and in how far they establish an authorial presence in their writing.

The extract in focus is a narrative account written by a scholar, depicting her life and character (Murfin & Ray, 1998). The extract is introduced by the rhetorical question, "*who am I as I write this book?*" The obvious answers to this fundamental identity question can be found within the context of the extract and they define the writer's identities (Stryker & Serpe, 1982). In the extract, the writer communicates her identities through the first person pronoun "I". The writer is the narrative voice (the persona) telling a story about herself. The extract is therefore written in the first person narrative point of view (Torto, 2005). This is a narrative technique in which the narrator appears as the pronoun "I", recollecting his or her experiences. One advantage of the first person narrative style is that the reader is likely to accept what the narrator presents in the text.

The second sentence of the extract "*I am not a neutral objective scribe conveying the objective results of my research impersonally in my writing*" sets the stage for a subjective presentation of the writer's identities. The extract is about the writer's life; it is therefore presented from a personal or individual point of view. The writer draws heavily on her own experiences, feeling and thinking in the construction of her identities. The word "*scribe*" in the second sentence is an archaic form. It is no longer in current use in the English language. By the use of archaism in the extract, the writer has evoked an image or attitude associated with the past.

The third sentence of the extract is long and complex. The first structure *“I am brining to it a variety of commitments based on my interests, values and beliefs”* is an independent clause which is introducing the sudden outburst of identities. In the clause, the phrase *“my interest, values and beliefs”* is indicative of the writer’s subjective stance. What follows the independent clause is a relative clause *“which are built up from my own history”* which is post-modifying *“my interests, values and beliefs”*. Again, the writer sounds subjective with reference to *“my own history”*. There is a spontaneous expression of multiple identities presented in parallel structures: *“as a white English woman aged 51 from a middle class family, as an adult educator in multi-ethnic, central London in the 1970s and 80s, as a wife and mother, as someone who only seriously engaged with the academic community in my late thirties, now a lecturer in a department of linguistics, teaching and researching in the field of language, literacy and education”*. The writer has employed parallelism, a rhetorical device, by presenting her ideas in grammatically similar constructions. Parallel constructions create a sense of balance that can be meaningful and revealing. By using parallelism, writers implicitly invite their readers to pay attention to the parallel elements or ideas (Murfin & Ray, 1998). The writer of the current extract has presented a litany of identities based on her life-history. This multiplicity of identities is in consonance with identity theorists who argue that the self consists of a collection of identities, each of which is based on occupying a particular role (Stryker, 1968; Stryker & Burke, 2000). These role identities are said to influence behavior in that each role has a set of associated meanings and expectations for the self (Burke & Reitzes, 1981).

The fourth sentence *“I am a writer with a multiple social identity, tracing a path between competing ideologies and their associated discourses”* introduces another dimension to identity construction in the extract: social identity. While identity theory focuses on the self as comprised of the various roles an individual occupies, social identity theory, on the other hand, postulates that the groups to which people belong can provide their members a definition of who they are (Hogg, Terry, & White, 1995).

In the fifth sentence, the writer also enacts multiple identities. She uses series of adjectives to depict a list of attributes: *“I have an idea of the sort of person I want to appear in the pages of this book: responsible, imaginative, insightful, rigorous, committed to making my research relevant to adults who return to study.”* Sentence six emphasizes the writer’s conviction to enact the qualities she has mentioned in the fifth sentence: *“At any rate, that is the sort of person I think I want to be as a member of the academic discourse community”*. The seventh sentence reiterates the attributes *“I would want to appear responsible, imaginative, insightful, rigorous and committed in most of my social roles but not all.”* In literary analysis, repetition is for emphasis. The writer is therefore stressing these identities and by this style he is placing them at the forecourt of the readers’ attention.

The eighth sentence *“For example, I’m not sure how important it is to me in my role as a mother to be rigorous”* is complementing the contrastive structure *“but not all”* that ends the seventh sentence. The writer thinks she should make some exceptions in relation to the multiple attributes she has already mentioned. She thinks she can be a rigorous academic; however, in the ninth sentence she modifies the generalization of her rigorous identity; she adds another identity *“loving mother”*. The five identities: responsible, imaginative, insightful, rigorous and committed to research, portray the writer as an academic; nevertheless, she appeals to the reader to consider her social role as a mother as loving.

Sentence ten, like sentence three above, is long and complex. Sentence ten is in two parts: The first part comprises similarly constructed grammatical structures arranged in a sequence suggesting some correspondence between them. The writer, again, employs the parallelism device at this part of the extract to present her multiple identities: *“As the coordinator of the Language Support Unit at Kingsway College in London for 11 years, as instructor in developmental education at San Joaquin Delta College, Stockton, California for a year, and as someone involved in the various developments in the UK National Adult Literacy Campaign since 1974, I see the purpose of my professional life—my vocation—as contributing to work which helps adults develop the Literacy Research Group at Lancaster University.”* Although repetition often plays an important role in establishing parallelism, the device is used in this context with subtle variations. The parallel structures are expressing a similar idea and they serve as introduction to the second part of sentence ten which is the main clause: *“I see the purpose of my professional life—my vocation—as contributing to work which helps adults develop the Literacy Research Group at Lancaster University.”* This clause is indeed independent and it is stating a fact about the writer’s autobiographical self (my professional life – my vocation). The clause also accentuates the writer’s contribution to knowledge. The writer’s subjective stance in the extract is also realised in the clause.

The eleventh and final sentence of this autobiography states the reason for the writer’s choice of vocation: *“My reason for focusing on writing rather than any other aspect of their studying process is that students themselves perceive writing as their main stumbling block”*. It is obvious that the writer has observed that students’ interests, attitude and knowledge in writing leaves much to be desired. The writer has chosen her profession in order to render a helping hand to students in the area of writing. The eleventh sentence is the epilogue of the display of multiple identities by the writer.

## **CONCLUSION AND IMPLICATIONS**

The current study has analysed the autobiographical section of the introduction to a book on writing and identity. The writer of the autobiography communicated her multiple identities by varying her lexical items and grammatical structures. The method of analysis was a combination of literary, linguistic and interpretive approaches. The study was conducted within the framework of the social constructionist theory which posits that self-hood shapes and constrains writing. Social constructionist theorists are also of the view that identity is located in events and experiences and that the “self” is socially constructed by the socially constrained nature of the life experience itself. The findings of the study were the multiple identities that were constructed by the writer through her autobiographical writing. The writer’s identities were constructed through the roles she performed in her professional life. The roles range from personal, academic, institutional, literary to social.

The current study has established series of facts concerning writing and identity. First, personal stories are the means by which identities may be fashioned. Second, a writer’s autobiographical self at any moment in time is the product of their past experience and encounters in all their richness and complexity. Third, a writer’s autobiographical self is constantly evolving over time. Fourth, a writer may construct a quite different discursive self from one text to another,

depending partly on the different demands of different occasions for writing. Finally, the autobiographical self is perhaps the closest thing to what people mean by “my identity” since this is unique to each individual.

The present paper has a number of implications. In the first place, it has implications for the theories of identity and social construction as it proves the fact that identity construction is a multi-faceted dynamic process embedded in social structure and manifested in discourse. Secondly, this paper contributes to the “self” in autobiographical writing. The paper has proved that who we are affects how we write and whatever we are writing. The paper also claimed that writing is an act of identity and that autobiographical self is the identity which people bring with them to any act of writing and this is shaped by their social and discursive history. Finally, this paper stimulates interest in research in literary analysis of academic texts.

### ABSTRACT

The present study was conducted to investigate types of intelligences as predictors of self-efficacy (general self-efficacy). The participants were 148 male and female Iranian B.A. students majoring in teaching of English as a foreign language (TEFL) and Translation at Takestan Azad University, Zanzan University, Zanzan Azad University, Payame Noor University of Zanzan, Payame Noor University of Abhar, and Shaheed Rajaei Teacher Training University. The instruments included a 100-item Michigan test, Gardner's MI questionnaire, and a 12-item General Self-efficacy scale. Data were analyzed through multiple regression analyses. Results indicated that musical and linguistic intelligences were predictors of general self-efficacy.

**KEY WORDS:** Multiple Intelligences, self-efficacy, general self-efficacy.

### INTRODUCTION

The Multiple Intelligences Theory (MIT), proposed in the early 1980s by Gardner, provided evidence that there are several independent ability areas, unlike traditional general intelligence concentrating on a narrow range of two logical-mathematical and linguistic intelligences. He redefined the concept of intelligence as a "biopsychological potential to process information that can be activated in a cultural setting to solve problems or create products that are of value in a culture" (Gardner, 1999, pp. 33-34).

Most previous studies in the field of second and foreign language learning have been conducted from the learners' perspective, and learners play a vital role in investigations. The application of multiple intelligences theory (MIT) is suggested as a structured way to address and understand the holistic nature of learners' diversity (Christison, 1996; Arnold & Fonseca, 2004). Besides MIs, another issue of increasing importance is learner beliefs about their potentials known as self-efficacy (SE). Bandura (1997) defines self-efficacy as "the belief in one's capabilities to organize and execute the courses of action required to manage prospective situations" (p. 3).

Although many studies have been conducted on MI and self-efficacy, few of them have explored the interrelationship between MI and self-efficacy, especially in foreign language learning situations. This justifies the need for studies relating MI theory aimed at fostering learners' intelligence profiles to learners' self-efficacy. Therefore, the present study aims to answer the following research question: Which type of multiple intelligences is a better predictor of generalized self-efficacy?

## **LITERATURE REVIEW**

### ***Multiple Intelligences***

During the last two decades, Gardner's MIs has been appreciated in language learning. Gardner (1983) suggested several intelligences to be at work simultaneously; so he changed the perception of a general factor of intelligence. He claims that humans possess a number of distinct intelligences that are manifested in different skills and abilities. Gardner (1983) believes that each person possesses at least seven basic intelligences. Armstrong (2002, p. 6) explained these intelligences as follows:

Linguistic intelligences: the ability to use words effectively.

Logical/mathematical intelligence: the capacity to use numbers and reason effectively.

Spatial intelligence: the ability to recognize form, space, color, line, and shape.

Bodily/kinesthetic intelligence: the ability to use body to express ideas and produce things.

Musical: The ability to recognize and perceive musical forms.

Interpersonal intelligence: the ability to understand the feeling and intention of other people.

Intrapersonal intelligence: the ability of self-knowledge and self-understanding.

Haley (2004) showed that through the implementation of MIT, students achieve greater success rates and develop a high degree of satisfaction and positive attitude toward the content. To find empirical evidence for this claim, a number of investigations have been done. Green's study (1999) supports this view by finding that the MI-based classrooms successfully produced environments with rich materials in which learners were motivated in the process of their learning. Temiz and Kiraz (2007) tried to find out whether the implementation of MIT has any effect on Literacy Education (LE). The results showed a positive relationship between them.

In another study, IKiz and Çakar (2010) studied the relationship between multiple intelligences and the academic achievement levels. Academic achievement scores turned out to be related to students' multiple intelligences. Results also contribute awareness to the self knowledge and self-efficacy of the students and to developing programs to improve their academic achievement.

The MIT, which provides a new approach in education, is the most important theory in the area of personal development area (Tirri & Komulainen, 2002). Nowadays, teachers apply the MI-based educational program since it addresses a variety of ways people learn (Shore, 2004; Kallenbach, 1999). The relationship between multiple intelligences and the learning of second language skills is a burgeoning area of research. In this regard, Ahmadian and Hosseini (2012) showed a statistically significant relationship between L2 learners' MI and their writing performance. In another study, Marefat (2007) concluded that kinesthetic, existential, and interpersonal intelligences were the best predictors of writing scores. However, Sadeghi and Farzizadeh (2012) indicated contrary results, that the components of MI did not have a significant relationship with the writing ability of the participants. Similarly, Hajhashemi and Eng (2012) reported no significant correlation between MI and the performance in reading competency.

In a study by Panahi (2011), the relationship between MI and the grammar knowledge of male and female EFL learners was examined. Results showed a significant relationship between MI of the learners and their grammar knowledge. In another study, Zarei and Mohseni (2012)

investigated the relationship between four types of intelligence and grammatical and writing accuracy of EFL learners. The results indicated that intrapersonal and interpersonal intelligences were predictors of grammar accuracy, and intrapersonal intelligence was also a significant predictor of the learners' writing accuracy.

Another aspect of MI theory is the relationship between MIs and language learning strategies. In this regards, Hajhashemi, et al., (2011) reported a low positive correlation between MI and different strategy types. It was also revealed that the highest correlation was between meta-cognitive strategies and MI, followed by compensation and cognitive strategies.

### ***Self-efficacy***

Self-efficacy is grounded in a larger theoretical framework known as Social Cognitive Theory (SCT), in which there are bidirectional interactions between the cognitive, behavioral and environmental or situational contexts (Wood & Bandura, 1989). Self-efficacy beliefs are not a stable attribute of an individual, but they are an active and learned system of beliefs held in context. The concept of self-efficacy is concerned with judgments of one's capability to produce a given pattern of behavior (Schunk, 1981).

According to Bandura (1994, 1997) and Bandura et al., (2003), learners can construct their self-efficacy beliefs through four sources of experiences including mastery experiences, vicarious experience or modeling, social persuasion, and physiological and emotional states. Mastery experiences are the most influential factor for developing self-efficacy and it helps learners determine the level of effort necessary for a success (Bandura, 1997).

The concept of self-efficacy has been widely investigated in various aspects of second and foreign language learning. Pintrich and De Groot (1990) showed that self-efficacy facilitated cognitive engagement. The study conducted by Mohsenpour, et al., (2008) revealed a negative relationship between self-efficacy and learning strategies. However some other researchers were against this claim by finding a positive relationship between these variables (e.g. Ames & Archer, 1988; Elliot, 1999).

Carroll, et al., (2009) examined the structural relations among self-efficacy, and academic aspirations. The results showed that academic self-efficacy and self-regulatory efficacy had a strong relationship with academic achievement. However, a negative relationship between social self-efficacy and academic achievement was reported. According to Newby-Fraser and Schlebusch (1997), self-efficacy has a significant negative correlation with level of stress.

### ***General self-efficacy***

Although Bandura (1997) originally focused on task-specific self-efficacy with a stronger predictive power than general self-efficacy, numerous experiences in different domains of functioning have generated more generalized beliefs of self-efficacy that have explanatory value as well (Bosscher & Smit, 1998). This has been supported by many studies (Chen, et al., 2001; Scholz, et al., 2002; Sherer, et al., 1982; Yildirim & Ilhan, 2010). General self-efficacy (GSE) refers to a broad and stable sense of personal competence which effectively deals with a variety of stressful situations (Luszczynska, et al., 2005; Schwarzer & Jerusalem, 1995; Sherer, et al., 1982).

### ***Multiple Intelligences and Self-Efficacy***

Many studies (Chan, 2007; Mikolajczak & Luminet, 2007; Penrose, Perry & Ball, 2007; Rastegar & Memarpour, 2009) have explored the connection of emotional intelligence and self-efficacy of teachers. In this regard, Penrose, et al., (2007) and Rastegar and Memarpour, (2009) concluded that there is a positive significant relationship between emotional intelligence and self-efficacy of teachers. Another study (Moafian & Ghanizadeh, 2009) in Iranian context supported the findings of this study, reporting a significant relationship between teachers' emotional intelligence and their self-efficacy while three subscales of emotional intelligence were found to be good predictors of teachers' self-efficacy. Chan (2007) also found that individuals who exhibited higher emotional intelligence had higher self-efficacy. However, Nikoopour, et al., (2012) concluded that all subconstructs of trait EI were moderate predictors of self-efficacy. In an attempt to investigate the effect of emotional intelligence and self-efficacy beliefs on high school students' achievement, Yazici, Seyis and Altun (2011) found gender, age and self-efficacy as the major predictors of learners' academic achievement.

Through the use of MI, students' sense of responsibility and efficacy as learners will be improved (Kolata, 2003). Traub (1998) showed that MI theory should be implemented with caution since educators have adapted MIT and applied its concepts in class without evidence about its efficacy. Many studies have examined the relationship between multiple intelligences and self-efficacy of learners.

Young (2003) suggested a new approach to improving mathematics achievement by the integration of MIT and self-efficacy theory. He claimed that learning through intellectual strengths increases students' mathematics achievement both directly from their increased understanding and indirectly by raising students' self-efficacy for mathematics.

Teacher self-efficacy construct, which refers to teachers' beliefs about their abilities to control the reinforcement of their actions within themselves or in the environment (Bandura, 1977; Rotter, 1990), plays a major role across diverse teaching conditions (Klassen, et al., 2009). It has been related to students' own sense of efficacy (Anderson, Greene, & Loewen, 1988; Tschannen-Moran, et al., 1998) as well as student outcomes such as achievement and motivation (Tschannen-Moran, et al., 1998). In Yazdanimoghaddam and Khoshroodi's (2010) study, the possible relationship between English language teachers' teaching efficacy and their multiple intelligences were examined. Based on the results, it was concluded that the linguistic and musical intelligences were the two main predictors of teachers' teaching efficacy whereas the other domains of intelligences, although intercorrelated, did not significantly contribute to the construct of teachers' teaching efficacy.

Mahasneh (2013) investigated the relationship between multiple intelligence and self-efficacy of students. Results indicated that there was a significant positive correlation between self regulatory and the bodily/kinesthetic, intrapersonal, logical, interpersonal, visual, musical, existential, and verbal linguistic intelligences. In another study, Beichner (2011) showed a relationship between multiple intelligences and students' academic self-efficacy. He reported higher self-efficacy for students in classrooms where teachers used two of their three dominant MI than the other two groups: classrooms where the teacher used one of their three dominant MI and the group in which none of students' dominant MI were emphasized. To conclude, although

there are a number of studies that explore the relationship between self-efficacy and multiple intelligences, they are few, and there are still some gaps.

## **RESEARCH QUESTION**

In order to fill the above mentioned gaps, this study aims to answer the following research question:

Which type of multiple intelligences is a better predictor of generalized self-efficacy?

## **METHODOLOGY**

### ***Participants***

This study was conducted with 148 male and female Iranian B.A. students majoring in TEFL and Translation at Islamic Azad University of Takestan, Zanjan University, Islamic Azad University of Zanjan, Payame Noor University of Zanjan, Payame Noor University of Abhar, and Shaheed Rajaei Teacher Training University.

### ***Instruments***

In this study, the following instruments were utilized: An already established MTELP (Michigan Test of English Language Proficiency) was used to specify the participants' level of proficiency and to homogenize them. It included 100 multiple choice items consisting of 40 grammar items; 40 vocabulary items; and four reading passages followed by 20 reading comprehension items.

A Multiple Intelligences questionnaire, based on Howard Gardner's MI Model, was administered to the participants to specify their intelligence profile. It measured seven dimensions of Gardner's MI theory. It comprised a set of 35 statements with 5 statements for assessing each of the intelligences. This questionnaire is available at [http://www.businessballs.com/freepdfmaterials/free\\_multiple\\_intelligences\\_test\\_young\\_people.pdf](http://www.businessballs.com/freepdfmaterials/free_multiple_intelligences_test_young_people.pdf)

Furthermore, a general self-efficacy, consisting of 12 items, which is the modified version of Sherer's General Self-efficacy (SGSES) was administered, with reported range of internal consistency of  $\alpha = 0.69$  (Bosscher & Smit, 1998).

### ***Procedure***

Initially, the MTELP was utilized; those students whose scores were less than one standard deviation away from (mean = 30.425, SD=10.7) the mean were selected as the sample of the present study. As a result, 32 of the participants were excluded, leaving a total number of 148 numbers.

In another session, Gardner's MI questionnaire and generalized self-efficacy were administered. The participants were required to complete both questionnaires by choosing among 5 alternatives, ranging from strongly agree to strongly disagree.

## **RESULTS AND DISCUSSION**

### ***Results***

The research question attempted to see which types of MIs are predictors of general self-efficacy scale. To this end, a multiple regression analysis was used. The results of the descriptive statistics are presented in Table 1.

A correlation coefficient was run between general self-efficacy of the students and their types of MI to see the degree of the relationship between them. Of all the seven predictors, only linguistic and musical intelligences account for a statistically significant correlation with general self-efficacy ( $r_{\text{linguistic}} = .249, p < .05$ ;  $r_{\text{musical}} = .287, p < .05$ ).

The result of the model summary (Table 2) shows that musical intelligence shared 8 % of variance with general self-efficacy while, together, the linguistic and musical intelligences account for around 14% of the total variance with general self-efficacy.

*Table 1: Descriptive statistics for general self-efficacy and multiple intelligences*

	Mean	Std. Deviation	N
GSE	38.2905	7.53699	148
Linguistic	2.8176	1.31985	148
Logical/math	2.8514	1.03256	148
Musical	2.9797	1.17496	148
Bodily/kinesthetic	3.5068	1.22611	148
Spatial / visual	3.0608	1.10796	148
Interpersonal	3.6622	1.09764	148
Intrapersonal	3.3378	1.23748	148

*Table 2: Model Summary<sup>c</sup>*

Model	R	R Square	Adjusted Square	R Std. Error of the Estimate
1	.287 <sup>a</sup>	.082	.076	7.24414
2	.382 <sup>b</sup>	.146	.134	7.01293

a. Predictors: (Constant), musical

b. Predictors: (Constant), musical, linguistic

c. Dependent Variable: GSE

Based on Table 3, the results of the ANOVA ( $F_{(1, 146)} = 13.12, p < .05$ ;  $F_{(2, 145)} = 12.39, p < .05$ ) show that the predictive power of both models is significant.

*Table 3: ANOVA<sup>c</sup> on general self-efficacy*

Model	Sum of Squares	df	Mean Square	F	Sig.
-------	----------------	----	-------------	---	------

1	Regression	688.778	1	688.778	13.125	.000 <sup>a</sup>
	Residual	7661.729	146	52.478		
	Total	8350.507	147			
2	Regression	1219.236	2	609.618	12.395	.000 <sup>b</sup>
	Residual	7131.271	145	49.181		
	Total	8350.507	147			

a. Predictors: (Constant), musical

b. Predictors: (Constant), musical, linguistic

c. Dependent Variable: GSE

*Table 4: Coefficients<sup>a</sup> of Multiple Intelligences*

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	32.801	1.628		20.148	.000
	musical	1.842	.509	.287	3.623	.000
2	(Constant)	28.692	2.012		14.258	.000
	musical	1.860	.492	.290	3.779	.000
	linguistic	1.439	.438	.252	3.284	.001

a. Dependent Variable: GSE

Table 4 contains the unstandardized as well as standardized coefficients of the two models, along with the observed t-values and significance levels. The first model shows that for every one standard deviation of change in one's musical intelligence, there will be about .28 of a standard deviation change in one's general self-efficacy. The second model shows that when musical and linguistic intelligences are taken together, for every one standard deviation change in one's musical and linguistic intelligences, there will be .29 and .25 of a standard deviation change in one's general self-efficacy, respectively. Meanwhile, all the standardized coefficients are statistically significant.

These results indicate that two types of intelligences including musical and linguistic intelligences are predictors of general self-efficacy.

### **Discussion**

The findings of some previous studies are partially similar to the results of the present study, in that they also emphasize MI as predictors of self-efficacy. Yazdanimoghaddam and Khoshroodi (2010) concluded that linguistic and musical intelligences are the two main predictors of teachers' teaching efficacy. This is in partial accordance with the findings of the present study since the same two types of intelligences turned out to be predictors of general self-efficacy.

Furthermore, the findings of the present study partially approve those of Shore (2001). Shore (2001) investigated the relationship between MI and students' self-efficacy. It was concluded that MI-based classrooms would have a positive effect on self-efficacy in ESL courses. Although a relationship was found between MIs and self-efficacy, the present study does not lend full support to that finding. Shore's study showed a relationship between writing self-efficacy and interpersonal, intrapersonal, bodily-kinesthetic, and linguistic intelligences.

A number of factors might have contributed to the results obtained in this study. This study was conducted with a small sample size of participants (180) while in studies like Mahasneh (2013), the number of participants was 576, and in Carroll, et al., (2009), the participants included 935 learners. The other possible factor resulting in different findings may be gender differences. In the present study, gender was not considered as a variable, but the previous studies on multiple intelligences like Nikoopour, et al., (2012), Schneider and Arikan (2009), and Razmjoo (2008), Hanafiyeh (2013) have emphasized gender differences among the participants in MI-based instruction. Another possible factor, which was not controlled in the present study, includes learners' level of proficiency; this study was conducted with B.A level students.

## **CONCLUSION**

The present study attempted to investigate types of multiple intelligences as predictors of self-efficacy. Findings showed that musical and linguistic intelligences are predictors of general self-efficacy. Based on the results of this research, it is concluded that learners' multiple intelligences made a contribution to predicting self-efficacy and some of the intelligence types are a better predictor of self-efficacy. This means that the enhancement of learners' MI will increase their level of self-efficacy and attention to learners MI profiles will raise learners' beliefs about their ability.

## ***Implications***

The findings of the present study may have implications for teachers, learners and materials developers. The findings of the present study seem to imply that teachers find better ways to help learners explore their ability as language learners and support them in developing their sense of self-efficacy. And it helps learners and teachers in planning activities to relate students' self-efficacy and their MI profiles and support learners with the best possible instruction. It also has some implications for materials developers and syllabus designers in developing materials and course books to improve the specific MI types that are directly related to self-efficacy.

## **LIMITATIONS OF THE STUDY**

There were a number of limitations in this study. One of the most important ones was finding homogenous students at the same level of language proficiency. In this study, the participants were homogenized in terms of their language proficiency based on their obtained score on the Michigan test; other elements affecting their proficiency level were not considered here.

Furthermore, the participants were selected from among B.A. level learners of English majoring in TEFL and translation. Therefore, care must be exercised in generalizing the results to other learners.

Finally, the participants of the present study included both female and male learners; so gender was not a variable. Besides this variable, the findings of the study may have been affected by some other variables like cultural and social factors, which were not considered in this study.

## ABSTRACT

This study sought to investigate the effect of various task types including Multiple-choice cloze task, Gap-filling task, Word formation task, and Code-mixing task on L2 vocabulary comprehension and production. A sample of 80 adult Iranian intermediate level learners participated in the study. They were in 4 groups; each group read the reading passages under one of the four conditions of Multiple-choice cloze, Gap-filling, Word formation, and Code-mixing tasks. At the end of the treatment, two posttests were administered. A 30-item vocabulary test in multiple-choice format was used to measure the participants' vocabulary comprehension. Another 30-item vocabulary test in fill-in-the-blanks format was utilized to measure the participants' vocabulary production. Two separate one-way ANOVA procedures were used to analyze the obtained data. The results showed an effect of task type, the word formation task was more effective than the other task types in vocabulary comprehension and production. It also turned out that those who were involved in the Gap-filling task were the least successful in both vocabulary comprehension and production. The present study may have theoretical as well as practical implications for the teachers, researchers, and syllabus designers.

**KEYWORDS:** Task-based language teaching, vocabulary learning, task type

## INTRODUCTION

Vocabulary knowledge occupies an important position in second language learning. Numerous attempts have been made to solve the challenges facing learners in reference to vocabulary learning. However, doubts remain over their effectiveness in improving learners' vocabulary comprehension and production (Song, 2011).

One approach which is claimed to be beneficial in coping with the problems of vocabulary learning is task-based language teaching (TBLT). In this adaptable approach of language teaching, tasks are employed as the main pedagogical tool to teach diverse language elements. Language learning occurs through the process of completing tasks, and learners master the target language more effectively when they are exposed to meaningful task-based activities in a natural way. Proponents of task-based language teaching believe that the uptake of vocabulary, as one of the key elements in second language learning, can be enhanced by employing proper pedagogical

tasks. However, designing effective pedagogical tasks has always been a huge challenge for second language (L2) researchers and teachers.

Current second language (L2) instruction research has encouraged the use of different tasks in (L2) classrooms. Task-based language teaching provides learners with access to both explicit and implicit learning experience. It has the ability to integrate meaning-focused communication with form-focused instruction. However, the positive impact of utilizing different task types on vocabulary learning is still open to question. The fact that this debate over the effectiveness of diverse task types in promoting vocabulary uptake remains unresolved indicates a need for further examination and research in this regard. The present study attempts to investigate whether employing different task types can influence the uptake of new vocabulary items.

## **REVIEW OF LITERATURE**

Task-based language teaching is considered as a powerful approach for maximizing language learning and teaching, which employs tasks as its main pedagogical tools to structure language teaching. In TBLT, learners are to use language to perform meaningful tasks and, thus, language which is meaningful to learners can pave the way for the learning process (Willis, 1996).

In defining task, we should draw a distinction between real-world tasks and pedagogical tasks, where the former refers to the tasks which the learner could possibly be required to carry out in the real world, and the latter refers to the tasks which would be highly unlikely for the learner to perform outside the language classroom (Rashtchi & Keyvanfar, 2007). Although pedagogic tasks seem to be of little real-world value, Widdowson (1987) argues that “tasks can be thought of as an investment to be drawn on to meet unpredictable communicative needs.” (p. 68)

Nunan (1989, p.10) states that task is “a piece of classroom work which involves learners in comprehending, producing or interacting in the target language while their attention is principally focused on meaning rather than form”. Willis (1996, p. 53), on the other hand, stresses that task is “a goal-oriented activity in which learners use language to achieve a real outcome”. While these definitions vary somewhat, they all emphasize the fact that pedagogical tasks involve communicative language use in which the user's attention is focused on meaning rather than grammatical form (Ellis, 2000).

In TBLT literature, there are many kinds of task categories. Willis (1996) offers six main types of including listing, ordering and sorting, comparing, problem solving, sharing personal experiences, and creative tasks (Richards & Rodgers, 2001, p. 234). Furthermore, According to Rashtchi and Keyvanfar (2007, p. 115) there are different classifications of task types including the following:

- ❖ Form-focused activities ( exercises)
- ❖ Meaning-focused activities ( tasks)
  - Focused tasks
    - Grammatical
    - Consciousness-raising
  - Unfocused tasks

- ❖ Pedagogic tasks ( Interactionally authentic)
  - Information-gap
  - Opinion-gap
  - Reasoning-gap
- ❖ Target tasks (situationally authentic)

Focused tasks have two objectives: one is to encourage communicative language use and the other is to encourage learners to use some specific predetermined linguistics item(s) (Rashtchi & Keyvanfar, 2007, p. 112).

Unfocused tasks can be classified based on the degree of their similarity to real-life situation. Some tasks correspond to the everyday life of learners and, thus, they are said to have situational authenticity. On the other hand, some tasks are rather artificial in the sense that they are unlikely to happen in everyday life; but, they tend to elicit the kind of language that corresponds to the language of everyday-life interaction. These kinds of pedagogic tasks are said to have interactional authenticity (Bachman, 1991).

A large body of research has been carried out on the application of tasks in various aspects of language learning. This study is focused on the effectiveness of tasks on receptive and productive L2 vocabulary learning. Ellis and He (1999) found that the interaction between output and dialogic interaction could contribute to productive as well as receptive vocabulary knowledge. Similarly, de la Fuente (2002) found that only negotiated interaction that incorporated output appeared to have promoted both receptive and productive learning of words, and increased productive word retention.

There is a belief that learners' pushed output can contribute to vocabulary learning in a number of ways. In this regard, Swain and Lapkin (1995, p. 376) argue that output tasks can lead to the noticing of linguistic shortcomings, "pushing" learners to modify output. Actually, output has a very interactive and significant role on vocabulary acquisition. There is also a theoretical claim that output may serve as a crucial means to strengthen connections between the lemma (the particular form that is chosen by convention to represent the lexeme) and the lexeme (the set of all the forms that have the same meaning). Such strengthened connections between the lemma and the lexeme enable learners to have easy access to and efficient control of vocabulary knowledge stored in their L2 language system. As Nation (1990, p. 86) puts it, "when L2 learners are engaged in output production, they are required to actively solve problems of word form or of word meaning on their own. Through such active processing of lexical information, a learner can achieve faster, more precise and automatic use of vocabulary knowledge than when just hearing or reading L2 vocabulary."

Maftoon and Haratmeh (2012) used a pedagogical approach to investigate the relative effectiveness of tasks with different involvement loads on the vocabulary knowledge of Iranian EFL learners. The goal was to investigate the way that the construct of involvement load is related to the Input Hypothesis (Krashen, 1985) and the Output Hypothesis (Swain, 1996) to see whether the involvement load or input/output-orientation of tasks is the determining factor in task effectiveness. Contrary to the predictions of the Involvement Load Hypothesis (Laufer & Hulstijn, 2001), the results of the study indicated that involvement load is not the only determining factor in task effectiveness, but input/output-orientation of tasks is also a decisive parameter in task effectiveness. While Laufer and Hulstijn's proposal is the first valuable step towards building a theory of vocabulary learning, the results of the study indicated that

involvement index may well not function independently of the task type, i.e., input or output orientation of a word-focused task.

Newton (1995) carried out a case study examining the vocabulary gains made by a group of adult learners of English as a second language as a result of performing four communicative tasks. Gains were measured on comparisons of pre- and post-tests of vocabulary from the worksheets from the four tasks. He found that the placement of a word on task worksheets and the nature of a task, whether a split information task or a shared information task, both had a strong effect on the use and learning of new vocabulary.

Joe (1998) examined the effects of text-based tasks and background knowledge (prior vocabulary knowledge and a disposition to use generative learning tactics when tackling new vocabulary) on incidental vocabulary learning. 48 adult ESL learners were randomly assigned to one of three treatments (a) reading and retelling a text with explicit generative training and without access to the text during recall, (b) reading and retelling a text without explicit generative training but with access to the text during recall, and (c) neither reading nor retelling a text. All subjects sat a pre-test (individual interviews and a read and retell task) and post-tests (individual interviews and two multiple-choice tests) designed to tap partial vocabulary knowledge gains. Results indicated that the process of reading and retelling a text promotes incidental vocabulary learning and that generative processing enhances vocabulary learning with greater levels of generative processing leading to greater vocabulary gains for unknown words.

Rott (2004) investigated whether L2 readers' sensitivity towards a new lexical form is heightened if they are repeatedly pushed to produce output and are immediately provided with relevant input in input-output cycles. Fourth-semester learners read three texts, with four target words each, under the following conditions: (a) cued-output task, (b) self-selected output task, and (c) un-enhanced (control) reading. Results showed that four input-output cycles did not contribute to retaining more robust form-meaning connections (FMCs) than the normal reading condition. In all three conditions, FMCs varied in strength and completeness, requiring different cues for retrieval.

Newton (2001) argued that rather than removing difficult words, teachers should consider a number of cooperative options for exposing learners to new words during task-based interaction. He examined data from a number of classroom tasks where learners had to deal with new words during task performance without access to a dictionary or teacher's intervention. The results suggested that not only rich language use results from negotiating new words, but that the meanings of many of these words are retained in the days after the task performance.

Kim's (2011) study consisted of two experiments investigating the involvement load hypothesis in vocabulary learning. Experiment 1 compared the performance of 64 adult English as a second language (ESL) learners from a range of countries at two different proficiency levels (i.e., matriculated undergraduate students vs. students in an Intensive English Program) to ascertain the effectiveness of three vocabulary tasks with different levels of task-induced involvement. Experiment 2 investigated whether two tasks hypothesized to represent the same level of task-induced involvement would result in equivalent initial learning and retention of target words by

20 adult ESL learners at two different levels of proficiency. The results of Experiment 1 showed that a higher level of learner involvement during the task promoted more effective initial vocabulary learning and better retention of the new words. The findings of Experiment 2 indicated that when different tasks had the same involvement load, they resulted in similar amounts of initial vocabulary learning and retention of new words.

These studies show that researchers seem to have a consensus as to the role of task based instruction in vocabulary learning. Despite this consensus on the general role of task-based instruction in vocabulary learning, there seems to be a paucity of research on how difficult task types can affect L2 vocabulary, particularly in an EFL context. In response to this paucity, the present study addresses the effects of Input-oriented and Output-oriented tasks on Iranian EFL learners' vocabulary comprehension and production.

## RESEARCH QUESTIONS

More specifically the present study aims to answer the following questions:

Q1. Which task type (Multiple-choice cloze task, Gap-filling task, Word formation task, and Code-mixing task) is more effective on L2 vocabulary comprehension?

Q2. Which task type (Multiple-choice cloze task, Gap-filling task, Word formation task, and Code-mixing task) is more effective on L2 vocabulary production?

## METHODOLOGY

### *Participants*

A sample of 113 Iranian male and female EFL learners participated in the study. They were studying English at Sokhane Ashna and Shokohe Andisheh institutes in Tehran. The subjects were selected from the intermediate level of proficiency, and their age ranged from 18 to 30. After the administration of the Michigan test of English language proficiency, 33 participants were excluded from the study because of either a different language proficiency test score, or not writing their names on the papers. There remained 80 learners to take part in the study.

### *Instruments and materials*

To conduct the present study, the following instruments were employed: a Michigan general language proficiency test was administered to homogenize the participants and to validate the posttests. The sample of Michigan test used in this study contained 25 multiple-choice items. It was an already established and verified in terms of reliability.

The target words for this study were selected from reading passages taken from Cambridge ESOL Examinations. To make sure that the participants had no prior knowledge of the target words, and to minimize the effect of their prior vocabulary knowledge, a vocabulary pretest containing 100 items was given to all the participants. These lexical items were contextualized in 100 English sentences. Each item contained one of the target words and required students to supply the Persian equivalent of the italicized words in the sentence. Those words the meaning of which the participants did not know were selected for inclusion in the posttest, and the familiar words were excluded from the posttests.

The instructional materials were ten reading passages taken from Cambridge FCE (First Certificate in English) examination. The passages were in an appropriate difficulty level to roughly match the learners' ability. Each passage contained 10 target words. Each of the four groups read the reading passages under one of the four conditions of Multiple-choice cloze task, Gap-filling task, Word formation task, and Code-mixing task.

At the end of the experimental period, a vocabulary comprehension posttest was administered to compare the effects of Multiple-choice cloze, Gap-filling, Word formation, and Code-mixing tasks on L2 vocabulary comprehension. It was a 30-item vocabulary test in the multiple-choice format. A 30-item fill-in-the-blanks vocabulary test was also used to measure the participants' productive knowledge of vocabulary. In the fill-in-the-blank test, the first letter of each word was given with its translation in Persian. This was done to ensure that the learners could produce the target words and to prevent the possibility of learners providing either partial synonyms or other words that fitted the context without necessarily being the intended words.

### ***Procedures***

Initially, a total number of 113 participants were selected. To homogenize the participants, a Michigan test of English language proficiency was administered. It was an already established and verified test in terms of reliability. As a result, 33 participants, who had scored more than one standard deviation away from (above or below) the mean, were excluded from subsequent statistical analyses, and there remained 80 approximately homogenous participants to take part in this study. The participants were divided into four groups. Each group was randomly assigned to one of the treatment conditions as follows:

- Group A: Multiple-choice cloze task
- Group B: Gap-filling task
- Group C: Word formation task
- Group D: Code-mixing task

To make sure that the participants had no prior knowledge of the target words and to minimize the effect of prior knowledge, a vocabulary pretest containing 100 items was administered prior to the treatment. The participants were required to supply the Persian equivalent of the italicized English words in 100 sentences. Each sentence contained one of the target words which had been extracted from the reading passages the learners were supposed to receive as treatment. The words which turned out to be familiar to more than three participants were excluded from the subsequent vocabulary comprehension and production post-tests.

In the next phase, the treatment began. Each group of participants received their treatment under one of the following conditions. The four task types consisted of the Multiple-choice cloze task (Group A); Gap-filling task (Group B); Word formation task (Group C), and Code-mixing task (Group D).

The participants of Group A, the Multiple-choice cloze group, received ten cloze texts. Each text contained ten gaps and was followed by ten four-option multiple choice questions. The

Participants of this group were required to fill the gaps in each text by choosing the right words from a list of ten four-option multiple choice items.

The Gap-fill group (Group B) was provided with ten cloze texts. In each text ten target words were deleted, leaving ten gaps. The target words and their English explanations were provided in random order as a list on a separate page along with five distractors in each text. The task for this group was to read the text and complete the ten gaps with the most appropriate words from a list of 15 words.

Group C was treated with Word formation task. They received ten texts. Each text contained ten gaps, each gap corresponding to a word. The 'stems' of the missing words were given along with the text and had to be transformed to the target and missing words. The types of word formation involved not only the addition of affixes (e.g. 'honest' to 'dishonesty'), but also internal changes ('strong' to 'strength') and compounding (e.g. 'rain' to 'raindrop'). The misuse of capital letters and other punctuation marks was ignored, but correct spelling was important.

Ten cloze texts were given to the participants of Group D, the Code-mixing task group. In each text, ten words were deleted, leaving ten blanks and missing words. The Persian equivalent of each missing word was provided in parentheses after each blank. These Persian equivalents were the clear hint to the missing words. The task for the learners was to fill each of the blanks with the English equivalent of the Persian words given in parentheses.

The experimental period lasted for 8 weeks, of which 5 weeks were allocated to the treatment, two weeks to the Michigan test and the pretest, and one week to the posttests. It needs to be noted, however, that not all the class time was used for the treatment each session. Since the learners were taking their general English course, only a third of each class time every week (about 45 minutes) was allocated to the experiment.

At the end of the experimental period, two post-tests were administered. A 30-item vocabulary test in multiple-choice format was used to measure the participants' vocabulary comprehension knowledge. Another 30-item vocabulary test in fill-in-the-blanks format was utilized to measure the participants' vocabulary production. To validate the post-tests, and to avoid creating learner sensitivity toward the target words, the Michigan proficiency test was given to a group of 30 students with characteristics similar to the target groups (EFL learners studying at the intermediate level) concurrently with the post-tests. To check the validity of the posttests, the correlation between these tests and a Michigan test was checked. The validity index of the comprehension and production posttests turned out to be .83 and .82, respectively. The reliability of the post-tests was also estimated through the KR-21 formula. The reliability index of the vocabulary comprehension and production post-tests turned out to be .42 and .66, respectively.

The validated post-tests were then administered to the 80 approximately homogeneous participants. The obtained data were then summarized and submitted to statistical analyses. Two separate one-way ANOVA procedures were run on the immediate posttest of vocabulary comprehension and production.

## RESULTS AND DISCUSSIONS

### *Investigation of the first Research Question*

The first research question sought to investigate the effect of various task types including Multiple-choice cloze task, Gap-filling task, Word formation task, and Code-mixing task on L2 vocabulary comprehension. To do so, a one-way ANOVA was used. Descriptive statistics are summarized in *Table 1*.

*Table 1: Descriptive Statistics for the ANOVA on Vocabulary Comprehension*

	N	Mean	Std. Deviation	Std. Error
Code-mixing	20	22.4500	2.64525	.59150
Word formation	20	24.7500	2.51050	.56137
Multiple-choice	20	21.5000	2.72416	.60914
Gap-filling	20	20.2000	2.83957	.63495
Total	80	22.2250	3.11783	.34858

*Table 1* indicates that the highest mean on the vocabulary comprehension test belongs to the Word formation group ( $\bar{x} = 24.75$ ), followed by the Code-mixing group ( $\bar{x} = 22.45$ ). The third highest mean belongs to the Multiple-choice cloze group ( $\bar{x} = 21.50$ ), and the Gap-filling group ( $\bar{x} = 20.20$ ) has the lowest mean.

In order to see whether the observed mean differences among the selected groups are statistically significant, the one-way ANOVA procedure was used. The results of the ANOVA procedure are summarized in *Table 2*.

*Table 2: the ANOVA Procedure on Vocabulary Comprehension*

	Sum of Squares	Df	Mean Square	F	Sig.
Between Groups	221.050	3	73.683	10.239	.000
Within Groups	546.900	76	7.196		
Total	767.950	79			$\omega^2 = .25$

In *Table 2*, the observed F-value and the significance level ( $F_{(3,76)} = 10.23$ ,  $p < .05$ ) indicate that there are statistically significant differences among the four groups. Therefore, it can be safely claimed that there are significant differences among the effect of these four task types on vocabulary comprehension.

At the same time, the index of the strength of association ( $\omega^2 = 0.25$ ) indicates that 25 percent of the total variance in the dependent variable (vocabulary comprehension) is accounted for by the independent variable (task types). This means that the remaining 75 percent of the variance is left unaccounted for.

In order to locate the differences among the study groups, a post hoc Scheffe test was utilized. The results are summarized in *Table 3*. As it can be observed in *Table 3*, the mean score of the

Word formation group is significantly better than the mean scores of the Multiple-choice and the Gap-filling groups, suggesting that the participants of the word formation group have outperformed their counterparts in the two groups, but the mean scores of the latter two groups do not differ significantly from each other.

Table 3: Multiple comparisons for the ANOVA on vocabulary comprehension

(I) group	(J) group	Mean Difference (I-J)	Std. Error	Sig.	95% Confidence Interval	
					Lower Bound	Upper Bound
Code –mixing	Word formation	-2.30000	.84830	.070	-4.7254	.1254
	Multiple-choice	.95000	.84830	.741	-1.4754	3.3754
	Gap-filling	2.25000	.84830	.080	-.1754	4.6754
Word formation	Multiple-choice	3.25000*	.84830	.004	.8246	5.6754
	Gap-filling	4.55000*	.84830	.000	2.1246	6.9754
Multiple-choice	Gap-filling	1.30000	.84830	.507	-1.1254	3.7254

\*. The mean difference is significant at the 0.05 level.

The result further indicates that although there is a difference between the means of the Code-mixing group and the Word formation group, the difference is statistically insignificant. Moreover, the result shows that there are no statistically significant differences between the Code-mixing group and the Multiple-choice group, as well as between the Code-mixing group and the Gap-filling group. The following graphic representation of the results (*Figure.1*) shows the differences among these groups more conspicuously

Figure1: Means Plot on the Vocabulary Comprehension

### Investigation of the second Research Question

The aim of the second research question was to examine the effect of various task types including Multiple-choice cloze task, Gap-filling task, Word formation task, and Code-mixing task on L2 vocabulary production. To this end, another one-way ANOVA procedure was run. The descriptive statistics are presented in *Table 4*.

Table 4: Descriptive Statistics for the ANOVA on Vocabulary Production

	N	Mean	Std. Deviation	Std. Error
Code-mixing	20	22.5500	4.09717	.91616
Word formation	20	22.9000	3.89196	.87027
Multiple-choice	20	19.3500	4.01674	.89817
Gap-filling	20	18.2500	3.29074	.73583
Total	80	20.7625	4.27013	.47742

Table 4 indicates that the highest mean ( $\bar{x} = 22.90$ ) belongs to the Word formation group, followed closely by the mean of Code-mixing group ( $\bar{x} = 22.55$ ). The Multiple-choice group has the third position ( $\bar{x} = 19.38$ ). The participants of the gap-filling group have the lowest mean ( $\bar{x} = 18.46$ ), which is noticeably lower than the other groups. To see whether or not the observed differences among the groups are statistically significant, the one-way ANOVA procedure was used. The obtained results are presented in Table 5.

Table 5: The results of the ANOVA on vocabulary production

	Sum of Squares	Df	Mean Square	F	Sig.
Between Groups	321.437	3	107.146	7.277	.000
Within Groups	1119.050	76	14.724		
Total	1440.487	79			$\omega^2 = .19$

As it can be seen in Table 5, the F-value and the significance level ( $F_{(3,76)} = 7.27$ ,  $p < 0.05$ ) are indicative of significant differences among the means. Moreover, The index of the strength of association ( $\omega^2 = 0.19$ ) shows that 19 percent of the total variance in the dependent variable (vocabulary production) is accounted for by the independent variable (task types), and that the remaining 81 percent is left unaccounted for.

Another post hoc Scheffe test was utilized to locate the differences among the groups. The results of the multiple comparisons are summarized in Table 6.

Table 6: Multiple Comparisons of Means for the ANOVA on Vocabulary Production

(I) group	(J) group	Mean Difference (I-J)	Std. Error	Sig.	95% Confidence Interval	
					Lower Bound	Upper Bound
Code -mixing	Word formation	-.35000	1.21344	.994	-3.8194	3.1194
	Multiple-choice	3.20000	1.21344	.082	-.2694	6.6694
	Gap -filling	4.30000*	1.21344	.008	.8306	7.7694
Word formation	Multiple-choice	3.55000*	1.21344	.043	.0806	7.0194
	Gap -filling	4.65000*	1.21344	.004	1.1806	8.1194
Multiple-choice	Gap -filling	1.10000	1.21344	.844	-2.3694	4.5694

\*. The mean difference is significant at the 0.05 level.

Based on *Table 6*, the difference between the Code-mixing group and the Gap-filling group is statistically significant, with the Code-mixing group outperforming the Gap-filling group. It is worth noting that there are no statistically significant differences between the Code-mixing group and the Word formation group, as well as between the Code-mixing group and the Multiple-choice group.

Moreover, the Scheffe test indicates that the mean score of the Word formation group is significantly better than the mean scores of the Multiple-choice and the Gap-filling groups, but the mean scores of the latter two groups do not differ significantly from each other. In other words, the participants of the Word formation group have outperformed those of the Multiple-choice and the Gap-filling groups, suggesting that Word formation task is the most effective task on vocabulary production.

The following graphic representation (*Figure 2*) shows the differences among the groups more conspicuously.

*Figure 2: Means Plot on the Vocabulary Production Test*

## DISCUSSION

Considering the findings of the study, we can conclude that there is a large gap between receptive knowledge from input-oriented tasks and output-oriented tasks in a way that productive tasks are more effective than receptive tasks on both vocabulary comprehension and production. This result is in contradiction with Krashen's input hypothesis, avowing that input alone is sufficient for the development of both receptive and productive second language knowledge. In addition, based on Krashen's natural order hypothesis, speech emerges. In other words, even productive knowledge develops naturally from receptive knowledge. This implies that input-oriented activities alone are not only capable of creating language knowledge, but also even more effective than output-oriented activities on the development of both receptive and productive language knowledge. Drawing on the distinction between receptive and productive knowledge of vocabulary, the finding of this study seems to support the role of output.

At the same time, there are studies that are in line with the findings of this study. In an experimental study, Ellis and He (1999) found that the interaction between output and dialogic interaction could be a beneficial factor for learners to acquire productive as well as receptive vocabulary knowledge. Similarly, de la Fuente (2002) found that only negotiated interaction that incorporated output promoted both receptive and productive learning of words, and increased productive word retention.

## **CONCLUSIONS AND IMPLICATIONS**

Based on the findings of this study, it can be concluded that in spite of the teacher-centered tradition of instruction in Iranian context, applying output-oriented tasks gives sufficient room to students to show themselves. In other words, if treated with output-oriented tasks, students become more engaged in the learning of the target language elements, and they take more active roles in the learning process. It can be concluded that employing output-oriented tasks can keep students motivated, and facilitate students' learning processes.

In the Iranian context, language instruction is mainly based on the input. Target language elements are mostly learnt through the receptive skills. There is no sufficient room for students to show their abilities through productive skills. On the other hand, employing output-oriented tasks necessitates learners to produce the intended language items. The production of the target language items through output-oriented tasks may have a greater level of appeal to learners due to their novelty. This sense of motivation and enthusiasm may partially account for the dominance/superiority of the output-oriented tasks over the input-oriented tasks.

Based on the obtained results, we can claim that this study lends support to the output hypothesis proposed by Swain (1985). The output hypothesis suggests that successful second language acquisition requires not only comprehensible input, but also comprehensible output, language produced by the learner that can be understood by other speakers of the language. It has been argued that when learners have to make efforts to ensure that their messages are communicated (pushed output), this puts them in a better position to notice the gap between their productions and those of proficient speakers, fostering acquisition (Richards & Schmidt, 2002).

The findings of the present study can have implications not only for teachers and learners, but also for materials developers. The knowledge of the effects of diverse task types on vocabulary learning can help teachers make more informed decisions as to which task types to choose to engage their learners in. Moreover, the results may be helpful in improving learners' autonomy. Given the superiority of output-oriented tasks over input-oriented tasks, learners can be allowed to experience greater levels of autonomy by being actively engaged in productive activities and assume more responsibility for their own learning rather than being passive bench-bound recipients of information.

Furthermore, the results of the current study might provide useful insights for the developers of instructional materials and syllabus designers in their selection of effective word-focused tasks in EFL General English materials. It can hardly be denied that adequate and sufficient vocabulary knowledge leads to good comprehension. Thus, given the importance of vocabulary in EFL General English classes, any word-focused task that helps learners to develop their vocabulary knowledge would certainly be welcomed.

And finally, this study could possibly lay the groundwork for a great deal of research to touch on the effect of different word-focused tasks on various aspects of vocabulary knowledge.

All in all, despite the apparent areas of discrepancy as to which task type is more beneficial than which other types, there seems to be almost a consensus that, overall, tasks are effective and

conducive to language learning in general and vocabulary learning in particular. Yet, the discrepancies among the findings of various studies as to the effectiveness of different task types on vocabulary learning, coupled with areas of gap between the findings of this study and those of other similar studies warrant more studies in the future.

## LIMITATIONS AND DELIMITATIONS OF THE STUDY

In the present study, the following limitations and delimitations should be taken into account:

1. There are various types of tasks considered as pedagogical tools in task-based language teaching approach. It was impossible to compare all task types in one study. Therefore, this study was confined to a limited number of selected tasks. This implies that the findings of this study may not be generalizable to other task types.
2. Due to time and administration limitations, only 80 language learners participated in the present study. Therefore, care must be exercised in generalizing the findings.
3. The students who participated in this study were male and female. This means that the participants' gender was not a variable.
4. The proficiency level of the participants was constrained to intermediate level. Thus, care should be taken in generalizing the result to learners of other proficiency levels.
5. The present study investigated the effect of different types of task on students' vocabulary comprehension and production; this means that the other language skills (e.g. reading comprehension, listening, speaking, etc.) were not of concern here.
6. While participants were carrying out the selected tasks, their performance could be affected by many different factors including their personality type, level of anxiety or motivation, and their learning styles. Additionally, it was impossible to impose complete control on the students' probable practice outside the classroom.
7. The vocabulary pretest (one hundred-item check-list) used in this study was not verified in terms of reliability. Therefore, more trustable findings will be reached using vocabulary pretest verified in terms of reliability.

## TEAM-TEACHING EFFICACY IN AN EFL CONTEXT: DOES THE AGE MATTER?

Mohammad Aliakbari, PhD & Jaber Khales Haghighi, MA

*Ilam University (Iran)*

*maliakbari@hotmail.com, Jaber.haghighi@gmail.com*

### ABSTRACT

This study was carried out to explore and compare the effectiveness of team-teaching as a model of coteaching in the promotion of children and adults English as a Foreign Language (EFL) students' general proficiency in Iran. Two classes of children and two of adults learners were chosen and based on the achieved scores in the pretests were assigned to control and experimental groups. The students of the control groups received instruction from one teacher, and those in the experimental groups were taught by a couple of teachers through team-teaching model. The results of the final achievement tests were analyzed through T-test computation. Findings revealed that implementing team-teaching was gratifying and beneficial in enhancing the achievement of adults and children impacting the group homogeneity in different manner. Team-teaching experience made all of the students in the experimental groups exhibit a tendency towards having two teachers in the following semesters.

**KEY WORDS:** Coteaching, Team-teaching, Coteaching Models, Language Proficiency

### INTRODUCTION

Delivering profitable and satisfying pedagogy has been the highlight of educational systems for decades. Many models and approaches have been put forward in recent years to improve the students' achievement as such are consultant model, collaborative pedagogy, differentiated instruction, and coteaching. The last one that is the focus of the current study has been emerged from half a century ago with the aim of cultivating and raising the students' academic attainment.

The notion of the present-day coteaching might be embarked upon many tendencies and movements from 1950s (Friend & Cook, 2010). One of the first trends was the educators' willingness to replace the traditional single teacher instruction with more effective approaches of pedagogy (Hanslorvsky, Moyer, & Wager, 1969, cited in Friend & Cook, 2010). Villa, Thousand, and Nevin (2004) stated that coteaching was established in 1960s to open up the opportunities for children to learn. Some years later and during 1980s, the educators felt the need to have a special educator collaborating with a general one to improve the students' achievement, especially for those with disabilities (Chapple, 2009). The purport to enhance the achievement of students in the late 1980s and 1990s contributed to the popularity of what today is called *coteaching* (Friend & Cook, 2010).

Since the early 1990s, the major characteristics of co-teaching have been identified to define and describe what coteaching really is (Dieker & Murawski, 2003; Vaughn & Schumm, 1995; Walther-Thomas, 1997). Bauwens and Hourcade (1995) defined cooperative pedagogy as a process of "two or more educators possessing distinct sets of knowledge and skills working together to teach a heterogeneous group of students in the general education classrooms" (p. 46). They believe that this model has the capacity to develop the potentiality of students and teachers

(Bauwens & Hourcade, 1995). To Friend and Cook (2007) collaboration is “a style for direct interaction between at least two co-equal parties voluntarily engaged in shared decision making as they work towards a common goal” (p. 7). As Villa, Thousand, and Nevin (2008) put it, coteaching refers to a situation when “two or more people sharing responsibility for teaching some or all of the students assigned to a classroom” (p. 3). All of these definitions and those proposed by other experts emphasize on working together, shouldering the same responsibilities, preplanning, and equal status of instructors in the same classrooms to achieve common goals.

Having these characteristics and factors in mind, this study, in the first place, seeks to find the efficiency of team-teaching among children and adults students in Iranian context and then, attempts to compare the effectiveness of coteaching in the classroom of children with that of adults’ learners in terms of students’ progress. Moreover, it explores the students’ and teachers’ evaluation of experiencing coteaching classes.

### ***Co-teaching models***

In the last two decades different approaches of co-teaching have been proposed by scholars. Villa et al. (2004) described supportive, parallel, complementary, and team-teaching as four approaches of coteaching. The first one, supportive teaching, is when one teacher as the main leader presents the instruction and the other teacher supports him/her. The teachers teach the lessons and generate supports to different groups of learners in a single classroom in parallel teaching; the instructors can move within and between the groups. As the name suggests, in complementary teaching, one of the instructors who assists the main teacher works as a complement and presents instruction, materials, and so forth when needed. Finally, in team-teaching all of the coteachers are responsible for presenting the information.

Six approaches to coteaching were described by Friend and Cook (2007): one teach, one observe; station teaching; parallel teaching; alternative teaching; team-teaching; and one teach, one assist. In the first approach, one of the teachers provides instruction and the other observes the students. The second approach is station teaching wherein some stations are provided and students move between the stations to learn. There can also be one station for students to work independently. In parallel teaching the class is divided into two or more groups, and each teacher works and teaches independently. In the forth approach viz. alternative teaching, one of the instructors teaches to a large group and the other to a small group of learners. It is added that the students in the small group work on something different from the other one. Teaming, or team-teaching, is similar to the team-teaching model proposed by Villa et al. (2004), wherein both teachers are responsible for delivering instruction, planning, assessing, grading and so forth. The last one is one teaching, one assisting when one of the teachers as the main instructor delivers the instruction and the other helps students. In a metasynthesis qualitative research, Scruggs, Mastropieri, and McDuffie (2007) identified this model as the one that is mostly adopted by coteachers. The following figure clearly manifests these approaches:

Figure 1: Co-teaching approaches. Adopted with permission from Friend & Bursuck (2009).

## REVIEW OF THE RELATED LITERATURE

Numerous studies have been qualitatively conducted to theoretically investigate the approach from various perspectives (e.g. Adams & Cessna, 1993; Weiss & Lloyd, 2003). Murawski & Dieker (2008) maintained that the essential strategies of implementing beneficial coteaching are preplanning, volunteerism, administrative support, and teacher training.

Simmons and Mageria (2007) who utilized observations and interviews to see if coteaching was truly implementing in a school district found diverse intensity of incorporating this approach. In first place, the researchers recommended the administrators to update the teachers' training. Further, they suggested "keeping effective coteaching pairs together, providing common planning time, encouraging special education coteachers to become part of content departments, and tracking student outcomes" as the effective strategies in improving coteaching pedagogy (p. 1).

Isherwood and Barger-Anderson (2007) conducted a qualitative study to identify the factors and characteristics of 15 general education and 5 special education teachers that influence the development of their works. They found coteachers' close relationships, obvious and predetermined responsibilities of teachers, and receiving support from administrators as the considerations that can positively impact the expansion and accomplishment of this approach.

Teachers or students' perception of coteaching has been another realm for studies during the previous decades (e.g. Keefe & Moore, 2004; Kohler-Evans, 2006; Salend, Gordon, & Lopez-Vona, 2002). In a study conducted by Austin (2001), 139 general and special education teachers were interviewed to find out their perceptions toward coteaching. The researcher reported that general education teachers referred to coteaching as a favorable approach for facilitating classroom management. Special education teachers also found coteaching beneficial in fostering the content knowledge. Both groups noted small and cooperative group learning as the most glorious experience in students' learning. Finally, general and special education teachers cited coteaching as an invaluable experience. Wilson and Michaels (2006) reported that both students with and without disability were in favor of attending in another classes with coteachers. The participants also added that they got higher scores when receiving coteaching.

Additionally, many classroom studies have been quantitatively conducted to probe the effectiveness of coteaching, among them a plethora of research failed to indicate the efficacy of practically implementing the approach. Beam (2005) studied the usefulness of coteaching in intermediate classrooms of students with disability. No difference was found in the behavior of students and their outcomes after implementing coteaching. Gale (2005) found no meaningful difference in the performance of students with disability in standardized tests, nor in their behavior when confronting with coteaching. Fontana (2005) probed the impact of coteaching on eighth grade students with disability. The students' performance in English and Math classrooms were analyzed. Moreover, the researcher collected data from teachers through one survey. The final results showed no enhancement on students writing, but considerable growth in students' self-concept and math. The surveys also showed the teachers' positive view towards coteaching. Idol (2006) found that coteaching did not significantly affect students with disability and students without disability performance on high-stakes tests.

The outcomes of a study performed by Murawski (2006) revealed no meaningful difference in the achievement of students with disability when receiving coteaching and solo-teaching. Potter (2011) discovered that there is no significant difference in the reading achievement of students with mild disabilities who received coteaching and those who received instruction from a single teacher. Aliakbari and Mansoori Nejad (2010) explored the effectiveness of coteaching in promoting the grammatical proficiency of Iranian junior high school students. They reported no evidence of meaningful difference in the achievement of the students in either group. The researchers suggested that implementing coteaching in Iranian context, in the realm of grammatical proficiency is dubious. Aliakbari and Mansoori Nejad (2010) maintained that "cultural background of students" could be the reason of non-significant results of coteaching in Iran (p. 8). Aliakbari and Bazayr (2012) conducted a classroom study to explore the efficacy of parallel teaching in a public school in Iran. The upshots of the study indicated that adopting parallel teaching is not effective in the promotion of the students' general proficiency in the given context. Among the reasons of non-significant outcomes, the researchers referred to the fact that "coteaching models are somehow new to the state education system in a way that participants culturally felt shocked by the innovation" (Aliakbari & Bazayr, 2012).

In contrast, there is a body of classroom research that proves the usefulness of coteaching (e.g. Bear & Proctor, 1990; Hadley, Simmerman, Long, & Luna, 2000; Marston, 1996). Through a quasi-experimental study, Jang (2006) reported that team-teaching promoted the students outcomes in Taiwan. Khaled Haghighi and Abdollahi (2013) sought the efficacy of team-teaching and station teaching in the promotion of students' reading comprehension in an EAP situation in Iran. In this experimental study, 52 sophomore students were selected and based on their performance in the pretest were assigned into three homogeneous groups. There were two experimental, receiving team-teaching and station teaching, and one control group, who were taught by one single instructor. The students' performance in the final test was analyzed through one-way ANOVA, and it became clear that both team-taught and station-taught groups outperformed those in the control group. But, no statistically meaningful difference was found regarding the two experimental groups. The researchers referred to prior planning and teacher training as key reasons of the accomplishment of the adopted models. Reviewing the related studies in the realm of coteaching, it is emerged that the investigation of co-teaching efficacy in

the area of language proficiency in private language institutes in Iran is absent from the present-day literature.

### **STATEMENT OF THE PROBLEM**

As with a large growth of schools, institutions, and colleges the students' desire to continue education is growing as well. The result, then, is an ongoing extensive number of students with wide variety of needs, expectations, and challenges to be fulfilled. Among the many delivery service systems, i.e. inclusion, consultation, differentiated instruction and team-working provided to meet these diverse yet interrelated needs and challenges, one that has received widespread attention during recent decades is coteaching. Furthermore, students gain their knowledge of English through various ways, among them private language institutes play noteworthy roles in enhancing students understanding and knowledge.

A number of studies have been performed to investigate the efficiency of co-teaching in the students' reading performance, high-stakes tests, grammatical proficiency and so forth. Contrasting results were reported from previous classroom studies, and the efficacy of practically exploiting co-teaching strategies still remained unclear. Few studies investigated the efficacy of co-teaching in Iran (Aliakbari & Mansoori Nejad, 2010; Aliakbari & Bazayr, 2012; Khales Haghighi & Abdollahi, 2013); further exploration is still needed to clarify the effectiveness of various models of co-teaching. Therefore, the ultimate goal of this study is to ascertain whether co-teaching as one of the manifestations of service delivery system among children and adults could enhance students' proficiency more favorably in comparison with single instructor-teaching system. Besides, it aims at discovering if implementing team-teaching affect the promotion of children and adults differently.

### **RESEARCH QUESTIONS**

The following research questions are addressed in the current study:

- 1) To what extent does implementing team-teaching impact the enhancement of children and adults general language proficiency in Iranian context?
- 2) How do the teachers and students in the experimental groups regard the experience of team-teaching instruction?

### **METHODOLOGY**

#### ***Design***

A mixed-method design was employed for this study. To provide answer for the first research question, a quasi-experimental design and to explore the second research question semi-structured interviews were conducted with the teachers and students of the experimental groups in the end of the study.

#### ***Participants***

The participants for the study were chosen from one private language institute, viz. Tarannom Language Institute in Ilam, western city, Iran. The method of choosing the participants was convenience sampling. There were two groups of students, control and experimental, studied English as a foreign language for three sessions a week in winter 2012. There were 29 students in the control groups and 30 students in the experimental groups. It is added that the children were 7 to 10 years old, and the adults were 18 to 30 years old. The following table summarizes the sampling distribution.

Table 1: The distribution and number of students in each group

		Children		Adult	
		Control	Experimental	Control	Experimental
Gender	Female	6	7	7	9
	Male	7	9	9	5
Mean age		8.9	8.2	25.5	24.3
Mean score in the pretest		87.2	86.4	85.93	86.47
Mean years learning English		2.7	2.9	3.1	3.4

Furthermore, three teachers who had experience of five and seven years of teaching English in EFL contexts ran the classes in the control and experimental groups. Two of the teachers had MA degree and the other teacher was an MA student in Teaching English as a Foreign Language (TEFL). The criteria for choosing the teachers were their experience, inclination for participation, academic knowledge, and teaching qualification.

### Materials

The main materials used in the current study were English Time (Rivers, & Tokoyama, 2005) and Touchstone (McCarthy, McCarten, & Sandiford, 2005). The first one, English Time (Rivers, & Tokoyama, 2005) of the series includes seven books for different proficiency levels of 5 to 12 years old learners. The book English Time 5 (Rivers, & Tokoyama, 2005) was practiced in the study. Furthermore, Touchstone 2 (McCarthy, McCarten, & Sandiford, 2005) was the main book of the course for adults' learners.

### Instruments

Two proficiency and two achievement tests were utilized as the instruments. All of the students took part in two tests, viz. pretest and posttest. The aim of the pretests was determining the homogeneity of the students in each group in terms of English language proficiency before initiating the instruction. The goal of posttests was investigating the achievement of students in the control and experimental groups. The tests for children learners included oral tests (speaking and listening using picture cues) with time restriction of 20 minutes, and paper tests included sentence and reading comprehension tests, with time restriction of 50 minutes. The tests for the adult students also included oral tests (speaking and listening in oral interviews), reading comprehension, grammar, true/false, close passage, and structure tests. Oral tests were completed in 30 minutes and paper tests in 75 minutes. All paper tests were piloted with the time intervention of two weeks, then, the *Threshold-loss agreement* was adopted and calculated through Brown's (1996) formula to ensure the reliability of the tests. Moreover, to seek the reliability of the oral interview tests, each test was scored by at least two raters. To ensure the inter-raters' reliability, the *Kappa statistics* were adopted. Table 2 presents the *kappa coefficient* ( $k$ ) for the reliability of each test. It worth noting that all the paper tests were prepared by tests administrators and teachers in the institute. As noted, all the tests were standardized before being used in the study.

Table 2: The calculation of K for the reliability of the pre- and posttests

	Tests	<i>K</i> for Paper Tests	<i>K</i> for Oral Tests
Children	Pretest	.71	.85
	Posttest	.79	.74
Adults	Pretest	.81	.87
	Posttest	.86	.76

Kappa lies on a scale of -1, 0, and 1. The Kappa=1 denotes complete agreement, 0 indicates agreement by chance, and -1 indicates less than chance agreement. Moreover,  $0.61 < K < 0.80$  denotes substantial agreement,  $0.81 < K < 0.99$  indicates almost perfect agreement. Therefore, the calculated K's for the tests adopted denote a high level of agreement. Experts' judgment was determined to prove the validity of the tests. The experts were asked to share their ideas about the content relatedness and the items preciseness and clearness. Having known the experts ideas, the test administrators implemented the changes needed, and removed or modified some items. Finally, upon the agreement of the experts, the tests were made ready to use in the real study.

### *Procedure*

Firstly, to determine the homogeneity of the control and experimental groups of children as well as adults' learners, two pretests were taken. Based on the students achieved scores in the pretests, the teachers divided the students into four classes, including two experimental and two control groups. In order to ensure that the experimental and control groups were homogeneous, Independent-Samples T-test was run.

The study was conducted in 20 sessions and in the last session the final exam was held. The children took part in the classrooms on Saturdays, Mondays, and Wednesdays, and the adults participated in the classrooms on Sundays, Tuesdays, and Thursdays in winter 2012, starting in January 8, to February 23. Thirteen children constituted one experimental group in the study. As the first experimental group of the study, they were co-taught by a couple of teachers through team-teaching. While, the other group of children considered as the control group, included 15 students, were taught by only one of the teachers. The other class of the experimental group comprised 16 adults' learners who received coteaching strategies of instruction. Finally, the last group also consisted of 13 adult learners in the control group, received instruction by one of the teacher-researchers.

Among various approaches of coteaching suggested by scholars, team-teaching model presented by Friend and Cook (2007), wherein both teachers are engaged in implementing the instruction, was employed in the study. The coteachers taught the lessons cooperatively and collaboratively and both of the teachers were responsible for planning, analyzing, and incorporating the instruction. The procedures and methods of teaching the content, in the experimental groups, were planned cautiously by the coteachers in advance. Coteachers crystallized their roles and tasks in the classroom, and tried to analyze individual learner's needs and share responsibilities before the class began in each session. Moreover, they emphasized and made students aware of the fact that both teachers are of equal authority in delivering instruction, assessing, managing classroom discipline and students' behavior as well as in scoring.

One week after the study ended, skilled and experienced interviewers conducted semi-structured interviews to seek answer for the second research question. Data needed from the students were

gathered through focus group interviews with 6-7 students in each group. It helped the participants to think together, challenge each other, and react to the salient points. The data from the teachers were also gathered in a friendly situation through semi-structured interviews. The average time for interviews with students was 20-23 minutes, and about 14-17 minutes with the coteachers. There were specific pre-determined core questions; however, the interviewers, who used interview schedules, allowed elaboration in the questions and answers to gather in-depth information. All interviews were audio-taped to ensure the accurate documentation of the data. Audio-tapes were then transcribed for analysis.

### **Data analysis**

To find answer for the first research question, the sum of the oral and paper tests were analyzed using the Statistical Package of Social Science (SPSS). To find answer for the second research question, a portion of data was transcribed. The portion was carefully reviewed and a list of answers including the advantages, disadvantages, recommendations, difficulties and so on was compiled. The list was analyzed as to be categorized and combined into larger units. The most frequent answers were then categorized into three groups of advantages, suggestions, and essentials. To ensure the reliability of the findings, the transcriptions were given to two experts to analyze the data. The results were compared and the agreed-upon answers were considered valid for the research question two.

## **RESULTS**

Descriptive and inferential statistical analyses were run to analyze the students' achieved scores in the pre- and posttests. Tables 3 and 4 reveal the children's performance in the pretest and posttest. Tables 6 and 7 present the adults performance in the tests.

**Table 3: Descriptive Statistics of the Children Performance in the Pretest and Posttest**

		<i>N</i>	<i>Mean</i>	<i>Std. Deviation</i>	<i>Std. Error Mean</i>
<i>Marks</i>	<i>Pretest</i>				
	<i>Coteaching</i>	13	86.40	5.853	1.511
	<i>Solo-teaching</i>	15	87.20	5.647	1.458
	<i>Posttest</i>				
	<i>Coteaching</i>	13	90.87	3.85	.995
	<i>Solo-teaching</i>	15	84.80	6.19	1.59

**Table 4: Inferential Statistics of the Adults Performance in the Pretest and Posttest**

	F	Df	Sig. (2-tailed)	Std. Difference	Error	Effect Size (Cohen's d)
Pretest	.016	27	.785	1.935		–
Posttest	1.583	27	.004	1.882		1.19

The descriptive and inferential statistics of results of the adult learners' pretest and posttest from the Independent-Samples T-test are demonstrated in Tables 5 and 6.

**Table 5: Descriptive Statistics of the Adults Performance in the Pretest and Posttest**

			N	Mean	Std. Deviation	Std. Error Mean
Marks	Pretest	Coteaching	16	86.47	5.167	1.334
		Solo-teaching	13	85.93	5.431	1.402
Marks	Posttest	Coteaching	16	89.27	5.161	1.33
		Solo-teaching	13	84.07	4.967	1.10

**Table 6: Inferential Statistics of the Adults Performance in the Pretest and Posttest**

	F	df	Sig. (2-tailed)	Std. Difference	Error	Effect Size (Cohen's d)
Pretest	.016	27	.78	1.93		–
Posttest	.294	27	.006	1.729		1.02

## DISCUSSIONS AND CONCLUSION

As was noted earlier, two control and two experimental groups were chosen for the study. Before beginning the study, pretests were held to capture the students' initial differences and to ensure that the control and experimental groups were homogeneous. Table 3, presents the mean score of the children in the control and experimental groups. The average score of the former is 87.20, and that of the latter equals 86.40. To see whether or not this difference is meaningful, T-test was adopted. As it is shown in Table 4, the sig=.706; thus, the claim of the homogeneity of the experimental and control groups, before initiating the instruction, is verified. Table 5 indicates the descriptive statistics of the adults pretest results. The experimental group generated a mean score of 86.47, and the control group achieved 85.93 as the average score. The sig=.785 in Table 6 reveals that the difference between the average scores is not statistically meaningful; accordingly, it can be claimed that the two groups were nearly homogeneous.

In the end of the semester, all students participated in the final achievement tests to figure out the efficacy of the treatments. Table 3, provides the descriptive statistics of the achievement score of the students in the children group. Although, the mean score of the experimental group, ( $\Sigma=90.87$ ) is higher than the control group ( $\Sigma=84.80$ ); the statistical analysis of T-test was exploited to determine the meaningfulness of this difference. The  $\text{sig}=.004$  in Table 4 indicates that the difference was statistically significant. Consequently, it proves that delivering instruction through team-teaching is considerably effective in enhancing students' proficiency in children.

Furthermore, to provide information about the magnitude of the provided information, effect sizes were calculated. In so doing, the *Cohen's d* formula, which can be used to figure out the differences between the means of two groups, was adopted. According to Cohen (1988) a value of .2 is generally considered a small effective size, .5 a medium effective size, and .8 or more a large effective size. So, the effect size of 1.19, presented in Table 4 yields a high level of effective size, suggesting that coteaching is a highly effective procedure for influencing children's outcome.

Descriptive statistics of the adults' performance is demonstrated in Table 5. It is crystallized that students of the experimental group obtained higher average scores ( $\Sigma=89.27$ ) comparing with those in the control group ( $\Sigma=84.07$ ). However, to ascertain if the difference between the two groups is statistically significant, the Independent-Samples T-test procedure was run (see Table 6). The  $\text{sig}=.006$ , indicates that the difference between the students' performance in the posttest was statistically meaningful. All in all, the findings indicate that employing team-teaching is considerably beneficial in fostering the adults' general proficiency.

The comparison of the standard deviation of the scores in the pre- and posttests indicates that the standard deviation of the children was 5.8 in the pretest that was reduced to 3.85 in the posttest; whereas, the standard deviation of the control group in the pretest equaled 5.6 and increased to 6.19 in the posttest. It suggests that implementing coteaching increased the homogeneity of the learners; while, the single teaching lowered the students homogeneity in the end of the study. The standard deviation of the adults in the experimental group was 5.1 in the pretest that remained constant in the posttest; the control groups' standard deviation was 5.43 and decreased to 4.96 in the final test. Put it differently, no considerable change was reflected in the homogeneity of the adults' learners in the experimental and control groups. The calculated effect size for adult groups is 1.02 that is a large effect size. It denotes that implementing coteaching is considerably effective in the promotion of the students' proficiency.

To sum up then, the findings revealed that employing team-teaching as a model of co-teaching procedure was effective in fostering the children and adults general proficiency; although, it affected the groups homogeneity in a different manner. To explore and highlight the differences between implementing team-teaching in the children and adults classrooms, and to find answer for the second research question, the teachers' and students' viewpoints were sought in an open-ended questionnaire. The following table summarizes the teachers and students' perspective on team-teaching.

Table 7: The summary of students' evaluation of team-teaching

Advantages	Essentials	Suggestions
<ul style="list-style-type: none"> <li>• Potentially effective</li> <li>• No time is wasted</li> <li>• Coteachers can devote great deal of time to analyze the students needs</li> <li>• Coteachers can observe and analyze other's classrooms</li> <li>• Coteachers can share experiences</li> <li>• Coteachers can cover the others' weaknesses</li> <li>• Coteachers spend less energy</li> <li>• Increasing the students' motivation</li> <li>• Increasing the students' interest</li> </ul>	<ul style="list-style-type: none"> <li>• Prior planning</li> <li>• Match coteachers</li> <li>• Creating and developing the culture of having two teachers</li> <li>• Administrators support</li> </ul>	<ul style="list-style-type: none"> <li>• Preparing the students mindset</li> <li>• Making the students' ready for coteaching</li> <li>• Involving parents for making the students ready</li> <li>• Implement coteaching from the students childhood</li> </ul>

Having the opportunity to share experiences is a major benefit of teaching cooperatively and collaboratively from the co-teachers' point of view. Most teachers implement their own procedures and techniques in teaching and in managing classrooms. They feel no need in observing, and analyzing other teachers' techniques and strategies of teaching and managing. Nonetheless, employing coteaching models and strategies of instruction enabled the teachers to make use of observing, and analyzing the couple's methods in teaching.

They also maintained that the model enabled them to support and cover the weaknesses of the paired one in the classroom. Moreover, they posited that less energy is needed to convey the message and to manage the classroom; hence there remains a considerable deal of time that can be devoted to analyzing the students' needs and progress. Nevertheless, they asserted that prior planning, especially in establishing and maintaining communication when presenting information, sharing responsibility, changing the roles, and so forth, is of utmost importance when co-teaching is implemented. Prior planning was also referred to as an inseparable element in studies where positive outcomes were reported (e.g. Bear & Proctor, 1990; Khales Haghighi & Abdollahi, 2013; Marston, 1996; Walther-Thomas, 1997).

For coteaching to be effective and successful the culture of having more than one teacher should be created and developed (Aliakbari & Bazayr, 2012; Aliakbari & Mansoori Nejad, 2010; Friend, 2007). One reason of non-efficacy of coteaching in Iran was the students' background culture. To overcome the obstacle, the administrators and coteachers tried to prepare the students' mindset for having two teachers before initiating and during the study. To the coteachers, amending the stereotypical conception of classrooms among children, that is individual instruction, occurred after one or two sessions. Whereas, the coteachers spent much time to change the traditional one-teacher instruction viewpoints in adults' classroom and letting them cope with the new situation. Stated otherwise, the children dealt with the new model of instruction effortlessly and easily. This might be due to the fact that the children's mindset about classroom environment, instruction, and teachers' roles is not fixed yet. They are more flexible in coming up with new ideas. However, having accepted two teachers instead of one, the students' motivation and interest in learning, as they expressed, were enhanced.

The majority of students referred to team-teaching as a novel, yet effective approach. Most of them stated that employing match coteachers in the classroom is potentially beneficial for enhancing the students' proficiency. They further noted that no time is wasted when two teachers attend and teach in one classroom. Many of them cited that the presence of coteachers can properly support the students, for instance one of the teachers covered grammar in the best possible way; while, the other one widened the students' vocabulary. Finally, all the students who were co-taught declared their willingness to having two teachers instead of one, in the following semesters.

Although contrasting results were reported in the previous studies, the most instructional benefits were reported for students in the presented study. One interpretation that can be put on the positive findings in the current paper, as mentioned before, might be due to preparing the students' mindset before initiating the instruction. Another interpretation can be related to the context where the studies took place. Two of the previous studies in Iran were conducted in state schools, wherein teachers do not have much flexibility in changing the routine conditions and might receive less administrative support comparing with private schools, institutes, or universities; however, this study was carried out in a private language institute where teachers are allowed to implement changes for better conditions, and gained sufficient administrative support.

### **IMPLICATIONS OF THE STUDY**

The ultimate goal of educational systems is to fostering the students' attainment. The upshots of the current study will yield the insights to positive educational changes especially in private language institutes by helping educators, administrators, and teachers to realize the significance and efficacy of team-teaching in EFL classrooms. Consequently, administrators and educators who are committed to advance the quality of delivering instruction and are minded for employing constructive instructional strategies and approaches may benefit from the findings of this study. In addition, it was revealed that the children accept the culture of coteaching easier than adults; thus, this study suggests the teachers, educators, and administrators to start implementing coteaching instruction from the learners' childhood.

### **LIMITATIONS OF THE STUDY AND SUGGESTIONS FOR FURTHER RESEARCH**

The current study, like the majority of studies, is faced with some limitations. The participants of the study were chosen from one private language institute in Ilam-Iran. Therefore, the outcomes may not be generalized to other populations in other contexts. To offer evidence of the effectiveness of team-teaching in Iranian EFL classrooms, further studies can replicate the current study with a larger number of participants. By adding more students and teachers remarking insights could be found.

Another limitation that may have affected the results is that this study was conducted in one semester in winter 2012 and with students of elementary levels. The interested researchers can longitudinally investigate the efficacy of this approach in other situations and with other participants. This study can also be repeated with students of different proficiency levels. Yet

another limitation was that only one model of coteaching was adopted in the present study. Future research will need to explore and compare the effectiveness of different models of coteaching in EFL classrooms.

### ABSTRACT

This study aimed at comparing the effects of two methods of storytelling and game playing on Iranian EFL kindergartner learners' vocabulary recognition as well as the methods' superiority over each other. 40 Iranian EFL kindergartner learners between the ages of 5 to 6 who were attending the kindergarten's pre-school classes were selected. They were assigned randomly into two experimental groups: storytelling and game playing. Each group received 8-sessions of treatment. Two point-to tests based on Jung's picture association test were used for the pretests and posttests. Based on the findings of a test of within subjects effects and an independent *t*-test, it was concluded that both the methods were effective and story-based group did slightly better. Implications are for kindergartner teachers, elementary level teachers, material developers, and parents who want to train bilingual children.

**KEYWORDS:** kindergartner, vocabulary recognition, storytelling, game playing

### INTRODUCTION

In today's global community, the study of foreign languages is a necessity (Omari, 2001). According to Chou, Wang and Ching (2012), in its role as a global language, English has become one of the most important academic and professional tools. Recent studies have highlighted the advantages of an early start in second or foreign language learning (Blondin et al., 1998; Edelenbos & De Jung, 2004; Johnstone, 2000). Basically, children are potential in acquiring and learning a foreign language, and even they learn it more quickly than those who are learning the foreign language after puberty (Mc Laughlin, 1978). According to Omari (2007) in kindergarten certain methods of foreign language teaching are more suitable than others because these years bridge the gap between early childhood and first grade. Segers, Takke, and Verhoeven (2004) mention that storybook reading in kindergarten plays a significant role in children's language and literacy development. Repeated exposure to new words, either within the text of a single book or through repeated readings of the same book, facilitates children's learning of those words (Elley, 1989; Penno et al., 2002; Robbins & Ehri, 1994; Senechal, 1997). Gaming is also a characteristic of human nature (Demirbilek, Yilmaz, & Tamer, 2010). Wright, Betteridge and Buckby (2006)

review the advantages of games for learning English and find out that games help and encourage learners for language learning in order to sustain interest and work.

### ***Children's First Language Acquisition and its Similarities with Second Language Acquisition and Learning***

One remarkable thing about first language acquisition is the high degree of similarity in the early language of children all over the world (Lightbown & Spada, 2006). While more is known about how children learn their mother tongue, researchers are just beginning to understand the processes of children's second language learning. Some researchers argue that the processes of first and second language learning in children share some important similarities (Gordon, 2007). Some 2<sup>nd</sup> language researchers believe that there is a natural learning sequence in 2<sup>nd</sup> language acquisition, parallel to 1<sup>st</sup> language developmental sequences (Lightbown, 1985). Krashen (1985) and other authors see this natural development to be the product of the language acquisition device, assumed to operate in adulthood, allowing childlike internalizations of the rules underlying the target language. Other authors stress the role of universal grammar in constraining the developmental sequence (Healy & Eugene Bourne, 1998).

### ***Critical Period***

The idea of a "Critical Period" was first introduced by Penfield and Roberts (1959). According to them, a child's brain is more plastic compared with that of an adult, before the age of 9, a child is a specialist in learning to speak; he can learn 2-3 languages as easy as one. Lenneberg (1967) believes that after laterization (a process by which the two sides of the brain develop specialized functions), the brain loses plasticity. Lenneberg claims that laterization of the language function is normally completed at puberty, making post-adolescent language acquisition difficult. Ausubel (1969) considers that children may be better able to acquire an acceptable accent in a new language and that they have certain cognitive advantages, too. Chase (1997) adds that learning ability decreases after ages eleven and twelve. He mentions that it is developmentally appropriate to teach languages during early childhood and early elementary years because of children's natural ability to acquire language during this stage in life.

### ***Early Bilingualism, and two methods of children tutoring: Story-telling and Game-playing***

There is a considerable body of research, as is assured by Lightbown et al. (2006, p.25), on children's ability to learn more than one language in their earliest years. The theory of bilingual facilitation is based on the framework proposed by Ben-Zeev (1977) and elaborated by Hakuta and Diaz (1985). Hakuta and Diaz characterized bilinguals as having enhanced "cognitive flexibility." Their essential idea is that bilinguals show a greater readiness to reorganize linguistic input and impute linguistic structure.

Teaching a language to young learners brings a number of challenges most of which stem from the characteristics of young learners that are different from those of older learners (Cameron, 2003); hence, taking these characteristics into account while determining the language instruction is of utmost importance. Young learners tend to learn implicitly rather than explicitly (Cameron, 2001; Halliwell, 1992; Keddle, 1997; Pinter, 2006; Scatterly & Willis, 2001). They can understand meaningful messages, but cannot analyze the language as a system yet. Children are good observers and they make use of such contextual clues like movements (body language), intonation, mimics and gestures, actions and messages in order to understand and interpret the language itself (Brewster et al., 2002; Cabrera & Martinez, 2001; Halliwell, 1992; Scatterly and Willis, 2001). A further characteristic is that young learners enjoy fantasy and imagination (Pinter, 2006). Games and cartoons suit well in fostering young learners' imagination and

fantasy. Cameron (2001) believes that learning characteristics of children need to be reflected in the design of teaching curricula. According to Semonsky and Spielberger (2004) the kindergarten and first grade teachers use many manipulative things in their teaching that appeal to the children's senses. Children are encouraged to hear, touch, smell, taste and see the actual objects they are using in their foreign language.

Young learners are quick to learn vocabulary, slower to learn structures (Demircioglu, 2010) and The primary role words play in language is to convey meaning (Balota, 1990). De Groot (2010) believes that from the viewpoint of a beginning learner vocabulary knowledge may be considered the most crucial language component: the chances of getting one's basic needs fulfilled in a foreign language environment are substantially better if the learner possesses some well-chosen basic vocabulary in the language concerned than when, instead, he or she masters the language's grammar flawlessly. Jane Feber (2008) believes that vocabulary instruction is important and although there may be no single right way to teach vocabulary to children, some common conditions do need to be met. For example, children need multiple exposures to vocabulary words taught with a variety of direct and indirect instructional methods. These include exposing children to a wide variety of books that appeal to their interests, introducing words in context, and utilizing mnemonic devices. she adds that students need to be actively involved in learning vocabulary which means that students need to see, touch, and feel the words to work with them actively. Since games and activities appeal to students, these seemed like a logical way to help them acquire vocabulary. Creating a classroom atmosphere in which words are fun, and playing with words is encouraged can be a powerful antidote to the very natural fear of making mistakes that can so easily inhibit learning (Thornbury, 2002).

Justice, Meier, and Walpole (2005) believe that the theoretical perspectives of vocabulary development are first, Incidental exposure to novel words is a critical mechanism for word learning; second, word learning is a gradual process, and third, adult input variations can influence the rate of novel word learning. Justice et al. (2005) also mention that although successful vocabulary instruction in elementary classrooms should emphasize explicit teaching of those words needed to access and succeed in the general curriculum, vocabulary instruction should also foster incidental learning opportunities. For younger children who are not reading, incidental exposure to new words occurs through conversations with others, overhearing words spoken in one's environment, and by being read to. Indeed, adult-child storybook reading interactions provide highly contextualized exposures to novel words in a routine that is authentic, familiar, and often motivating to young children (Roth, 2002). New words can be learned with the help of pictures, too. Al-Seghayer (2001) claims that the contribution of visual stimuli to vocabulary learning can also be attributed to a specific process which links vocabulary system of human beings to their imagery system, and this process is closely related with the organization of linguistic knowledge and imagery system in our minds.

Storybook reading is an important factor in vocabulary growth (Bus, Van Ijzendoorn, & Pellegrini, 1995), both at home and in the school environment. Reilly and Ward (2000, as cited in Tavit & Soylemez, 2008) believe that stories have lots of repetition which reinforce the acquisition of language items in the classroom and they build up the child's confidence as the language classroom atmosphere is non-threatening. Stories are also useful tools to enhance

comprehension by visuals, touching and seeing things. Reilly and ward also mention that Good picture books are a rich source for understanding new vocabulary and actually understanding the meaning of a story even if one doesn't understand each word.

Current language learning theories follow the premise that children learn best through discovery and experimentation and being motivated to learn in a playful and relaxed context (Griva, et al., 2010). Language learning can be linked with natural activities such as play, since young children can learn languages as naturally as they learn to run, jump and play (Baker, 2000, as stated in Griva, et al., 2010). One of the numerous benefits that come with using games to help students develop and improve in their oral skills is that they engage children in cooperative and team learning (Ersoz, 2000). Lee (1995) believes that teaching vocabulary through games encourage children's interaction and provide opportunities for real communication by bridging the gap between the classroom and the real world. Lee also mentions that games are highly motivating and help students to make learning fun and relaxed. They make the lesson less monotonous, since they maintain students' attention and interest in the language without getting bored and sustain their effort of learning. There is a competitive element that enhances effective learning as games keep learners interested in winning (Nguyen & Khuat, 2003, as stated in Griva, et al., 2010)

### **THE SIGNIFICANCE OF THE PRESENT STUDY**

We seldom stop to marvel at the speed and ease with which children learn their first language. The phenomenon is nothing short of a miracle. All normally developing children master the complexity of pronunciation, grammar, and vocabulary of their first language with first four or five years of their lives. While their first language facility surprises no body, we often marvel at how quickly children learn a second language; like the case of immigrant children who speak English without a trace of an accent after having been in an English-speaking environment for a relatively short time. As it was argued by a lot of authors and researchers in the literature, this ability of the children has got a time-limit. So, the researcher's main motive and purpose for doing this research is to reap the benefits of this time-limited capability by using two of the most appropriate methods for the children i.e. story-telling and playing vocabulary games. The researcher wants to examine which of these techniques will give a better answer. This study can thus lead to development of certain guidelines for teachers who are teaching English at the kindergartens to five-six year old kids.

### **RESEARCH QUESTIONS AND HYPOTHESES**

Based on the above-mentioned literature, this study addressed the following research questions:

1. Has pictorial story-telling got any significant effect on kindergartners' foreign language vocabulary recognition?
2. Have physical activities through games got any significant effect on kindergartners' foreign language vocabulary recognition?
3. Is there any significant superiority in using pictorial story-telling method to teach foreign language vocabulary at the recognition level over playing vocabulary games method, or vice versa?

Based on the above questions, the following research hypotheses were formulated:

1. Pictorial story-telling has not got any significant effect on kindergartners' foreign language vocabulary recognition.

2. Physical activities through games have not got any significant effect on kindergartners' foreign language vocabulary recognition.
3. There is no significant superiority in using pictorial story-telling method to teach foreign language vocabulary at the recognition level over playing vocabulary games method, or vice versa.

## **METHODOLOGY**

### ***Participants***

The participants of this study were 60 Iranian kindergartners between the ages of 5 to 6 and a half. They were chosen from Bojnourd, Naghme-ye-Shadi kindergarten. They were divided into two groups. There were 11 girls and 19 boys in story-telling group, and 12 girls and 18 boys in game-playing one; thus, among 60 participants, there were 23 girls and 37 boys. They hadn't passed any English courses before.

### ***Sampling Procedures***

The study was a pretest-posttest as well as a comparison-group one. It was quasi-experimental because the convenience sampling was used as the kindergarten in which the study was done had got two classes each containing about thirty 5 to 6-year-old kindergartners. However, they were randomly assigned into two experimental groups called story-telling and game-playing. Thus, there were two independent variables named story-telling group and game-playing-group as well as one dependent variable named vocabulary recognition. Each of the groups consisted of 30 participants totaled 60. Both groups were taught by the researcher herself.

### ***Instrumentation***

In order to achieve the goals of this study, a point-to test is used by the researcher. This test is something like Jung's picture association test. Association tests are methods for discovering complexes by measuring the reaction time and interpreting the answers to given stimulus words or pictures (Routledge, 1979). Picture association tests involve the presentation of a series of stimulus pictures to a respondent who is asked to quickly supply the word that first comes to his mind after seeing the stimulus picture. Presumably the respondent would give the word that he most closely associates with the stimulus picture (Gupta, 2004). The researcher's reason to choose Jung's test was that the participants in the study were kindergartners, so, they were not literate in either their mother tongue or the target language. According to Tavit, Muge, and Soylemez (2008), kindergartners are children who have not started compulsory schooling and have not started yet to read and write. In this test they heard the words read by the researcher and were just needed to point to the right picture on the flashcards set in front of them and got a 'one' or a 'zero.' Two point-to tests were done during the study, a pretest at the first session, to assure that the participants are homogeneous, and hadn't known any of the chosen vocabulary, and a posttest which aimed to measure and compare the amount of grasp of vocabulary by each group. The aim of this research was to test the respondents at the recognition level, so the researcher just asked the pupils to point to the picture as they heard the related word, without saying anything.

### *Procedure*

The participants in both treatment groups named the story-based and game-playing groups had two classes each week totaled 8 sessions during 4 weeks. Each class session lasted about 30 minutes to avoid the kindergartners' boredom. 8 stories were selected from the book *First Friends*, class book1, by Susan Lannuzzi for the 8 sessions of the class with story-based group. And the games selected for the game-playing group were "Chinese whisper," "What's missing," "Draw it relay," and "Balloon toss." The participants took the pretest at the first session and the posttest in session 9. Two points should be noted: (1) No student took the tests (pre- and post-test) twice, and (2) both groups were taught by the researcher herself. The sampling method used in this study was convenience sampling. However, random assignment to groups was used by the researcher. As Mackey and Gass (2005) argued, to assess the feasibility and usefulness of the data collection methods and make the necessary revisions, the whole study was piloted before the beginning of the main study.

### *Story-based Group*

The participants of the story-based group were required to listen to 8 stories accompanied by related pictures during 8 sessions; each session, 1 story. The stories were chosen from a book named *'First Friends' class book no. 1*, by Susan Lanuzzi. The researcher first showed the participants the flashcards of the vocabulary to be taught and said the words loudly and asked the pupils to repeat them. The repetition's aim was to absorb the pupils' attention to the words and not to prepare them for those words' production. At the next step she gave them pages with the story's comic strips, and asked them to look at comic strips. The pictures of the comic strips were big, colorful, and easy to follow. The researcher then told the story of the comic strips with a loud voice. Her voice was louder than usual to take the pupils' attention, because they were so excited and energetic, and some of them were really naughty. And also the loud voice had a dominant role, too, for the kids to take the orders. As the researcher explained the story, she pointed to the pictures and sometimes did some gestures for better understanding. The story was told twice; the first time the teacher just explained it, and the second time she wanted the students to participate and repeat some parts. At the end of the session the researcher again repeated the vocabulary with the flashcards. And finally she gathered the pages in order to prevent any extra work on the vocabulary at the participants' homes and any derangement in the course of study. At the ninth session, the researcher took the point-to test to assess the grasped knowledge of the participants.

### *Game-based Group*

For the game-based group four games were selected; two of them were played at each session during the eight sessions of the treatment. At the beginning of the sessions the same vocabulary as the story-based group were worked accompanied by flashcards; the researcher showed the flashcards and said the words loudly and asked the students to repeat. Again The repetition was to absorb pupils' attention to the words and not to prepare them for those words' production.

The games were done with the aid of the flashcards. The pupils were sat in two rows so for "Chinese whisper", the researcher showed one of the flashcards to the first student of each of the rows and asked him or her to whisper it to his or her classmate, sitting next to him or her, and this process continued till the last member of the row. The group had won, if the last member would have shouted the word sooner than the other squad. The next game was "What's missing". The researcher set the cards on a table in front of the class and asked the participants to gather in front of the table and look at the cards, then asked them to close their eyes. The researcher promptly hid one of the cards, asked the pupils to open their eyes and guess the missing card. At "Draw it relay", the children were divided to two groups; the researcher told two different words to the

groups and asked them to rush to the board and draw it. The team, who was speedier, was the winner. In “Balloon toss” game, the researcher used a soft ball and tossed it to different children, showed them the flashcards, and asked them to say the words.

## DATA ANALYSES AND RESULTS

### *The Normality Tests*

The assumption of normality is empirically tested through one sample Kolmogorov-Smirnov test. As shown in Table 1, by considering the fact that  $0.848 > 0.05$ , the researcher came to this conclusion that the data did enjoy normal distribution.

*Table 1: One-Sample Kolmogorov-Smirnov Test*

Pretest	Posttest			
40	40	N		
1.6250	11.9000	Mean		
1.67466	2.50947	Std. Deviation	Normal Parameters(a,b)	
.184	.134	Absolute	Most	Extreme
.184	.134	Positive	Differences	
-.166	-.099	Negative		
1.164	.848	Kolmogorov-Smirnov Z		
.133	.468	Asymp. Sig. (2-tailed)		

The assumption of homogeneity of variances has proved through Levene's Test for Equality of Variances.

### *Independent T-Test Pretest*

Based on the results displayed in Table 2, It could be concluded that story-based group did not differ significantly from game-based group ( $p=0.926$ ,  $df=38$ ,  $t=0.093$ ). The calculated p-value is equal to 0.926 which is more than 0.05.

Table 2: Independent Samples Test

		Levene's Test for Equality of Variances		t-test for Equality of Means						
		F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
									Lower	Upper
Pretest	Equal variances assumed	.142	.709	.093	38	.926	.05000	.53644	-1.03596	1.13596
	Equal variances not assumed			.093	37.228	.926	.05000	.53644	-1.03670	1.13670

***The first two Research Questions***

Based on the results displayed in Tables 3 and 4, it could be concluded that the effects of the within-subjects is significant ( $p=0.0005$ ,  $F(1,38)=476.257$ ). The effect was significant because  $F=476.257 > 251.1$ , and  $p=0.0005 < 0.05$ . Thus, the null-hypotheses as pictorial story-telling has not got any significant effect on kindergartners' foreign language vocabulary recognition and physical activities through games have not got any significant effect on kindergartners' foreign language vocabulary recognition were rejected.

Table 3: Descriptive Statistics

Group		Mean	Std. Deviation	N
Pretest	Game based	1.6500	1.81442	20
	Story based	1.6000	1.56945	20
	Total	1.6250	1.67466	40
Posttest	Game based	11.2000	2.16673	20
	Story based	12.6000	2.68328	20
	Total	11.9000	2.50947	40

Table 4: Tests of Within-Subjects Effects

Source		Type III Sum of Squares	df	Mean Square	F	Sig.	Partial Eta Squared	Noncent. Parameter	Observed Power <sup>a</sup>
Testperiods	Sphericity Assumed	2111.512	1	2111.512	476.257	.000	.926	476.257	1.000
	Greenhouse-Geisser	2111.512	1.000	2111.512	476.257	.000	.926	476.257	1.000
	Huynh-Feldt	2111.512	1.000	2111.512	476.257	.000	.926	476.257	1.000
	Lower-bound	2111.512	1.000	2111.512	476.257	.000	.926	476.257	1.000
Testperiods * Group	Sphericity Assumed	10.512	1	10.512	2.371	.132	.059	2.371	.323
	Greenhouse-Geisser	10.512	1.000	10.512	2.371	.132	.059	2.371	.323
	Huynh-Feldt	10.512	1.000	10.512	2.371	.132	.059	2.371	.323
	Lower-bound	10.512	1.000	10.512	2.371	.132	.059	2.371	.323
Error(Test periods)	Sphericity Assumed	168.475	38	4.434					
	Greenhouse-Geisser	168.475	38.000	4.434					
	Huynh-Feldt	168.475	38.000	4.434					
	Lower-bound	168.475	38.000	4.434					

Also, as it can be seen in figure 1, both the story-based and game-based groups have got improvements from pretest to posttest.

Figure 1: Pretest and Posttest of the Means of Both Groups

**The third Research Question**

Based on the results displayed in Table 5, it could be concluded that the story-based group outperformed the game-based group ( $t = -1.81$ ,  $df = 38$ ,  $p = 0.077$ ). The p-value is equal to 0.077 which is slightly bigger than 0.05, thus the third null hypothesis as There is no significant superiority in using pictorial story-telling method to teach foreign language vocabulary at the recognition level over playing vocabulary games method, or vice versa was rejected.

Table 5: Independent Samples T-Test

		Levene's Test for Equality of Variances		t-test for Equality of Means						
		F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
									Lower	Upper
Posttest	Equal variances assumed	1.580	.216	-1.815	38	.077	-1.40000	.77119	-2.96120	.16120
	Equal variances not assumed			-1.815	36.386	.078	-1.40000	.77119	-2.96347	.16347

**DISCUSSION AND CONCLUSION**

The research questions in this study were concerned with effectiveness of using stories or games on foreign language vocabulary recognition of children, without producing the words to learn. And also they were concerned with the significance of difference in the effect of these two methods. The analyses indicated that both groups, story-telling and game-playing, were effective, and the story-based group did slightly better. The findings of this study support the scholars' claim that story-telling and game-playing promotes learning a foreign language. The results of this study, regarding the participants' improvement seen at the posttest, supports the positive effects of story-telling in young learners' language development. This supports the scholars' claims cited in the literature part, such as Grave (1990), Wright (1997), Elley (1989), Seedhouse and Li (2010). There were a lot of story books for beginners in the market, but the researcher tried to find something which was meaningful, interesting, exciting and funny; because, according to Gerngross and Puchta (2009), the content of what the children are offered in the new language is of crucial importance in motivating them to work out the meaning of what they hear. On the other hand, as it was supported in previous studies such as Krashen (1986) and Linse (2005), the researcher tried to find pictorial stories to provide comprehensible input. The findings of this study support the scholars' claim that storybook reading is an important factor especially in vocabulary growth. This was supported in previous studies such as Bus et al. (1995), Brett et al. (1996), Robbins et al. (1990), Penno et al. (2002), Reilly et al. (2000, as cited in Tavil et al. 2008). According to Ur (1996), children in general learn well when they are active and when action is channeled into an enjoyable game. Some researchers like Alcorn (2003) believed that games require participation, competing in order to achieve certain goals and have special goals. Thus, the games in this study were all competing, and this competition added a lot of excitement to the class. And also the goals of the games used in this study were simple and obtainable. Children learn best through discovery and experimentation and being motivated to learn in a playful and relaxed context as is cited in Griva, et al. (2010). All the games used in this study put

the children in a pending position in this way motivated them. In Chinese whisper, all the participants were awaiting their turn to become aware of the words through whispering. In What's missing, children were awaiting with eyes closed, shivering with excitement, while the researcher chose one of the flashcards and hid it. Then, they compete with their classmates in guessing the missed card. In Draw it relay, the participants were awaiting to hear their group's word, then rush to the board and draw the related picture, while others in the group shouting and trying to help them to draw it better. In Balloon toss, children were awaiting their turn all playtime long, the ball might hit them at each second. So, the researcher used the pending element to motivate and excite the participants more. All the four games engaged children in cooperative and team learning (Eroz, 2000) and they had a competitive element that enhanced effective learning as they kept learners interested in winning (Nguyen and Khuat, 2003; as stated in Griva, et al., 2010). Ur (1996), as is stated in the literature, believes that an instructor should not confuse using games as method of teaching a language with a situation where the language learning activity is called a "game" which conveys the message that it is just fun not to be taken too seriously. The researcher felt to some extent that using mere games as a language teaching method was likely to lead on this anti-educational and demoralizing situation mentioned by Ur; although, the researcher tried to use some games in which the emphasis was on vocabulary. After this research was done, the researcher came to conclusion that games are better to be considered as an assisting power for the main method.

## **IMPLICATIONS**

After attending the classes for at least ten sessions, the researcher was sure that story-based group would pass the post-test with better results because that group revealed a deeper understanding during the class time. As the researcher experienced, pupils of story-based group were more attentive to the vocabulary's meaning, while at the next group, game-playing, children were more cautious about winning a contest. But the researcher's expectancy did not happen and both groups took the test with tiny difference. If the researcher was to choose between these two methods the better one, she believed story-telling would work better; although, their combination could be the best choice. With story-telling pupils can gain a better understanding of the sense of the words meanwhile game-playing can add variety and excitement to the learning procedure.

## **LIMITATIONS OF THE STUDY**

Like any study, this research faced a number of limitations which have to be taken into consideration while attempting to generalize its findings. First, in each of the two classes, which were attended by the researcher, there were thirty children which the researcher kept 20 of them as a pilot group, and there was no opportunity for the researcher to module up the groups into smaller squads. In the case of smaller groups, with more supervision, the results may be changed. Second, during the main study the pilot group were attending the classes too. There was no opportunity for the researcher to isolate them, because the classes should pass their regular way with all the classmates together. Third, the research is done in just one kindergarten with children coming of almost the same level of society; thus, the results may not be necessarily generalizable to children of all societal levels.

### ABSTRACT

The purpose of the present study was to investigate if proficiency level and metalinguistic knowledge affect Iranian EFL learners' degree of pragmatic competence. Participants included 92 junior students at Shiraz Azad University. The elicitation instruments used for data collection were a. Oxford Quick Placement Test (OQPT), used to measure the testees' proficiency level, b. a Grammaticality Judgement Test (GJT), to show their metalinguistic knowledge, and c. the Discourse Completion Test (DCT) developed by Beebe, Takahashi, and Uliss-Weltz (1990), to investigate their level of pragmatic competence. Based on their scores on the OQPT, the participants were divided into three groups of high, mid, and low proficiency. The data collected from the administration of the above mentioned three tests were then analyzed by the descriptive statistics, Repeated Measures ANOVA and correlation. The results revealed that proficiency level is not the factor which determines the students' degree of pragmatic competence as there was no significant relationship between the students' proficiency level at different groups and their performance on the DCT. However, it was observed that the students' pragmatic competence is significantly affected by their metalinguistic knowledge.

**KEYWORDS:** Proficiency level, Metalinguistic Awareness, Metalinguistic Knowledge, Pragmatic Competence

### INTRODUCTION

For the past 40 years, the question of to what extent the overall second language (L2) proficiency contribute to pragmatic competence has been an ongoing discussion in the study of L2 pragmatics; however, only a very small number of studies have examined the pragmatic and grammatical awareness of second or foreign (L2) language learners in an integrated paradigm. The main reason for this was the teaching methodology used, in which grammar was central to learning. An increasing consensus among educators and researchers (Alderson & Steel, 1994; Germain & Seguin, 1995; Hammary, 1991; Larsen-Freeman, 1995) was that a number of learners lacked

linguistic accuracy in performance. They maintain, this linguistic accuracy stems from the knowledge of grammar, proficiency, and knowledge about grammar, Metalinguistic Knowledge (MK) or Metalinguistic Awareness (MA).

Proficiency level, as defined by Bachman & Palmer (1996), is learner's knowledge of L2 grammar and vocabulary, a subcomponent of general language ability. MK often measured through grammaticality judgments, particularly those which require error correction (Alderson et.al, 1996; Ellis, 1991), is proposed by Hu (2002) and Ellis (2004) as learners' explicit knowledge about the syntactic, morphological, lexical, phonological and pragmatic features of the second language. The comprehension of pragmatic meaning can be differentiated from linguistic comprehension in view of the fact that it requires the listener to understand not only the linguistic information, such as vocabulary and syntax, but also contextual information such as the role and status of interlocutor, the physical setting of the conversation and the types of communicative acts that would likely occur in that context (Rost 2002). Bardovi-Harlig, and Mahan-Taylor (2003) defined pragmatics as “using socially appropriate language in a variety of informal and formal situations”. Pragmatic ability, which is an important part of the language proficiency construct (Bachman, 1990; Canale, 1983; Canale & Swain, 1980), is the ability to use language appropriately according to the communicative situation.

## **THEORETICAL FRAMEWORK**

Researchers working in different areas of L2 acquisition have examined pragmatic development from several perspectives. In a recent study, Kasper (2001) identified four general theoretical approaches that have been taken to account for pragmatic development in second and foreign language learners: a comprehensive model of communicative competence, information processing hypotheses, sociocultural theory, and language socialization theory. The approach important for this study concerns the relation between pragmatic competence and grammatical competence, so, the focus of the present study is the first option, that is, it focuses on a comprehensive mode of communicative competence. Pragmatic ability in a second or foreign language is part of a nonnative speaker's communicative competence and therefore has to be located in a model of communicative ability (Savignon, 1991). In Bachman's model (1990), 'language competence' is subdivided into two components, 'organizational competence' and 'pragmatic competence'. Organizational competence comprises knowledge of linguistic units and the rules of joining them together at the levels of sentence ('grammatical competence') and discourse ('textual competence'). Pragmatic competence is subdivided into 'illocutionary competence' and 'sociolinguistic competence'. 'Illocutionary competence' can be glossed as 'knowledge of communicative action and how to carry it out'.

## **REVIEW OF THE RELATED LITERATURE**

Rahimy and Moradkhani (2012) found that using GJ tasks enhances knowledge of grammatical patterns in Iranian learners of English at university level. Correa (2011) considered Metalinguistic Knowledge as explicit, verbalizable knowledge of grammatical rules and investigated the relationship between MK and subjunctive accuracy by learners of Spanish at three levels. She found MK indeed is positively correlated with accuracy in the use of subjunctive structure as hypothesized. Fatahi Milasi & Pishghadam (2007) explored the role of explicit knowledge in general language proficiency and the interplay of explicit and implicit knowledge in grammaticality judgements and found that there was a strong relationship between both groups' performance on the two measures. Analysis of the response patterns on GJT indicated an intricate interplay between explicit and implicit knowledge of the test-takers. Also, in a study, Alderson, Clapham and Steel

(1997) investigated the metalinguistic knowledge of university modern languages students and compared this knowledge with the students' level of foreign (French) language proficiency. As they reported, the relationship between metalinguistic knowledge and proficiency was weak. Elder and Manwaring (1997) widened the scope of the research done by Alderson, Clapham, and Steel (1997) by giving the Metalinguistic assessment Test and tests of language proficiency to students learning three different languages at elementary as well as advanced levels. The findings supported the existence of a weak relationship between the metalinguistic knowledge and language proficiency.

Refusals are speech acts that function as a response to another act such as a request, an offer, an invitation and a suggestion. The speech act of refusal is a face-threatening act and requires a high level of pragmatic competence because it tends to risk the interlocutor's positive or negative face (Brown & Levinson, 1978). To check the pragmatic transfer of refusal strategies, Qadoury (2011) compared two groups of Iraqi native speakers of Arabic, and American native speakers of English by their responses to a modified version of 12- items written discourse completion task. This was the same as what Beebe, Takahashi, and Uliss-Weltz (1990) did with Japanese and American speakers. In both studies, data were analyzed according to frequency types of refusal strategies and interlocutor's social status and was found that EFL learners expressed refusals with care represented by using more statements of reason/explanation, statements of regret, wish and refusal adjuncts in their refusals than the native speakers and they were more sensitive to the lower status interlocutors. The majority of studies that have looked at the relationship between grammatical and pragmatic competence show higher proficiency learners to be generally better at drawing inferences (Carrell, 1984), using speech act strategies (Trosborg, 1995), and comprehending illocutionary force (Koike, 1996). However, Bardovi-Harlig and Dornyei (1998) state that a good level of grammatical competence does not imply a good level of pragmatic competence. In short, the literature presents two generally accepted claims about the relationship between grammatical competence and pragmatic competence: (1) grammar is not a *sufficient* condition for pragmatic competence; however, (2) grammar is a *necessary* condition for pragmatic competence.

Xu, Case, and Wang (2009), in a study examined the influence of length of residence in the target language community and overall L2 proficiency on L2 pragmatic competence with a reference to L2 grammatical competence. A questionnaire consisting of 20 scenarios was administrated to the participants measuring their pragmatic and grammatical competence. Results revealed that both length of residence and overall L2 proficiency influenced L2 pragmatics significantly with overall L2 proficiency demonstrating a stronger influence. Findings also showed that there was a strong and positive correlation between pragmatic and grammatical competence for advanced participants and all participants as a group.

To investigate the relationship between pragmatic competence and organizational competence, and to see the possible effect of the learner's field of study on this relationship, Abuali (1995) examined two groups of subjects (native speakers of English and non-native speakers) participating in the preliminary phase and six other groups of Farsi speaking university students participating in the main phase of the study. The subjects were from different fields of study. The results of the study supported the idea that the EFL learners' field of study affects their language competence and also showed a positively moderate correlation between pragmatic competence and organizational competence.

## PURPOSE AND RESEARCH QUESTIONS

As pragmatic competence represents a part of overall L2 proficiency, the common-sense assumption would be that an increase in overall L2 proficiency would be followed by an increase in L2 pragmatic competence. However, several studies (Kreutel, 2007; Bardovi-Harlig, 2001; Kasper 1997; Bouton, 1996; Boxer & Pickering, 1995) have shown that learners of high grammatical proficiency will not necessarily possess comparable pragmatic competence. Even grammatically advanced learners may use language inappropriately and show differences from target-language pragmatic norms. Regarding this, the present study is aimed at finding the relation between the two important factors of metalinguistic knowledge and pragmatic competence, and also their correlation with learners' language proficiency level to see if knowledge about language can play a significant role in the degree of pragmatic comprehension of Iranian learners of English as a foreign language. In doing so, this study is aimed at finding the answer to the following questions:

R.Q.1. Are there any significant differences between the performances of high, intermediate, and low proficient students on a grammaticality judgment test?

R.Q.2. Are there any significant differences between the performances of high, intermediate, and low proficient students on a discourse completion test?

R.Q.3. Is there any significant relationship between the performance of different groups of proficiency level in a metalinguistic knowledge test and the pragmatic competence test?

R.Q.4. Are there any relationships between the students' proficiency level, metalinguistic knowledge, and their performance on discourse completion test?

## METHODOLOGY

### *Participants*

Ninety-two male and female junior students of Shiraz Azad University were randomly selected to participate in this study. They were all Persian speakers, learning English as a foreign language. The participants were divided into three groups of high, intermediate, and low proficiency based on their scores in the Oxford Quick Placement Test (OQPT) (2005). The mean of the scores was calculated and in order to have three homogeneous groups the top and low 27% of the total number of the participants were considered as group one (high) and group three (low) respectively, and the mid 46% were considered as group two (mid). So, the participants who scored 43 and above were included in the high proficient group (level one), those who scored between 36 and 42 (inclusive) were considered as belonging to the mid group (level two), and those who scored 35 and below were considered as low proficient students (level three). This way, there were 25 participants in level one, 42 participants in level two, and 25 participants in level three (Table 1)

Table 1: Groups of students according to the OQPT

level	N	Minimum	Maximum	Mean
1 level	25	43	55	49
2 level	42	36	42	39
3 level	25	30	35	32.5

### *Instrumentation*

The participants were required to perform on the following three tests:

#### *1. Oxford Quick Placement Test (OQPT)*

Used as a placement test, the OQPT contains 60 multiple-choice items. The participants are supposed to choose the correct choices in 35 minutes.

### *2. Grammaticality Judgment Test (GJT)*

Used to assess Metalinguistic Knowledge, the GJT contains ten ungrammatical sentences. It has three phases each having one point. In phase 1, the participants are to find the grammatical error in a given sentence and underline it. In phase 2, they are asked to provide the related rule in either L1 or L2. In the third phase, they should write the correct form of the grammatically ill-formed part. No time limitation is set. A total score of thirty is assigned, three for each item.

### *3. Discourse Completion Test (DCT)*

The DCT, already used by Beebe, Takahashi, and Uliss-Weltz (1985), and Yamagashira (2001), is a written role-play questionnaire consisting of 12 situations. Each situation presents respondents with a detailed description of the context and the social status between the interlocutors. The refuser's social status relative to the interlocutor in each group of situations involves three levels: high, equal, and low. Each situation consists of a gap in which only a refusal would fit. The gap is followed by a rejoinder which is said to limit the range of allowable responses a DCT can elicit and thereby facilitate rating (Rover, 2005). The 12 DCT situations are divided into four types: three requests, three invitations, three offers, and three suggestions.

### *Is 'Discourse Completion Test' a Reliable Data Collection Instrument?*

According to Nurani (2009), in pragmatic research, Discourse Completion Test (DCT) is one of the data collection instruments whose reliability is questioned. This is due to several weaknesses of DCT. Firstly, the authenticity of the situations is limited. Then, the hypothetical nature of the situations in DCT simplifies the complexity of interactions in real conversation. Moreover, what people claim they would say in the hypothetical situation is not necessarily what they actually say in real situations. In addition, DCT is not able to bring out the extended negotiation which commonly occurs in authentic discourse due to the absence of interactions between interlocutors. Beebe and Cummings (1996) claim that although the absence of feeling and interaction, insufficient social and situational information such as detailed background of the event and comprehensive information on the role relationship between the speaker and the hearer lead DCT to some drawbacks, the naturalness is only one of many criteria for good data and it does have weaknesses hardly discussed. Natural data clearly represent spontaneous speech; nevertheless, natural data collection is not systematic. The social characteristics of the participants such as age, ethnic group, and socioeconomic status are often unknown, and the time consuming nature of data collection contributes to the main weaknesses of natural data. Moreover, it is inconsistent in applying ethnographic data collection methods.

Beebe and Cummings (1996) add that it is true that absence of naturalness leads to lack of psychosocial dimension of DCT; however, it cannot be ignored that DCT provides several important strengths. DCT allows researchers to collect a large amount of data in a relatively short time. Furthermore, they state that DCT creates model responses which are likely to occur in spontaneous speeches. DCT also provides stereotypical responses for a socially appropriate response.

### *Administration Procedure / Data Collection*

Firstly, the participants were given the Quick Placement Test according to the results of which they were divided into three groups of high, intermediate, and low proficiency. It took 35 minutes. After

that, the grammaticality judgment test was administered. There was no time limit for the task. The third task was the Discourse Completion Test which revealed how much competent the participants were in dealing with pragmatics of the L2. As it was mentioned in the review of the related literature section, all the three tests were used by other others in the field several times and high levels of validity and reliability were reported for them. However, to double check the reliability of the DCT, the verbalizations were marked independently by the author and an experienced university instructor, and finally, the interrater disagreements were resolved through discussion.

#### ***Scoring Procedure of Grammaticality Judgment Test***

The verbalizations were marked independently by the author and an experienced university instructor. In view of Schmidt (1990), a somewhat relaxed view of what constituted a correct rule was adopted so as to avoid an overly restrictive definition of correct metalinguistic knowledge and to allow scope for the participants to express their understanding. A verbalization was accepted as correct if it expressed the essential information. Thus, a correct rule might be given in a nontechnical language, or cover a somewhat broader or narrower scope than the preset rule statement (Green & Hecht, 1992). For example, a verbalization like “You use *a* when you mention a person or a thing for the first time” was considered just as good as the more precise statement “The indefinite article is used before a singular count noun to indicate that the referent is not identifiable in the shared knowledge of the speaker and the hearer.”

#### ***Scoring Procedure of Discourse Completion Test***

To analyze the data obtained from the administration of the DCT, the researcher used the same semantic formulas as Beebe, Takahashi, and Uliss-Weltz (1985), and Yamagashira (2001) did (see appendix E for a complete list). The total number of semantic formulas of any kind used for each situation was obtained and the frequency of each formula for each situation was counted. A list was made. Grammatical accuracy was not examined.

#### ***Data Analysis***

The data collected from the administration of the above mentioned three tests were then transferred to SPSS Version 16 (1998) for statistical analysis. The significance level was set at .05. In analyzing the data, the descriptive statistics and Repeated Measures ANOVA was used to find the relationship between proficiency level and Grammaticality Judgment Test, and proficiency level and the participants’ performance on Discourse Completion Test. The relation between the students’ proficiency level, metalinguistic knowledge, and their performance on Discourse Completion Test was computed using correlational analysis.

### **RESULTS AND DISCUSSION**

Table 2 shows the correlation between proficiency and metalinguistic knowledge in different levels. The correlation between proficiency and metalinguistic ( $r = .68$ ,  $p = .000$ ) was significant at level one for the high proficient students; whereas, in levels two and three the correlation was not significant. That is, there was no correlation between the performances of mid and low proficient students and their metalinguistic knowledge.

Table 2: Correlation between proficiency and metalinguistic knowledge

proficiency		metalinguistic knowledge
Level 1	Pearson Correlation	.684**
	Sig. (2-tailed)	.000
Level 2	Pearson Correlation	.031
	Sig. (2-tailed)	.845
Level 3	Pearson Correlation	.336
	Sig. (2-tailed)	.101

Table 3 shows the correlation between the performances of high, intermediate, and low proficient students on Discourse Completion Test.

Table 3: Correlation between proficiency and Pragmatic Competence

proficiency		pragmatic
Level 1	Pearson Correlation	.315
	Sig. (2-tailed)	.126
Level 2	Pearson Correlation	.142
	Sig. (2-tailed)	.369
Level 3	Pearson Correlation	.159
	Sig. (2-tailed)	.447

The table indicates that there is no correlation between the students' proficiency level and their pragmatic comprehension of context. Another correlation showed the relationship between the metalinguistic knowledge and the pragmatic competence of the students of different proficiency levels. Table 4.

Table 4: Correlation between metalinguistic knowledge and pragmatic competence

metalinguistic knowledge		pragmatic
Level 1	Pearson Correlation	.488*
	Sig. (2-tailed)	.013
Level 2	Pearson Correlation	.343*
	Sig. (2-tailed)	.026
Level 3	Pearson Correlation	.562**
	Sig. (2-tailed)	.003

The results show that, for the three groups of high, mid, and low proficiency, there is a significant correlation between the scores on Grammaticality Judgement Test which is an indicator of metalinguistic knowledge, and the scores on the Discourse Completion test as an indicator of pragmatic competence; however, this correlation is more significant for the high and the low proficiency groups. To find the relationship between the students' proficiency level, metalinguistic knowledge, and pragmatic competence, a correlation was run in the SPSS programme. As clear in Table 5, each two of the variables have a significant relationship with each other.

Table 5: Correlation between proficiency level, metalinguistic knowledge and pragmatic competence

		proficiency	metalinguistic	pragmatic
proficiency	Pearson Correlation	1	.541**	.306**
	Sig. (2-tailed)		.000	.003
	N	92	92	92
metalinguistic	Pearson Correlation	.541**	1	.492**
	Sig. (2-tailed)	.000		.000
	N	92	92	92
pragmatic	Pearson Correlation	.306**	.492**	1
	Sig. (2-tailed)	.003	.000	
	N	92	92	92

### Findings

1. As the results in Table 2 indicated, there is no correlation between proficiency and metalinguistic knowledge for the mid and low proficient students; however, this correlation is significant for the high proficient group about .68. This is in line with what Sorace (1985) found about the relationship between metalinguistic knowledge and use of specific structures on different tasks. According to him, there was “a highly significant correlation between knowledge and use in non-beginners”, [high proficient students].

So, we can infer that, in low and mid levels, the students’ proficiency is not yet high enough to help them understand the knowledge about language. It shows that there is a positive correlation between the linguistic knowledge and the metalinguistic knowledge of the participants, in that, the higher their linguistic knowledge is, the higher their metalinguistic knowledge will be. Moreover, the absence of correlation between proficiency and metalinguistic knowledge in mid and low levels may also mean that teaching about language (teaching the grammatical points deductively) is not preferred for the students of low proficiency and that, this would be possible as students’ linguistic knowledge improves and they acquire enough understanding about the metalinguistic knowledge.

2. The absence of correlation between proficiency and pragmatic competence in the three levels (Table 3) is a great evidence that, the L2 learners, even the high proficient ones, perform poorly when it comes to interacting in a real situation. This fact highlights the need to differentiate pragmatic competence from linguistic competence. As Eslami – Rasekh and Eslami – Rasekh (2005) found, the explicit teaching of pragmatics does influence the EFL learners’ appropriateness. David (2008) also recommended that English language teachers should move beyond linguistic processing of meaning to pragmatic meaning in language teaching and learning, and that authentic language samples must be used by English language teachers to provide practice for students in expressing themselves pragmatically, not just linguistically. So, any students need to be exposed to the real situations through explicit instruction on pragmatics in classroom and watching films.

3. As mentioned earlier, the comprehension of pragmatic meaning can be differentiated from linguistic comprehension because it requires the listener to understand not only linguistic information, such as vocabulary and syntax, but also contextual information, such as the role and status of the interlocutor, the physical setting of the conversation, and the types of communicative acts that would likely occur in that context (Rost, 2002; Van Dijk, 1977).

Here (in Table 4), as the students improve in proficiency from level three (low) to level two (mid), and from level two (mid) to level one (high), as their metalinguistic knowledge increases, their pragmatic competence also increases, however, the proportion of this increase is less from level three to level two (.56 to .34) compared with level two to level one (.34 to .49). Xu, Case, and Wang (2009) found that, there was a strong and positive correlation between pragmatic and grammatical competence for advanced participants and all participants as a group.

4. The positive relationship between scores on Grammaticality Judgement Test vs. the test of L2 proficiency, Discourse Completion Test vs. test of L2 proficiency, and Grammaticality Judgement Test vs. Discourse Completion Test, ( Table 5), for the entire sample indicates that in general, as the students' proficiency level increases, their understanding of the knowledge about language (metalinguistic knowledge) also increases; however, this increase in proficiency knowledge more weakly leads to an increase in pragmatic competence, whereas, the more metalinguistic knowledge the students acquire, the better they can perform in situations that need pragmatic competence.

## CONCLUSION

The insignificant differences between the performance of the three proficiency groups (high, mid, and low proficient) on Discourse Completion Test indicates that pragmatic failure can occur in an interaction between individuals from the three groups. That is, even high proficient students couldn't perform well in situations where pragmatic comprehension was needed. They even risked committing pragmatic failure and sometimes were considered rude. Foreign language teachers should be aware that fluency in a language involves both a mastery of linguistic knowledge and pragmatic knowledge. Even language learners with a fairly advanced level of proficiency can produce pragmatic failures. This study illuminates several areas where ESL/EFL students might appear inappropriate (i.e., confrontational, presumptuous, vague) when making a refusal. To help our students achieve optimal pragmatic success, teachers need to make students aware of specific *speech act sets* and the accompanying *linguistic features* that are necessary to produce appropriate and well-received refusals, and other important speech acts. Therefore, explicit teaching of L2 pragmatics in the language classroom might be necessary. Language teachers should adopt teaching materials or language activities focused on conscious raising. Moreover, language learners should be taught to be aware of pragmalinguistic and sociopragmatic behavior (Kasper, 2001).

Before generalizing the findings of the study, we must be aware of some limitations. According to McNamara (2007), if pragmatics is to be understood as language use in social settings, tests would necessarily have to construct such social settings. There are many differences between written and spoken language with regard to hesitation phenomena, tone of voice, facial expression, gesture and a number of other nonverbal cues that interlocutors use to contextualize their utterance and convey their meaning. The present study used DCT as a research tool. Data obtained from a written role play questionnaire might be different from naturally occurring data. So, future studies need to employ other research tools such as role plays or simulation to support the use of Discourse Completion Task.

### ABSTRACT

The significance of learning English as an international language is widely acknowledged in diverse areas particularly in educational settings (Farhady, 2010). Effective language learning is undoubtedly appreciated in an educational setting and teaching styles contribute to fulfillment of this ambition. Teaching style is viewed as teachers' identifiable and consistent behaviors and techniques in classroom (Conti, 1986). Generally speaking, every teacher follows particular styles in classroom depending on the learners, subject matter, and course objectives. Grasha (1996) proposed a model for teaching style in which teachers' teaching styles are categorized into five groups. It is worthy of note that this model provided the theoretical framework for the current study. Acknowledging the great impact of teaching styles on learners' achievement and varying teaching styles in different context, this survey study aimed at describing English as a foreign language (EFL) teachers' dominant teaching styles at private language centers. To this end, 103 EFL teachers working at private language centers in Iran were randomly selected to fill out the teaching style inventory (TSI) developed by Grasha (1996). Using descriptive statistics, the findings of this study showed that EFL teachers dominantly implement formal teaching style in private language centers. The implications of the findings are also discussed.

**KEY WORDS:** teaching styles, private language centers, teacher-centered, student-centered

### INTRODUCTION

Learning English as an international language plays a pivotal role in current educational system of Iran, international marketing, and diplomacy. It is worthy of note that despite other Asian countries like Japan in which English is used as medium of internationalization, the significance of learning English is restricted to educational setting in Iran (Farhady, 2010). As such, language learning is extensively recommended in educational settings and English is an indispensable course offered at all levels of education from Junior High to university.

One of the determining factors in learners' successful learning is teaching styles (Knowles, 1980). Large bodies of supportive evidence stress the effect of teaching style on learners' achievements (Conti, 1985; Miglietti & Strange, 1998). Teaching style refers to "a predilection toward teaching behavior and the congruence between educators' teaching behavior and teaching beliefs" (Heimlich & Norland, 1994, p.34). In fact, teaching styles are reflections of an amalgamation of teachers' theoretical assumptions and actual teaching practice. Jarvis (2004)

provides a more vivid account of teaching style and believes that a style “is the totality of one’s philosophy, beliefs, values, and behaviors, and it incorporates the full implementation of this philosophy; it consists of substantiation and support of beliefs about values and attitudes toward elements of the student learning and teacher learning exchange” (p. 40).

The categorizations of teaching style have been recurrently stated in literature using different terminologies (Akbari & Karimi Allvar, 2010). For example, Flanders (1970) grouped teaching styles into Direct style (didactic) and Indirect style (student-centered). Similarly, Bennett (1976) identified informal (student-centered) and formal (teacher-centered) teaching styles. Moreover, Campbell (1995) proposed another categorization of teaching styles, which includes Didactic, Socratic and Facilitative teaching styles. Didactic teachers are dominant authorities in educational settings. Socratic teaching style is again a teacher-directed approach and students' questions determine the direction of teaching process. Facilitative teachers create a pleasant environment and students are responsible for their own learning.

In the same vain, Grasha (1996) asserted that teachers' teaching style is a representation of teachers' value system and needs. Regarding the role played by teachers in a class, Grasha introduced a framework based on which teachers' teaching styles are grouped into five classes: (a) formal authority teaching, (b) expert, (c) personal model, (d) delegator, and (e) facilitator.

The framework formulated by Grasha (1996) is the theoretical background of this study and his categorization of teaching styles could be traced back to the traditional dichotomy of teacher-centered and student-centered teaching styles. More specifically, an expert model possesses the knowledge that students need and is concerned with transmitting correct information to students. A formal authority model is mainly involved with providing feedback to students and establishing rules and expectations. This teacher is assumed as an expert in his field of study, responsible for preparing materials and managing the students. The personal model teacher assumes himself as a model for students and students have to emulate his approaches.

The facilitator teacher focuses on teacher-student interaction, tries to guide students by asking questions and suggesting options, and encourages students to make informed decisions. In this style, the teacher is a good listener trying to enhance teacher-student interactions and critical thinking. The delegator teacher is characterized as a resourceful person who is available at the request of students. Fostering autonomy in learners is of primary significance for the delegator teaching style. The summary of this classification in terms of teacher-centered and student-centered could be observed in Table 1.

*Table 1: Grshas' teaching styles (Psychology Factsheet, 1996)*

<b>Teacher-centered styles</b>	<b>student-centered styles</b>
The Expert style	the facilitator style
The personal style	the delegator style
The Formal Authority styles	

As seen in Table 1, the expert style, the personal style, and the formal authority style are attributed to teacher-centered styles whereas the facilitator style and the delegator style are defined as student-centered styles. However, the issue of concern is that teachers' teaching styles might differ depending on the context and students' needs and that no single teacher is following only one style in an educational setting. Grasha (2002) maintained, "Each style is not a box into which faculty members fit; rather, all of the dimensions shown are present in varying degrees within the attitudes and behaviors of teachers" (p.140).

Therefore, teaching style could fall into four clusters: Expert/Formal Authority (38%); Cluster 2: Personal Model/Expert/Formal Authority (22%); Cluster 3: Facilitator/Personal Model/Expert (17%); and Cluster 4: Delegator/Facilitator/Expert (15%). Moreover, drawing a clear border between teacher-centered and student-centered styles might be a demanding task if not impossible and teachers might represent an amalgamation of both teacher-centered and student-centered teaching styles.

Teaching styles have been studied in diverse contexts and from different angles. In here, a summary of the most relevant studies into teaching styles are discussed. According to the literature, teachers' teaching styles vary depending on the context of teaching (e.g. public schools or private centers) (Korthagen, 2004), the subject matter, or the curriculum (Cunningsworth, 1995), and learners' learning styles (Oxford, 2002). Of influential factors in teaching styles are demographic variables including age, gender, students' learning styles and level of education (Brew, 2002).

In an investigation into the impact of gender on teaching styles in Iran, Karimvand (2011) found that male teachers practice a more authoritarian teaching style compared to female teachers. The other variable affecting teachers' teaching style is self-efficacy. Soodak and Podell (1997) discovered that experienced teachers show more resistance to change in their perception of personal efficacy and use different types of activities. This is less true of less experienced teachers.

Grasha invented a personality type inventory, which has been used by Larenas, Moran and Rivera (2010) in a quest for the relationship between teachers' personality type and teaching style. They selected their respondents from both public and private sectors. The findings of their study indicated that public sector participants tended to follow a facilitator teaching style and an extrovert personality type; yet private sector participants showed a more authoritative teaching style and an introverted type of personality.

In an investigation into educational backgrounds and teaching styles of athletic training educators in entry-level CAAHEP accredited athletic training programs, Rich (2006) studied 338 athletic educators in the US. The investigator used Grasha' teaching style inventory to collect data .The findings showed that athletic educators predominantly use a personal model and none of the educators practices delegator style of teaching.

Campbell and Yong (1993) conducted a study on foreign language institutes in the People's Republic of China. They found that a composition of the audio-lingual method and traditional teacher-centered grammar translation method were practiced in these institutes.

Riazi and Razmjoo (2006) studied language-teaching methodologies used in Shiraz EFL institutes. They used both qualitative and quantitative instruments to collect data. Detailed

observation and a questionnaire addressing EFL learners about the effectiveness of instruction in the institutes in which they registered were used to gather data. Findings of this study showed that EFL teachers tend to practice communicative language teaching in private language institutes.

Faruji (2012) examined EFL dominant teachers' teaching styles in private language centers using Grasha' teaching style inventory and interview questions on 24 respondents. Her findings indicated that EFL teachers are performing Formal Authority Style, Expert Model Style, Facilitator Style, Personal Style, and Delegator Style, respectively. Kassaian and Ayatollahi (2010) conducted a study on the optimal level of teachers' guidance among Iranian EFL instructors. Their findings showed that teachers' levels of guidance vary depending on the nature of courses (English for specific purposes or general English).

Asadollahi and Rahimi (2012) investigated Iranian EFL teachers' teaching styles in high schools. They used Teaching Activities Preference (TAP) questionnaire developed by Cooper (2001). This study revealed that "male and female teachers were different in extroverting, sensing, and feeling styles of teaching while female teachers used activities related to these styles more than their male counterparts did" (p.157).

Currently English is a course offered in both junior high and high schools in Iran. However, learning English is increasingly in demand in diverse areas of society and due to some limitations and shortcomings in high schools, Iranian students tend to attend private language centers to learn English. The other justification encouraging people to enroll in private language centers to learn the language could be sought within teaching methodologies and styles EFL teachers perform. Iranian EFL teachers prevalently follow grammar translation method (GTM) in high schools, which heavily relies on vocabulary memorization and translation activities (Dolati & Mikaili, 2011). In GTM-oriented classrooms, the focus is on reading passages and reading activities. As such, few listening and speaking activities are practiced in GTM classes. Since in high schools GTM is regularly practiced, many language learners interested in learning spoken and communicative language attend private language centers.

Substantial research evidence confirms that teachers' teaching styles are not all the same and teachers adopt various styles to create effective teaching (Baily, 1984). In addition, effective teaching styles contribute to effective learning (Knowles, 1980). Although teaching styles have been looked upon from several points of view, studies into EFL teachers in private language centers are still sparse. Hence, this study attempts to determine EFL teachers' dominant teaching styles in private language centers in Iran.

## **RESEARCH QUESTIONS**

To keep abreast of the latest developments both in theory and practice in teaching language, to incorporate the latest research findings into theory and practice of language pedagogy and in response to the demands placed on language teachers by the society, in the Iranian context, some attempts have been underway to shift away from traditional teacher-centered classes to learner- and learning-centered ones. Given that each of these approaches entails different teaching styles,

which are not necessarily compatible with the other approaches, the current research seeks to determine whether in Iranian language centers a real change has taken place or not. Specifically, an attempt is made to determine whether these language centers are teacher-centered or learner-centered in terms of the teaching styles adopted by language teachers.

## METHODOLOGY

### *Sampling procedure*

Population of this survey study included the teachers teaching at private language centers. To select the samples, the researchers used convenient sampling and selected two available cities: Yasuj and Gachsaran. Then, because the language centers in these two cities were scattered, the researchers applied random cluster sampling to choose the participants of the study. According to Ary, Jacobs, Sorensen, and Razavieh (2010) cluster sampling is a kind of probability sampling in which the chosen unit is a group of individuals who are naturally together. That is a number of individuals who share similar characteristics with regard to the variables in the study and formulate a cluster.

In this study, the selected unit is English private language centers in which language skills are taught in Yasuj and Gachsaran. Based on a list of the ministry of education, there are 50 English private language centers in Yasuj and Gachsaran of which 13 centers were randomly selected. Thirteen clusters comprised 110 EFL teachers. Thru one -stage cluster sampling, all the teachers in 13 language centers were surveyed.

The participants of this study were different in terms of level of education, teaching experiences and field of study. Demographic information about the participants is given in Table 2. The majority of samples were female (63%) and the rest male (37%). Their teaching experiences ranged from one year to fifteen years. All of the EFL teachers had the experience of teaching all four language skill: speaking, listening, reading and writing.

*Table 2 Demographic Information of participants*

Variable	f	%
<b>Gender (n=103)</b>		
Male	37	35.92
Female	66	64.07
<b>Years of teaching experience</b>		
One year or less	14	13.59
2-5 years	55	53.39
6-10 years	25	24.27
10 or more than 10	9	8.73
<b>Level of education</b>		
B.A.	61	59.22
M.A.	37	35.92
Ph. D.	5	4.85
<b>Age of the teachers</b>		
18-23	26	25.24
24-35	67	65.04
36 and more	10	9.70

### ***Instrumentation***

To collect the data use was made of teaching style inventory (TSI) that is a forty-item questionnaire designed by Grasha (1996). In this questionnaire a five-point Likert scale ranging from 1= strongly disagree to 5= strongly agree is used. This inventory is a standard quantitative tool to categorize teachers' instructional behavior into five styles: (a) expert, (b) formal authority, (c) personal model, (d) facilitator, and (e) delegator. On the whole, TSI showed an acceptable internal consistency ( $\alpha=0.75$ ). In fact, each subsection of TSI is composed of eight questions and teachers were required to mark the choice that best described their teaching preferences (see appendix A). That is, eight questions were pertinent to each teaching style of expert, formal authority, personal model, facilitator, and delegator.

Once the questionnaires were completed and gathered, the scores given to the items of each subscale were tallied and five groups of scores were obtained. The scores of each subcategory of TSI reflect teachers' teaching style.

### ***Data collection and analysis***

The current study was carried out from March 15, 2012 to Jun 20, 2013. To collect the data, the researchers first contacted the managers of the selected private language centers in Yasuj and Gachsaran and then the two previously mentioned questionnaires were administered in person. To ensure the full cooperation of the participants, the researchers offered a small gift to the participants. These small incentives helped the researchers to obtain responses that are more accurate. Thru one-to-one administration, the instruments were simultaneously handed in to one hundred and ten participants and the researchers explained the aims of the study and asked them to provide accurate responses. Finally, one hundred and three questionnaires were found complete and seven questionnaires were left out due to missing data.

In this quantitative study, the researchers made extensive use of Statistical Package for Science (SPSS) 16 to carry out data analysis. In particular, descriptive statistics were used to shed light on EFL teachers' dominant teaching styles.

## **RESULTS AND DISCUSSION**

This study investigated EFL teachers' dominant teaching styles in private language centers. Data were analyzed though SPSS and the descriptive statistics are provided in Table. 3.

*Table 3: EFL teachers' teaching styles (descriptive statistics).*

Teaching styles	N	minimum	maximum	mean	standard deviation
Formal authority	103	22	40	30.20	5.03
Personal model	103	19	37	29.95	3.30
Facilitator	103	20	38	29.84	3.85
Expert model	103	17	37	29.17	3.77
Delegator	103	15	38	27.45	3.84

According to the results of this study, EFL teachers dominantly use formal authority teaching style Formal (mean =30.20, SD=5.03). However, delegator model is the least dominant teaching style EFL teachers employ in private language centers. After formal authority teaching style, EFL

teachers preferred to adopt personal model (mean=29.95, SD=3.30), facilitator style (mean=29.84, SD=3.85), expert model (mean=29.17, SD=3.77), respectively.

As mentioned earlier, formal authority teaching style is a teacher-centered style of teaching. In teacher-centered approach, the teacher is the authority in the classroom whereas in a learner-centered approach the students can participate in decision-making processes and teachers are primarily concerned with facilitating learning rather than controlling students (Rogers & Freiberg, 1994). Because in Iranian high schools, EFL teachers prevalently employ GTM to teach students, Iranian language learners prefer to attend private language centers to learn spoken language and communicate in English. Unlike GTM, that is a reading-based method, in Communicative Language Teaching (CLT) “everything is done with communicative intent” (Larsen-Freeman cited in Rao2002, p.81) and students are provided with opportunities to voice their opinions and participate in decision-making processes. Therefore, in CLT teachers establish a mutual relationship with the students to develop learning. However, contrary to the researchers' expectations, the results of this study indicated that EFL teachers manipulate formal authority teaching style, that is a teacher-centered style in private language centers. EFL teachers tending to practice Formal Authority Style heavily rely on transmitting accurate knowledge to students. They are assumed to be experts in their field of study, responsible for preparing materials, managing the class, setting rules, providing students with appropriate feedbacks and doing tasks in standard ways (Grasha, 2002).

The results of this study were in line with those of Faruji (2012) on EFL teachers' dominant teaching styles in English language centers. One reason for this finding could be that the overall educational system of Iran is strongly affected by behavioristic approaches to learning. Iranian teachers still practice traditional methodologies and styles in educational settings to maintain their dominance over the students and to be the locus of control (Pishghadam & Navari, 2010). It is worth noting that teachers' philosophy of teaching affects their teaching styles and in such a traditional system, conventional teaching or teacher-centered styles are encouraged and practiced. In Iran, parents and educational authorities expect teachers to be the locus of control and students' latitude is not allowed. The findings vouch the results of an investigation on foreign language institutes in the People's Republic of China by Campbell and Yong (1993). Their results revealed that Audio-Lingual Method, a teacher-centered, method is followed in foreign language centers in China. Interestingly, this finding could be supportive evidence for the tendency of teachers to adopt a teacher-centered methodology in such countries.

The other justification for applying a teacher-centered teaching style in private language centers is that the nature of subject being learned is different in an EFL class. As Littlewood (1984) puts it, developing communicative ability is the primary goal in a foreign language learning environment. Unfortunately, an informal language environment is not available for most EFL learners. Therefore, EFL teachers shoulder the huge responsibility of creating an environment where EFL learners are exposed to language even minimally (Krashen, 1976). Under such circumstances, EFL teachers should teach students thru communicative tasks and activities. Undoubtedly, EFL teachers are required to establish a rapport with students and build a warm environment to ease learning; yet they should be meticulous in terms of controlling students' inevitable misbehaviors. Thereupon, EFL teachers need control everything to contribute to a successful teaching and learning environment.

The results of this study do not support the findings of a study on athletic educators' teaching styles by Rich (2006). This inconsistency might be because teachers of different subjects exhibit

varying teaching styles and behaviors. Additionally, the findings of the current study do not lend support to the results of an investigation into EFL teachers' methodologies in private language institutes in Shiraz. This discrepancy could be attributed to the setting of data collection. This could be due to the fact that Shiraz is a metropolis and language learning is deep-rooted in this city. Normally teachers might be provided with better facilities in terms of teacher training courses in larger cities and are, thus, in a position, to acquire the latest teaching methodologies and skills.

## **CONCLUSION**

This descriptive survey study was aimed at determining EFL teachers' dominant teaching styles in private language centers. The data were analyzed thru SPSS and descriptive statistics and it became clear that EFL teachers predominantly have formal authority style (a teacher-centered style). The findings of this study could have implications for EFL teachers in that it could provide them with a profile of their performances, in the light of which they could improve their teaching practices. However, further studies are required to discover the impact of proficiency level of students on EFL teachers teaching styles. This study used a quantitative instrument to gather the data to draw a snapshot of teachers' dominant style.

Every research project may suffer from some limitations and the current investigation is no exception. Due to the fact that the participants of this study were selected thru cluster sampling from small districts, the findings will have limited generalizability. Moreover, some variables beyond the control of the researchers might affect the overall results of this study. Further, the instrument used in this project was a questionnaire and a superficial picture of teaching style was depicted. More studies could be done to shed light on how teachers teach and what factors affect how they do this.

## ABSTRACT

This article has been aimed at discussing the ways in which experimental methodological research in English language teaching (ELT) in many contexts is problematic. It also addresses how excessively orienting Teaching English as a Foreign Language (TEFL) student researchers and teacher researchers towards experimental studies, at the expense of engaging them in thought-provoking argumentative writing and theorizing, has rendered them incapable of discovery-learning and critical thinking in their field of specialization. A discussion has also been presented about different educational philosophies and how they apply to our EFL context in Iran. In summary, it has been argued that our ELT context in Iran is highly dominated by strict adherence to experimentally-oriented thinking and researching away from provision of opportunities for ELT-specializing students to practice thinking through an argumentative genre. Consequently, rarely have they developed the ability and self-confidence to *doubt* and think beyond and above what they have read in books or been dictated upon by other western scholars. This has given rise to a trend of thinking the only product of which has been the habit of *believing* what the so-called [omniscient] Big Names have too much confidently argued to be the TRUTH.

**KEW WORDS:** theory-construction; criticality; innovativeness; argumentative genre

## INTRODUCTION

A comparison between three outstanding educational philosophies clearly reveals how each of them differentially advocates a distinctive approach to educating people. These educational philosophies are called classical humanism, re-constructionism, and progressivism (Clark, 1987). At one end exists classical humanism which, although dating back to very old eras in the history of education, is still widely prevalent in some parts of the world where education is merely an exchange of information from the knower to the learner. At the other end of the continuum, lies progressivism which rightly propagates the need for developing critical thinking and reflectivity in learners. This is what will result in discovery-learning by enhancing the habits of self-regulated problem solving and reflection.

In the field of English language teaching (ELT) in particular, such criticality and reflectivity in methodological research and theorizing are suppressed by excessively orienting English teachers and ELT university students towards experimental studies within the limits of pretest-intervention-posttest cycles. This article, therefore, aims at providing a critical analysis of this situation and proposing some hints for enhancing innovativeness, criticality, and agency in both English teachers and ELT-specializing students.

## EDUCATIONAL VALUE SYSTEMS

There are three educational value systems which reflect particular socio-political and philosophical beliefs (Clark, 1987). Clark adopts Skilbeck's (1982) conceptual framework through which he has identified three broad value systems which permeate educational processes. These value systems in education are *classical humanism*, *reconstructionism*, and *progressivism*. Each is elaborated below.

*Classical humanism* is concerned with the one-way exchange of knowledge from the knower, i.e. the teacher, to the learner for the purpose of promoting intellectual capacities and cultural values. The learner is considered a person who receives and, later, applies and uses what the teacher has taught him or her. The teacher is the only agent who decides what is worth teaching and learning and how it is to be taught and learned, with little room left for creativity, decision-making, and criticality by the learner. Although Clark (1987, p. 5) presents Skilbeck's (1982) analysis of the classical humanist approach to education as characterized by "the ability to analyze, classify, and reconstruct elements of knowledge, so that these capacities can be brought to bear on the various challenges likely to be encountered in life", in some educational systems based on classical humanism the product of learning closely corresponds the first two levels of Bloom's (1956) six-level taxonomy of objectives for the cognitive domain (Richards and Schmidt, 2002), i.e. the levels of 'knowledge' and 'comprehension'. Of course, not very pessimistically, the second level (comprehension) may not accrue in many cases. Rarely do learners reach the final level of 'evaluation' in such contexts – Bloom's taxonomy consists of six levels, namely, knowledge, comprehension, application, analysis, synthesis, and evaluation.

Unlike classical humanism which is knowledge-oriented (Clark, 1987), *reconstructionism* is society-oriented (ibid). This educational philosophy, in Clark's (1987) words, "is an essentially optimistic ideology which believes that man can improve himself and his environment...and that social, economic, intellectual, and spiritual advance can all be planned for. Education is seen as an important agent for bringing this about." (p.14). Reconstructionism is also objective-oriented. That is, it breaks knowledge down into achievable objectives towards which teachers and learners strive. In this philosophy "human beings must be seen as persons, as purposive agents, to be valued as equals irrespective of their level of ability or achievement" (ibid).

The third educational philosophy is *progressivism*. It is "a learner-centered approach to education" which sees the learner "as a whole person and not just as a disembodied intellect or as a skilled performer" (ibid). It emphasizes the provision of learning experiences and opportunities in which children can learn from their own learning and by their own efforts.

The only man who is educated is the man who has learned how to learn; the man who has learned how to adapt and change; the man who has learned that no knowledge is secure, that only the process of seeking knowledge gives a basis for security (Rogers, 1969, cited in Clark, 1987, p. 49).

Therefore, unlike classical humanism which considers knowledge “a set of closed truths and fixed facts” (ibid), progressivism sees knowledge as:

A creative problem-solving capacity that depends on an ability to retrieve appropriate schemata from a mental store, to utilize whatever can be automatically brought to bear on a situation, and to bend existing conceptual structures to the creation of novel concepts that offer a working solution to the particular problem in hand (ibid, pp. 49-50).

The greatest emphasis in progressivism is placed upon “learning by doing rather than by being taught” and upon “learners as active participants shaping their own learning” (ibid, p. 50).

### **THE EDUCATIONAL VALUE SYSTEM INSPIRING OUR SCHOOLING**

There are a number of ways in which our educational system corresponds with classical humanism or, to some extent, re-constructionism, away from progressivism. Of course, a comprehensive discussion of all of these ways is beyond the scope of this article. Therefore, I will scratch the surface with reference to some of them.

First, from the perspective of teachers, one could argue that teachers themselves have been reared and educated in a memorization-reproduction-oriented way. They themselves, in most cases, have not developed the skills for critical thinking and analysis which are the pre-requisites for innovativeness. To what extent are such teachers able to help their learners develop the habits of criticality and reflectivity while they are studying or learning?

Second, the *methodologies* which are used for teaching mostly encourage memorizing discrete, non-integrated, unanalyzed pieces of information the only product of which is knowledge acquisition. To what extent, if any, have we encouraged our students to stop to wonder whether, and to what extent, what they are told or what they read is actually correct? To what extent have we helped them realize the fact that nobody is God? Do we really teach them how to become *thinkers* or do we, in reality, *force* them to become *learners and imitators*? Both the way teachers themselves have been educated and the methodologies they adopt for teaching their students inculcate in the students’ minds the habit of imitating and non-critically accepting whatever they hear, see, or read. Having been educated through such *methods and methodologies*, can such students, some day in future, be expected to have any well-thought-out hypotheses about the validity of the prospective methods which they, as would-be teachers, would adopt for their own professional practice? In other words, can they develop in their future students the skills and habits of being critical and evaluative, habits which they themselves *lack*? Are our university students specializing in TEFL real critics of ELT methods or do they only assemble some pieces of information such as review of literature, treatment, data collection and analysis, and discussion to submit a paper as a course requirement?

Third, the way we assess and evaluate the performance of our students renders them memorizers, regurgitators of stuff remembered from books, and, in a nutshell, *non-thinkers*. Are our students judged and evaluated by what they have thought and contributed themselves, even if they are not

perfectly right, or by how exactly they have copied verbatim and by rote the contents of the course book? Are our students normally encouraged to risk presenting arguments of their own and are such risks valued by educators? Even disappointingly, students are sometimes penalized for using their own opinions in answering questions and for not using the exact words they have read in books. Here exists a very critical difference between our evaluation criteria and those followed in developed countries where novelty in thinking, originality and genuineness in ideas, and being critical and analytic are highly valued.

### **PROBLEMS WITH EXPERIMENTAL STUDIES CONDUCTED IN OUR CONTEXT**

Although the merits of experimental design for research purposes cannot be ignored because of the high degree of “control of extraneous variables” (Mitchell and Myles, 2004, p.127) and also due to “control of the target language and target structures to be learned, control of exposure, control of instruction (explanation), control of tasks, and control of response measurement” (Hulstijn, 1997, pp.139-40, cited in Mitchell and Myles, 2004, p.127), Mitchell and Myles (2004) argue that:

It is questionable how far you can isolate variables that would be interacting in a natural context, and therefore how far results obtained in that way mirror what happens in real life with real languages. Moreover, because of the highly controlled nature of laboratory experiments, the questions being asked tend to be very specific and local, with the resulting danger of ignoring how different aspects of the learning process might interact (p. 127).

De Graaff (1997, p. 272, cited in Mitchell and Myles, 2004, p. 128) maintains that “However, the more controlled the design and the more specific the learning task, the more we bear the risk of not studying L2 acquisition any more, but only participants’ capacity to carry out some kind of cognitive puzzle.” Therefore, one of the disadvantages of experimental studies is the high degree of control they entail. But the question that arises at this point is how this disadvantage, apart from being an inherent drawback of experimental studies for adequately explaining the L2 acquisition process, is related to our present discussion. The answer lies with the fact that such a degree of control and a priori determinism in specifying research questions, variables and procedures severely narrows the researcher’s peripheral vision in looking for a “complex unpredictable” (Larsen-Freeman, 1997) array of interactions and interrelationships among a complex unpredictable constellation of variables. Such a peripheral vision is exactly what a researcher or scholar uses when s/he engages in the complex process of hypothesis generating and consequently theory-construction about second language acquisition (SLA) processes. Especially in our own ELT context it has mistakenly been fashionable to think that experimental studies must be legitimized by a related review of literature which, although useful in itself, may sometimes simplistically be considered a theoretical panacea at the expense of any self-initiated theorizing and innovativeness on the part of the researchers themselves. In other words, the confining stipulations of conducting experimental studies such as the requirement that a researcher must always continue what other previous researchers have done up to a certain point and be inspired by the existing literature on the research question in hand severely restrict our researchers’ freedom to proceed with their possibly novel ideas and hypotheses, to the point that, in many cases, they completely abandon their initial research questions because of the limitations

they encounter during the carry-out of their studies until they come up with totally new questions which are infinitely different from what they were initially supposed to do, let alone the mirage of their becoming theorists and innovators.

A further problem with TEFL experimental studies in our context and actually many other contexts in general relates to the accuracy with which such studies are carried out. The accuracy of these studies may be considered problematic on several grounds as follows.

First, in many cases such studies are conducted by TEFL university students as course requirements. Due to the practical limitations in carrying out genuine experimental studies in many ELT contexts such as availability and accessibility of samples of subjects, time limitation, facilities and financial problems, commitment and collaboration of participants, such studies do not adequately represent reliable studies. Second, student researchers themselves may not have the ability, expertise or commitment to put their full investment in the studies. This is because, in many cases, such students do not have good reasons and motives for carrying out experimental studies except a pass score in their own course. They, therefore, sometimes *wrap the task up* very quickly while they seem to be doing sound experiments. Also, sometimes teachers do experimental studies to get promotion, again with the same or similar problems of truthfulness and trustworthiness. Next, experience in reading the reports of such studies and being consulted by their conductors, who are M.A. and even Ph.D. students, has shown that, in many cases, the researcher students do not have enough training in the basics and principles of research such as design, data analysis, statistical concepts and procedures, randomization, interpretation of results, and so on. For example, some student researchers or teacher researchers make attempts to homogenize intact-group classes simply by administering a general language proficiency test prior to the treatment. And they naively think that this can account for an absence of randomization.

In summary, these problems and the like are very likely to yield experimental studies which do not enjoy acceptable indexes of reliability and are likely to suffer low internal and external validity. Finally, such studies mostly take the form of methods-comparison studies, sometimes as mere replications of previous studies. Rarely do such studies reveal genuine questions arising out of deliberation, reflection, and sound theoretical argumentation. All these render researchers *knowledge consumers* rather than *knowledge producers* and *real thinkers*.

### **IMPLICATIONS FOR METHODOLOGICAL RESEARCH IN ELT**

Especially in contexts representing 'Expanding Circle' countries (Kachru, 1985), it is still fashionable to think that only one method which is related to a particular theory of learning or theory of language is superior to other methods, therefore, rejecting other rival stances. For example, it has become fashionable to reject any method or methodological issues affiliated to the behaviorist psychology and accept anything related to communicative language teaching (CLT), at least among practitioners with lower academic education. Most people in the field of ELT in these contexts believe that there is an alleged "best method", in Richards' (2001) terms, for teaching English which outweighs other methods and underlying theoretical principles. Therefore, every university student specializing in TEFL engages or is required to engage in methods-comparison studies in pursuit of that best method – a phenomenon resulting in their being *theory-users* rather than *theory-constructors*. This is because as long as one takes a "classroom as experimental laboratory" perspective (Breen, 2001) with certain pre-specified and controlled variables in mind, s/he is bound to be a servant of the principles of the experiment-

based mode of thinking. Breaking such confines requires engaging in thought-provoking argumentation and critical theorizing and theory analysis. This is likely to result in multi-dimensionality in thinking and knowledge productivity. It is this sort of orientation to research that lets us know that we cannot totally and simplistically reject the behaviorist psychology simply because others have done or said so, i.e. criticized it. Even if others have rejected it, they have been able, or at least encouraged, to think and argue analytically and convincingly rather than support or reject the totality of a theory by blindly imitating other people or based on the findings of a single laboratory-based experimental study.

Such narrow-mindedness has prevented those involved in English language teaching (ELT) in many countries from becoming self-actualized thinkers and has oriented them towards being greedy reviewers and narrators of the available literature.

There seems to exist a vicious cycle which is very difficult to get out of. This knowledge-dependency which is prevalent in our context has taken away from us the self-confidence to think critically, act confidently, and generate the knowledge which we are otherwise supposed to *faithfully* borrow from others.

We have been schooled in a tradition which emphasizes *knowing* and *memorizing* only. Rarely does it encourage critical reflection and thinking. When applied to ELT methodology, this tradition has always based English language teacher education and teacher research on the assumption that others have supplied the necessary theoretical underpinnings and principles upon which teachers and researchers can draw for their own teaching practices and research purposes. Hardly ever are we judged by what we have dared say about what we ourselves believe to be true about language teaching methods and methodology away from the dictatorship of the outer professional world.

I do not intend by any means, however, to deny the importance and relevance of what others have said and done which is already available to us in the form of ELT literature. What I am trying to downgrade is strict and illegitimate adherence to conducting *pretest-treatment-posttest* experimental studies in many EFL contexts in pursuit of either “best methods” (ibid) or testing and verifying what other people have argued to be the best methods. Such are the sources of non-criticality and non-creativity which have rendered our students at all levels of education imitative. Although such experimentation, in many cases, is justifiable and necessary, it is, by itself, not all that is sufficient for an academic in TEFL to become a discovery-oriented scholar.

Why can't our practitioners base their experimentations on SLA theories generated in our own ELT/EFL context? Why shouldn't we educate theoreticians whose theories and theoretical innovations would generate a large body of research, as is the case with many western scholars? Why is it that our share of ELT methodology is only review of, and doing research based on, the literature provided by others? To what extent, if at all, have our own scholars been able to propose original theories of first and/or second language acquisition, models of curriculum design, and language teaching methods? How many new scientific terminologies and ideas have we been able to coin with reference to methodology in ELT and other applied linguistics areas? Almost all method-related concepts and distinctions have been experimentally researched by

English-major students in our own context. But the question that arises is what percent of these research-generating ideas and concepts, e.g. focus-on-form versus focus-on-forms (Long, 1991), comprehensible input (Krashen, 1981) versus comprehensible output (Swain, 1985), different negotiation strategies (Ellis, 2008), etc. belongs to our professional TEFL community? How much theory have we contributed to the repertoire of ELT literature? In other words, how much our strict adherence to experimental studies has contributed to theory construction, novelty of ideas, and originality of thoughts away from attempts to verify other scholars' thoughts and theories?

Even a well-conducted experimental study which is supposed to provide the researcher with useful findings about the effectiveness of particular methods must be preceded by deep conceptual reflection and reasoning. Otherwise, it would not be well-grounded. It is through analyzing and critically reflecting on other people's theories, rather than doing laboratory-based experimentation, that one can gain a deeper understanding not only of those arguments and theories but also of how much one had realized such theories before and how deeply s/he understands them now. This is because in laboratory-based research we are led by the limits of the design and variables of the study to ignore so many potentially insight-providing nuances that emerge only through reflection and critical analysis. For example, suppose that the counterarguments by which the theoretical underpinnings of audio-lingual approach were called into question were replaced with counterarguments derived from a methods-comparison study following an experimental design. Would the latter counterarguments be as appealing and convincing as the former?

## **TWO APPROACHES TO THEORY-BUILDING**

Two broad approaches to theory-building have been identified (Long, 1985, cited in R. Ellis, 2008, p. 926): the " 'research-then-theory' approach and the 'theory-then-research' " approach. According to Ellis, "This corresponds to the difference between an inductive (empiricist) approach to theory-building and a deductive (rationalist) approach." (ibid) There is considerable debate over which approach to theory-building is more defensible. For example, Ellis (2008) referring to Beretta's criticism of the research-then-theory approach maintains:

Beretta (1991:505) referred to this approach [the research-then-theory approach] as a 'bottom-up strategy' and argued that researchers should seek plentiful data before proceeding to formulate a theory. He [Beretta] argued that the tendency of researchers to formulate theoretical statements prematurely constitutes a weakness of this approach (p.927)

Another weakness of this approach, according to Ellis (ibid), is that "it leads to theories that are particularistic rather than general (i.e. theories that seek to explain only a limited set of data)". Gregg (1993, cited in Ellis, ibid) also argues that this approach to theory-building results in "shallow theories (i.e. theories that stick as closely as possible to what is observable and, therefore, do not address phenomena)". Ellis (2008) also quotes Long's (1985) evaluation of this approach observing that:

researchers in the research-then-theory approach are less likely to be 'wrong' because their theoretical claims are based firmly on empirical evidence – always providing, of course, that their observations are valid and reliable – but the end result of their efforts may be 'limited' and perhaps ultimately 'irrelevant' (p. 927).

The second approach to theory-building, i.e. the theory-then-research approach, has been positively evaluated for 'lending itself to the construction of deep theories (i.e. theories that go beyond what has been observed by acknowledging the importance of those aspects of nature that cannot be observed (Gregg, 1993); for allowing for predictions to be formulated, tested, and modified (Ellis, 2008); for the adoption of a theory from outside the realm of SLA research such, e.g. the emergentist and skill-building models adopted from cognitive psychology and the constructionist models derived from socio-cultural theory (ibid); and for being more likely to bring about a paradigm shift and being associated with scientific revolutions (ibid).

However, we are not intending to argue in favor of either one approach to theory-construction as being superior to the other one because maybe it is safer to think that both approaches are needed and each has its own 'strengths and weaknesses' (Long, ibid). Such strengths and weaknesses have already been referred to above. Therefore, as Jordan (2003, cited in Ellis, 2008, p. 928) has argued, maybe a pluralist approach to theory development is more advantageous.

The points that I would like to emphasize are twofold. The first point is that engaging in such theoretical mind-exercising activities, i.e. theory-then-research approach, better directs our TEFL students towards becoming authorities in the field in several ways. First, they deeply understand other scholars' theories. Second, they have to read a lot. Third, they have to be analytic and evaluative. Fourth, they practice formulating ideas of their own. Fifth, they can overcome their fear of proposing wrong ideas. Sixth, they can purify and expand their understanding of mainstream ideas and concepts in the field. Seventh, they develop self-confidence in their ability to become thought-generating scholars. Many other advantages can be added to these, of course. The second point that I am trying to emphasize is that in both approaches to theory-construction research alone does not have anything to offer unless it leads to the formulation of some testable and falsifiable statements in the form of a *theory*. Therefore, the question of '*To what extent does strict adherence to the research-then-theory approach as the only adopted approach lead to the development of ELT theories and the enlightenment of our researchers' minds?*' seems pertinent! That is, the dominance of the research-then-theory approach in contexts such as ours in Iran, contrary to its real purpose in other contexts, is not looked upon as a means of helping students become *thinkers and theorists*. Rather, it is considered a *research-for-research* approach. Why is it the case that we are not used to assuming agency and having a voice in the world of theory-construction and novelty-creation in ELT methodology and L1 and L2 acquisition?

## CONCLUSION

University students of TEFL and English teachers in our country receive a lot of training on different theories and methods concerning ELT. But there are very rare, if any, cases of students or teachers who have the ability and courage to transcend the boundaries of *receiving and unquestionably believing* what they encounter in the literature and make novel contributions of their own to the field of language learning or teaching. Very rarely do we have specialists who propose new ideas in the field. We are most often fully aware of other people's theories, even more than those theorists themselves. But we are often unable to analyze, synthesize and evaluate those theories and/or methods and come up with novel ones of our own. Sometimes popular

authorities in the field of language teaching methodology are not even aware of the contents of their own books, even though they have authored those books. This means that they do not emphasize memorizing or even knowing much information. Rather they have developed the habits and skills of discovery-learning and making novel contributions of their own. In other words, one does not have to keep so much information in his mind, something a machine can do much more efficiently, but he does have to learn how to think critically and synthesize all that he has studied into new ideas of his own. But we know much more information about ELT methods than there exists in a library without being able to reach a point of theorizing and methods-inventing of our own. Why is such the case? Maybe it is because we are accustomed to working within the limits of experimental studies, in a direction pre-specified by others, looking for hard evidence based on narrow-ranging classroom research away from speculative work and discovery-learning in creative ways.

## ABSTRACT

The emergence of socio-cultural perspectives in language education on the one hand and the recent trends towards more contextualized and authentic forms of language tests on the other hand have led practitioners to take more into account issues of culture in language teaching practices and of course in designing appropriate tests; tests which are namely fair and not biased toward individual test takers' cultural values. This study is therefore an attempt to find out if cultural schemata and proficiency level affect Iranian EFL learners' cloze test performance and recall of the passage. Participants included 144 freshman students at Islamic Azad University of Shiraz. They took a 50-item placement test (Oxford Placement Test) measuring their proficiency level, and two cloze tests (one culturally familiar and the other culturally unfamiliar). They were also asked to write whatever they recalled from the text after they finished the cloze test. The results revealed that both cultural schemata and proficiency level significantly affected cloze test performance and recall of the passage. It was also observed that more proficient students were less affected by cultural familiarity of the passage, and the cloze test scores correlated very highly with recall scores. Based on the findings of the study, test developers should be more sensitive to individuals' cultural differences and proficiency level when designing cloze tests as integrative measures of reading ability.

**KEY WORDS:** cultural achemata, proficiency level, cloze test performance, recall of passage

## INTRODUCTION

Language testing has generally followed the trends in language teaching methodology, while language teaching is affected by advances in linguistics and psychology. As a result, language testing has to a great extent been directly and indirectly influenced by epistemology in general psychology and related fields, such as educational measurement, innovations in psychology and education. This trend has caused test-makers to change their methods, from discrete point tests, which are still in use in many areas, to integrative testing (Farhady, Jafarpur, & Birjandi, 1994). Among the types of integrative tests, the cloze test is perhaps the most representative (TalebiNezhad & Dastjerdi, 2006).

As Nielsen (2011) asserts, cloze tests measure reading comprehension, and not just a readability level of the text because they provide empirical evidence of how easy a text is to read and

understand for a specified target audience. However, the cloze procedure has several advantages over other types of reading assessment. For example, cloze tests are very easily created and administered. They are also based on silent reading, which is the predominant and most natural form of reading. Moreover, they can be constructed from materials that teachers use for instructional purposes or from authentic texts and they do not require the writing of specific comprehension questions. Finally, and perhaps most importantly, cloze tests often exhibit a high degree of consistency; though this consistency may vary considerably depending on the text selected, the deletion starting point and gap rates that are employed (Alderson, 1979; Sciarone & Schoorl, 1989).

Researchers have not yet had an agreement on what cloze tests really measure. As asserted in Tremblay (2011), some researchers have proposed that cloze tests tap low-level lexical and grammatical competence (e.g., Alderson, 1979; Markham, 1985), whereas others have argued that cloze tests can also measure higher level discourse competence (e.g., Bachman, 1982; Fotos, 1991; Jonz, 1990). Although no firm consensus has been reached as to what aspects of linguistic competence cloze tests measure, their scores have been found to correlate highly with standardized proficiency scores and therefore are claimed to provide an excellent overall picture of proficiency since they reflect the degree to which language skills are used in a meaningful context. In the same vein, a number of researchers have also found them to be particularly useful tools for measuring reading comprehension (Cecilia, 2003). In general, "Today, cloze tests are widely used in some places such as Iran & China as part of some large-scale language tests such as TOEFL and IELTS", (Ajideh & Mozaffarzadeh, 2012, p.143).

Written recall task has also been recommended as a measure of reading comprehension and is generally considered as an integrative test in that several features combine to convey the meaning upon which a response is then based. It requires readers to read a passage silently and then to write down everything they can remember from the text. There is evidence that a recall protocol provides data that reflect the nature of the reading process in terms of encoding, restructuring and analyzing information.

Although the written recall task and cloze test are both integrative tests, they differ in the nature of their response modes. According to Savignon (1983) cloze tests entail a discrete-point response mode whereas recalls have a global response mode. Both have proved to be affected by different factors which need to be controlled if we want to construct valid and reliable tests. Cloze may be influenced by the level of the difficulty of the text, the amount of the text on either side of the blank, text redundancy, personal characteristics, cultural schemata, and many others. Research also reveals that recall of the text is affected by factors such as the text structure, memory, the topic of the passage, the conditions under which the test is administered, scoring procedures, and so on. For example, Yuh-Fang Chang (2006) compared readers' performance on the immediate recall task and a translation task in order to explore the effect of memory on readers recall. The results showed that the requirement of memory in the recall task hinders the test takers' ability to demonstrate fully their comprehension of the reading passage.

Among the factors mentioned above, cultural familiarity of the passage and proficiency level, are claimed to cause variations in test takers' performance on cloze tests and written recall tasks.

Therefore, the present study intends to investigate these two factors and see to what extent they may affect students' performance on a cloze test and the recall of the passage once the cloze test is taken.

### **CULTURAL SCHEMATA**

Schema is generally defined as the background knowledge one has about the topic one is reading and may have an effect on the interpretation of the passage being read. The background knowledge may consist of personal history, cultural beliefs, attitudes, interests, so on and so forth. Cook (2001) states “for a reader to make sense of a text a particular piece of background information is required and a person who does not possess the information does not get much out of the text” (p.12).

Schemata can be of two types; formal and content schemata. The former is the knowledge of language and linguistic conventions, including knowledge of how texts are organized, and what main features of particular genres are. The latter, however, is the knowledge about the content of the passage readers need to have in order to be able to understand it. Such knowledge does not simply need to be available- it needs to be activated by the reader, or the text, if it is to be used in accurate understanding.

Some studies report that a match between background knowledge presupposed by the text and that possessed by readers leads to a better comprehension than a mismatch (Johnson 1981; Steffensen, Joag-Dev, & Anderson, 1979). Other studies show that providing students with background knowledge facilitates understanding of unfamiliar texts (Gatbonton & Tucker, 1971; Johnson, 1982). The combined provision of background knowledge and previews for students particularly enhances L2 reading comprehension (Chen & Graves, 1995).

Rezaei, Barati, and Youhanaee (2012) in a study investigated the effect of content familiarity and test format on Iranian English learners. The subjects of this study were sampled from advanced students studying at different language institutes in Isfahan, Iran and based on an OPT test 70 students were considered as the target participants. Each participant was given a test of reading comprehension with familiar content and unfamiliar content. It became clear that content familiarity facilitates comprehension. In the same vein, Keshavarz, Atai, and Ahmadi (2007) investigated the contribution of content and background knowledge, vocabulary and syntactic knowledge, and L2 proficiency to reading comprehension and recall. 240 male Iranian EFL learners participated in the study. Each participant was tested with a familiar, and an unfamiliar text. The authors found that familiarity with content was significantly correlated with reading comprehension test scores and recall scores. Chihara, Sakurai, and Oller (1989) changed several culturally unfamiliar words (e.g. Nicholas, Athen, Klein) from two English texts into more familiar words (Ben, Osaka, Daiei) for the Japanese participants. Leaving all other words intact. They controlled other possible intervening variables such as the content and syntactic complexity of the two texts. The results of the cloze test showed that the participants performed significantly better on the modified, that is culturally familiar, cloze texts than on the original texts.

Partially replicating Chihara et al.'s (1989) experiment, Sasaki (2000) investigated how schemata activated by culturally familiar words might have influenced students' cloze test-taking processes. She changed several unfamiliar words in the original cloze test passage to more familiar ones in the modified version. Unlike Chihara et al., however, students were asked to give

verbal reports of their test-taking processes, and to recall the passage after they had completed the test. Results demonstrated that those who read the culturally familiar cloze text tried to solve more items and generally understood the text better, which resulted in better performance, than those students who read the original text. When students read content familiar text, they might have enjoyed the situational interest aroused by the text. Tomlinson (1998), for example, maintained that when students see elements of their local culture in classroom materials, they feel much more engaged and identify themselves with the context of the text. As the last example we can mention Carrell (1981), who examined the comprehension of advanced ESL Japanese and Chinese subjects using folktales from different cultural orientations. Her findings showed that the cultural origin of the text affected the subject's recall of information from the texts, as well as the subjects' judgments of the level of difficulty of the texts.

### **PROFICIENCY LEVEL**

L2 proficiency has been conceptualized in different ways, none of which, according to Stern (1983), provides a completely satisfactory expression. Stern (1983) states that "until 1970 or so, proficiency was defined as the knowledge of phonology, vocabulary, and grammar; however, more recent definitions of proficiency include semantic, discourse, and sociolinguistic features". The description of proficiency is therefore an important step in the studies of second / foreign language testing since the proficiency level of testees has been manipulated as a variable in most language testing research. In addition to the role of content (cultural) schemata in EFL reading comprehension, the potential interaction between content and learners' proficiency also concerns researchers in EFL reading. Carrel (1984) suggested that the nonnative readers in her study failed to use background information because they were linguistically bound.

### **RESEARCH QUESTIONS**

The present study tends to investigate the impact of cultural schemata and the proficiency level on cloze test performance, and recall of the passage. The main purpose we are after is to indicate the effect of cultural familiarity of the passage on cloze test performance. In fact written recall task is added to double-check the same effect as another test of reading comprehension. In this vein, the present study seeks to answer the following research questions:

- R.Q.1. Do participants perform better on a cloze test when the passage is culturally familiar or when it is unfamiliar?
- R.Q.2. Do participants perform better on a recall task when the passage is culturally familiar or when it is unfamiliar?
- R.Q.3. Are there any relationships between the students' proficiency level and cultural familiarity of the passage in their performance on cloze tests?
- R.Q.4. Are there any relationships between the students' proficiency level and cultural familiarity of the passage in their performance on a written recall task?
- R.Q.5. Is there a relationship between students' performance on a cloze test and written recall?
- R.Q.6. Is there an interaction between cultural familiarity and proficiency level in cloze tests and written recall tasks?

## **METHODOLOGY**

### ***Participants***

One hundred and forty four freshman students at Shiraz Islamic Azad University participated in this study. The participants were divided into three groups of high, intermediate, and low proficiency based on their scores on Oxford Placement Test (OPT) (Allan, 2004). The mean of scores was calculated and one half of standard deviation was added to and subtracted from it in order to have three homogeneous groups. So the participants who scored 30 and above were included in the proficient group (group 1), those who scored between 25 and 29 (inclusive) were considered as belonging to the intermediate group (group 2), and those who scored 24 and below were considered as low students (group 3). In this way, there were 54 participants in group 1, 46 in group 2, and 44 in group 3.

### ***Instruments***

To indicate the participants' proficiency level, the standardized Oxford Placement Test (Allan, 2004) was administered to all participants. The original test includes 200 tests items from which we chose the second part including 50 items for two main reasons: 1. The second part looks more like a cloze test. 2. With only 50 items we would not have problems of time and the participants would not get bored and tired. For cloze test administration, we needed to construct two kinds of cloze tests, one, culturally familiar, and the other, culturally unfamiliar. For this purpose, we made use of a cloze test taken from Sasaki (2000) as the unfamiliar cloze for our participants. In his study, he administered it as the familiar cloze to Japanese students. The cloze test was constructed based on fixed-ratio method (every 5<sup>th</sup> word was deleted). Then some modifications were made in terms of wordings of the passage in order to make it culturally familiar for Iranian participants. Care was taken to ensure that there would be similar passages in all other aspects such as, difficulty level, number of words, and the places of all the blanks. Both cloze tests consisted of 50 blanks.

### ***Administration procedure***

First the Oxford Placement Test was administered to all the participants to determine their proficiency level. The participants were given about 25 minutes to answer the questions in the OPT.

It was not possible for the researcher to administer both cloze tests (culturally familiar and culturally unfamiliar) to the same participants because there was the possibility of practice effect. So each group of proficiency level was further divided into two groups in order to give one, culturally familiar cloze test, and the other, culturally unfamiliar cloze test. It should be noted that the two groups of each proficiency level were selected in such a way that they would have equal means. The cloze tests were administered after an interval of two weeks from the proficiency test. Based on the pilot study done before, participants were given 35 minutes to perform on the cloze tests.

All participants were also asked to write down whatever they remembered from the passage either in their mother tongue or the target language. This way, it was intended to eliminate the possible effect of L1 or L2 on the participants' quality and quantity of recall. This procedure was done after all cloze tests were collected from the participants. They were instructed to write the recall on a separate piece of paper.

### ***Scoring procedure***

To score the cloze test the exact word method was used. The participants were expected to guess the exact word used in the original passage. This type of scoring method was used because it is

easier than the other methods. For written recall task first the idea units of the passage were all identified. As a whole there were 66 idea units. Then the recall papers were studied, and then one point was given to each idea unit if it was recalled verbatim or in a close paraphrase or correct translation.

### Data analysis

In order to make sure that the two groups of proficiency were homogeneous and there was no difference between their performances on the proficiency test, an independent t-test was run. The results showed that there was no statistically significant difference between them. In order to indicate the relative effect of participants' level and cultural familiarity of the passage on the cloze test performance, a two-way ANOVA was run. The same procedure was also followed for participants' performances on recall task in order to measure the same thing. Finally a correlation between the scores of recall task and cloze test was taken.

## RESULTS AND DISCUSSION

The first research question in this study examined whether cultural familiarity of passage affects students' cloze test performance or not. Table 1 displays the result of the two-way ANOVA run in order to answer this question. Based on the table it can be concluded that cultural familiarity of the passage significantly affects students' cloze test performance. The findings are in line with what Carrell and Eisterhold (1983), Chihara et al. (1989), Chen & Graves, (1995), Anderson (1999), and Sasaki (2000) noted in their studies. They mentioned background knowledge and familiarity with the passage as the very important factor on the reader's reading comprehension ability.

Table 1: Two-way ANOVA

Dependent variable: cloze

Source	Type III Sum of Squares	df	Mean Square	F	Sig.
Corrected Model	3529.895	5	705.979	26.036	.000
Intercept	46690.218	1	46690.218	1271.905	.000
Culture	663.293	1	663.293	24.462	.000
Level	2740.108	2	1370.054	50.527	.000

The second research question in this study examined whether cultural familiarity of passage affects students' recall task or not. Statistical statistics two-way ANOVA was run in order to answer this question. As it is shown in Table 2, the result was (.000) and significant at ( $p < .5$ ). So, like what Carrell (1981) and Yuh-Fang Chang (2006) found, the cultural familiarity of the text significantly affected the subject's recall of information from the texts.

Table 2: Two-way ANOVA

Dependant variable: recall

Source	Type III Sum of Squares	df	Mean Square	F	Sig.
Corrected Model	2085.892	5	417.178	22.002	.000
Intercept	14789.334	1	14789.34	779.992	.000
Culture	549.840	1	549.840	28.999	.000
Level	1528.752	2	764.376	40.313	.000

Table 3 displays the results of an independent t-test run to answer the third research question which was if the effect of cultural schemata on cloze test performance varies among different proficiency levels. Results reveal that the lower two groups (intermediate and low) are significantly affected by cultural schemata but not the high group. As Carrel (1984) suggested, the nonnative readers in her study failed to use background information because they were linguistically bound. According to this table, participants with higher proficiency level in this study are also less affected by cultural schemata. This may be due to the students' using their higher proficiency level to compensate for the unfamiliarity of the passage.

*Table 3: Independent t-test*

level	culture	mean	Mean dif.	Sig. (2-tailed)
High	1	24.91	1.826	.290
	2	23.9		
Inter.	1	19.37	4.556	.002
	2	14.81		
Low	1	16.41	6.545	.000
	2	9.86		

The fourth research question asked if the effect of cultural schemata on recall task performance varies among different proficiency levels. Table 4 displays the results of an independent t-test run to answer the question. The results reveal that all groups of proficiency level are more or less affected by cultural schemata. The relationship which was observed was the same as that of the cloze test. As students' proficiency level decreases, culture affects more significantly their performance on recall task.

*Table 4: Independent t-test*

level	culture	mean	Mean dif.	Sig. (2-tailed)
High	1	16.04	3.696	.015
	2	12.35		
Inter.	1	12.41	4.074	.003
	2	8.33		
Low	1	7.95	4.000	.000
	2	3.95		

The fifth research question asked if there is any interaction between the two variables of the study. As results in Table 5 show, there is no interaction between these two variables at all.

*Table 5: The interaction between culture and level*

Test	Source	Sig.
Recall cloze	Culture*level	.975
	Culture*level	.100

The correlation which is reported in Table 6 is .67 and it shows that scores of cloze test on recall task both as tests of reading comprehension are highly correlated. The scores of cloze test and recall task was also correlated separately for each proficiency level. According to Table 7 the correlation is only significant for the two lower groups but not for the higher ones, and scores of lower proficiency groups were more highly correlated. The former case may be interpreted as a

result of memory, and the latter shows that students who received low grades on cloze test have also received low on recall task.

*Table 6: Correlation*

Correlations	Recall
cloze Pearson correlation	.670**
Sig. (2-tailed)	.000
N	144

*Table 7: Correlation between groups*

level	Recall
1 cloze Pearson correlation	.246
Sig. (2-tailed)	.099
N	46
2 cloze Pearson correlation	.563**
Sig. (2-tailed)	.000
N	54
3 cloze Pearson correlation	.848**
Sig. (2-tailed)	.000
N	44

## CONCLUSION

So, as far as the results of the study implicated, different levels of English proficiency had a determining effect on the success in performing integrative measurements. In better words, it was observed that cultural schemata as well as proficiency level have a direct effect on the testers' cloze test performance and recall of the passage therefore it can be argued that the findings of this study clearly depicts that, contrary to the stereotype, the design and construction of appropriate integrative tests can be quite a demanding task and requires much expertise at least for beginner and intermediate test takers. Part of the challenge is due to the fact that attempts to contextualize language tests may lead to bias toward particular proficiency groups and cultural backgrounds. For advanced test takers; however, this is not a major threat. Proficient test takers in this study were less affected by cultural familiarity of the test.

## SUGGESTIONS FOR FURTHER RESEARCH

The interested researcher(s) can investigate the effect of cultural schemata on other versions of cloze test such as: C-test, and can compare the effect of cultural schemata on participants' cloze test performance and traditional reading comprehension test. The participants of the present study were university students. The interested researcher can do the same research using different participants such as high school students, or investigate whether the effect of cultural schemata on cloze test performance and recall task varies among different age groups.

## SPEECH ACTS IN AMERICAN ENGLISH AND PALESTINIAN ARABIC

**Ibrahim M. R. Al-Shaer**

*Al-Quds Open University*

*P.O. Box 988, Bethlehem, West Bank, Palestine*

*E-mail: ishaer@qou.edu*

### ABSTRACT

This study attempted to examine how both English and Arabic realize certain speech acts, mainly authoritative speech acts, promising and thanking. For this purpose, an analysis of spontaneous naturally-occurring utterances comprised of declaratory speech acts, commissives, and thanking in both English and Arabic was conducted. In the light of this analysis, the study highlighted interesting differences displayed by the two languages as to how they realize the given speech acts at the level of structures and lexical items used. The study also showed that cross-cultural and pragmalinguistic characteristics of Arabic speech acts as compared with their counterparts in English are of paramount importance for sociolinguistic, contrastive, semantic and translation studies.

**KEY TERMS:** Speech act, commissives, locutionary act, illocutionary act, perlocutionary act, performative utterances, naturally-occurring utterances.

### INTRODUCTION

Our daily talk includes speech acts or utterances that serve certain functions. We perform speech acts when we promise, thank, apologize, or introduce someone, for example.

In inter-cultural interactions, speech acts are tricky to execute because people are not always aware of the cultural norms that regulate the conventions of the other language; they may simply resort to their native language conventions and convey them to others. Therefore, it is crucial that people become aware of not only knowledge of the language but also of the culturally appropriate ways to perform the speech acts in that language. Sometimes what conveys a message in one language might not produce the same one when presented in another. An example of potential misunderstanding between an English and an Arab interlocutors would be when the former invites the latter saying *Would you like to have a cup of tea?* and the Arab person declines the invitation saying just *Thank you*. The English person would probably not understand it as a refusal and would say *thank you, yes or thank you, no*. This is because the utterance used in polite English as a response to an invitation always includes *thank you* regardless of whether one accepts or turns down the invitation.

Clearly, speech acts are very culture specific and differences in this field would produce potential misunderstanding among people. As Gass and Neu (2006) put it, "Speech acts are realized from culture to culture in different ways, and these differences may result in communication difficulties that range from the humorous to the serious". Similarly, Gass and Selinker (2008: 288) claim that all "languages have a means of performing speech acts and

presumably speech acts themselves are universals, yet the form used in specific speech acts varies from culture to culture". This goes in line with Wolfson's (1986: 119) notion that "speech acts differ cross culturally not only in the way they are realized but also in their distribution, their frequency of occurrence, and in the function they serve".

Accordingly, the present study attempts to investigate performative utterances in both English and Arabic. The focus will be on three functions of performative utterances: declaratory or highly authoritative speech acts, promising and thanking. The assumption here is that each of the two languages has more than one way of expressing each of the three functions or speech acts under investigation, in terms of their structure, inclusion or exclusion of performative verbs. Differences are anticipated at the structural and lexical level, particularly in colloquial Arabic, mainly because speech acts are culture-specific expressions. In this connection, Hudson (1980: 111) says, "if speech act categories are cultural concepts, we might find them to vary from one society to another."

## **LITERATURE REVIEW**

### ***General Background***

Utterances are formed of words or lexical items in any given language. Utterances have functions to express depending on the situation and occasion which trigger these utterances. These functions are put in what Austin (as cited in Searle, 1969: 23) calls "illocutionary acts". When utterances have certain verbs, they are described as 'speech acts', i.e. they perform acts on the given occasion. In English, Searle (1969: 28) mentions a list of such performative verbs which illocutionary acts contain (e.g. "state", "describe", ... etc.).

A speech act as an utterance has been described by semanticists (of course for the first time by Austin 1962) as having three acts: the locutionary act, in which the utterance as a linguistic construction of words has sense and is not ambiguous; the illocutionary act which refers to the utterance used to perform a certain act such as "a greeting, a statement, a prediction, a promise, a prohibition, or whatever" (Allan, 1986: 104); the perlocutionary act, which is the effect that the utterance can bring about in the addressee's or hearer's state of feeling or reaction. "The perlocution of an utterance is the causing of a change to be brought about, perhaps unintentionally, through, or by means of, the utterance" (Hurford et al, 1983: 243).

Sperber and Wilson (1986: 243) go even further saying that "language can be influential in performing actions (i.e. speech acts), such as bringing about and executing obligations, or affecting others' thoughts and actions, or even generating fresh affairs and further social interactions."

Utterances that function as speech acts cannot be described as true or false, though they may take the form of statements. Rather, "the uttering of the sentence is, or is part of, an action" (Austin, 1962, as cited in Palmer, 1981: 161). So statements or utterances can perform lots of functions such as promising, warning, christening, apologizing, thanking ... etc. Utterances performing such functions are described as performatives. In this regard, and in order for speech acts to be successful as communicative acts, Cohen (1994) as cited by Morsi, 2010, P.6) points out that the

successful planning and production of speech act utterances depend on the sociocultural and the sociolinguistic ability of the speaker. Cohen (1994) defines the Sociocultural ability as the respondents' skill at selecting speech act strategies appropriately with the given culture involved, "the age and sex of the speakers, their social class and occupations, and their roles and status in the interaction" (22). By Sociolinguistic ability, Cohen (1994) refers to appropriately selecting the linguistic forms or expressions that are used to realize the speech act.

Performative utterances, or performatives, can be classified as direct or indirect speech acts. A direct speech act has illocutionary force made explicit by means of a verb, such as promise, warn, apologize, congratulate, among others, whereas the illocutionary force of an indirect performative utterance is made implicitly, i.e. without a performative verb. Yet, the two types " have the same illocutionary point " (Allan, 1986: 165).

Speech acts may be explicitly or implicitly performative. This means that we can use a verb which denotes, for example promising, when we utter ' I promise to visit you '; or we can just say ' I will visit you "; in which case no explicit verb of promising is mentioned. According to Grundy (2000: 53) " .... Non-explicit, even very implicit, ways of using language performatively are the norm. "

To illustrate how utterances function as such, i.e. as direct or indirect speech acts, we cite here the utterances given by Allan (ibid, 165-6) in which she shows how the same command can be issued or effected in three ways which depict three illocutionary forces, but all have the same illocutionary point:

" I order you to leave immediately. "  
" Go out ! "  
" Out ! "

provided they are uttered with proper prosody and in the right context. She also gives a good list of explicit performative verbs:

*" abjure, abolish, accept, acknowledge, ... , withdraw " . (pp. 167-8)*

A good test for a performative utterance is the insertion of the adverb ' hereby ' between the subject and the performative verb, e.g. I hereby submit my resignation.

Performatives can be negative in meaning and in structure as follows:

- I hereby refuse your resignation.
- I hereby don't agree to your resignation.

English direct performative utterances must have the performative verbs in the present tense in the case of explicit speech acts, but this is not necessarily the case in implicit speech acts. The examples above illustrate the case of explicit speech acts.

The following utterance exemplifies an indirect speech act with no explicit performative verb:

- I'll lend you some money when I cash my salary.

In this example (will + v) express a promise, though a conditional one.

- The following statement can also exemplify an indirect speech act.
- This watch is yours.

Here we can imagine a situation in which someone, for example, gives a watch as a present to his wife, sister or friend. So the speech act of giving a present has been performed by means of a statement. Speech acts might have the form of a question, but the intention of the speaker who utters the question is to perform something else, for example, a request. Thus,

- Can you pass the salt? does not question the ability of the addressee to pass the salt. Rather, the speaker in uttering this question wants the hearer to realize and recognize that this is a request to pass the salt. In natural language we can get things done by people through different ways. For example, directives (directing people to do something) can take a number of forms. Holmes (1992: 289 – 90) speaks of an indefinite number of possible utterances which could express a directive. She cites some examples of how to get people to sit down which range from orders and commands to declaratives as follows:

- |   |                               |
|---|-------------------------------|
| - Sit down                                | imperative                    |
| - You sit down                            | you imperative                |
| - Could you sit down?                     | Interrogative with modal verb |
| - Sit down, will you?                     | Imperative + interrogative    |
| - Won't you sit down?                     | Interrogative with negative   |
| - I want you to sit down.                 | Declarative                   |
| - I'd like you to sit down.               | Declarative                   |
| - You'd be more comfortable sitting down. | Declarative                   |

In this context language can be seen as defined by Halliday (1973: 7) as " meaning potential ": " that is as sets of options ". But people take into consideration the factors against which they decide on their choices of options, which include the social context, the social distance, the social values and culture, and the interactants themselves: who is saying what to whom, in what capacity, and for what purpose, and the shared assumptions and knowledge of the world. One important remark about the functioning of utterances as speech acts is the intention of the speaker concerning the message he wants to convey. An utterance may express or have more than one illocutionary force. Kempson (1977: 59) points out a few linguistic actions of the sentence:

" There are four large bulls in that field. " She explains that this sentence " may be used as a warning (to a walker who is about to cross the fence), a statement (to a new assistant on the farm), a boast (to a fellow farmer), or a threat (to a boy who is misbehaving). "

The same also applies to other forms of utterances, i.e. imperatives and interrogatives. Kempson (ibid, p. 67) explains that " we can use an interrogative form to give information or to make a request for action, and we can also use an imperative both to give information and to request information. "

### ***Previous Studies***

To the best of my knowledge few studies were conducted in this area, though not strictly contrastive in nature and focus. The first study was conducted by Khalil and McCarus (1999) and dealt with performative utterances cited from MSA written genres: “plays, short stories and formal/legal documents, texts that should provide a higher incidence of performatives “ (p. 8). In the second study, El-Zeini (2001) has examined expressions of gratitude in colloquial Cairene Arabic. She also cites some other studies that have dealt with the same topic, i.e. expressions of gratitude (EOGS) in Arabic, in addition to some more other linguistic functions. But she points out that Hussein’s study (1995) "is the only one that describes EOGS as a speech act in Arabic " (p. 173).

In an attempt to examine the cultural differences in the implications of expressing thanks, Hinkel (1994) investigated the ability of 199 non-native speakers of English (Chinese, Arab, Indonesian, Korean, Japanese and Spanish) to judge the appropriateness of giving thanks in common situations similarly to native speakers of English. The study revealed that 199 non-native speakers ranked expressions of thanks for appropriateness significantly different from the 34 non-native speakers of the control group. Hinkel’s study (1994) showed that native speakers were very consistent in their judgments of the relevant thanking expressions whereas respondents whose native languages were heterogeneous showed no consistency in their rankings of the thanking expressions studied.

Morsi (2010) investigated how Egyptians living in the United States utilize their vernacular Arabic to express gratitude and indebtedness in return for a favor or generosity. She explains the strategies and various expressions Egyptians used in her study. The instances of expressing thanking in her study and responses to it as used by Egyptian Arabic speakers living in the United States show that these Egyptians recourse to repetition, redundancy, and plenty of formulaic expressions which include blessings and supplications as strategies to convey sincerity and gratitude to their addressees.

### **RESEARCH QUESTIONS**

The study is meant to answer the following two questions:

1. How do English and Arabic realize certain speech acts (i.e. authoritative, promising and thanking)?
2. What differences do English and Arabic display as to how they structurally and lexically realize such speech acts?

### **METHODOLOGY**

The English and Arabic corpora of this study comprise spontaneous spoken utterances that are authentic and contextualized. The English examples were collected from Tillitt and Bruder's book entitled "Speaking Naturally: Communication Skills in American English" <sup>1</sup>, in addition to references which contain discussions on speech acts. As for the Arabic examples, these have been collected from both MSA (Modern Standard Arabic) and daily social interactions, as observed and heard by the researcher in his daily interactions with native speakers of Arabic in Bethlehem

---

<sup>1</sup> Many English utterances have been borrowed from Tillitt and Bruder's book entitled "Speaking Naturally: Communication Skills in American English" , Cambridge University Press (1985).

Governorate. The researcher for this part of the corpus has focused on how native speakers of Arabic would perform thanking and promising or committing themselves to doing things in their daily transactions. Of course, most, if not all, of this part focuses on Palestinian dialect, of which Bethlehem regional dialect is exemplary. The thanking (expressing gratitude) utterances consist of expressions collected by the researcher from villagers and peasants or expressions used by females in their social interaction. The colloquial ones are more realistic in this regard because they are frequently used in the most natural context. The collected Arabic and English utterances have been respectively presented to a panel of seven native speakers of Arabic and another panel of seven native speakers of English working at Bethlehem University in the West Bank to appeal to their intuitive knowledge and to get their feedback on the basis of their immediate reactions. Both panels, with very few exceptions, judged the given utterances as authentic and natural.

## RESULTS AND DISCUSSION

### *English Language*

#### *Declaratory (Performative) acts:*

Consider these examples:

1. I hereby pronounce you guilty.
2. The court/jury hereby permits you to stand down. (Allan, 1986: 168)
3. We hereby authorize you to pay on our behalf a sum not exceeding \$ 500. (Allan, p. 168).
4. You are hereby authorized to pay .....
5. Out!
6. I don't grant your request. (Allan, p. 171)
7. I refuse your request. (Allan, p. 171)

Declaratory acts in English as the examples above show can have three types or forms:

- Form 1 consists of subject (first person) + (hereby) + performative verb+ other words:

e.g. I (hereby) pronounce you guilty.

- Form 2 consists of a declarative statement which can be either an active voice statement consisting of a subject (the name of an institution or an authorized body + (hereby) + a performative verb + other words:

e.g. The court/jury (hereby) permits you to stand down. It could also be a passive voice statement.

e.g. (1) You are (hereby) authorized .....

(2) Notice is hereby given that trespassers will be prosecuted.

It should be noted that " the person(s) responsible for illocution is (are) represented by the agency of the performative clause. Thus, it is a necessary condition on the explicit performative clause that S (speaker) is agent for himself or another, whichever takes responsibility for enforcing the illocution in the performative " (Allan, 1986: 169)

- Form 3 has no subject (overt subject) and no explicit performative verb or object ..... etc. It is enough to use a particle, for instance, as this example shows:

- " Out! " in the sense " I declare the ball out! uttered by a referee.

The above examples under forms one and two have performative verbs in the simple present tense. However, performative verbs can occur in the present progressive as well, as in:

- I am betting you £10 Arsenal will win.

Another important point is that declaratory performative verbs can occur as negative performatives, as in:

- " I don't grant your request, " provided it is uttered with the appropriate prosody. In addition, the verb ' refuse ' can be used to express a negative performative act as in:

- I refuse your request.

### *Commissives*

Examples:

- I (hereby) promise to come to the party.
- " I am hereby promising you not to scatter chips on the carpet " (Allan, 1986: 170).
- " I do promise to come more often " (Allan, p. 170)
- I will not scatter chips on the carpet anymore.

It is clear that commissives in English can occur in the simple present and the present progressive when they have explicit performative verbs as in:

- I (hereby) promise to come to the party.
- I am (hereby) promising you not to scatter chips on the carpet.

They also occur in the emphatic-do form as in:

- I do promise to come more often.

It is conditional that the performative clause occurs in the indicative mood. When commissives have no explicit performative verbs, they occur in the future with will:

- I will not scatter chips on the carpet any more.

Allan (1986: 174-5) sums up the necessary conditions on the form of explicit performative clauses in English as follows:

1. The clause complies with the normal rules of English grammar.
2. The main verb in the performative clause must be a performative verb which spells out the illocutionary point of U.

3. The performative verb must be in the present (non-past, non-future, non-perfect) tense, because the illocutionary act is defined on the moment of utterance.
4. A performative clause must be 'realis', i.e. designate an actualization of the illocutionary act. Therefore, (a) a performative verb can only co-occur with root modals which are 'realis', and not with 'irrealis' epistemic modal auxiliaries; and (b) a performative clause must be in the indicative mood.
5. The subject of the performative clause is conditioned by the fact that the speaker S is agent for either himself or another, whichever takes responsibility for enforcing the illocution described by the performative verb. More often than not this controls the form of the SU NP.
6. It is often said that a performative verb necessarily occurs in the simple aspect; and it does normally do so, perhaps for the same reason that the simple aspect is normal in on-the-spot reporting of football matches, baseball games, etc. However, there are occasions where a performative may occur in the progressive aspect. Conditions 2-6, and 7 below, constitute sufficient conditions on the form of the performative clause.
7. A performative verb can typically be preceded by the adverb 'hereby' meaning "in uttering this performative." This adverb will precede the negative performative 'not' or auxiliary verb + n't or a negative performative.

(pp. 174-5)

- We also note that: (i) a performative clause may be either positive or negative, in the sense of denoting an act of doing or not-doing respectively; and (ii) a performative clause may be emphatic.

#### *Thanking*

Thanking as a speech act can occur on numerous occasions. Leech in this connection (as cited in El-Zeini, 2001: 172) defines thanking as "a convivial function whose goal of stating appreciation helps maintain a polite and social atmosphere."

For the purpose of this study, thanking on the occasions of giving a gift, doing a favour, helping and asking about someone's health for the English part of the study will be examined as illustrated by Tillit and Bruder (1985). Informal language or utterances will be the focus of the discussion.

#### Thanking for a gift:

Native speakers of English receiving the gift usually say three things:

- " 1. an expression of thanks;
2. a compliment on the gift itself, showing that the recipient likes the gift; and

3. a question relating to the gift (its origin), use, maker ... etc) to show interest in the gift “ .

Examples:

1. When receiving roses:

- Oh, thank you! I just love roses. Are they from your garden?

2. When receiving a picture:

- It's beautiful! Thank you very much. I've always wanted a picture from Japan. Did you get it in Osaka?

- “ Another way of thanking for a gift is to use an expression of thanks and then to state that a gift was not necessary or expected:

- Oh, Thank you. But you really didn't have to. “

(p. 37)

#### Thanking for doing a favor or for helping

In this situation someone volunteers to do something to help another party, a friend, or anybody who may be in need of help or who might ask to give him/her a hand in doing any of his/her little businesses. People who receive help find themselves obliged to say something in return for this help. Sometimes in case of receiving “ bigger “ favours, that is, ones involving more time or effort, the beneficiary ... may also give a gift to the doer of the favor “. (ibid, p. 38)

#### Expressions of gratitude native speakers of E. use in informal situations:

- Thank you very much.
- Thank you so much.
- Many thanks.
- Thanks, you've saved my neck.
- Thanks, love!
- Thanks a million!
- Thanks a lot for ....
- I really appreciate your help!
- Thanks!

#### Expressions of gratitude when someone tries to help but fails the attempt:

- “ Thank you very much for trying, at least.
- Thank you so much for your efforts.
- Thanks anyway.
- Thanks a lot. “ (Tillitt & Bruder, 1985: 41)

Syntactically, expressions of gratitude as evident from the examples above, can vary in structure:

1. the verb ‘ thank ‘ + object (a pronoun referring to the person offering help) + adv. P. (usually very (so) much.
2. I + adv + V + obj. (NP): I really appreciate your help.
3. NP —————> modifier + (N-plural): Many thanks.
4. N (PL) + a word expressing affection: Thanks, love!
5. Thanks + a comment: Thanks, you've saved my neck.
6. Thanks + NP which functions as an adverbial: Thanks a million.

a lot for trying at least.

I declare the establishment of the state of Palestine.  
I declare Palestine a State. (Uttered by President Arafat)  
An active simple present tense has been used.

(2) *yahallu-l-barlamān*

Is dissolved the parliament.  
The Parliament is dissolved.  
(Simple Present Passive)

2. Perfect:

- *zawwajtuka ibnati*

I married you daughter-my.  
I married you my daughter.  
(I marry you my daughter).  
or (I give you my daughter's hand in marriage)

- *bi<sup>3</sup>tuka sayyarati*

I sold you car-my.  
I sold you my car.  
(I sell you my car)

3. Imperative:

- *iðhabū fa'antum a-ṭ- ṭulaqā'.*

Go-you, you free.

Go, you are free.

(was uttered by Prophet Muhammad (peace be upon him) when he freed captives, once his enemies, after conquering Mecca).

- *liyutlaq sarahu-s-sujanā'*

Let release freedom of prisoners.  
Let prisoners be released.  
(I order prisoners be released)  
(uttered by a king/president of a state)

4. Nominal Clauses:

- *'anti ṭāliq* (You divorcee)

You are divorced  
(uttered by a Muslim husband to his wife to divorce her)

- *'anta mafusulun mina-l-<sup>3</sup>amal*

You dismissed from the work (job).  
You are dismissed from your job.  
(You are fired from your job)  
(uttered by an employer, a boss or a manager)

*Arabic declaratory or performative acts:*

The focus here is on colloquial expressions of promising or pledges. But for the sake of contrast, some examples of formal commissives will be discussed.

1. Formal Commissives:

- *sawfa 'azūruka*

Will I visit you  
(I will visit you)

No performative verb. Will + V constitute the promise, same as in implicit or indirect commissives.

- *'a<sup>3</sup>iduka biḏālik*

I promise you with that.  
(I promise to do (that))  
(Here an explicit performative verb is used in the simple present tense, same as in English).

- *wa-Allah-i la 'ahḏuranna*

by Allah emphatic particle I come + emphatic particle.  
(I will certainly come).  
(Three emphatics are used: a solemn oath + emphatic particle (L) prefixed to the verb (come) + emphatic “anna” suffixed to the same verb.

- *la-ka <sup>3</sup>alayya 'an 'abḏula juhdi.*

For you on me to exert effort – my  
(I promise you to do my best)  
Structure: PP + PP + Particle + simple present + Obj.

- *'i<sup>3</sup>tabir ḏālika 'amran mulziman lī*

Consider (you) that a matter binding to me.  
(illocutionary force: I commit myself to this matter)  
Structure : (imperative + clause)

2. Informal (colloquial) Commissives:

- <sup>3</sup>ala 'eini w <sup>3</sup>ala rāsi

On my eyes and on my head  
( I promise) or (With pleasure!)  
Structure : PP and PP (no subject + no verb)

This expression denotes emphasis and strong commitment. The body parts mentioned in the two prepositional phrases are two of the most important organ's of one's body. The connotation is that the speaker strongly, solemnly and respectfully commits himself to keep his promise.

Similarly is the following expression:

- min-l-<sup>3</sup>ein hāy la-l-<sup>3</sup>ein hāy

From this eye to this eye.

This is uttered with the speaker's finger pointing to each eye. The implication is that the request (the thing wanted by the hearer (interlocutor)) will be granted or done, and that the speaker will not be able to look the hearer in the eye if he (speaker) does not keep his promise.

Structure : (PP + PP)

- <sup>3</sup>ala ha-l-kašim

On this nose.  
(I promise)

Again a body part is referred to make a promise. In Arabic, the nose as a body part connotes honour and pride; therefore, when someone makes a promise touching his nose with his finger, his promise is to be taken very seriously. Hence, we find an Arab who says:

*Qawmun humu-l- 'anfu wa-l- 'aḏnābu gayruhumu      wa man yusawwi bi 'anfi-n-nāqati-ḏ-  
ḏanabā*

(My) People are the nose; others are the tails. Who equalizes the she-camel's head with the tail?

Structure : (PP → P + NP)

- 'amrak ya sīdi

Your order master – my.  
Your order my master.  
(I promise to grant your request)

This promise is made to someone who enjoys high respect for being a dignitary or a close friend.

Structure : Nominal clause → GP + vocative

- wa law ! 'ana mahsū bak

a particle of exclamation I am yours.

(I promise, with pleasure !)

This is also a promise made to someone who is thought of highly by the speaker making the promise.

Structure : Exclamatory particle + nominal clause.

- 'ayy *kaṭa* ' *raji<sup>3</sup>nī*

If you find any defect, I am responsible.

This is said during a transactional exchange. It is a pledge made by the speaker to emphasize the good quality of his services (goods) and that he will be responsible for any defect discovered when the consignment is delivered to the hearer.

Structure : Conditional sentence (utterance)

- *rah* *yiwasalak* *Lahad* *indak*

Will reach you to your place.

It will reach you to your place.

(It will be delivered direct to you)

This is an implicit promise: future tense.

- 'ana *mahsub* *šawārbak*

I am for your moustache.

(I promise)

This is another promise which refers to a bodypart i.e. the hearer's moustache. The reference connotes high respect, and, therefore, it will be taken as a solemn promise and commitment on the part of the speaker.

Structure : a declarative statement

- w *rahmit* ' *abūy fi trābu gir* ' *azūrkum*

And grace father-my in soil-his will I visit you.

(I swear on my father's grave to visit you)

This is a very solemn promise made by a swear on the speaker's father's grave to fulfill the visit to the hearer. The speaker cannot but do so.

Structure : (a swear (on something) + an emphatic word (*gir* which is equivalent to will)+ verb.

- *tawakkal* *ala Allah*

Depend on Allah

(Trust in God)

(I promise)

“ This is a promise which is made implicitly, but it denotes the speaker’s good intention to fulfill his promise using a religious expression. “

Structure: Imperative clause which has positive religious assurances.

*Informal expressions of gratitude in Arabic:*

El-Sayed (1990), as cited in Eli Hinkel (1994) points out that thanking and responses to it in Arabic culture are utilized as a way to establish closer social relationships. “Expressing thanks establishes social reciprocity and group belonging between the speaker and the addressee”. The following occasions or situations were selected as is the case with the English part of the study.

- Expressions of gratitude for a gift

- *šukran*

(Thank you)

- *šukran jazilan*

Thanks a lot.

Many thanks!

- *rabbna ydīmak fouq rāsi*

Allah-our keep you above (on) head-my

" May God protect you for me! "

This is uttered by wife to husband, or sister to brother in return for a gift, usually in a village or a rural area.

- *ykaθθir kirak ‘afdālak ʾalina kθīra*

Increase (Allah) bounty-your, favours-your on us many

(may Allah (God) increase your bounty; you always overwhelm us by your favours.)

This is uttered to someone who is superior to the speaker because the hearer repeatedly gives generously.

The following expression functions in the same way:

- *gamartna bkaramak w lutfak*

You overwhelmed us by your generosity and kindness.

- *min yadd ma nī<sup>3</sup>damhāš*

From a hand that we do not miss

May Allah save your hand.

(May Allah protect you for us)

(very often said by a mother to son; or sister to brother)

- *Allah ywassī<sup>3</sup>ha <sup>3</sup>alik*

Allah enlarge it upon you.

" May Allah give you more and more! "

(Very often said by a needy person when offered a gift or charity from a friend or a relative).

- Expressions of gratitude when receiving favours, assistance or help:

- *hāḏa ma<sup>3</sup>rūf ma bansā tū l <sup>3</sup>umri*

This is a favour that I will never forget all my life.

(This is said when someone does a great favour to the speaker)

- *yislamu 'idik, gallabtak ma<sup>3</sup>āy*

Save hands- yours, bothered I you with me

May Allah save your hands; I have bothered you.

(said when someone gives a hand to someone else (the speaker), usually said by a female)

- *ykiff <sup>3</sup>annak šarraha*

Drive away (Allah) from you evil-its.

May (Allah) protect you against its evil (the fire).

This is said when the speaker gets his cigarette lit by the hearer.

Usually the hearer reciprocates by saying.

- *wa la tqāsi harrha*

You no suffer heat – its.

(May you never suffer its burns)

- *Allah yiqaf ma<sup>3</sup>ak*

Allah stand with you.

May Allah be with you.

(May Allah (God) help you)

(Usually said by a female)

- *Allah yirda<sup>3</sup>alik w yihmīk*

Allah be pleased on you and protect you.

(May Allah be pleased with you and protect you!)

(Usually said by a female)

- *Allah yib<sup>3</sup>id a z-zālmīn<sup>3</sup>annak*

Allah drive away oppressors from you.

(May Allah keep oppressors away from you)

(Usually said by a female)

- *Allah yinišlak min kull dīq wa yij'allak fi kull tarīq sdīq*

Allah save you from every distress and make for you in every road a friend.

(May Allah save you from every distress and give you a good company wherever you go!)

(Usually said by a female in return for a big favour)

- *Allah ytawwil<sup>3</sup>ūmrak*

Allah extend your life-span

(May Allah let you live long!) (May you enjoy longevity!)

- *Yisqik min zamzam*

Drink you from zamzam

(May Allah enable you to drink from the water of Zamzam (at the Holy Mosque of Meccaa in Saudi Arabia). (said by the speaker when offered a drink of water)

Expressions of gratitude after a visit to ask after someone's health:

The most common expressions heard in our area and dialect are the ones in these exchanges:

Visitor to patient + when leaving: *biruh<sup>h</sup> aš – šarr in ša'a Allah*  
Go the evil, if Allah wills.  
Get better, Allah willing  
(May you get better soon)  
(Get better soon)

The patient usually reciprocates: *Allah la ywarrīk šarr*

May God not show you evil.  
(May Allah bestow health upon you)  
(May Allah protect you against evils)

Visitor when leaving: *mšafa wi m<sup>3</sup>āfa 'inša'a Allah*

May you recover, God willing!  
(May you recover soon!)

Patient reciprocates: *šukran, Allah yib<sup>3</sup>id-l-marad<sup>3</sup>annak*

Thanks, may Allah keep off disease from you.  
(Thanks! May you remain healthy and sound)

It is clear from most of the expressions of gratitude used by Palestinians in their daily interactions that the most frequent expressions used are of the supplicant form. This comes to confirm the findings of El-Zeini (2001: 172). These supplications include the mention of Allah (God), commonly at the beginning, or in an invocative expression at the end of the supplication. In case this mention is not explicit, it is implicitly understood. Usually, in addition, those supplications include a simple present tense.

## **SUMMARY AND CONCLUSION**

### ***Declaratory (Performative) Speech Acts***

Declaratory (performative) speech acts in English can have the following characteristics:

- a) Explicit performative in which there is a performative verb in the present tense (simple or progressive, active or passive. The subject can be first speaker (I, we) or an institution, a body, a group, a court ... etc, acting as the agent.
- b) There is no evidence of implicit declaratory acts, i.e. in which there is no preformative verb;
- c) A particle alone can be used (with the subject and verb ellipted);
- d) The adverb ‘ hereby ‘ is optionally inserted between the speaker and the verb in explicit performative acts;
- e) The emphatic ‘ do ‘ can be used with the performative verb, in which case it must precede the verb.

In contrast, Arabic declaratory (performative) speech acts are characterized by the following;

- a. Explicit performative verbs can be either simple present (imperfect) or simple past (perfect);
- b. Declaratory acts can come void of verbs, i.e. they can be nominal clauses which include no verbs at all;
- c. Subjects of explicit verbs are implicitly understood as ‘ I ‘ or ‘ we ‘;
- d. Declaratory acts can have explicit performative verbs in the passive form. It is understood that the speaker is the agent who has the authority or empowerment to do so, i.e. to perform the act.
- e. A particle alone does not function as a performative speech act in Arabic.

### **Commissives**

Commissives in English can be either explicit or implicit speech acts. In case of explicit speech acts a commissive verb (simple present or progressive, active or passive) is used. In implicit speech acts, we find (will + verb) instead of explicit verbs. An emphatic ‘do’ can precede the commissive verbs in English.

In Arabic, on the other hand, commissives vary in structure from a prepositional phrase, a nominal clause, a conditional clause to utterances which start with a performative verb as in English. The performative verb can be explicit (simple present) like 'a'id' (I promise), 'ata'ahhad (I pledge) or a future tense (with sawfa (will) + verb (will + verb). Sometimes the dividing line between commissives and assertives in Arabic tends to disappear, as in the following speech act laka 'alyy 'an 'aḏ ul juhdi (I promise to exert all effort) see this example above). Moreover, in Arabic commissives, there is reference to body-parts such as head, eye, nose, and neck, for these refer to and connote honour, pride and strong commitment.

In addition, double emphasis can be prefixed and suffixed to the performative verb as *la'ahduranna* ( I will certainly come), in which the emphatic *lām* (L) is prefixed to the verb, and the emphatic (*nnā*) is suffixed to the verb itself, but this is a case of a formal commissive speech act, which we do not hear in layman's daily interactions; even we can have the same example in a triple emphatic form in which the verb is preceded by the oath “ *wa-llāhi* (I swear by God).

### **Thanking**

Thanking as a speech act in English informal exchange, varies from one word to many. It can come as a plural noun alone (thanks!), or as a noun phrase (Many thanks, or a verb clause (Thank you) + an adverbial qualifier (so/very much). Sometimes, an expression of gratitude can be followed by a comment to acknowledge the importance or vitality of the hearer's effort, help, gift or favour.

In Arabic, however, the speech act of thanking in informal situations, i.e., in daily social interactions or transactions which occur in the colloquial dialect, we find completely different expressions than in English. In most cases, religious formulae are found which take the form of a supplication with an explicit mention of the name of Allah (God) at the beginning. In cases, where the name of Allah is not mentioned, it is implicitly understood or taken for granted, and can be recovered very easily.

In all cases of thanking, the expressions show politeness, acknowledge the hearer's help, favour or gift, and express deep indebtedness to him. In most cases as well, supplications are uttered with verbs after God's name. Thanking in colloquial Arabic expresses strong positive feelings and sentiments toward the addressee, and they are face threatening on the part of the speaker.

The data has shown that in informal or colloquial Arabic speech acts people rarely, if at all, use performative verbs. In fact, performative verbs more often than not, are used in the standard dialect (variety) of Arabic. They are used as such in formal situations, and as Stubbs (1983: 157) puts it, though not in connection with Arabic speech acts, “ At the very least they differ in style and emphasis. In other words, the actual use of explicit performative verbs depends on the formality of the context, on the emphasis expressed or on the functions of an utterance in denying a preceding utterance .”

To conclude, this paper has attempted to examine how both English and Arabic realize certain speech acts, mainly authoritative speech acts, promising and thanking. For the sake of the study, the researcher collected some data which consisted of declaratory speech acts, commissives, and thanking in both English and Arabic. As for speech acts of thanking, these were confined to informal expressions (expressions we hear in everyday social use of either language). But these have also been specified in terms of occasions on which they are used: receiving gifts, help, favours and showing interest in someone's health. Structures of speech acts were analyzed in a way that could serve the purpose of the study. Finally, a contrast (pointing out the differences) between English and Arabic was made.

Arabic dialects (colloquial, social and regional) are full of speech acts which have to be explored by researcher. It seems that this area is still fresh ground for research. Cross-cultural and pragmalinguistic characteristics of these speech acts contrasted with their counterparts in English are of paramount importance for sociolinguistic, contrastive, semantic and translation studies.

## LEARNING DISTRACTIONS AND MISERIES THROUGH PARTICIPANT OBSERVATION IN ESL CLASSROOMS

**Parastoo Babashamsi**

*Faculty of education, University Putra Malaysia, Malaysia*

### ABSTRACT

Classroom observation is a significant part of educational measurement in teacher evaluation system across the country. The purpose of the study is to investigate the feeling and anxiety of learners in participant observation and what is expressed in the questioner's sheet. Our goal is to identify physical and emotional behaviors that are linked to students learning. We explored the effect of observation modes on inferences about the level or ranking of teaching in similar levels or in classrooms for one term. A qualitative research method is being employed in the study. Sampling is purposive in selecting the classes for observation and answering the questioner's and all the informants are aware of the effect feeling of an observing when they answer the questions. This topic is very specific and never mentioned in any previous study.

**KEY WORDS:** learning distractions, miseries, ESL classrooms

### INTRODUCTION

Classroom observations are useful exploratory strategies because human observations can intuitively discern the high level of behavior and make appropriate judgment on limited information that may be difficult to automatically be decided from raw sensor data.

Participant observation refers to a form of sociological research methodology in which the researcher takes on a role in the social situations under observation. Covert observation involves the researcher fully participating in the activities of the social group without informing them, thus the research is carried out secretly, and share in the lives and activities of those being studied by learning their language and interpreting their behavior (Becker, 1985).

The researcher could gain access into the group through contact with a gate keeper who would introduce him or her to the group. Overt participation on the other hand is when the researcher is open about the purpose of his presence and is given permission to perform this research by the person in the highest state of authority. Participant observation involves examining social behavior as it occurs rather than as it is reported through interviews and questionnaires (Encyclopedia).

Much has been written on the roles used by the participant observer (Adams & Preiss, 1960; Bryman & Burgess, 1999; Gans, 1999). Gold (1958) extended the idea of participant observation into four major roles: (1) the complete participant, (2) the participant as observer, (3) the observer as participant, and (4) the complete observer.

As mentioned in International Encyclopedia of the social science (2008); the *complete participant* rarely reveals that research is being conducted; however, in this circumstance it is difficult for the participant observer to pose questions. The *participant as observer* role involves researcher and researched being aware that their relationship stems from research activity. The *observer as participant* consists of the observer making the research purpose clear from the start of investigation. Finally, the *complete observer* role entirely removes the researcher from any form of participation so that the purposes of the research are not revealed. Major goal of observation in this study is to understand whether and how teacher's instructional practices changed overtime. Specifically to what extent teachers increased their use of instructional strategies that enhance students learning. We need to know how a teacher taught the materials in his/her style, approach, method and rapport with the students. We need to know how receptive the students were and what was going besides those things we expected.

Student's emotion toward learning can have a drastic effect on their learning experience. (Ivon Arroyo). Students evaluate the effective inferences agents on both affective and emotional outcomes. Previous projects have produced computational tutors that recognized and responded to models of emotion. Projects have tackled the sensing and modeling of emotion in learning and educational gaming environments. A dynamic decision network was used to measure student emotional state based on variable such as heart rate, skin conductance and eyebrow position. Studies have evaluated the impact of affective interface agents on both affective and motivational outcomes based factors (gender, ethnicity).Lack of engagement was shown empirically to correlate with a decrease in learning (Hoda Eydgahi).

Researchers can maximize their abilities to grasp motives, beliefs, customs and such. (Rothe, 1993) The most widely used procedure or research method has been the systematic classroom observation based on interactive coding system. That you can apply what you learn from observation to modify your program in order to adapt your environment and teaching strategies (Dr. Peter j. Dirr). There are different observation methods; checklist, inventories, internal rating, holistic rating, narrative descriptions, questionnaires, models, open ended questions.

### **ADVANTAGES AND DISADVANTAGES OF PARTICIPANT OBSERVATION**

Bernard (1994) lists five reasons for including participant observation studies all of which increase the study's validity:

1. It makes it possible to collect different types of data. Being on a site over a time familiarizes the researcher to the community, thereby facilitating involvement in sensitive activities to which he/she generally would not be invited.
2. It reduces the incidence of reactivity" or people acting a certain way when they are aware of being observed.
3. It helps the researcher to develop questions that make sense in the native language or are culturally relevant.
4. It gives the researcher a better understanding of what is happening in the culture and lends credence to one's interpretations of the observation. Participant observation also enables the researcher to collect both quantitative and qualitative data through surveys and interviews.
5. It is sometimes the only way to collect the right data for one's study.

However class observations cause problems for teachers and trainers;

-They tend to be judgmental, relying, on trainers subjective judgment rather than developing.

-Participant observation cause considerable stress and upset on part of instructor.

-Teachers don't like it; they think it is threatening, frightening.

-The checklist focused on too much at once.

-There was no continuity from the first to second observation and visits are not linked.

-As Barbara B. Kawalich (2005) illustrates, different researchers, understanding of what they observe based on representation of events and the subsequent of what occur.

## **PROBLEM STATEMENT**

Several problems have been identified when conducting participant observation. Researcher must always remember that they are located in a social setting for the purpose of social science. They are involved and detached. This will help them to overcome the risks of over identifying with other participants and "going native" in the setting by no longer questioning the actions and activities that are observed (Encyclopedia, 2008). The researcher needs to collect data that are reliable and valid (Shaffir & Stebbins, 1991). Ethical problems are also frequently raised for the researcher through being placed in a marginal role with the result that stress and anxiety have to be managed throughout a study. This is frequently the case in covert studies where the researcher is unable to take notes or to use a range of other methods of research and often violates principles of informed consent, privacy, and confidentiality (Burgess, 1989; Lauder, 2003). The participant observer therefore needs to manage the study by being aware of the problems encountered in the research process by engaging in critical self-reflection of the research experience (Bourdieu, 2003) and by bringing the study to a successful close.

It is evident that language learners at different stages have problem with observers. In one hand observation increase the amount of teacher new strategy usage. On the other hand it increases learner's anxiety decrease their concentration during the class. However numerous studies have been done on learner's anxiety and teacher's dissatisfaction; Marrian and Caffarella (1999, p.139), Edgar Schein, As Adler (1994, p.380), Johnson and Sackett (1998).

In contrast to previous studies we want to use this factor in qualitative method. In attempt to end this study duty to see how this element is perceived by the learners and to what extend it affects the student's concentration.

## **RESEARCH QUESTIONS**

\_Will the participant observation distract student's attention hence attending in classroom?

\_Will participant observation infer scores due to this model of observation?

## **METHODOLOGY**

### ***Participants study design***

For the purpose of this research a purposive sampling is used, and to elaborate on details more, a qualitative study is used. Our participants Four classes in pre-intermediate and four in intermediate levels of Zabansara English Institute (120 students) where chosen purposively , to be able to speak English and answer perfectly, to be observed so later they can answer the interview questions in more details. Eight part time English educated teachers were selected because of their experience and knowledge in teaching English. The teaching team was informed about the TTC and observation would focus on TTC framework of the institute. Furthermore, the teachers were asked not to change their teaching behaviors during the observed classes.

### ***Instrument***

This study tries to understand students through their reaction to participant observer and by answering interview questions that is done after observation. The reason for this is to understand students real feeling by entering the observer into the classroom and its side effects on learning process. Because participant observation is one of the rules of evaluating the instructors obeying TTC framework of the institutes this observations are necessary, on the other hand If these observations are going to have a negative effect on learning process the supervisors must think of it and find a solution. Data for different students and teachers can be summed after the interviews.

### ***Procedure***

The observations for the study were done by the supervisor, who visited the classes twice a term, a total of 16 observations (20-30 minutes each) were recorded. This study is based on semi-structure in-depth interview from twenty four informants. The data are transcribed and the coded for analysis. In- depth interview is to receive adequate information besides to express their feeling, opinions, views, and thoughts. Meanwhile the researcher gets to the point rapidly and the vogue responses are made clear. In order to gain the validity, interview questions were examined by two PhD teaching English field and their comments were taken into account. The informants in the interview confirmed to transcribe comments of their own.

## **RESULTS AND DISCUSSION**

The observations revealed that usually all classes in different levels were somehow disturbed and confused by the entrance of the observer. But in higher level classes it was obvious that they adapted to the new environment more quickly than the lower levels. They found themselves and became calm after five minutes and try to concentrate on their study and to the instructor. In lower levels this adaptation took around 10-15 minutes and still they more concentrated on observer rather than their instructor. While speaking they just looked at observer, couldn't complete their sentences completely and they were somehow confused. Although higher level students were not so, and either they tried to do their best toward the participant observer.

The questionnaires' were analyzed in relation to the purpose of the study and to analyze data, comparative method is applied in this study. Dick (2005) highlighted that constant comparison is the heart of process qualitative research. The comparison was done between the ideas of informants and concepts as they emerged. Analysis of informants is as follow;

1. Describe your feeling about your English class.

First and foremost, all respondents state that they have a good feeling toward their English class. They like it first because they are enthusiastic in learning new subjects and usually they like their teachers that attracts them toward the class. Likewise, some as a sample stated that;

-I have good feeling to my English class and I like it very much.

-I really like it, it's enjoyable.

-All the classes in zabansara are perfect and I enjoy them.

-They are enjoyable and useful.

It is clear that every one of informants really have a good feeling toward their English class and enjoy it.

## 2. What you like best about your English class?

Most of the respondent's state that they like their teacher, either emotionally or technically.

-Being with good teacher like Mr. Firoozkoohi.

-My friend and my teacher, they are very important to me.

-My class is very good and my teacher makes me relax.

-Our teacher is very good.

On the other hand some of them said they like discussions and speaking parts in the class.

As a sample they some higher level students said;

-I feel very good and nice about free discussions.

-Free discussions; because I think it improve our speaking.

-Interesting discussions are the best part.

## 3. What disturbs you in your English class?

All of the respondents stated that nothing usually disturb them in their classroom.

-Nothing bothering me in the class.

-Nothing, but other class's noise and voice of the TV.

-Nothing, because I come here with love.

All of them clearly stated that no disturbance happened to them during their classroom and that can reveal that everything physically and emotionally is appropriate in the classroom and if there be a disturbance is very small.

## 4. Does the presence of your observer disturb you in your English class?

What we can see understand from the answers of the questionnaire's, we can see that most of the students have positive attitude to this question. That mean more or less they have stress by the presence of the observer in their classes. As some of them mentioned:

-I was stressful.

-So, so.

-Yes I have stress.

But in higher levels this disturbance conditions is reduced. And as the questionnaire's mentioned they have less stress or disturbance less than the lower levels, because they have more self confidence and can speak better than the lower levels.

Of course these students were few but usually they could speak English perfect. From these reactions we can conclude that one of the reasons of having stress during the presence of the

participant observer can be the amount of self concept or self confidence that the students have toward themselves.

5. What are the effects of the presence of observer on you and your classroom?

As we analyzed question four, lower level informants have been more disturbed than the higher level classes, and this is directly stated in this answers;

-I think class is better in these situations.

-Every student tries to become better.

-I try to speak correct.

They usually have stress and the effect of this stress can directly be on the student's concentration and learning process.

Stress can disrupt learning process and memory development (long term potentiating, LTP) as it forces the brain to revert to more primitive survival needs.

6. When you find yourself in stressful situations, do you primarily worry or do you actively seek a solution?

As we analyze the responses of the questionnaires, the higher levels usually stated that:

-When I find myself in stressful situations, I try to solve it.

-I try to seek a solution.

-I usually seek a solution because there isn't any problem that we cannot solve it.

Lower levels stated that:

-I get sad.

-When I have stress, I usually cry.

-I get confused.

Again we can conclude that the higher level students with higher self steam can with the problems better and earlier than the lower levels, so the presence of participant observer can have a more disturbance effect on the students who have lower self steam.

7. How your instructor does play a role your feeling when an observer comes to your classroom?

Most of the informant stated that they feel better when they have friendly instructors that could make them relax. Regarding to the first research question we can conclude that almost all the students who come to the institute usually like their English classes and they have good feeling toward them. THE best thing they like about their classes in the second question is that they first like their teachers and the class environment, and their goal is to speak better. By the third question, nothing special disturbs their concentration while they were in their classroom. In question number four we concluded that usually all the students have a kind of stress and anxiety when observer comes to the classroom, but in question five as we stated, higher level students were less disturbed although they have stress by the presence of the observer, moreover by question six we can see that they can adapt to the new environment sooner because they have higher self confidence.

## CONCLUSION

Although this study is a small scale study due to the limitations of time and number of informants and their short answers to the questions, it provides a glimpse into how students feel by the

entrance of participant observers into class environment. It is argued that this problem may originate from their self confidence, environment or teachers. Thus, finding of this study suggest further research on self concepts. Moreover, results show that great number of factors can affect the class disturbance but why participant observer has the most. Finally, it is worth mentioning that there is no mismatch between what is observed and gained by the observer during the class and what they wrote as the answers to their questionnaires sheet. It is hoped that adopting different research designs, efficient ways of observations be established to avoid the class distractions or learning disturbance.

## **LIMITATIONS OF THE STUDY**

This study has some limitations related to sample of classrooms that may limit the generalization of findings. First the number of the level of the classes needed for observation. Second, though English is a critical course for long-term success, the generalizability of our results remains unknown. Third, the study use a single method of observation and so, how these findings can generalize to other protocols is not known.

### ABSTRACT

As a matter of fact, conditional constructions easily replicate the human intelligent to anticipate various circumstances and to suppose consequences on the basis of known or imaginary conditions. The main purpose of the current study is to consider whether or not conversational shadowing has any impact on the acquisition of English conditional sentences. This study has pedagogical implications for English instructors aiming at educating learners. To fulfill the purpose of this study, 60 English learners at intermediate level from five intact classes in one language institute were chosen. The participants were homogenized in terms of their language proficiency by a standardized proficiency Nelson English test. The standardized proficiency pretest signified that the selected groups were unfamiliar with the target structures prior to the posttest. During the study, the experimental group metacognitively centralizing their attention to language form and meaning of conditional sentences by shadowing everything that their instructor says during interaction and communication. The paired sample t-test computed between the means of the pre-test and post-test showed that there was a statistically significant difference between the performances of the selected group on the post-test. Thus, the analysis of the students' answers in the post-test showed that conversational shadowing had positive impact on teaching and learning the conditional sentences.

**KEYWORDS:** conversational shadowing, pre-test, post-test, conditional sentences

### INTRODUCTION

There are so many languages used in the world, but people all over the world use English as the international language. Bloomfield (1995) noted that English, as the international language, is used in almost every country in the world. English is an essential language for every activity like trading, education or even in science and technology. On the other hand, Hall (1993) assumed that grammar is a description of certain organizing aspects of a particular language. Thus, for using English language, people should be familiar with grammar, as basic part of language, to communicate with each other and improve the ability in understanding many kinds of knowledge.

In view of the above, conditional sentences are one of the important parts of English grammar. Conditional sentences are often used to describe unreal situations, i.e., situations that are the

opposites of the fact. Conditionals are different from other structures as they have two clauses: a subordinate clause (if-clause or 'protasis'), which states the condition of reasoning and a main clause (or 'apodosis'), which features the outcome of inferences (Traugott et al., 1986). Conditional sentences, as intricate syntactic and semantic structure in the international language, have attracted the attention of a lot of language acquisition researchers. Second language learners are engaged in difficulties to produce, comprehend and imitate of this structure. By the way, second language scholars such as Celce-Murcia and Larsen-Freeman (1999) reported that learners of English as a second language (ESL) have difficulties in acquiring English conditionals due to the syntactic and semantic complexities embedded in conditional constructions. In fact, Celce-Murcia, and Larsen-Freeman. (1999) cited a survey done by Covitt (1976), stating that conditional sentences ranked fifth among the serious teaching problems encountered by ESL teachers in the Los Angeles area. With all the problems associated with the difficulties of teaching and learning conditionals, this study, by considering that conversational shadowing is an important second language teaching method in the field of language teaching, mainly attempts to demonstrate the tangible its effect on learners' oral performance for using conditional sentences. According to Murphey (2001), shadowing is a technique in which learner wishing to learn a skill by selecting only certain words and phrases through communicate and interaction with another (mentor), while that person is employing their expertise on a value-producing assignment.

## **THEORETICAL AND METHODOLOGICAL ISSUES**

Conditionals in English have been one of the focuses of study not only in linguistics but also in psychology and philosophy. In linguistics, it has been analyzed from different perspectives, for example, functional grammar (Dik, 1990; Cuvalay, 1996), and semantic and pragmatic analysis (Beck, 1997; Fintel, 1997). There has been a lack of agreement over the meanings and uses of conditionals (Werth, 1992).

Among the most difficult grammatical structures for ESL learners, conditionals stand fifth after articles, prepositions, phrasal verbs, and verbals (Celce-Murcia & Larsen-Freeman 1999). Celce-Murcia and Larsen-Freeman (1999) cite a survey conducted by Covitt (1976) that found conditionals ranked fifth (behind articles, prepositions, phrasal verbs, and verbals) among the most serious teaching problems encountered by ESL teachers in the Los Angeles area. The main difficulties lie in the following aspects:

- a. Form
- b. Meaning
- c. Oversimplified explanations
- d. Time-tense relationships

The learners usually find problems with form and meaning. The form causes problems because conditional sentences consist of two clauses (i.e., if and result clauses), which can switch places. The if-clause (If-C) is the antecedent, in which the speaker states the condition of reasoning, and the then-clause (result-C) is the consequent in which the speaker states the outcome of inferences (Traugott et al., 1986:5). English conditional sentences can be divided into sentences of real conditions and sentences of unreal conditions. The real conditionals can be further divided into those that express some type of factual relationship and those that present a predictive relationship. The unreal conditionals are used to express extremely unlikely or hypothetical situations and situations that are assumed to be contrary to known facts or counterfactual (Zhang, 2005).

The conditional or rather the dependent clause can start with words such as *if, unless, provided (that), providing (that), even though, even if, whether or not, as long as*, and *on condition that*. Conditional sentences directly reflect the language user's ability to reason about alternatives, uncertainties, and unrealized contingencies. An understanding of the conceptual and behavioral organization involved in the construction and interpretation of these kinds of sentences provides fundamental insights into the inferential strategies and the cognitive and linguistic processes of human beings. (Traugott, 2009) Conditional sentences, which are used for a variety discourse functions, from cognitively and linguistically dimensions are intricate structures make big problems for teachers and learners. Until now, much research has been down on conditionals but it is not easy to suggest how conditional sentences should be taught practically. This part of the paper has an attempt to consider previous researches that have been done about difficulties inherent in the teaching and learning of conditionals.

Conditional sentences are common syntactic configurations, which express causal relationships, potentialities, possibilities, and evidence relationships in discourse concerned with explanation and argumentation. In English, a conditional sentence is often expressed in the form of 'If A, then C.' (Li, 1995). The typical English conditional construction is *if p, then q*. The *if*-clause is the *antecedent*, in which the speaker states the condition of reasoning and the *then*-clause is the *consequent* in which a speaker states the outcome of inferences (Traugott, as cited in Chou, 2000). The word *then* can be omitted without distorting the meaning of a conditional sentence.

There are four main conditional types that they differ distinctly from each other with respect to their time reference (present, past and future) and in relation with the actual world (factual, possible and counterfactual). It should be mentioned that each type of conditionals is functionally distinctive and distinguishable. The Present Factual expresses a true and unchanging relationship that is not bounded in time. A Future Predictive expresses future plans or contingencies. Present and Past Counterfactuals refer to impossibilities with reference to the present or the past (Celce-Murcia & Larsen-Freeman, 1999).

Norris (2003) assumed that verb forms in conditional sentences often do not retain their normal references to time (p.43). Consider these examples:

- (a) If it rains, we will stay at home.  
(Future reference: it is only a prediction)
- (b) If it rained, we would cancel the game.  
(Present reference: But it is not raining / Future reference: Raining is not strongly negated; there is still a chance that it will rain.)
- (c) If it was / were to rain, we would have to go inside.  
(Future reference: But it is highly unlikely that it is going to rain.)
- (d) If it had rained, they would all have got wet.  
(Past reference: But it did not rain, so they did not get wet.)

Maule (1988) believes the simplistic approach of introducing only type 1, 2, and 3 conditionals does more harm than good. If students are taught only a few simplified forms, they will be

unequipped to encounter or express the variety of forms that exist in the English language. Ur (1989), in reply to Maule's (1988) article, says that she teaches the traditional three types because although they do form the minority in actual usage, they do "occur frequently enough to be considered useful" and because "they are difficult." Consequently, this study attempts to consider fundamental types of conditional sentences as below:

*Zero Conditional:* This conditional form is used to describe universal statements like facts, rules and certainties. In a zero conditional, both the condition and consequent clauses are in the simple present tense. An example of such sentences is: *If you heat water, it boils.*

*First Conditional:* Conditional sentences of this type are also called potential or indicative conditionals. They are used to express a hypothetical situation that is probably true, but the truth of which is unverified. In the first conditional, the condition is in the simple present tense, and the consequent can be either in past tense or present tense, usually with a modal auxiliary verb preceding the main verb, e.g., *If the acceleration is good, I will buy it.*

*Second Conditional:* This is usually used to describe less probable situations, for stating preferences and imaginary events. The condition clause of a second conditional sentence is in the past subjunctive (past tense), and the consequent clause contains a conditional verb modifier (like *would, should, might*), in addition to the main verb, e.g., *If the cell phone was robust, I would consider buying it.*

*Third conditional:* This is usually used to describe contrary-to-fact (impossible) past events. The past perfect tense is used in the condition clause, and the consequent clause is in the present perfect tense, e.g., *If I had bought the a767, I would have hated it.*

By the way, Ur (1989) explains that the conditional type 1 is not just non-past: the present tense after 'If' actually refers to the future and the past form in type 2 refers to unreal present or at least non-past time, and finally type 3 deals with past time. The students need to know about the oddities of these particular types of conditionals. Present factual and future predictive (conditionals zero and one conditionals) take fewer grammatical features than present counterfactual and past counterfactual (two and three conditionals). Apart from the various conditional forms, the second language learners have problems with the time-tense relationship with if-clause and main-clause. In a study, Covitt (as cited in Norris, 2003) proved that oversimplified explanations, form, meaning, and time-tense relationship are the serious problems relevant to learning the conditional sentences.

Likewise, Nayef and Hajjaj (1997) summarize three points in teaching conditionals: "forms of the verbs, the time reference of the verbs, and the meaning of the condition in each of the patterns"(p.140). They assert that in conditional sentences the agreement of the forms of the two verbs in the two clauses is the source of difficulty for the learners.

According to the study conducted by Ford and Thompson (1986), if-clauses account for nearly 80% of conditional sentences in their corpora, encompassing four functions in both oral and written discourses: offering options for future follow-up activities, introducing contrasts, providing examples for generalizations and making inferences. As social functions, initial if-clauses can also be used to give directives, speak humorously and sarcastically, and offer apologies, commands, advice, and instructions (Celce-Murcia & Larsen-Freeman, 1999). In spoken discourse, Ford (1997) examined conditionals and their functions based on 55 conditionals

from casual conversations of adult native speakers of English, coming up with several social discourse functions of conditionals:

1. Initial If-clauses may connect a comment to the statements said earlier, so it plays a connective role.
2. Conditionals introduce new understanding to the previously spoken stuff which focused on a single idea.
3. If-clauses usually moderate the tone of the message, moving it away from disagreement toward being less confrontational by using softening hypothetical information.
4. If-clauses usually express requests and suggestions rather than commands. They can be used after directives, proposals and offers to bring about effective actions. Conditional sentences can also express desirability. According to Mayes's (1994), findings, conditionals help us explore the relationship between language and the human mind reflecting the psychological thoughts and the state of the speaker (e.g., sorrow, regret, disbelief, cynicism).

Berent (1985) worked on the order of acquisition of conditionals to predict learners' difficulties. Two experiments were conducted to compare the production and comprehension of real, unreal, and past unreal (i.e., types 1, 2 and 3) conditional sentences for 55 advanced and low-advanced adult ESL learners. The findings showed that despite the complexity of structure in type 3, the learners had less difficulty in comprehension than in production.

Therefore, these theoretical and methodological problems show that instructors and learners are confronted with a problem in how to teach and learn conditionals properly and practicality. Thus, this intent study aims to reflect the efficiency of conversational shadowing in learning and teaching conditional sentences. In fact, Shadowing defines as the act or task of listening in which the learner tracks heard speech and vocalize it as clearly as possible, while listening attentively to the incoming information (Tamai, 1997). Learners repeat what they hear after a brief time to shadow and monitor what they shadow simultaneously. This process engages not only the language areas but various other large portions of listener's brain (Kadota, 2007). Shadowing trains the rehearsing process, allowing them to hold the phonological information longer in the phonological loop (Kadota, 2007).

The effectiveness of shadowing in classrooms has been investigated throughout the field on second language acquisition (Kuramoto & Matsuura, 2002), Lambert (1992), Murphey (2001), Mochizuki (2006), Toda and Liu (2007), Tamai, (1992, 1997, 2001, 2005), Suzuki (2007). For example, Tamai (1997) compared shadowing and dictation, and concluded shadowing improved learners' listening proficiency faster than dictation.

## **RESEARCH QUESTIONS**

-To what extent does teaching through conversational shadowing improve the language learners' performance in term of using conditional sentences?

## **METHODOLOGY**

### ***Participants***

The participants of this study were 60 English learners from five intact classes in one language institute whose English knowledge was determined to be at the intermediate level based on the placement test given to them by the institute. However, in order to make sure that the participants were at the intermediate level prior to the main data collection, a Nelson proficiency test was given to them. After the scores were obtained, 30 Of them whose scores were one standard deviation above or below the mean were selected as intermediate level.

### ***Instrument***

The first instrument of this study was a proficiency test that was used to confirm that there was no significant difference between the language knowledge of the selected group as participants. The designed test consisted of three sections: grammar, vocabulary, and reading comprehension questions (10 multiple choice items in each section). Before administrating the proficiency designed test, it was piloted with another group of learners in another language institute to assure its reliability ( $r = 0.80$ ).

The second instrument was a 30-item proficiency test in the form of multiple-choice questions was used to check the learners' knowledge of the use of English conditional sentences, which was administered to the participants after the treatment. It worth mentioning that an item analysis was done and some items were modified, deleted, or replaced by some new ones. Its face and content validity was proven through the expert opinion of the supervisor and English instructors and for ensuring that the post-test is reliable, we used Cronbach's Alpha reliability that its reliability was significantly high and equaled to 0.88.

### ***Procedure***

To achieve the objectives of the study, the following processes were done:

#### ***Pre test***

In order to check the homogeneity of the selected group as participants of this study a proficiency test (Nelson) was administered and the results showed that participants were homogeneous in terms of their language proficiency.

#### ***Treatment***

Based on conversational shadowing as teaching method, a lot of conversations in the form of English conditionals were taught in the classroom context. In fact, conversational shadowing makes an opportunity for learners by exposing to a lot of conversations as ESL context and engaging them actively in conversation. Interactive shadowing, which includes selective shadowing, adds questions and comments from the listener into the conversation making it more natural and showing more involvement on the part of the listener (Murphey, 2001).

#### ***Post test***

When the treatment was over, a proficiency test was administered to assess the participants' knowledge on the four types of conditional sentences. The purpose was to examine whether there has been any significant difference in the scores of the learners after the treatment.

## **RESULTS**

The Nelson test, pre- and post-test were piloted for four types of conditional sentences in order to reflect the purpose of this paper, which is to investigate the effect of conversational shadowing on enhancing learner oral performance in terms of the use of conditionals.

In order to ensure the reliability of the pre-test and post-test, we used Cronbach's Alpha reliability. According this test, pre-test reliability was 0.80 and post-test reliability was 0.88, which highly significant.

*Table1: Reliability Statistics (pre-test)*

Cronbach's Alpha	N of Items
.806	30

*Table2: Reliability Statistics*

Cronbach's Alpha	N of Items
.881	30

The process of data analysis began with analyzing the data obtained from pre and post-tests. A paired sample t-test was run to compare the scores on pre-zero conditional to post-zero conditional session in order to show the efficiency use of conversational shadowing on teaching conditionals. As displayed in Table 3 the mean scores for pre-test and post-test of conditionals through conversational shadowing are 3.60 and 4.87 respectively but their correlation is .006 and low.

*Table3: Paired Samples Statistics*

		Mean	N	Std. Deviation	Std. Error Mean
Pair 1	Pre-zero conditional	3.60	30	1.545	.282
	Post-zero conditional	4.87	30	1.525	.278

*Table4: Paired Samples Correlations*

		N	Correlation	Sig.
Pair 1	Pre zero conditional & Post zero conditional	30	.006	.976

The results of the paired sample t-test of zero-conditional (T-value= 3.205, P-value= .003<.05) revealed a significant difference from pre-zero conditional to post-zero conditional session. Thus, it can be concluded that the conversational shadowing method has positive impact on teaching and learning zero-conditional.

**Table5. Paired Samples Test**

		Paired Differences					t	df	Sig.(2-tailed)
		Mean	Std. Deviation	Std. Error	95% Confidence Interval of the Difference				
					Lower	Upper			
Pair 1	Pre zero conditional - Post zero conditional	-1.267	2.164	.395	-2.075	-.458	-3.205	29	.003

*Figure1: The comparison between pre- & posttest of zero-conditional sentences*

For answering the research questions raised before, data were analyzed and the following tables were elicited. From Table 7, paired sample t-test revealed a significant difference from pre-first conditional to post-first conditional session, where T-value=2.188 and P-value=.009<.05). In table 8 we showed mean of pre-test (=5.73) and post-test (=4.50). Their correlation is .284.

It should be mentioned that the comparison between pre- & posttest of first conditional sentences shows the efficiency of conversational shadowing method on teaching and learning conditionals.

*Table 6: Paired Samples Statistics*

		Mean	N	Std. Deviation	Std. Error Mean
Pair 2	Pre-first conditional	4.50	30	2.097	.383
	Post-first conditional	5.73	30	1.911	.349

Table 7: Paired Samples Correlations

		N	Correlation	Sig.
Pair 2	Pre-first conditional & Post first conditional	30	.284	.128

Table 8: Paired Samples Test

		Paired Differences							
				Std. Error	95% Confidence Interval of the Difference				
					Mean	Lower			
Pair 2	Pre-first conditional - Post-first conditional	-1.233	2.402	.439	-2.130	-.336	-2.812	29	.009

Figure 2: The comparison between pre- & posttest of first conditional sentences

In order to answer the research question raised before, data were analyzed and the following tables were elicited. From Table 11, paired sample t-test revealed a significant difference from pre-second conditional to post-second conditional session, where T-value=5.253 and P-value=.028<.05. In table 9 we showed mean of pretest (=6.50) and post-test (=4.57). Their correlation is .401.

Table 9: Paired Samples Statistics

		Mean	N	Std. Deviation	Std. Error Mean
Pair 3	Pre- second conditional	4.57	30	1.977	.361
	Post-second conditional	6.50	30	1.676	.306

Table 10: Paired Samples Correlations

		N	Correlation	Sig.
Pair 3	Pre-second conditional & Post-second conditional	30	.401	.028

Table 11: Paired Samples Test

		Paired Differences					t	df	Sig. (2-tailed)
		Mean	Std. Deviation	Std. Error	95% Confidence Interval of the Difference				
					Lower	Upper			
Pair 3	Pre- second conditional Post-second conditional	-1.933	2.016	.368	-2.686	-1.181	-5.253	29	.000

Figure 3: The comparison between pre- &amp; posttest of second conditional sentences

From Table 13, paired sample t-test reveal a significant difference from pre-third conditional to post-third conditional session, because T-value=1.233 and P-value=.231(>.05). In table 11 we showed mean of pretest (=5.20) and posttest (=4.70). Their correlation is .081.

Table 12: Paired Samples Statistics

		Mean	N	Std. Deviation	Std. Error Mean
Pair 4	Pre third conditional	4.70	30	1.878	.343
	Post third conditional	5.20	30	1.972	.360

Table 13: Paired Samples Correlations

		N	Correlation	Sig.
Pair 4	Pre third conditional & Post third conditional	30	.324	.081

Table 14: Paired Samples Test

		Paired Differences					t	d	Sig. (2-tailed)
		Mean	Std. Deviation	Std. Error	95% Confidence Interval of the Difference				
					Lower	Upper			
Pair 4	third conditional- post third conditional	-.500	2.240	.409	-1.336	.336	-1.223	29	.231

Figure 4: The comparison between pre- & posttest of third conditional sentences

## DISCUSSION

As it can be deduced from the above-mentioned data, the post-test group which was being taught four type conditional sentences through using conversational shadowing has performed better. Thus, it can be concluded that the treatment (taught through conversational shadowing) was effective method. The finding of the study answered the research questions by improving conversational shadowing in teaching and learning procedure. In fact, conversational shadowing make sufficient environment in which learners exposed to the different types of conditional sentences as ESL contexts where English is spoken as the media of daily communication or education. All the details related to the results of pre-test and post-test proved the effectiveness using conversational shadowing in teaching and learning.

## CONCLUSION

This paper, by elaborating the impede issues involved in the teaching and learning English conditionals, was provided to consider that conversational shadowing as an method has positive effect on enhancing learners' oral performance in terms of the use of relative clause. The results reflected an insight that conversational shadowing supports learning of learners. The findings provided some pedagogical implications for teaching conditionals in developing and improving conversational shadowing. In real, conversational shadowing, as an important second language teaching method in the field of language teaching has tangible effect on learners' performance by engaging them in their own learning.

## LIMITATIONS AND SUGGESTIONS FOR FURTHER RESEARCH

Like any other research, this study may be confronted with some unavoidable limitations:

- 1-Regarding to limitation of time, the current study was performed during a semester
- 2-The findings of this study cannot be generalized to other groups due to the small sample size
- 3-Affective independent variables such as age and personal variables are not taken into account due to the limited number of the available participants
- 4-Limited this study to learners from intermediate level of education and to only one English structure

It would be worthwhile to replicate this study with bigger sample of participants include learners from different levels of education and from different social groups with longer-term research design for improving external validity and generalizability of this research.

This study only investigated the impact of conversational shadowing on oral performance of conditional sentences therefore; other studies can focus on the impacts of conversational shadowing on other skills including listening, reading and writing and other English structures.

### ABSTRACT

Recently, higher education systems seek to use network-based and Internet-based information technologies in education, teaching and learning. This type of education is presented through electronic means such as the Internet, intranet, extranet, and hypertext. Although e-learning has been increasingly accepted in developed countries, in developing countries there are still many obstacles for web-based training. E-learning in Iran higher education system has been started since 2003, however, its development has been very slow. The present study is a survey research. The participants of the study are faculty members, graduates and PhD students in Agriculture in Bu Ali Sina University. Total number of participants were analyzed. The accuracy of indicators and items in the questionnaire (Face Validity) has been confirmed by specialists. A questionnaire was used to collect data. Reliability was calculated by using Cronbach Alpha. In this study, Factor analysis is used to achieve the key factors. The results show that deficiency of executives, Lack of learners' motivation, infrastructural barriers, restriction of credit, and software and hardware limitations are the main problems in the development of web-based training. At the end of the article, some recommendations are presented aiming to accelerate electronic training in Iran's higher education system.

**KEY WORDS:** Higher Education, Faculty of Agriculture, E-Learning, Web, Iran

### INTRODUCTION

Electronic learning, another term for distance learning, is any learning system where teaching behaviors are separated from learning behaviors. The learner works alone or in a group, whom is guided by study material arranged by the instructor in a location apart from students. Students have the opportunity to communicate with an instructor with the aid of a range of media (such as text, telephone, audio, video, computing and Internet technology, etc). Electronic learning may be

combined with various forms of face-to-face meetings.

These guidelines define distance learning as all learning situations where learners and instructors are not together as they would be in a traditional setting. Thus, distance learning can occur in many configurations. It can be synchronous (instruction delivered and received simultaneously), or it may be asynchronous (instruction delivered and received at different times). Students may receive distance learning privately, or they may gather in groups/classes to receive it.

Electronic learning, also is named distance learning, has become a pervasive and growing phenomenon. Innovative uses of technologies create more effective techniques to distribute learning in non-traditional ways. As a result, new organizational structures and learning arrangements are appearing throughout higher education. Many traditional institutions have added distance learning programs. Educators are forming new institutions that deliver distance learning exclusively. Academic institutions and corporations are combining resources to bring electronic learning to workplaces. Academic institutions are pooling course offerings through distance learning so students have opportunities to create a degree program that uses course offerings from multiple schools. All of these emerging delivery structures bring questions about the quality of the education being delivered.

Arbaugh (2002) defined e-learning as the use of the Internet by users to learn specific content. Other researchers define e-learning as using modern Information and Communications Technology (ICT) and computers to deliver instruction, information, and learning content (Selim, 2007). The stakeholders of e-learning are learners, faculty, administrative and technical staff, and employers (Ozkan & Koseler, 2009).

These guidelines highlight quality issues specific to distance learning. Since electronic learning has become more prevalent, it is difficult to distinguish it from campus-based learning. Remote access to learning materials, databases and libraries, electronic communication, computer-connected workgroups, archived lectures, and other features of distance learning increasingly are used in campus-based instruction.

E-learning efforts and experiments currently receive much attention across the globe. The availability of electronic and web-enabling technologies also dramatically influences the way we view the learning strategies of the future (Kramer, 2000; Hitz, 1995).

Accordingly, the Educational Management Information System and simulated period are all aspects of electronic learning. So, the most comprehensive definition of e-learning can be provided is: The use of information technology to manage, design, present, select, communicate, navigate, guide, support and develop learning (Beneke, 2001). E-learning is any targeted web-based technology program to teaching people by which we can learn any interesting thing anytime and anywhere. E-learning is the confluence of distance education, computer-based training and Internet technologies. Since 1998 that Web Pages Show was developed, this type of training improved much (Beneke, 2001).

The existing face-to-face learning paradigm is no longer the only educational paradigm due to the advent of e-learning that makes it possible to receive education without being restricted by time and space (Hyeoncheol & Injin, 2007). Inoue (2007) indicates that “isolation and disconnectedness in the online environment may be to blame for student dropout, as well as the feeling of isolation that may lead to loss of motivation to learn” (cited from Doris, Supawan, &

Greater numbers of students on traditional campuses encounter and choose non-traditional learning methods. "Technology-delivered education" often describes learning on today's campus, as well as distance learning. Therefore, many of those issues are relevant for technology-delivered education of all sorts, whether or not it is distance learning.

When examining the literature at the intersection of teaching and learning with information and communication technology (ICTs), one is struck by the relative lack of focus upon the potential problems and drawbacks of the incorporation of technology into educational work-life (i.e. Granger, Morbey, Lotherington, Owston, & Wideman, 2002; Hassini, 2006; Liaw, Huang, & Chen, 2007; Marbach-Ad & Sokolove, 2001; Marbach-Ad & Sokolove, 2002; Mazzolini & Maddison, 2007; Ruthven, Hennessy, & Deaney, 2005).

Virtual education system is not limited to any specified courses, expertise, time and age and due to extent of their activity can activate training in all stages and levels. This is why it is not limited by space and time and can invited all those interested in learning to the options easier than ever in education, public institutions, universities and industry. This type of training has been welcomed not only in formal education, but also in all institutions requiring education (Mayer, 2005).

Information technology has created new opportunities for education. More than 1000 institutions in 50 countries provide e-learning options (Sharma & Kitchens, 2004). E-learning is a useful tool for enhancing the quality of teaching and learning. E-learning is an "innovative approach to education delivery via electronic forms of information that enhance the learner's knowledge, skills, or other performance" (Siritongthaworn, Krairit, Dimmitt, & Paul, 2006, p. 139).

E-learning is raised as an alternative way to enhance the traditional training approach and in this learning type more varied experiences are given to students and more teaching facilities are provided for faculty members (Wilson, 2003). For the past few years, there has been a growing understanding of the important role of information and communication technologies (ICT) in higher education. Various new models of education are evolving in response to the new opportunities that are becoming available by integrating Web-based technologies (Barak & Rafaeli, 2004; Light, Nesbitt, Light, & White, 2000; Ward & Newlands, 1998). Though Web-based technologies are considered to be commonly used for educational purposes, the transition from traditional teaching to ICT-enhanced environments is not obvious and ought to be further investigated.

Electronic learning is as an individual patient education in which learners are able to achieve educational goals due to their talents. In fact, they learn how to learn that one of its educational goals (Hewitt-Taylor, 2003). E-learning should be considered as a method for providing more flexible learning and creating more opportunities for students which facilitates tracking progress for learners and their activities and it can provide an opportunity creating new effective learning environments (Yaghoubi, 1391).

ICT can serve as a tools for designing new learning environments (Donovan & Nakhleh, 2001),

integrating virtual models (Dori, Barak, & Adir, 2003), and creating learning communities (Gordin, Gomez, Pea, & Fishman, 1997; Rafaeli, Barak, Dan-Gur, & Toch, 2004). However, not all teachers are convinced that ICT should be an integral part of their teaching strategies (Galanouli, Murphy, & Gardner, 2004). Galanouli et al. (2004) declared that resisting change is a state of mind for many teachers and one of the most difficult barriers for effective ICT integration.

Because enabling technologies present many opportunities as well as challenges in the realizing of e-learning, it is imperative that educators and institutions planning to embark on the development of e-learning systems, have a clear and accurate understanding of the capabilities, limitations and influences of these technologies (Cloete, 2000). Creative approaches and competent strategies to manage these limitations at the instructional design, the user levels as well as integration to other systems, need to be established and understood in order to ensure a degree of quality comparable to that of traditional learning. Without the integration of well-established methods and techniques, many of the e-learning efforts may be futile, leaving frustrated facilitators and badly educated students in their wake (Cloete, 1999).

The expansion of e-learning products is one of the fastest growing areas of education since it allows cutting down the costs and it improves the cost-effectiveness of education (Gilbert, Morton, & Rowley, 2007). Despite the proliferation of papers into distance learning in the last past decade, most research has considered technical, financial and administrative aspects and less research was focused on didactic issues. More recently, methodological issues were addressed by researchers, considering various approaches for delivering online courses (EL-Deghaidy & Nouby, 2008). The model of a training based on self-instructional materials and independent study was deeply revised and the focus of distance learning research enlarged to the application of innovative didactic methods such as cooperative learning, having the constructivist learning theory as a reference (Amhag & Jakobsson, 2009; So & Brush, 2008; Wheeler, Yeomans, & Wheeler, 2008).

Faculty resources and faculty management should be consistent with the school's stated mission. A mission-directed commitment to distance learning may require the addition of new faculty with the requisite skills and experience. Whether through the hiring of new faculty or through developing extant faculty, distance learning technologies and pedagogies must be incorporated into the institution's capabilities.

Gaining faculty commitment is vital to successful implementation of a program. It often is helpful to begin with the involvement and development of a small cadre of faculty who are highly respected by their peers. These early-entry faculty members then can become resources to assist the development of additional faculty.

The roles faculty will perform should be determined first. Individual faculty members may have roles that are different from, and more specific than, their traditional, on-campus roles. In some cases, distance learning providers have unbundled the traditional faculty role to create specialists in such tasks as creation of course goals and structure, creation of learning materials and experiences, delivery of instruction, or learning assessment. When such unbundling occurs, appropriate faculty management processes must be put in place, including processes that help people in these separate roles to interact with each other. Faculty management must be tailored to the specific performance demands of learning situations, pedagogy, technology, institutional culture, etc.

The Internet information technology offered tools for developing collaboration and cooperation activities in distance learning (Jara et al., 2009; Macdonald, 2003), facilitating student interactions in a constructivist perspective linked to Vygotsky's theory (1978). Cooperation implies an engagement to peers through social interaction (Amhag & Jakobsson, 2009; Hew & Cheung, 2008) and collaboration activities delivered in the virtual social environment offered the student the possibility to develop understanding through their own constructs, becoming active learners. Chao, Saj, and Hamilton (2010) believe that collaborative course implementation is the best way to design high quality online courses.

Implementing distance learning programs requires new technical and pedagogical skills. The school must provide resources to expand and develop these skills in the faculty. Distance learning demands on faculty in terms of planning and administrative assignments also may differ from traditional practice. Distance learning modules may not fit neatly into standard units the institution uses to manage faculty workloads and assignments. The school's reward system should recognize the demands placed upon the faculty involved in distance learning activities.

The faculty's composition and qualifications are essential components to creating high-quality distance learning programs. The school's faculty should understand and embrace the change from a teaching-centered to a learning-centered environment; with learners, rather than students, and with facilitators and designers of learning experiences, rather than teachers. The former concentrates on achievement of learning goals and seeks the most effective means to accomplish them. The latter focuses on the organization and delivery of information.

Reporting on successful initiatives and interventions is common, often alongside obstacles and problems that must be 'overcome' in order to expand access or enhance the adoption of ICTs (Banwell et al., 2004; Dexter, Seashore, & Anderson, 2002; Duggleby et al., 2004; Granger et al., 2002; Hennessy, Ruthven, & Brindley, 2005; McCarney, 2004; Rogers, 2000; Ruthven et al., 2005). Rarely front-and-center is that ICTs in education might create the conditions of possibility for the expansion of existing problems, or for the development of entirely new challenges in the work-life of university educators. As noted by Nichol, Watson, and Waites (2003) in their editorial introduction to their special issue of the British Journal of Educational Technology, there is a significant gap between the "optimistic rhetoric" that dominates discussion about ICTs in education, and the rather more problematic reality (see also Reynolds, Treharne, & Tripp, 2003). This led to the central issue addressed here, namely what experiences and impacts do "Teaching Assistants" report with regard to email in the context of their work at the university?

Recent studies have shown that "the successful implementation of educational technologies depends largely on the attitudes of educators, who eventually determine how they are used" (Albarini, 2006). Indeed, understanding the intrinsic and extrinsic dimensions, and including moderating factors (specifically, the cultural dimensions) that influence educators' attitudes towards ICT and adoption in higher education is, therefore, a focal point of interest but is under-researched in recent educational studies of information-accessing behavior (see for instance, Chang and Lim (2002)). As Li and Kirkup (2007) propose, "how far culture influences people's perception of the Internet and their use of it (. . .) needs further research". As Venkatesh (2000)

notes, there is a significant and growing body of research regarding the importance of the role of intrinsic motives in technology use (see for instance, Davis, Bagozzi, and Warshaw (1992); Finneran and Zhang (2005) and Sanchez-Franco and Roldan (2005) for a review).

Other limitations in the use of computers in Iran higher education are: lack of proper understanding of virtual learning environments, lack of proper infrastructure and telecommunication, lack of enough bandwidth to transmit and receive information. Moniee (2004) in his article argued that system of supply and demand for higher education still does not have an accurate understanding of virtual spaces and it is not well acquainted with the features and functions; and, basic IT skills are not still well known (Moniee, 2004). In this system, the success of learner is associated with technical skills in the use of computers and networks (Shuster, 2003).

Distance learning requires significant financial resources for technology and support. Faculty members and administrators require assistance to manage the logistics of distance learning and support systems must be developed for the distance learning delivery system. An integrated team of computer service technicians, counselors, site administrators, distribution clerks and information resource (library) personnel should support distance learning faculty. The magnitude of these costs often is underestimated by people initiating distance learning programs. There is a significant relationship between attitude and familiarity, and knowledge of the use of information technology. It is believed that proficiency in Internet services, and researchers' attitudes toward distance learning through the Internet causes this type of education to be highly appreciated. It is stated that the most important students' problems to access to information resources are lack of library with the relevant information and not having enough time for extra reading. Therefore, the barriers to the development of web-based education in third world countries can be found in Table 1.

*Table 1: Influencing factors of the barriers and limitations in the creation, implementation and development of e-learning*

<b>Influencing factors of the barriers and limitations in the creation, implementation and development of e-learning</b>	<b>Author/organization and the date of studies</b>	<b>Results of the study</b>

In the educational system of Iran, the use of ICT to increase the access to learning is one of the changes that is slowly being created. Nowadays, despite many problems e-learning is increasingly growing in Iran, and every year more and more universities are taking advantage of these methods in education and teaching. In 1382, the first web-based training began at Shiraz University for some engineering majors. Subsequently, some of the top universities decided to

hold their e-learning courses. We can say that there is a growing wave of e-learning is shaping; and, it seems that in the next few years some courses will be offered through e-learning. Present study analyzes the problems of web-based training in agricultural colleges of Iran. This study has three purposes:

- 1 - Identification of different (technical, human, administrative) barriers of development of e-learning in the College of Agriculture
- 2 – Identification of the different (technical, human, administrative) solutions of development of e-learning in the College of Agriculture
- 3 - Assessing the educational needs of students and teachers for the optimal use of e-learning in teaching and learning

## **METHODOLOGY**

The present study is a survey research.

### ***Participants***

The participants of the study are faculty members, graduates and PhD students in Agriculture in Bu Ali Sina University. Total number of participants were analyzed. The University is located in West of Iran, in the province, and it is one of the oldest universities of Iran. The university currently has 13 colleges 56 Departments of Education 14,000 students and 424 Faculty members (University Website: <http://www.basu.ac.ir>). This university is ranked 12th in University Rankings of Iran. In this study, frequency, distribution and relationships among the variables are reviewed and evaluated by selecting and studying samples chosen from the community.

### ***Research Instrument***

A questionnaire was used to collect data; but beside it, interviews, observation and documentary studies have also been operated. The accuracy of indicators and items in the questionnaire (Face Validity) has been confirmed by specialists. To evaluate the reliability of the study, questionnaire was distributed among a number of training scholars and computer software experts and web scientists.

### ***Data Analysis***

The results were reviewed and Cronbach Alpha was obtained 0.78 which is an acceptable figure. Due to the nature of the research the data were described and analyzed. In describing the data, descriptive statistics such as frequency, percentage, median, mode, standard deviation, variance, means and other items were used. In the data analysis, factorial analysis was used to obtain the key factors. Furthermore, a number of hypotheses have been tested.

## **DATA DESCRIPTION**

Based on the collected data, 74.6 percent of faculty members were male and the rest (25.4 %) were female. The mean age and SD was 39.06 years and 5.942, respectively. They are all instructing in different fields of agriculture. Also, 3.2 percent of the respondents are full professors, 12.7 percent of them are associate professors, 82.5 percent are assistant professor and

the rest (1.6 percent) are instructors. Note that they have the average of 7.43 years of teaching experience. Faculty members largely used computer in their house than university, workplace, college and the department. They had an average of 6 hours and 10 minutes per day of computer use. According to the results, only 33.3 percent of faculty members prefer to use the written and printed texts (books, reports, journals and magazines), and the rest (66.7 %) were interested in the use of electronic text (e-journals, CD, DVD, etc).

Table 2: Faculty members' familiarity with four language skills, Computer software, various programs internet and the level of internet access

Four skills	Familiarity with the four English language skills (percent)					
	Very low	Low	moderate	high	Very high	Ordinal average
Reading	0	3.2	23.8	39.7	33.3	4.03
Writing	0	7.9	41.3	44.4	6.3	3.49
Listening	3.2	15.9	44.4	31.7	4.8	3.19
Speaking	7.9	14.3	55.6	15.9	6.3	2.98
Computer software	Faculty members' familiarity with each of the computer software					
word processors such as Microsoft Word	0	1.6	11.1	46.0	41.3	4.27
Presentation program such as Corel Presentation and Power Point	1.6	4.8	11.1	49.2	33.3	4.08
Operating system software like Windows, Linux	7.9	7.9	34.9	31.7	17.5	3.43
Spreadsheet programs like Excel, Lotus, Pro, Quarto	14.3	15.9	33.3	27.0	9.5	3.02
Statistical software packages like Minitab, MSTAT, SAS, SPSS	11.1	28.6	23.8	33.3	3.2	2.89
Graphics software like AutoCAD, Corel, Photo Shop	14.3	41.3	27.0	12.7	4.8	2.52
Databases like Clipper, FaxPro, Access, Oracle	36.5	31.7	17.5	12.7	1.6	2.11
Various internet programs	Faculty members' familiarity with each of the internet programs					
E-Mail	0	4.8	9.5	30.2	55.6	4.37
WWW	3.2	4.8	20.6	38.1	33.3	3.94
Chat	20.6	19.0	20.6	27.0	12.7	2.92
FTP	28.6	25.4	23.8	17.5	4.8	2.44
Discussion Group	47.6	23.8	20.6	6.3	1.6	1.90
USENET	52.4	28.6	12.7	3.2	3.2	1.76

Location of student access to computers and the internet	Faculty members' access to computers and the internet					
House	1.6	6.3	14.3	22.2	55.6	4.24
university	4.8	6.3	22.2	41.3	25.4	3.76
Workplace	4.8	6.3	25.4	36.5	27.0	3.75
college	6.3	4.8	34.9	30.2	23.8	3.60
department	11.1	7.9	28.6	34.9	17.5	3.40

1= very low, 2 = low, 3 = moderate, 4 = high, 5 = very high

Knowledge of English language is a necessity factor for the use of the Web in education. Unfortunately, English language teaching in Iran is not favorable. Many faculty members are unable to take advantage of English sources. However, research findings show faculty members' reading skills is at upper intermediate level (4.03 out of 5), writing skill is moderate (3.49 out of

5), listening skill is moderate (3.19 out of 5) and speaking skill is poor (2.98 out of 5). The faculty members also participated in internet application courses. So that 20.6 % of the faculty members have passed training courses such ICDL, Catia, Minitab, Lingo, Photoshop, ARC, GIS, and PC user. Many faculty members in Iran are familiar enough with the software. Their highest rate of familiarity is with Microsoft Word (4.27 out of 5). Then, the faculty members are familiar with the following software respectively; software like Corel Presentation and Power Point (4.08 out of 5); operating systems like Windows and Linux (3.43 out of 5); statistical software packages such as Minitab, MSTAT, SAS and SPSS (3.02 out of 5); spreadsheet programs such as Excel, Lotus, Pro and Quatro (2.89 out of 5); graphics software such as AutoCAD, Corel and Photo Shop (2.52 out of 5); databases such as Clipper, FoxPro, Access and Oracle (2.11 out of 5). In fact, the faculty members in Iran have relative dominance to their required software. The results show that the faculty members use average of the Internet applications is at an acceptable level. Based on the average correlation, the faculty members make most use of the followings, respectively; E-Mail (4.37 out of 5); WWW (3.944 out of 5); Chat Programs (2.92 out of 5); FTP (2.44 out of 5); Discussion Group (1.90 out of 5); USENET (1.76 out of 5); and, GOPHER (1.70 out of 5). The results are shown in Table 2.

### ***Barriers and restrictions of creation, operation and development of e-learning in the College of Agriculture***

Table (3) shows the barriers and restrictions of creation, operation and development of e-learning in the College of Agriculture in Bu-Ali Sina University. However, the main problems and limitations of e-learning in Iran are: lack of technical and administrative support to maintain e-learning equipments (4.60 out of 5 0.133), old computer system (4.63 out of 5 and coefficient of variation = 0.136), inability of faculty to change the order of presentation of the course (4.38 out of 5 and coefficient of variation = 0.156), low ability of learners to perform individual operations which finally leads to spending more time with the faculty (4.30 out of 5 and coefficient of variation = 0.160), fluctuation in Internet speed and lack of real speed (3.95 out of 5 and coefficient of variation = 0.225). In the contrary, the following items are in the lowest priority: low speed internet and the actual bandwidth (ordinal average of 3.71 out of 5 and coefficient of variation of 0.319), lack of faculty access to individuals to solve problems in the field of e-learning (ordinal average of 3.17 out of 5 and coefficient of variation of 0.317), excessive dependence students' learning on computers and neglecting from teachers' guidance (ordinal average of 3.11 out of 5 and coefficient of variation of 0.323), limited access to computers and online communication with faculty members (ordinal average of 3.03 out of 5 and coefficient of variation of 0.435).

Table 3: Barriers and limitations in the creation, implementation and development of e-learning (Percent)

Num	Item	mean	SD	CV	prior
1	Lack of administrators attempt for culture-building in the field of e-learning	4.60	0.610	0.133	1
2	Old computer system	4.63	0.630	0.133	2
3	inability of faculty to change the order of presentation of the course	4.38	0.682	0.156	2
4	low ability of learners to perform individual operations which finally leads to spending more time with the faculty	0.430	0.687	0.160	3
5	fluctuation in Internet speed and lack of real speed	3.95	0.888	0.225	4
6	lack of giving priority to the e-learning in the comprehensive program of ICT development in the country	3.38	0.851	0.252	5
7	lack of coverage of optic fiber in the entire country	3.81	0.965	0.253	5
8	low potential for evaluating progress in learning courses	3.41	0.891	0.261	6
9	poor time management tools and planning for individual students	3.49	0.914	0.262	7
10	lack of attempt of administrators for culture-building in developing e-learning in the countries	3.52	0.948	0.262	8
11	low e-learning system for the continuity of learning activities by faculty members	3.57	0.946	0.265	9
12	lack of faculty interest for e-learning	3.65	0.970	0.266	10
13	the low proportion of structure with the needs of individuals or groups in the e-learning system	3.14	0.840	0.268	10
14	lack of funds for the development of e-learning in universities	3.57	0.962	0.269	11
15	low rates of encourage for e-learning system in the relationship between the learner and teacher	3.30	0.891	0.270	12
16	deficiency or absence of local manufacturing facilities, and components required for e-learning	3.22	0.870	0.270	13
17	lack of development of e-learning at high management level and those involved in educational planning	3.46	0.947	0.274	13
18	low e-learning system in terms of providing feedback by the faculty members	3.57	0.979	0.274	13
19	lack of experienced faculty on the e-learning and e-teaching units	3.44	0.947	0.275	14
20	high cost of setting up an educational technology equipment	3.37	0.938	0.278	15
21	lack of policy for the implementation and appropriate strategic management of the development of educational technology in universities	3.35	0.936	0.279	15
22	lack of full cooperation of the Ministry of Science and the Ministry of Communications and Information Technology regarding the development of electronic learning	3.43	0.979	0.285	16
23	unfamiliarity of faculty with methods of communicating with students using e-learning	3.54	1.013	0.286	16
24	less compatibility applications with a network of e-learning	3.41	0.978	0.287	17
25	absence or lack of incentives for virtual teaching	3.27	0.937	0.287	18
26	possible limitations of laboratory sessions through e-learning	3.48	0.998	0.287	19
27	lack of necessary policy to certify or endorse the content, quality and structure of electronic courses in universities	3.41	0.978	0.287	20
28	unfamiliarity of planners and administrators with the concept of e-learning applications	3.48	1.014	0.291	21
29	lack of transparency in e-learning goals	3.54	1.029	0.291	22
30	high cost of the electronic library in the universities	3.40	1.009	0.297	23
31	the low level devices for e-learning system to express ideas for teachers and learners	3.27	0.971	0.297	23
32	lack of (user friendly) software and non-dynamic in the e-learning courses	3.25	0.967	0.298	24
33	high cost of Internet service	3.32	0.997	0.300	24
34	the low level of the learner or instructor permission to change the presentation of the course	3.29	0.991	0.301	25
35	lack of a comprehensive program for network security in e-learning	3.41	1.026	0.301	26
36	lack of enough training in the field of educational technology for the faculty	3.43	1.043	0.304	27
37	lack of investment and credit for the development of the needed infrastructure for e-learning	3.62	1.099	0.304	28
38	insufficient faculty expert regarding the new educational technologies	3.52	1.075	0.305	28
39	requiring a lot of time preparing the students	2.90	0.911	0.314	29
40	faculty resistance to change and their worries regarding electronic technology	3.37	1.067	0.317	30

### ***Factor analysis of barriers and constraints, operation and development of e-learning in the College of Agriculture***

Due to the high number of obstacles and constraints and the need to reduce it to a few key factors, in the present study, the exploratory factorial analysis was used. In this method, the researchers have no prior plan to predict or identify the number and nature of hidden elements beyond the variables. So, the researchers assume that each variable can be covered with any other variable under a specific agent. Despite the strength of this technique for data analysis, it is not possible to use in any situation. Only the qualified data can be used for factorial analysis. KMO and Bartlett's test coefficient should be used for this purpose. If the value of KMO is greater than 0.5, certainly, factorial analysis can be used. In the present study, the coefficient of KMO is 0.710 that is an appropriate figure and Bartlett's test is significant at 99% level (sig = 0.000). (Table 6)

*Table 4: The KMO coefficient and the Bartlett test for students*

Test Name	Value
KMO	0.710
Bartlett	3.726
Sig	0.000

After ensuring the data is proper to perform the factorial analysis, the rotation varimax norm is used to achieve the significant factors. The extracted factors are indicated in table 5 Collectively, these factors explains 60.077 % of the variance related to affecting variables on the barriers and constraints on the development of e-learning in the College of Agriculture, Bu-Ali University. In simple terms, considering these seven factors could explain 60.077 percent of the effective factors in the creation of obstacles and limitations in the launch and development of e-learning in the department of Agriculture.

*Table 5: The number of extracted factors with eigenvalues, percentage of variance and cumulative percentage*

Number	Agent Name	Eigenvalue	Percent of the variance of Eigenvalue	cumulative percentage
1	Deficiency of executive factor	27.429	21.814	21.814
2	Credit constraints	38.923	10.254	32.068
3	infrastructure constraints	47.728	8.382	40.450
4	Cultural constraints	52.325	6.266	46.716
5	The educational limitations	57.228	4.827	51.543
6	human limitations	60.623	4.705	56.248
7	Technical limitations	64.124	3.829	60.077

Loading status of factors is presented in table 6.

Table 6: Variables related to each of the factors influencing barriers of the development of e-learning and factor loadings obtained from the rotated matrix

Priority	Factors Name	Variables	Factor loading
1	Deficiency of executive factor	low potential for evaluating progress in learning courses	0.681
		low e-learning system for the continuity of learning activities by faculty members	0.536
		low e-learning system in terms of providing feedback by the faculty members	0.679
		the low level of the learner or instructor permission to change the presentation of the course	0.547
		low rates of encourage for e-learning system in the relationship between the learner and teacher	0.664
		lack of full cooperation of the Ministry of Science and the Ministry of Communications and Information Technology	0.573
		insufficient faculty expert regarding the new educational technologies	0.557
2	Credit constraints	the high costs preparation and production of material for the content of e-learning and updating them	0.732
		high cost of Internet service	0.710
		lack of funds for the development of e-learning in universities	0.750
		deficiency or absence of local manufacturing facilities, and components required for e-learning	0.836
3	Infrastructure barriers	limited access to computers and online communication with faculty members	0.554
		low speed internet and the actual bandwidth	0.797
		lack of coverage of optic fiber in the entire country	0.669
		fluctuation in Internet speed and lack of real speed	0.808
4	Cultural constraints	lack of development of e-learning at high management level and those involved in educational planning	0.545
		lack of necessary policy to certify or endorse the content, quality and structure of electronic courses in universities	0.662
		lack of giving priority to the e-learning in the comprehensive program of ICT development in the country	0.707
		lack of attempt of administrators for culture-building in developing e-learning in the countries	0.703
5	The educational limitations	lack of enough training in the field of educational technology for the faculty	0.545
		unfamiliarity of planners and administrators with the concept of e-learning applications	0.554
		stakeholders' opposition with e-learning methods	0.673
		unfamiliarity of faculty with methods of communicating with students using e-learning	0.677
6	human limitations	requiring a lot of time preparing the students	0.686
		faculty resistance to change and their worries regarding electronic technology	0.673
		lack of experienced faculty on the e-learning and e-teaching units	0.556
7	Technical limitations	lack of technical and administrative support to maintain e-learning equipments	0.591
		possible limitations of laboratory sessions through e-learning	0.515
		lack of policy for the implementation and appropriate strategic management of the development of educational technology in universities	0.507

As it can be seen, 7 key factors cause barriers and limitations in the development of e-learning in the College of Agriculture.

**First factor (Deficiency of executives):** This factor alone explains 21.814 percent of total variance of barriers and constraints in the implementation and development of e-learning in the College of Agriculture and it is the top priority. There are 7 factors with the loading factor greater than 0.5 which are presented below: low potential for evaluating progress in learning courses; low e-learning system for the continuity of learning activities by faculty members; low e-learning system in terms of providing feedback by the faculty members; the low level of the learner or

instructor permission to change the presentation of the course; low rates of encourage for e-learning system in the relationship between the learner and teacher; lack of full cooperation of the Ministry of Science and the Ministry of Communications and Information Technology regarding the development of electronic learning; and finally, insufficient faculty expert regarding the new educational technologies.

**Second factor (Restriction of credit):** This factor explains alone 10.254 percent of total variance of barriers and constraints in the implementation and development of e-learning in the College of Agriculture and it is the second priority. There are 4 factors with the loading factor greater than 0.5 which are presented below: the high costs preparation and production of material for the content of e-learning and updating them; high cost of Internet service; lack of funds for the development of e-learning in universities; deficiency or absence of local manufacturing facilities, and components required for e-learning.

**Third factor (infrastructural barriers):** This factor explains alone 8.382 percent of total variance of barriers and constraints in the implementation and development of e-learning in the College of Agriculture and it is the third priority. There are 4 factors with the loading factor greater than 0.5 which are presented below: limited access to computers and online communication with faculty members; fluctuation in Internet speed and lack of real speed; lack of coverage of optic fiber in the entire country; low speed internet and the actual bandwidth.

**Forth factor (cultural barriers):** This factor explains alone 6.266 percent of total variance of barriers and constraints in the implementation and development of e-learning in the College of Agriculture and it is the forth priority. There are 4 factors with the loading factor greater than 0.5 which are presented below: lack of development of e-learning at high management level and those involved in educational planning; lack of necessary policy to certify or endorse the content, quality and structure of electronic courses in universities; lack of giving priority to the e-learning in the comprehensive program of ICT development in the country; lack of attempt of administrators for culture-building in developing e-learning in the countries.

**Fifth factor (educational barriers):** This factor explains alone 4.827 percent of total variance of barriers and constraints in the implementation and development of e-learning in the College of Agriculture and it is the fifth priority. There are 4 factors with the loading factor greater than 0.5 which are presented below: unfamiliarity of faculty with methods of communicating with students using e-learning; unfamiliarity of planners and administrators with the concept of e-learning applications; lack of enough training in the field of educational technology for the faculty; stakeholders' opposition with e-learning methods.

**Sixth factor (human barriers):** This factor explains alone 4.705 percent of total variance of barriers and constraints in the implementation and development of e-learning in the College of Agriculture and it is the sixth priority. There are 3 factors with the loading factor greater than 0.5 which are presented below: requiring a lot of time preparing the students; faculty resistance to change and their worries regarding electronic technology; lack of experienced faculty on the e-learning and e-teaching units.

**Seventh factor (technical barriers):** This factor explains alone 3.829 percent of total variance of barriers and constraints in the implementation and development of e-learning in the College of Agriculture and it is the seventh priority. There are 3 factors with the loading factor greater than 0.5 which are presented below: lack of technical and administrative support to maintain e-learning equipments; possible limitations of laboratory sessions through e-learning; lack of policy for the implementation and appropriate strategic management of the development of educational technology in universities.

As it can be seen, 7 key factors cause barriers and limitations in the development of e-learning in the College of Agriculture. These factors are depicted in figure 1. As the table shows, on the whole, 7 key barriers and constraints are effective in the implementation and development of e-learning in the College of Agriculture University of Bu Ali Sina University. These factors are shown in Figure 1.

## CONCLUSION

New technologies have great potential to transform and shape teaching and learning activities to all higher education institutions and they provide tools to design modern scientific environments which it has never been possible before. For this reason, many universities in Iran want to set up e-courses using information technology capabilities in the form of e-learning or online learning. However, the review of literature shows that the development of e-learning in educational systems is faced with many problems which unfamiliarity of policymakers and educational planners with such problems can impose heavy costs on educational institutions.

This paper aims to familiarize planners, policy makers, students and faculty members with the e-learning issues in agricultural higher education. It was found that strengthening and developing telecommunication infrastructures in educational institutions and providing access to information networks in such institutions is one of the important steps in the development of e-learning; because effectiveness of e-learning depends on the reliability and accessibility of hardware and software. And, lack of good telecommunication infrastructures severely affects the relationship between the learner and the educational system. Therefore, funding for facilities and e-learning tools for universities is a serious necessity. Many researchers have cited lack of hardware and software as one of the major challenges in the development of e-learning (Anstead et al. 2004; Shea et al. 2005; Zhang et al. 2002; Usun, 2006).

Investments in human resources training and training of skilled manpower are another important issue in the development of e-learning. Because development of e-learning will fail without a skilled and capable workforce and resistance of traditional training will be increased and finally, the way of approaching information technology to higher education will be harder. In addition, the nature of academic courses must be considered carefully before e-learning implementation. E-learning cannot be replaced by traditional training. E-learning should be focused on courses and subjects that traditional education system is unable to respond to them. Finally, we can say that to overcome the barriers of e-learning development in universities and educational institutions a holistic and integrated approach is needed. The policies to orient and provide the necessary resources to facilitate the development of long process of e-learning should be determined.

## **RECOMMENDATIONS AND LIMITATIONS**

1. The users' skills and technical knowledge of the English language and mastering of software, hardware and networking are necessary factors for the development of web-based training in Iran. Before planning for the development of e-learning, students' familiarity and mastery of computer skills and attending in workshops will be indispensable.
2. Since the shortage of qualified, proficient and competent teachers and experts in the field of e-learning and electronic content production is obvious, it seems training interested teachers and experts is essential.
3. Now, software and educational content and material for the development of e-learning in many academic disciplines have not been developed yet. Necessary steps should be taken in this regard.
4. Based on the research findings, low speed and inappropriate connection are the main problems in the development of e-learning. Accordingly, improved communication infrastructures in Iran to increase internet speed are essential in Iran. Although effective actions have been done in this regard, it's not enough for the development of e-learning and investment is need.
5. In Iran, training the teachers for optimal use of e-learning software is a must. Many professors are both distrustful of e-learning and novice of the necessary software.
6. Given the practical nature of Agricultural fields, holding troubleshooting classes alongside electronic-training sessions is a necessity.
7. Strengthening the Internet Security Systems Network to increase safety and protect the content, material and tests is a necessity in the E-learning network. Currently, e-learning applications and software can easily be penetrated.
8. Currently, many of the students do not have access to high speed Internet at home. It is necessary to provide facilities to access electronic education.

## ABSTRACT

On the basis of the importance of textbooks as one of the elements in curriculum which will guarantee effective teaching and learning in English as a foreign language (EFL)/English as a second language (ESL) courses and the necessity of textbook evaluation for selecting appropriate textbooks, this study tried to evaluate an English for Specific Purposes(ESP) book taught in Imam Ali Military Academy, Faculty of Aviation to indicate if ESP students of Helicopter Piloting are satisfied with their textbook in terms of their objectives, needs, and wants in addition to format and design of the textbook. The participants were a group of 70 male students, their age varied from 22 to 24. The materials to be evaluated included the ESP textbook *English for Pilot Students* prepared for the third year pilot students. The data collection instrument utilized was a 38-item questionnaire in a five-scale Likert categorized into 4 options as 1-objectives, 2-needs, 3-wants, and 4-format and design. The researchers also observed the ESP class and an interview was done with some students and teachers to get their ideas as well. The result indicated that ESP students of Helicopter Piloting were satisfied with their textbook in terms of their objectives and needs while they were not satisfied with their textbook in terms of their wants and format and design of the book. Findings of this study may offer insights for those involved in educational administrations, syllabus design, curriculum planning, and materials development to do their best to improve the quality and appropriateness of ESP textbooks, materials, and instructional objectives.

**KEY WORDS:** Needs Analysis, Evaluation, Curriculum, Selection, ESP

## INTRODUCTION

In every teaching context, textbooks play an important role in imparting learning and assisting teachers to fulfill their responsibility. According to Riazi (2003), "textbooks play a very crucial role in the realm of language teaching and learning and are considered the next important factor in the second/foreign language classroom after the teacher" (p. 52). Likewise, as Hutchinson and Torres (1994) put it, "The textbook is an almost universal element of [English language] teaching. Millions of copies are sold every year, and numerous aid projects have been set up to produce them in [various] countries.... No teaching-learning situation, it seems, is complete until it has its relevant textbook ( p. 315).

Arguments have encompassed both the potential and the limitations of materials for 'guiding' students through the learning process and curriculum as well as the needs and preferences of

teachers who are using textbooks. Other issues that have arisen in recent years include textbook design and practicality, methodological validity, the role of textbooks in innovation, the authenticity of materials in terms of their representation of language, and the appropriateness of gender representation, subject matter, and cultural components. Whether believe it or not, when one accepts the value of textbooks, it must surely be with the qualification that they are of an acceptable standard or level of quality and appropriate to the learners for whom they are being used (Hutchinson & Torres, 1994). It is absolutely essential, therefore, that policy makers establish and apply a wide variety of relevant and contextually appropriate criteria for the evaluation of the textbooks that are used in language classrooms (Hutchinson & Torres, 1994).

Textbook as a teaching material usually receives a special attention in English courses. It has always been suggested that the textbook is an almost universal element of English language teaching (Hutchinson & Torres, 1994). Sheldon (1988) agrees with this observation and suggests that textbooks not only represent the visible heart of any English Language Teaching (ELT) program but also offer considerable advantages for both the student and the teacher.

## **REVIEW OF LITERATURE**

Textbooks play a pivotal role in language classrooms in all types of educational institutions – state schools, colleges, language schools – all over the world (Lamie, 1999). According to Lamie (1999), that is why despite the development of new technologies that allow for higher quality teacher-generated materials, demand for textbooks continues to grow, and the publishing industry responds with new series and textbooks every year. According to Razmjoo (2007) many students working with a textbook feel secure and have a sense of progress and achievement. According to Cunningsworth (1995), Textbooks are an effective resource for self-directed learning, an effective resource for presenting materials by the teachers, a source of ideas and activities, a reference source for students, a syllabus that reflects pre-determined learning objectives, and support for less experienced teachers who have yet to gain in confidence (p. 113).

In fact, information on textbook selection is useful since it is sometimes part of the ESL/EFL teacher's responsibility to select the textbook she/he will use in a given class. Such a decision should be made carefully and systematically, not arbitrarily (Daoud & Celce Murcia, 1979, p. 193). They add that even in countries where the choice of the textbook does not directly involve the teacher, teachers may be asked to submit reports on the usefulness of the textbooks they are already making use of in their teaching programs. Several possible criteria and procedures for carrying out a sound selection of appropriate textbooks have been suggested. However, selecting an appropriate textbook is not a wholly objective process. While many guidelines are suggested, the individual subjective judgments of the teachers are central to it.

Tomlinson (2001) contends that textbook evaluation, on the other hand, is an applied linguistic activity through which teachers, supervisors, administrators and materials developers can make sound judgments about the efficiency of the materials for the people using them. It is also believed that textbook evaluation helps teachers move beyond impressionistic assessments and it helps them to acquire useful, accurate, systematic, and contextual insights into the overall nature of textbook material.

The importance of textbooks in English courses is now widely recognized (O'Neill, 1982; Torres, 1994; Haycroft, 1998). Haycroft (1998) believes that one of the primary advantages of using textbooks is that they are psychologically essential for students since their progress and achievement can be measured concretely when we use them (Haycroft, 1998). Secondly, as Sheldon (1988) points, students often harbor expectations about using a textbook in their particular language classroom and program. A third advantage, as O'Neill (1982) and Ur (1996) indicate, is that textbooks are generally sensitive to students' needs. However, because of the vast array of textbooks to choose from, the textbook selection process poses problems on English courses. According to Hycroft (1998), the critical issue in any language course is textbook selection. The magnitude of the problem becomes more curtail when there are numerous textbooks in the same area written by authors from different fields of study.

This can be clearly shown in Iranian ESP textbooks which are frequently written by either field specialists or Teaching of English as a Foreign Language (TEFL) expert. To this end, textbook evaluation seems to be an inevitable part of any syllabus. The evaluation of textbook has a significant influence on the ability of students to meet their language learning objectives and affects both the process of learning and outcomes (Nunan, 1985).

According to Smoak (1996) with the growth of English for specific purposes (ESP), a large number of textbooks have been published for different areas of specialization by different publishers. Therefore, on the basis of the importance of textbooks as one of the elements in curriculum which will guarantee effective teaching and learning in English as a Foreign Language (EFL) and English as a Second language (ESL) courses and the necessity of textbook evaluation for selecting appropriate textbook, this study tried to evaluate an ESP textbook on "Helicopter Piloting" which has been written by a field specialist and an EFL expert. As Tomlinson (2001) believes, while the quality of EFL textbooks has improved dramatically in recent years, the process of selecting an appropriate text has not become any easier for most teachers and administrators. Program directors and classroom teachers are under pressure to adopt new reading textbooks on a fairly regular basis, and often on a short notice. While publishers' representatives may provide some informed assistance, their need to sell new products clearly influences their recommendations. (p. 224)

English language instruction has many important components but the essential constituents to many ESL/EFL classrooms and programs are the textbooks and instruction materials that are often used by language instructors. As Hutchinson and Torres (1994) suggest, the textbook is an almost universal element of [English language] teaching. Millions of copies are sold every year, and numerous aid projects have been set up to produce them in [various] countries...No teaching-learning situation, it seems, is complete until it has its relevant textbook (p. 315). Other theorists such as Sheldon (1988) agree with this observation and suggest that textbooks not only "represent the visible heart of any ELT program" (p. 237), but also offer considerable advantages - for both the student and the teacher - when they are being used in the ESL/EFL classroom.

Haycroft (1998), for example, suggests that one of the primary advantages of using textbooks is that they are psychologically essential for students since their progress and achievement can be measured concretely when we use them.

Second, as Sheldon (1988) has pointed out, students often harbor expectations about using a textbook in their particular language classroom and program and believe that published materials have more credibility than teacher-generated or "in-house" materials.

Third, as O'Neill (1982) has indicated, textbooks are generally sensitive to students' needs, even if they are not designed specifically for them, they are efficient in terms of time and money, and they can and should allow for adaptation and improvisation.

Fourth, textbooks yield a respectable return on investment, are relatively inexpensive and involve low lesson preparation time, whereas teacher-generated materials can be time, cost and quality defective. In this way, textbooks can reduce potential occupational overload and allow teachers the opportunity to spend their time undertaking more worthwhile pursuits (O'Neill, 1982; Sheldon, 1988).

A fifth advantage identified by Cunningsworth (1995) is the potential which textbooks have for serving several additional roles in the ELT curriculum. He argues that they are an effective resource for self-directed learning, an effective resource for presentation material, a source of ideas and activities, and a reference source for students, a syllabus where they reflect pre-determined learning objectives, and support for less experienced teachers who have yet to gain in confidence. Although some theorists have alluded to the inherent danger of the inexperienced teacher who may use a textbook as a pedagogic crutch, such an overreliance may actually have the opposite effect of saving students from a teacher's deficiencies (O'Neill, 1982; Williams, 1983; Kitao&Kitao, 1997).

Finally, Hutchinson and Torres (1994) have pointed out that textbooks may play a pivotal role in innovation. They suggest that textbooks can support teachers through potentially disturbing and threatening change processes, demonstrate new and/or untried methodologies, introduce change gradually, and create scaffolding upon which teachers can build a more creative methodology of their own. Thus, EFL textbooks can play an important role in the success of language programs. In fact, they are the realization of the processes of means/ends specification in the curriculum planning. Sheldon (1988) suggests that "textbooks represent the visible heart of any ELT program" (p. 237). They provide the objectives of language learning; they function as a lesson plan and working agenda for teachers and learners. Cunningsworth (1995) argues that textbooks are an effective resource for self-directed learning, an effective resource for presentation material, a source of ideas and activities, and a reference source for students, a syllabus where they reflect pre-determined learning objectives, and support for less experienced teachers who have yet to gain in confidence. He also contends that we should also ensure "that careful selection is made, and that the materials selected closely reflect [the needs of the learners and] the aims, methods, and values of the teaching program" (p. 7).

Textbooks are among the most important resources utilized to achieve the aims of a course which are based on the learners' needs. However, they should not become the aim of the course themselves and set those aims (Brown, 1995). Regarding the importance of the textbooks, one should make sure that those books meet appropriate criteria. In Cunningsworth's (1995) words, we should ascertain that "careful selection is made, and that the materials selected closely reflect the aims, methods, and values of the teaching program" (p. 7).

## **SIGNIFICANCE OF STUDY**

According to what Tomlinson believes the process of materials evaluation can be seen as a way of developing our understanding of the ways in which it works and, in doing so, of contributing to both acquisition theory and pedagogic practices. It can also be seen as one way of carrying out action research (Tomlinson, 2001). Textbooks play a very crucial role and it has generally been agreed that selecting textbooks is the most controversial and challenging issue for teachers and administrators which shows the importance of evaluation (Haycroft, 1998). However, there is little research focused on the differences among textbooks which is written in the same area by different authors from different fields such as ESP textbooks. Therefore, the current study aims at contrasting an ESP textbook for the students of Helicopter Piloting. The findings of this research can largely assist the researchers, material designers, and teachers to suitably select textbooks. Firstly, this study seeks to evaluate the Iranian military academy students' textbook in the field of Helicopter Piloting based on current trends in ELT, curriculum design, and materials development to find out if they conform to the EFL universal characteristics and recent pedagogical principles. Secondly, the study will highlight the main shortcomings of the textbook and offer suggestions to improve both the structure of the course and the design of the textbook.

In Iran, all decisions regarding curriculum, materials and instruction are determined by the Curriculum Development Center of the Ministry of Education and teachers are expected to strictly follow the guidelines created for them by the national government. This book has not been properly revised since it was introduced. Moreover, neither at the stage of introducing this book nor at any other stage was any Need Analysis survey carried out. Therefore, there is an urgent need for updating and evaluating the materials according to recent findings in applied linguistics and curriculum design. But it should be remembered that the implications of evaluation in a nation-wide educational context of university departments are of crucial sensitivity and consequences. (Jahangard, 2007; Razmjoo, 2007; Azizfar, Koosha&Lotfi, 2010). Hence, it is necessary to choose and define the relevant criteria by which the merits and drawbacks which are shown in the textbook are going to be examined. The textbook evaluation criteria developed by the researcher for this study are based on a set of universal characteristics of EFL textbook evaluation which not only correspond to the local needs, but also are flexible enough to be used worldwide.

## **STATEMENT OF THE PROBLEM**

Decisions related to textbook selection and evaluation are of great importance. It is a fact that selecting and evaluating textbooks in EFL context is of utmost importance. However in Iran, there is limited research conducted to evaluate the textbooks that are already in use or those that are intended for use in future. In most of these studies, the researchers have themselves evaluated different textbooks by means of the checklists and questionnaires suggested by other scholars (Jahangard, 2007; Razmjoo, 2007; Azizfar, Koosha&Lotfi, 2010). However, the primary users of textbooks are the teachers. So, a comprehensive evaluation can only be carried out while the teachers and their view points are also taken into consideration.

According to Hutchinson and Waters (1987), when we evaluate a textbook with an intention of adoption, we try to match what is offered by the book with the needs of our language program. However, this is no easy job for the teachers. For one thing, teachers may be overwhelmed by the rich contents of the book, which usually has several volumes. For another, teachers do not always have a clear awareness of what their students need. (p. 49)

## **RESEARCH QUESTIONS**

The following two research questions are posed for the purpose of this study:

**Q1:** Are ESP learners in Helicopter Piloting satisfied with their textbook in terms of their objectives, needs and wants?

**Q2:** Are ESP learners in Helicopter Piloting satisfied with their textbook in terms of format and design?

## **METHODOLOGY**

### ***Participants***

The population for this study consisted of a group of students passing their 7<sup>th</sup> semester of Helicopter Piloting at Imam Ali Military Academy, Tehran, Iran. The sample included 70 male students, their age varied from 22 to 24, and all were going to pass their ESP courses related to their above-mentioned major. They were asked to answer a questionnaire including 38 questions related to their needs, wants and objectives in addition to their textbook format and design.

### ***Instruments***

The data collection instrument utilized in this study was a questionnaire prepared by the researcher. In order to do so, several questionnaires suggested by different scholars and adapted, with the addition of new items and a new scoring system on the basis of the objectives, needs and wants of the learners and format and design of the book were scrutinized and the items relevant to the textbooks under study were selected. Finally, a 38-item questionnaire in a five-scale Likert (Strongly Agree, Agree, No Opinion, Disagree and Strongly Disagree) and based on four groups of questions related to objectives, needs, wants, and format and design was prepared and edited with the help of some professors of the field to assure if participants are satisfied with their textbook in terms of their objectives, needs and wants in addition to the format and design of their Textbook. What's more, to get more information the researcher observed the ESP class according to environmental qualifications, and students' qualifications and as the second data collection tool the researcher also prepared teachers' interviews and students' interviews according to some professors' ideas of the field to get enough information about students and teachers of the ESP book. In order to assure the reliability of the test the researcher gave the questionnaire again to a group of 27 to do the same test for the retest process and the questionnaire was given to them to read the questions carefully and select the best option out of the five options.

### ***Procedure***

The aim of this research was to present the main developments of textbook evaluation and needs analysis as related to English for Students of Helicopter Piloting, and to realize the main weaknesses and pitfalls encountered by Military Academy students and to look for the best policies and methods in which most of their expectations, needs and course materials are prepared in the best convincing ways. So, the researcher was decided to evaluate the ESP textbook "*English for Pilot students*" taught at Imam Ali Military academy. To carry out the research the following measures were taken to conduct the study:

First of all, the researcher analyzed the general and specific books related to students of Helicopter Piloting in details and elaborated on the most important positive and negative points. This time-consuming work not only helped the researcher have a good informative view about the books, but also could help the researcher assure the validity of the data collected since it made it possible to compare different comments of students with his own ideas about the books.

In addition, a 38-item questionnaire in a five-scale Likert (Strongly Agree, Agree, No Opinion, Disagree and Strongly Disagree) was prepared and edited with the help of some professors of the field to assure if ESP Students of Helicopter Piloting are satisfied with their textbook in terms of their objectives, needs and wants in addition to the format and design of their Textbook. The questionnaire was given to a group of 70 students to read the questions carefully and select the best option out of the five options considered (Strongly Agree, Agree, No Opinion, Disagree and Strongly Disagree). In order to assure the reliability of the questionnaire, the researcher retested the questionnaire among learners. What's more, it must be mentioned that to assure the "Internal Validity" (the extent to which the result of a study are a function of the factor that the researcher intends) and the "Content Validity" (the representativeness of measurement regarding the phenomenon about which we want information) (Mackey&Gass, 2005, pp. 107-109) the researcher finalized the questionnaire based on experts' comments of the field and edited the questionnaire based on the research questions and hypotheses. The use of a five-scale Likert helped the researcher to assure the "Face Validity" (the familiarity of our instrument and how it is to convince others that there is content validity to it) (Mackey &Gass, 2005, p. 107).

Finally, the researcher observed the ESP class to touch and feel the situation according to environmental qualifications, teachers' qualifications and students' qualifications and did the interview with some of the students and extracted their own and free ideas about their course, textbooks and the other materials of the field. On the whole, the researcher made the best use of both qualitative and quantitative data collection tools.

In order to analyze the data, the researcher considered frequencies and percentages for students' answers given in the questionnaire and used chi-square test to indicate whether differences are statistically significant or not and the null hypotheses about objectives, needs, wants, format and design of the textbook are supported or rejected.

## **RESULTS**

This part of the study includes a complete analysis of the results obtained from the statistics of data collection process about the research questions of the study. The statistics are shown completely in figures and tables and the results obtained from the data are explained in details to prove the researcher's agreements or disagreements on research questions and hypothesis.

### ***Research question one***

The first research question of the study was as follows:

Q1: Are ESP learners in Helicopter Piloting satisfied with their textbook in terms of their objectives, needs, and wants?

### ***Analysis of questions related to objectives***

Table 1 displays the frequencies and percentages of the participants responses to the items related to the objectives of Helicopter Piloting students. Based on these results it can be claimed that

about 19 percent of the students believe that the textbook meets their objectives. Another 33.4 percent agree with this idea, i.e. 52.7 percent of the responses show agreement with the idea that the Helicopter Piloting textbook meets their objectives. On the other hand about 38 percent strongly disagree (15.6 %) or disagree (22.9%) with the idea that the textbook meets their objectives. 8.9 percent of students have taken a neutral position.

*Table 1: Objectives of Helicopter Piloting Textbook*

	Frequency	Percent
<b>Strongly Disagree</b>	<b>109</b>	<b>15.6</b>
<b>Disagree</b>	<b>160</b>	<b>22.9</b>
<b>No Opinion</b>	<b>62</b>	<b>8.9</b>
<b>Agree</b>	<b>234</b>	<b>33.4</b>
<b>Strongly Agree</b>	<b>135</b>	<b>19.3</b>
<b>Total</b>	<b>700</b>	<b>100.0</b>

**Results:** The results of the chi-square test ( $\chi^2(4) = 116.47$ ,  $p = .000 < .05$ ) (Table 2) indicate that the above mentioned differences are statistically significant. In other words, the Helicopter Piloting students significantly believe that the textbook meets their educational objectives. Thus, the null hypothesis as ESP learners in Helicopter Piloting are not satisfied with their textbook in terms of their objectives is rejected.

*Table 2: Chi-Square Objectives of Helicopter Piloting Textbook*

<b>Asymp. Sig.</b>	<b>.000</b>
<b>a. 0 cells (0.0%) have expected frequencies less than 5. The minimum expected cell frequency is 140.0.</b>	

***Analysis of questions related to needs***

Majority of the respondents, i.e. 44.3 percent strongly agree (25.5%) and agree (19.8%) (Table 3) that the Helicopter Piloting textbook meets their needs. On the other hand, 42.5 percent believe that the textbook does not meet their educational needs. About 13 percent of the respondents have taken a neutral position.

*Table 3: Needs of Helicopter Piloting Textbook*

		Frequency	Percent
Valid	Strongly Disagree	127	22.7
	Disagree	111	19.8
	No Opinion	74	13.2
	Agree	105	18.8
	Strongly Agree	143	25.5
	Total	560	100.0

**Results:** The results of the chi-square test ( $\chi^2 (4) = 23.92$ ,  $p = .000 < .05$ ) (Table 4) indicate that the above mentioned differences are statistically significant. In other words, the Helicopter Piloting students significantly believe that the textbook meets their educational needs. Thus, the null hypothesis as ESP learners in Helicopter Piloting are not satisfied with their textbook in terms of their needs is rejected.

***Analysis of questions related to wants***

Table 5 displays the frequencies and percentages of the participants responses to the items related to the Wants of Helicopter Piloting students. Based on these results it can be claimed that about 9 percent of the students believe that the textbook does not meet their Wants. Another 31.9

percent agree with this idea, i.e. 40.9 percent of the responses show disagreement with the idea that the Helicopter Piloting textbook meets their Wants. On the other hand, about 40.6 percent strongly agree (11.9 %) or agree (28.7%) with the idea that the textbook meets their Wants. 18.4 percent of students have taken a neutral position.

*Table 5:Wants of Helicopter Piloting Textbook*

		Frequency	Percent
Valid	Strongly Disagree	57	9.0
	Disagree	201	31.9
	No Opinion	116	18.4
	Agree	181	28.7
	Strongly Agree	75	11.9
	Total	630	100.0

**Results:** The results of the chi-square test ( $\chi^2 (4) = 127.873$ ,  $p = .000 < .05$ ) (Table 6) indicate that the above mentioned differences are statistically significant. In other words, the Helicopter Piloting students significantly believe that the textbook does not meet their educational Wants. Thus, the null hypothesis as ESP learners in Helicopter Piloting are not satisfied with their textbook in terms of their wants is supported.

### **Research question two**

The second research question of the study was as follows:

Q2: Are ESP learners in Helicopter Piloting satisfied with their textbook in terms of format and design?

### **Analysis of questions related to format and design**

**Analysis:** Majority of the respondents, i.e. 46.2 percent strongly disagree (18.3%) and disagree (27.9%) (Table 7) that they are satisfied with the format and design of the Helicopter Piloting textbook. On the other hand, 38.9 percent are satisfied with the format and design of their textbook. About 14.8 percent of the respondents have taken a neutral position.

Table 7: Format and Design of Helicopter Piloting Textbook

		Frequency	Percent
Valid	Strongly Disagree	141	18.3
	Disagree	215	27.9
	No Opinion	114	14.8
	Agree	158	20.5
	Strongly Agree	142	18.4
	Total	770	100.0

**Results:** The results of the chi-square test ( $\chi^2(4) = 36.688$ ,  $p = .000 < .05$ ) (Table 8) indicate that the above mentioned differences are statistically significant. In other words, the Helicopter Piloting students significantly are not satisfied with the format and design of their textbook. Thus, the null hypothesis as ESP learners in Helicopter Piloting are not satisfied with their textbook in terms of their format and design is supported.

a. 0 cells (0.0%) have expected frequencies less than 5. The minimum expected cell frequency is 154.	

## DISCUSSION AND CONCLUSION

ESP students of Helicopter Piloting are satisfied with their textbooks in terms of their objectives based on the results obtained from the study. Thus, the null hypothesis as ESP learners in Helicopter Piloting are not satisfied with their textbook in terms of their objectives is rejected. This is because of the fact that the discipline-specific content of the book that is completely related to the students' field of study is really helpful to improve their knowledge of their specificity in English. The book has a consistent pattern; so, it can serve as a good learning support. The textbook of Helicopter Piloting includes concepts and knowledge that are familiar to students of this field and also offers something new to make the students involved through

thinking about the subjects in English. Considering this research area, most of the instructors and students believed that there was a proper match between the objectives of the book and objectives of the course. The two parties were also satisfied with the suitability of the textbook. The results of this study were consistent with Garinger's (2002) beliefs in this regard. According to Garinger (2002), the objectives of certain textbooks need to be parallel with the objectives of the course. Moreover, he suggests that the textbook should meet the needs of the learners and also need to be appropriate to the intended audience. In fact, ESP is usually stated to be goal-directed. Students study English for study or work purposes. "This has implications for the kind of activities and topics on the course" (Robinson, 1991, p.2). So, there is a good parallel between the findings of this study and the other related ones in this case.

ESP students of Helicopter Piloting are mostly satisfied with their textbooks in terms of their needs according to the results obtained from the study. Thus, the null hypothesis as ESP learners in Helicopter Piloting are not satisfied with their textbook in terms of their needs is rejected. The reason for this satisfaction is that the textbook which is being taught is in accordance with students' needs and can cover their expectations. It has a task-based syllabus that lets the students experience and learn through doing different tasks and activities. The content of the reading passages are in accordance with the content of their course of studies. The course book can provide enough information about their field of study and most of the discussion they have during the class can help them to match what they learn here with the other points covered in their other Persian courses and the points are in a good harmony. The book is certainly a good and unique source for this course being in hand. Most of the subjects a student of Helicopter Piloting needs to know about are covered in this book. As the author of the book has been both a helicopter pilot and an ELT expert, the book seems to have taken into account both disciplines throughout its various parts. Plenty of exercises following each section provide the students with enough practice in related fields and despite lack of enough time to review them all, most of the exercises can be considered as a self-study activity possible to be practiced out of class. In this respect, most of the students and also teachers were of the opinions that the content of the textbook was motivating and ordering of materials by topics was in a logical fashion. Regarding the appropriateness of the content to the students' needs, background knowledge, major, and their level of proficiency, both parties were positive on the mentioned Helicopter piloting textbook. The results of this category were consistent with the findings of Ghalandari and Talebinejad (2012) that the subject matter of ESP textbooks is compatible to the students' needs and achievement.

ESP students of Helicopter Piloting are not satisfied with their textbooks in terms of their wants since the results obtained from the data indicate it exactly. Thus, the null hypothesis as ESP learners in Helicopter Piloting are not satisfied with their textbook in terms of their wants is supported. To answer why the results obtained in this way it is good to pay attention that although the students may come to university with high motivation and interest, but in classes where no attention is paid to communication skills and practical issues, students have no opportunity to express themselves and ideas and this fact results in losing their motivation and interest. Generally speaking, students do not show any motivation toward learning English. The reason is that the course presented at the university cannot satisfy the students' wants and interests not only because students are in a low level of English proficiency, but also because

these ESP presented courses cannot give them whatever they need for their future jobs. This ESP textbook does not provide the students with opportunities to use the target language to achieve communicative purposes. So, it is important for the book to recycle instruction and to provide frequent and ample exposure to the instructed language features in communicative use. Unfortunately, the book does not consider that the nature of language teaching and learning is based on communication and interaction. Consequently, it requires students' involvement and participation in class activities and discussions.

In addition, in such ESP classes, because of the shortage of time, interaction between students and teachers and especially students and students and pair work is very little or almost impossible. The literature on ESP mostly puts emphasis on the communicative language methodology. For example, Farhady (1995) did not believe that reading ability is the only skill that Iranian students need to improve. He also puts emphasis on the communicative aspect of teaching in the ESP context. Similarly, Grant (1987) points to the communicative aspects of the textbook and believes that as a result of using the textbook, the students should be able to communicate a language. According to Dahmardeh (2009), new words in the textbooks under analysis are presented out of a plausible context as isolated sentences. Sarhady (2009) contends that language functions presented in the textbooks are so context-limited that it is too difficult for students to visualize the situation in which communication has happened. And finally, Azizfar et al (2010) have stated that the materials designers have just focused on the mechanical drills. They believe textbooks are limited to substitution and repetition drills, and students are required to produce simple sentences, and that they are not provided with the opportunity to practice communicatively the language they are learning. However, the findings of this study were not in line with these views.

ESP students of Helicopter Piloting are not satisfied with their textbooks in terms of format and design owing to the obtained results of the study. Thus, the null hypothesis as ESP learners in Helicopter Piloting are not satisfied with their textbook in terms of their format and design is supported. The reason for this dissatisfaction could be based on the reality that when a textbook does not have a good format and design, it affects both students' and teachers' motivation and interest to learn or teach that book. In the field of ELT specifically for ESP classes of pilot students it is important to use colorful, attractive and pleasurable course books. Pictures and illustrations in most cases help the students' visual memory to retain more information. If a course book has enough space on each page and between the lines, the students can take notes and write the important points during the lesson. Unfortunately, in the book for pilot students one of the most important problems is that the sentences of the book are written with no suitable space between the lines and it bothers the readers while reading the text since the page is really crowded by the words. It shows that how a perfect book in terms of format and design can boost the quality of language learning and students' motivation for learning. So, the educational department must increase the students' interest to improve their learning which would be really impossible without a well-designed textbook.

What's more, analyzing the format and design of the Helicopter Piloting textbook, most of the participants were of the opinions that the textbook was not attractive and its illustrations and photographs were not motivating enough to encourage the learners to read about the subject. The students said that their ESP course book should be colorful in order to be understandable. If their textbook did not have a good layout and design, it would affect their motivation and interest to read that book. It is clear that physical appearance of a textbook is very important. McDonough and Shaw (2003) believed that clarity of layout is an important criterion for textbook evaluation.

The pictures and illustrations help the students' visual memory to retain information. Visual materials such as photograph, chart, and diagram not only should have cosmetic value but also instructive value and learning purpose (McDonough & Shaw, 2003). Similarly, Garinger (2002) suggests that both students and instructors want visually stimulated material that is well organized and easy to follow. Therefore, layout, design, and organization should be considered. Thus, the results of this study were not in line with these views and previous studies done in this regard.

There were some limitations in this study and the researcher could not control the following factors:

- ✓ Although ESP students of Helicopter Piloting cooperated well in answering the questionnaire, many of them were not willing enough to answer the interviews questions and only 6 students helped the researcher in this regard.
- ✓ Since the special course for the students of Helicopter Piloting is just held in their 7<sup>th</sup> semester and it is just possible to collect the data in even semesters (second term of the year), it made the researcher miss so much time until the beginning of the term to make it possible distribute the questionnaire, observe the class, collect the data, and do the interviews.
- ✓ As Imam Ali Military Academy is based on a perfect discipline and it has its standard and specific rules, it was only possible for the researcher to observe 1 class and more important, it was a difficult task to retest the questionnaire for the second time since professors of the course were decided to cover most parts of the book due to the time limitation. In addition, it was to some extent difficult to gather learners and some participants were not eager enough to cooperate with the researcher for the retest process as well.

### **PEDOGOGICAL IMPLICATIONS**

Findings of this study may offer insights for those involved in educational administrations, syllabus design, curriculum planning, and materials development. Different sections of the textbook can be modified by the committee of textbook developers and policy makers of Imam Ali Military Academy in order to improve its attraction and quality. Teachers may also get insights from the findings and employ different strategies to compensate for the weak points of the textbook. However, there are some significant points help course designers and authorities to improve the whole framework of ESP classes in this regard which are as follows:

The method of teaching by the professors is not satisfactory by some students. This can be due to the kinds of reading books in which all students are concerned with a vocabulary list and a passage to read without having enough time to communicate in the class. This limits their capabilities in using their innovation for making new sentences with different words in different situations. Lack of time is a disaster in their field of study for their English classes.

In all classes a traditional approach to teaching was applied by the professors that can be due to the lack of time or the overall structure of the book that were designed for a reading course. It can be investigated if it is possible to apply a more communicative approach for teaching the same material or new material needed in order to improve all four skills of the students to match their future needs more than before.

Another noticeable implication is derivable from the result of text analysis; that is, the texts require modifications and refinements to be according to learners' needs and to be functioning as incentive of efficiency which lead students to reach their goals. Besides, texts can be modified to include more fascinating and more motivating topics to refresh learners' views toward their own ESP courses. This study may provide a good basis for developing comprehensible materials for students in different ESP courses. As a result, in the case of selecting passages for a course, syllabus designers should consider the learners' interests in reading comprehension. They can design appropriate textbooks on the basis of different skills needed for students and based on short-term and long-term goals. It can cause a great development in English teaching in Iranian universities. They can enhance the attractiveness of the books and students' motivation to read technical texts and make the best use of the books.

It is an undeniable fact that there must be clear objectives in ESP courses, and then based on those objectives relevant and perfect materials should be designed and developed to meet learners' objectives. The time allocated to Military Academy ESP courses especially in the field of Helicopter Piloting must be increased since professors are faced with many problems for covering all units of the books.

## AIMS AND SCOPE

The international journal of language learning and applied linguistics world performs as a platform for the new scholars to share their insights with other scholars in the form of original papers.

The international journal of language learning and applied linguistics world is a double-blind peer-reviewed international journal dedicated to promoting scholarly exchange among teachers and researchers in the field of language teaching and applied linguistics. Papers submitted to the journal will immediately be sent to two related reviewers who are responsible to provide feedback on the content and the language use.

The journal is published monthly in online and print versions. The scope of the journal includes, but not limited to, the following fields:

*Theory and practice in English*  
*Language teaching & learning*  
*Teaching English as a second or foreign language*  
*Applied linguistics*  
*Discourse studies*  
*Syllabus design*  
*Language learning problems*  
*Computer assisted language learning*  
*English for specific purpose*  
*English for academic purpose*  
*Language teaching & testing*  
*Translation studies*

### ABSTRACT

Potential mismatches between learners' and teachers' perception of appropriate reading strategies in academic reading contexts are of singular importance. This study reports a number of these mismatches in the context of English for Academic Purposes (EAP) at the college level. The reading strategy section of Reading and Writing Strategies Questionnaire (Baker & Boonkit, 2004) was submitted to 12 male sophomore EAP undergraduate students of psychology at the University of Tehran, and their responses were analyzed for their exploitation of reading strategies. Students were asked to check how often they would use reading strategies from 1 "Never" or "Almost never" to 5 "Always" or "Almost always" (Likert-scale inventory). Then, the same questionnaire was given to three faculty members of the psychology department who taught EAP courses to psychology students. The results showed that the students did not use strategies as intended, indicating a mismatch between what was reported to be useful to students by their teachers and their uptake of those strategies. Finally, a set of mismatches between the teachers' recommended and practiced reading strategy repertoires and those of students were identified.

**KEY WORDS:** Reading strategy; Perceptions of students; Reading and writing strategies questionnaire; EAP contexts

### INTRODUCTION

Defining language learning strategies (LLS) and learner strategies is well indicative of their significance and features. The dictionary meaning of the word *strategy* carries notions of "planning, directing, and managing things well for a certain purpose" (Hornby, 1990, p. 1270). Research on language learning strategies in second language (L2) learning started in the mid 1970s (Anderson, 2005). Oxford (1990) expands the definition of language learning strategies by stating that "learning strategies are specific actions taken by the learner to make learning easier, faster, more enjoyable, more self-directed, more effective, and more transferable to new situations" (p. 8). Thus, strategies are said to refer to specific actions or techniques and not characteristics that describe a general approach to learning (Wenden, 1987). According to the widely used technical definition from cognitive psychology, strategies are "operations employed by the learner to aid the acquisition, storage, retrieval, and use of information" (Oxford, 1990, p. 8; Wenden, 1987, p. 7).

A common assumption in strategy use is that effective strategy use helps students self-direct and control their own learning processes inside and outside the classroom. Self-direction is significant for the learners' language development as it reduces their reliance on teacher, and enables them to take responsibility for their own learning and develop more confidence, involvement, proficiency (Oxford, 1990), empowerment (Grenfell & Harris, 1999), and autonomy (Benson & Voller, 1997; Oxford & Nyikos, 1989). To promote opportunities for self-access language learning, researchers (Gardner & Miller, 1999) suggest that teachers raise students' awareness of language learning

strategies that could be employed in handling specific language tasks by discussing with them how to approach these tasks and by playing strategy search games urging students to think of possible uses of strategies in a particular context (Oxford, 1990). Therefore, a number of researchers argue that raising students' consciousness or awareness of the possible uses of these strategies can help them control and self-direct their own learning and develop their autonomy.

Language learning strategies are specific learning actions or behaviors that might or might not be observable. The latter type usually includes mental processes that cannot be captured by an observer (Wenden, 1987). Other strategies such as cooperating with others can be observed. However, some strategies are sometimes used outside the classroom so they cannot be documented easily by the teacher through observations (Oxford, 1990).

Whether observable or not in the students' actions for the purposes of research, the teachability and learnability of these strategies is one of the most investigated issues in research. It has been shown that learning strategies are behaviors that could be learned, rejected, and modified. "They are a part of our mental software" (Wenden, 1987, p. 8) called "learner training", "strategy training", or "learning to learn training", the teaching of learning strategies modifies and extends the teachers' role (Oxford & Nyikos, 1989). The teachers' role is to promote a learning environment that allows students to work on their strategies, train them to identify these strategies and assist their autonomy (Oxford, 1990). According to Wenden (1987), this increases the potential of their learnability and teachability, as shown in studies on strategy training programs, which have concluded that LLS are "readily teachable" (Oxford & Nyikos, 1989). In reference to explicit strategy instruction, Oxford (1989) notes that "strategy training is most effective when students learn why and when specific strategies are important, how to use these strategies, and how to transfer them to new situations" (p. 12).

Anderson (2005) recognizes how language learning strategies are related to success in accomplishing language learning tasks, stating that less successful learners do not progress in their tasks as more successful learners do due to the formers' lack of strategy repertoires, strategy use, and awareness of such strategies. Green and Oxford (1995) connect progress, L2 skills, and the development of strategies by stating that "language learning strategies are specific actions or techniques that students use, often intentionally, to improve their progress in developing L2 skills" (p. 262). Oxford (1990) has argued that a greater emphasis should be placed on identifying effective language learning strategies and on teaching students how to use them successfully. Some researchers have reported the differences between successful and less successful learners based on the language learning strategies they use (e.g., Vann & Abraham, 1990; Vandergrift, 1997). They sum up that good language learners seem to be skillful in monitoring and adapting different strategies, demonstrating flexibility in using strategies to accomplish different language learning tasks.

Oxford (1990) explains how direct and indirect strategies can be used to develop each of the four language skills: listening, reading, speaking, and writing. Language learning strategies are usually connected to each other and do not happen in isolation from each other. Anderson ascertains how strategies are interconnected and views them as a "process" (2005, p. 757). Brown (2002) also gives teachers a practical guide about how to deal with language learning strategies in the classroom. Some research has shown that integrating strategy instruction into regular classroom instruction brings about effectiveness (Anderson, 2005; Cohen, 1998).

Furthermore, research has tended to focus on the use of specific strategies in language skill areas, including listening, speaking, reading and writing. Reading strategies of L2 learners have been the focus of some researchers (Anderson, 2003, 1991; Mokhtari & Sheorey, 2002; Sheorey, 1999; Sheorey & Mokhtari, 2001). One of these attempts to investigate learning strategies was Mokhtari and Sheorey's (2002) study using the Survey of Reading Strategies (SORS) as a standardized instrument. Recently, the SORS was used by Anderson (2003) to measure metacognitive reading strategies used by EFL and ESL students while reading academic materials online. The adapted survey was called the Online Survey of Reading Strategies (OSORS), but the SORS classification was kept as global reading strategies, support strategies, and problem-solving strategies such as rereading difficult texts, and adjusting reading rate. To increase learners' online reading abilities, Anderson (2003) finally recommends that teachers focus their students' attention on the OSORS metacognitive reading strategies.

Many studies have focused on the advantages gained from linking the content of an ESL reading course to that of the mainstream course, aimed at benefiting from the discipline-based texts and focusing on developing reading skills by dealing with topics in the mainstream course (Benesch, 1988; Guyer & Peterson, 1988; Kasper, 1994). As found by Kasper (1996), discipline-based texts rather than literary texts have proven to benefit students more and improve their reading comprehension. Kasper explains this in the light of schema theory, arguing that discipline-based materials promote more elaborate schemata, provided that comprehension of literature is subjective in nature.

Therefore, focusing on introducing the English language literature including genres such as poems, stories, novels, etc. does not match the students' needs. Choosing texts on themes from other disciplines can thus enhance the students' objective sense and let them experience real life texts dealing with information and points of view that draw on their schemata. In addition, reporting on the impact of discipline-based content on developing English reading comprehension, researchers (Kasper, 1996) argue that such content encourages students to construct schemata and increase their metacognition of reading process, and also guides them to use more efficient comprehension strategies.

Additionally, the development of efficient reading strategies for students to use should allow for a sequence of instruction, including direct explanation, guided practice, independent use or practice, and group feedback (Kasper, 1996; Nist & Simpson, 1987; Shih, 1992; Weinstein, 1987). Nist and Simpson (1987) argue that group feedback following independent practice enhances self-regulated learning and reading comprehension by allowing self-monitoring and self-evaluating. However, Kasper (1996) claims that such an instructional sequence is insufficient to improve the reading performance of ESL students, arguing that the type of material is more critical and again pointing to the significance of discipline-based materials. We can conclude that group discussions form a scaffold to the reading input, and peer review of writing can also help students edit their work.

According to Baker and Boonkit (2004), in the reading process, reading strategies "are techniques and methods readers use to make their reading successful" (p. 302). Learners can employ such techniques in the reading process which include: "reading for pleasure in English, skimming and scanning, summarizing information, making guesses, prediction, making inferences, underlined words and phrases, and making notes" (Baker & Boonkit, 2004, p. 303)

Previous body of research has identified some of the skills needed to establish a balance between skills and language, which might as well be transferable from L1 if such skills are already well-developed there. These skills are: selecting what is relevant for the current purpose; using all the features of the text such as headings, layout, typeface; skimming for content and meaning; scanning for specifics; identifying organizational patterns; understanding relations within a sentence; using cohesive and discourse markers; predicting, inferring and guessing; identifying main ideas, supporting ideas and examples; processing and evaluating the information during reading; and transferring or using the information while or after reading (Dudley-Evans & St John, 1998). Other skills might be developing private dictionaries and research charts, and questioning or challenging readings (Pally, 2001).

Flowerdew and Peacock (2001) identified a number of macro- and micro-reading skills that EAP students need to develop. The macro-skills include the ability to make use of learners' existing knowledge to make sense of new material and fit new knowledge into their schema. Important micro-skills include recognizing logical relationships, definitions, generalizations, examples, explanations and predictions, and distinguishing fact from opinion. The purpose of this study thus is to examine the frequency of reading strategies among Iranian EFL male second year undergraduate students of psychology in EAP contexts.

## **RESEARCH QUESTIONS**

The main research question guiding this study is:

To what extent do EFL male second year undergraduate psychology students' reading strategy repertoires match their teachers' recommendations of useful and effective strategies in EAP Contexts?

## **METHODOLOGY**

### ***Participants***

Twelve second-year male undergraduate EAP students majoring in psychology at the University of Tehran volunteered to participate in the study. They were asked to check how often they use reading strategies from 1 "Never" or "Almost never" to 5 "Always" or "Almost always" (Likert-scale inventory). Then the same questionnaire

was given to three faculty members of the psychology department who used to teach EAP courses to psychology students.

### ***Instruments***

In order to explore students' exploitation of reading strategies, we elicited responses to the reading strategy section (the first 32 items) of Baker and Boonkit's (2004) Reading and Writing Strategies Questionnaire (downloaded online, Appendix [A]). This questionnaire had been extensively used in learning strategies studies which is a testament to its reliability and validity. Nevertheless, to make sure that the reading section of the questionnaire would still yield consistent responses, we pilot tested it before the final administration and calculated its reliability ( $r = .89$ ).

### ***Analysis of the data***

The data collected by the questionnaire were coded in a database using the Statistical Package for the Social Sciences (SPSS) software, version 16.0. As the study sample was relatively small, it could not be considered for a significant statistical analysis. Therefore, the questionnaire items were classified according to Baker and Boonkit's (2004) categorization of reading and writing strategies. Tables were generated to summarize the average use of strategies in each category. In reading strategy categories, Oxford's (1990) means were used as cut-off points as to what was low, medium, or high use of strategies. As the scale was from 1.0 to 5.0, the averages ranged from 1.0 to 5.0. A low average use of reading strategies would be within the average range of 1.0 to 1.4, meaning it was never or almost never used. Means from 1.5 to 2.4 reported a low use of reading strategies as they were generally not used. If strategies were sometimes used, they were within the range of 2.5 to 3.4, and the use of strategies was medium. A high use of strategies would fall within the range of 3.5 to 5.0, but if strategies were usually used, the reported averages would be from 3.5 to 4.4. If they were always or almost always used, the averages would be from 4.5 to 5.0. Table (1) provides a picture of how quantitative data from the questionnaire collected from the students and teachers were analyzed using the mentioned cut-off points.

*Table 1: Analysis Key of Quantitative Data Collected Using Questionnaire*

<b>High</b>	<b>Always or almost used</b>	<b>4.5 to 5.0</b>
	<b>Usually used</b>	<b>3.5 to 4.4</b>
<b>Medium</b>	<b>Sometimes used</b>	<b>2.5 to 3.4</b>
<b>Low</b>	<b>Generally not used</b>	<b>1.5 to 2.4</b>
	<b>Never or almost never used</b>	<b>1.0 to 1.4</b>

## **RESULTS AND DISCUSSION**

This section reports the results of Baker and Boonkit's (2004) Reading and Writing Strategies Questionnaire administered to the EAP class and three EAP teachers of the psychology department. It involved reading strategies used in the process of reading which are classified into general reading behavior, pre-reading strategies, while-reading strategies, and post-reading strategies. Table (2) illustrates the means of students in reporting their reading strategies.

*Table 2: EAP Class Means in Reading Strategies*

<b>Class</b>	<b>General Reading Behavior</b>	<b>Pre-Reading Strategies Mean</b>	<b>While-Reading Strategies Mean</b>	<b>Post-Reading Strategies Mean</b>	<b>Average</b>
<b>EAP (n=12)</b>	3.85	3.59	3.19	3.01	3.40

In this EAP class, both the students' general reading behavior and the pre-reading strategies were high as students indicated that they usually used them. On the whole, the means of every set of strategies indicated that students used most of these strategies in their reading habits.

The level of analysis of data obtained from the Inventory of Reading Strategies was taken further to compare the students' positive and negative appropriation of strategies in their reading process as indicated by the students themselves and in comparison with their teachers' recommendations in the inventory. A "POSITIVE USE" meant that the students only used the recommended strategies while a "NEGATIVE USE" indicated that the students used

the strategies that were not recommended. So both the teachers' recommendation and the students' reported use framed the positivity and negativity of strategy use as explained earlier. Negativity should be understood here as the mismatch between teachers' and students' reported use of strategies. The teachers' responses to the items as "Never" were coded as "Not Recommended" and "Sometimes" or "Usually" were coded as "Recommended" strategies. The students' responses to the item as "Never" were dealt with as "Not Used", and "Sometimes" or "Usually" as "Used" strategies. So, if a student reported using a strategy that his teacher had recommended (sometimes or usually), it was considered a positive use. If the student said he did not (never) use a strategy that was not recommended for use, it was still a positive use. On the other hand, if he reported using an item (sometimes or usually) his teacher had not recommended, it was considered a negative use. If he responded that he did not (never) use a recommended strategy, it was a negative use as well.

At this level of the analysis of the results, we considered the students' use of strategies looking at the extent to which they used strategies as taught and recommended by their teachers. The results reported in this section reflect the students' positive and negative use of strategies. Negative use of strategies is also emphasized here as it showed that students did not use strategies as they were expected to. The results revealed a match between the students' and their teachers' ratings as shown here as a positive use of strategies, but there was also a clear mismatch, which was considered a negative use of strategies. Tables (3) and (4) below present the percentages of negative and positive strategy use among EAP students as reported in their questionnaire responses, classifying the items into positive and negative strategies according to the analysis criteria explained earlier.

Table 3: EAP Students' Negative Strategy Use

Strategy Category	EAP Psychology Students (n=12)
<i>Negative Strategy Use</i>	(n)=12
General Reading Behavior	0%
Pre-Reading	8.33%, n=1
While-Reading	25%, n=3
Post-Reading	16.66%, n=2

- Negative and positive strategy uses for each strategy category were computed by dividing the number of reported negative or positive items by the total number of positive and negative strategies.
- "Negative" is a term that Baker and Boonkit (2004) used in their reading and writing questionnaire to mark items that they considered negative in reading and writing processes. However, it was used in this table to keep the same classification they have used in their questionnaire for ease of analysis.

Table 4: EAP Students' Positive Strategy Use

Strategy Category	EAP Psychology Students (n=12)
<i>Positive Strategy Use</i>	(n)=12
General Reading Behavior	0%
Pre-Reading	0%
While-Reading	8.33%, n=1
Post-Reading	16.66%, n=2

As can be seen in Table (3) above, in their reading processes, the students reported using the following reading strategies from the most negatively-used to the least: 1) while-reading (25%), 2) post-reading (16.66%), and pre-reading strategies (8.33%), indicating a major problem in while-reading and after-reading processes.

The reading strategies that were shown to be appropriated negatively by the EAP students were:

- asking about the purpose of texts (pre-reading);
- breaking sentences into words and phrases (while-reading);
- predicting while reading (while-reading); and
- making inferences (post-reading).

## CONCLUSION

The research question of this study looked at the extent to which students' reading strategy repertoires matched their teachers' recommended strategies in EAP courses.

As shown in the study, students did not use strategies as intended, indicating a mismatch between what was reported to be useful to them by their teachers and their ultimate strategy use. "Sources of mismatch" between teachers' intentions and students' interpretations in task-based pedagogy were investigated by Kumaravadivelu (1991) who classified observations of such a mismatch into ten sources: cognitive, communicative, linguistic, pedagogic, strategic, cultural, evaluative, procedural, instructional, and attitudinal. In this study, a set of mismatches between the teachers' recommended and practiced reading strategy repertoires and students' reported strategy use repertoires were identified. As argued by Kumaravadivelu (1991), mismatches between teacher intention and teacher interpretation may be inevitable, but they need not be totally negative, and "a particular mismatch, if identified and properly handled, can give learners an opportunity to negotiate further in order to tease out a problem in their own way" (p. 106).

Even if there was a "negative use" (negative uptake) in reading strategy use, it could still be identified and more effective strategies could be scaffolded by teachers. The students' uptake in strategy use was negative because it was contrary to the teachers' strategy repertoires with regard to what the teacher felt would be useful for them.

## IMPLICATIONS FOR PEDAGOGY

Teachers could use various inventories of reading strategies as needs analysis tools to help them diagnose students' use of strategies and explain why students may not use some of strategies as taught in the course. The study indicated that students had some learning difficulties and instances of bad performance in mainstream courses related to their reading aloud, and slow reading. Students' use of some reading strategies was shown to be negative, pointing to a mismatch between pedagogical goals and students' strategy use. Therefore, teachers could address such learning difficulties and scaffold a positive use or uptake of strategies more often for particular students.

## LIMITATIONS

In considering this study, it is also important to acknowledge some limitations:

1. Classroom observation was not possible to develop a full picture of the contexts of study. Thus we were outsiders in reporting this research, and the study reflected mostly teachers' and students' rhetorical accounts of their classroom activities.
2. Baker and Boonkit's (2004) Reading and Writing Strategies Questionnaire was a de-contextualized inventory as it did not address a specific context for students to consider when they responded to the items. In a sense, it is best to provide students with a specific context so that they report the processes that they go through in carrying out these tasks.
3. It is possible that students responded randomly to the Likert-scale inventories used in this study, which made it difficult to envision how often students really used such strategies.
4. The Inventory of Reading Strategies was originally meant to reflect students' reported strategy use, but teachers were also asked to comment on how useful strategies were to students and how often they should use them. As one of the EAP teachers commented, the inventory was meant for students or learners and not for teachers.
5. The study sample was small and insufficient for a significant statistical analysis. Also, the participants of this study were undergraduate students of psychology, and there may be some variations for students of other disciplines.

## APPENDIX

English Reading Strategies					
<b>General Reading Behaviour</b>					
1.	I often read texts in my native language.	1	2	3	4 5
2.	I often read English texts.	1	2	3	4 5
<b>Pre-Reading: Before Reading A Text in English, I Do The Following:</b>					
3.	I read the topic or heading of the text.	1	2	3	4 5
4.	I look at the pictures or graphs of the text.	1	2	3	4 5
5.	I think about the reasons why I am reading the text.	1	2	3	4 5
6.	I read the first sentence of the text.	1	2	3	4 5
7.	I try to predict what the text will be about.	1	2	3	4 5
8.	I ask myself about the author's purpose for writing the text.	1	2	3	4 5
9.	I read the provided questions (if any) before I read the text.	1	2	3	4 5
<b>While Reading A Text in English, I Do The Following:</b>					
10.	I read the whole text quickly to understand the main idea.	1	2	3	4 5
11.	I translate the sentences into my native language for the main idea of the text.	1	2	3	4 5
12.	I check my predictions about the text while reading.	1	2	3	4 5
13.	I use the vocabulary and the structure to help me understand the main idea of the text.	1	2	3	4 5
14.	I must understand every word in the text in order to get the main idea.	1	2	3	4 5
15.	I split up (break) sentences into phrases or words for my understanding of the text.	1	2	3	4 5
16.	I take notes, highlight or underline the important points while I am reading the text.	1	2	3	4 5
17.	I use my background (world) knowledge to help me understand the text.	1	2	3	4 5
18.	I scan (read quickly) for the answers to some questions provided with the reading.	1	2	3	4 5
19.	I skip words if I don't know their meanings.	1	2	3	4 5
20.	I guess the meaning of some words from context clues.	1	2	3	4 5
21.	I use a bilingual dictionary (translating from English to my native language) whenever I need to get the meaning of an unknown word.	1	2	3	4 5
22.	I use an English-English dictionary if I need to know the meaning of an unknown word.	1	2	3	4 5
23.	I predict what is going to happen next while reading.	1	2	3	4 5
24.	I read the text in detail.	1	2	3	4 5
<b>Post-Reading (After Reading), I Do The Following:</b>					
25.	I make inferences after finishing reading the text.	1	2	3	4 5
26.	I summarize the text after I finish reading it.	1	2	3	4 5
27.	I discuss what I understand with my friends or teacher.	1	2	3	4 5
28.	I go back to read the details of the text for the answers to understand questions on it.	1	2	3	4 5
29.	I use a dictionary after I understand the main idea of the text.	1	2	3	4 5
30.	I take notes on all the new words and phrases for my vocabulary bank.	1	2	3	4 5
31.	I apply the knowledge from some texts in my everyday activities.	1	2	3	4 5
32.	I give myself a reward when I have finished.	1	2	3	4 5

## THE RELATIONSHIP BETWEEN SELF-EFFICACY BELIEFS AND ENGLISH ACHIEVEMENT TEST

Hamidreza Pouyamanesh

### ABSTRACT

This study investigated the relationship between self-efficacy perceptions and English achievement test. The study participants were 138 Iranian female students in two separate schools. Eighty-eight participants were third grade middle school students, and fifty participants were third grade high school students. The students' perception of self-efficacy was measured through a thirty-four item questionnaire called Morgan and Jinks student efficacy scale (MJSES) which was translated into Persian. English achievement tests that were publicly administered throughout country simultaneously were also obtained from school authorities. The results of the study indicated the existence of a positive and significant relationship between middle school students' self-efficacy and their English grades, and a positive and significant relationship between high school students' self-efficacy and their English grades. The analysis also indicated that there is not a significant difference between middle and high school students with regard to the relationship between their self-efficacy and English grades.

**KEYWORDS:** self-efficacy beliefs, achievement test, middle school, high school

### INTRODUCTION

Self-efficacy beliefs have gained increasing significance in educational research, particularly in studies of academic success. In this area, researchers have argued that students' self-efficacy beliefs are correlated with students' academic performances and achievement (Bandura, 1981; Morgan & Jinks, 1999; Pajares & Schunk, 2001). In other words, learners who are more efficacious have higher scores than those of their less efficacious peers. In this paper, the researcher tries to elaborate on this relationship to add to the body of the research in this field.

### REVIEW OF THE LITERATURE

Social cognitive theory is an approach to comprehending human cognition, action, motivation, and emotion. This theory posits that individuals are able to reflect on their performances and control them and that they can manipulate their environments instead of just passively responding to them. Social cognitive theory also supposes that individuals' actions are goal-oriented and are done on purpose which is guided by foresight. Meta-cognitive activities also play a significant role in this theory which implies that individuals are self-reflective and able to monitor their experiences and conducts. By regulating and controlling their environment, learners also exert direct control over their behavior and are capable of self-regulation.

Bandura, Barbaranelli, Caprara and Pastorelli (1996) believe that self-efficacy is derived from social cognitive theory. Bandura (1986) defines self-efficacy as "people's judgments of their capabilities to organize and execute courses of action required to attain designated types of performances" (p. 88).

The beliefs which individuals hold about themselves are important factors in regulating behavior. Therefore, behavior can be affected in two ways; either individuals engage in activities that they think they are confident and competent in or they refrain from tasks that they feel contrary. In fact, self-efficacy helps to determine how much effort, perseverance and resilience is put on an activity. It means that individuals with higher perception of efficacy have greater effort, persistence and resilience. Emotional reactions may also be determined by efficacy beliefs. For instance, people who have low self-efficacy perceptions believe that a task is hard and hence become stressful and

depressed easily. However, those individuals who hold a high sense of self-efficacy are more relaxed during an activity. Therefore, these factors are strong predictors of people achievement.

Self-efficacy beliefs are divided into three dimensions: magnitude or level, generality, and strength (Bandura, 1997). Magnitude or level is related to the number of stages of increasing difficulty that an individual feels he/she can handle. Generality of self-efficacy is whether success or failure experiences affect self-efficacy beliefs in the same situation or contexts. And, strength of self-efficacy points out to “the resoluteness of a people’s convictions that they can perform the behavior in question” (Maddux, 1995 p. 9).

There are two concepts that overlap with self-efficacy thus hard to be distinguished. The first construct is self-esteem. The most important difference between self-esteem and self-efficacy is that self-efficacy is not a personal characteristic (Maddux, 1995). Self-efficacy is pertinent to certain fields or even subfields of human behavior. Learners can have high levels of self-efficacy in a field such as mathematics, sports, or learning languages, but have low self-esteem. They can also have high self-esteem and feel inefficacious in math and science. The joint factor between self-efficacy and self-esteem is that both of them are assessments. The outstanding disparity between them is that self-efficacy is the assessment of capability, and self-esteem is the assessment of self-worth (Epstein & Morling, 1995). The second construct that overlaps with self-efficacy is confidence. Bandura (1997) points out that confidence is “a nondescript term that refers to strength of belief but does not necessarily specify what the certainty is about” (p. 382). An individual can be confident that he will fail or succeed in math. Self-efficacy is the belief in one’s strength to accomplish specific levels of performance. Confidence is not related to the person’s strength or capability to perform at a certain level.

There are a number of factors which are believed to affect self-efficacy, such as goal setting, information processing, models, encouragement and feedback, socio-economic status, and culture and self-perception.

1. Goal setting: one of the important cognitive processes is goal setting which affects outcome. Individuals who possess a goal are more efficacious for obtaining that goal and work diligently to get it (Schunk, 1995).
2. Information processing: those students who believe they are unable to handle the material taught possibly possess a low sense of self-efficacy. However, those who consider themselves capable of understanding the material are likely to have a high sense of efficacy (Schunk, 1995).
3. Models: learners may become efficacious by watching peers. Watching others doing a task successfully enhances self-efficacy since it makes a proper basis for comparison. However, observing a peer fail will decrease self-efficacy (Bandura et al, 1996).
4. Encouragement and feedback: persuading learners they “can do it” or providing them with positive feedback raises students’ self-efficacy levels (Schunk, 1996). During feedback, convincing learners that their success is the result of their own effort enhances motivation and self-efficacy.
5. Socio-economic status (SES): SES is believed to influence self-efficacy in a number of fields. Tong and Song (2004) conducted a study on 102 low and regular SES Chinese college students. They indicated that the general self-efficacy scores of high socioeconomic-status students were significantly higher than those of their low socioeconomic-status peers.
6. Culture and self-perceptions: Klassen (2004) studied self-efficacy perceptions across cultural groups. He analyzed 20 articles conducted over the course of 25 years. The outstanding finding in these articles was that subjects from Asian countries with collectivist environments possessed lower self-efficacy beliefs than subjects from western countries with individualist cultures.

Maddux and Lewis (1995) offered a number of strategies for self-efficacy information. The first one is verbal persuasion which means encouraging learners to cope with their stress and to risk that might result in success. The second strategy is the use of imaginal and vicarious experiences. Maddux and Lewis (1995) define vicarious experiences as watching of live or taped models doing a task that learners think they are unable to do. Their definition for imaginal experiences is the meetings in which learners visualize themselves coping with a demanding task, such as second language learners having a presentation in front of a group of native speakers. Enactive experiences are almost defined like vicarious experiences but the only dissimilarity is that, in enactive experiences, learners actually do or practice the task alone or with help. The next strategy is the control of physiological and emotional conditions which is offered by Schunk (1996). It can be clearly noticeable when learners are not confident about their abilities in performing a task through observing their physiological and emotional state. Some of those states are sweating, anxiety, nervousness, and increased heart rate. Consequently, through decreasing emotional arousal like anxiety during performing a task, we can raise self-efficacy. Maddux and Lewis (1995) suggest some

strategies for decreasing emotional and physiological arousal among which are breathing techniques, meditation, and relaxation.

Many researchers (Bandura, 1981; Jinks & Morgan, 1999; Pajares & Schunk, 2001) believe that self-efficacy of students can predict their academic success. It is argued that highly efficacious students are confident about their performance, work very hard in order not to fail, do challenging tasks and believe that their failure is due to insufficient effort or lack of enough knowledge that they believe they are capable of (Magogwe & Oliver, 2007). Bandura (1986) further suggested that success plays a significant role in self-belief and can determine one's level of achievement. Schunk (1995) highlighted that if students believe they are capable of performing better, they do not maintain low self-efficacy. Thus, Pajares (1996) asserted that "how individual interpret the result of their performance attainments, informs and alters their environment and their self-beliefs, which in turn inform and alter their subsequent performances" (p. 543). According to Pajares (2000), beliefs that learners build and develop and they consider them to be true are crucial factors in their success or failure in school. This would lead one to infer that research on achievement, on why students achieve or fail to achieve, and on why they do things they do in school should naturally focus, at least in great part, on students' self-efficacy beliefs.

With regard to language learning, the pertinent research studies indicate practical support for strong effects of self-efficacy perceptions on this field too (Yazici, Seyis, & Altun, 2011; Yusuf, 2011; Huang & Shanmao, 1996; Templin, 1999; Templin, Guile & Okuma, 2001; Anstrom, 2000). Based on her study on the key variables in language learning, Cotterall (1999) considered self-efficacy as a crucial variable in success of language learners. If people have high positive self-efficacy about learning a second language, then they believe that they have the power and abilities to reach this goal. On the other hand, people with low self-efficacy feel that they do not have the power and abilities to learn a language, thus admitting failure from the start.

While there are many studies in the literature, (e.g., Magogwe & Oliver, 2007; Yilmaz, 2010; Rahimi & Abedini, 2009; Mango, 2009), investigating the effect of self-efficacy beliefs on students and its relationship with different variables (e.g. learning strategies and proficiency), little attempt has been made to examine the variables as related to English achievement of Iranian middle school and high school students. That is why this study was designed to address this gap in the literature and focus on the relationship between Iranian female students' self-efficacy beliefs and their level of schooling and their scores in English achievement test.

## **RESEARCH QUESTIONS**

More particularly, the present research will answer the following questions:

- 1) Is there any relationship between the Iranian middle school female students' self-efficacy beliefs and their grades in English achievement test?
- 2) Is there any relationship between the Iranian high school female students' self-efficacy beliefs and their grades in English achievement test?
- 3) Is there any significant difference between middle school and high school Iranian female students regarding the relationship between their self-efficacy beliefs and their grades in English achievement test?

## **METHODOLOGY**

This study was primarily a correlational research. This quantitative data collection method was used in this study to investigate the relationship between self-efficacy and English achievement tests of middle and high-school female students. Data were collected from a scale that is Morgan-Jinks student efficacy scale (MJSES) and from students' English achievement test.

### ***Participants***

The participants of this study were 138 middle and high school female students. There were three intact classes of third grade middle school female students with eighty-eight participants, and three intact classes of third grade high school female students with fifty participants. They were almost of the same age in two separate schools in east of Tehran. The middle school students were around 15 years old, and high-school students were around 18 years old.

### ***Instrumentation***

A brief survey were conducted to collect demographic information from students including name, gender, age and English language background before the main part of the study that is Morgan-Jinks Student Efficacy Scale (1999).

The Morgan-Jinks Student Efficacy Scale (MJSES) were used in this study to collect self-efficacy beliefs of students. Learners rated themselves in this survey. "The MJSES is a more extensive inventory that makes use of self-report grades as a dependent variable" (Morgan & Jinks, 1999, p. 225). This questionnaire consists of 34 items and these 34 items have been divided into 3 subscales which are talent, effort and context. It was selected because, as Morgan and Jinks (1999) indicate, the MJSES scale has undergone extensive development to assure validity and reliability. Morgan and Jinks (1999), in their original study to develop this questionnaire, reported the overall reliability .82 and the reliability of each of the subscales of talent, effort and context .78, .66 and .70 respectively. However, these items were slightly modified to fit into the needs of this study. Since the researcher believed that the students were not that much proficient in English, the items were also translated into the Persian language. To further assess the reliability of the self-efficacy survey, a Cronbach's alpha reliability coefficient was computed. The internal consistency of the scale was .74. Therefore, this scale is considered reliable with a Cronbach's alpha coefficient of .74 since, generally speaking, a value of more than .7 is discussed that possesses an acceptable degree of internal consistency (Pallant, 2002).

In addition, grades of the students in their final English achievement test were collected to find the relationship of these grades with self-efficacy beliefs of students. In order for the data to be reliable, the researcher asked authorities of the school to provide him with students' grades which were administered to them all over the country simultaneously.

### ***Procedure***

Permission was obtained from school authorities and from students' parents before distributing the questionnaire. The survey was distributed to the students to collect demographic information. Then, the researcher described the questionnaire to the students and he helped them with their problems while they were answering the items. The researcher stuck to the detailed procedure of the administration of the questionnaire as was dictated by the original authors in order not to disturb the reliability of the study. The students were enlightened that this questionnaire had nothing to do with their course grades so that they would be encouraged to answer the items honestly. The items were designed for a 4-point Likert-scale response. A certain behavior was stated and followed by a four-interval scale, each one corresponding to the extent to which the respondent believed the statement applied to her to him. An example is "I am a good science student" followed by really agree, kind of agree, kind of disagree, and really disagree. The participants were asked to circle one number that best represented the degree to which the corresponding statement applied to them. 1 represents 'strongly disagree', 2 'disagree', 3 'agree' and 4 'strongly agree'. Therefore, means above 2 represent positive self-efficacy beliefs, with higher results equating to stronger and more positive beliefs.

The Pearson r correlation was computed on the data received from the Liker-scale questionnaire and students' English achievement grades to delineate the degree of relationship between the two variables. The two correlations were also changed into Z-scores to find out whether the difference between them was statistically significant or not. Before calculating the mean score of each subject, the values of some items (Items No. 5, 15, 19, 20, 22, 23 and 28) had to be reversed because they carried an opposite weight to the purpose of this study.

## **RESULTS**

### ***The First Research Question***

Question 1: Is there any relationship between Iranian middle school female students' self-efficacy beliefs and their grades in English achievement test?

Data obtained from the self-efficacy scale and the middle school female students' English grades were used to answer this question. Eighty-eight students filled out the items. A Pearson correlation was computed on the scores obtained from both of these scores, and the results showed a medium correlation between the middle school students'

self-efficacy and their grades in English achievement test. There was a statistically significant positive correlation ( $r=.30$ ,  $p<.01$ ) between scores obtained on the self-efficacy scale and students' English grades. The results indicated that the Iranian middle school female students are also strongly efficacious with a mean of above two ( $M= 3.18$ ).

The descriptive Statistics and correlation between middle school students' self-efficacy beliefs and their grades in English achievement test is summarized in table 1 below.

*Table 1: Means, Standard Deviations, and the Correlation: Middle School Female Students' Self-efficacy and English Achievement Test (N=88)*

	English Scores	Questionnaire Scores
<i>English Scores</i>	<i>1</i>	<i>.301*</i>
<i>Questionnaire Scores</i>	<i>.301*</i>	<i>1</i>
<i>Mean</i>	<i>18.37</i>	<i>3.18</i>
<i>SD</i>	<i>1.4</i>	<i>.27</i>

\*. Correlation is significant at the 0.01 level (2-tailed).

### ***The Second Research Question***

Question 2: Is there any relationship between Iranian high school female students' self-efficacy beliefs and their grades in English achievement test?

Data from the self-efficacy survey and those from the English achievement test were used to answer this question. A Pearson correlation was computed on scores obtained from the self-efficacy scale and those obtained from English test. The results showed a medium association between the two sets of scores. There was a statistically significant positive relationship between self-efficacy and English achievement test ( $r=.41$ ,  $p<.01$ ). The coefficients of correlation found above rejected the null hypothesis and confirmed that there was a statistically significant positive relationship between self-efficacy and English achievement test. High school students were also strongly efficacious with a mean of 3.03.

The descriptive Statistics and correlation between high school students' self-efficacy beliefs and their grades in English achievement test is summarized in table 2 below.

Table 2: Means, Standard Deviations, and the Correlation: High School Female Students' Self-efficacy and English Achievement Test (N=50)

	English Scores	Questionnaire Scores
<i>English Scores</i>	1	.410*
<i>Questionnaire Scores</i>	.410*	1
<i>Mean</i>	17.32	3.03
<i>SD</i>	1.97	.25

\*. Correlation is significant at the 0.01 level (2-tailed).

### **The Third Research Question**

Question 3: Is there any significant difference between Iranian middle school and high school female students regarding the relationship between their self-efficacy beliefs and their grades in English achievement test?

Data from the first and second questions were used to answer this question. The researcher used the correlation between middle school students' self-efficacy and their English grades on the one hand, and the correlation between high school students' self-efficacy and their English grades on the other hand to see whether there are statistically significant difference between two sets of scores. In other words, the investigator tried to see whether the correlation difference between the first and second questions is statistically significant or not. The table 1 and 2 given above show that the correlation between middle school students' self-efficacy and their English scores was  $r=30$ , while for high school students it was slightly higher,  $r=41$ . Although these two values seem different, is this difference big enough to be considered significant? To figure out whether the difference between these two values was significant, the researcher adopted the formula mentioned in "SPSS Survival Manual" (Pallant 2002). The two correlations obtained from the first and second questions were changed into Z scores by the means of "Transformation of r to z" table. Then, these values were slotted into the equation which is utilized to calculate  $Z_{obs}$  (Pallant 2002). The obtained value of  $Z_{obs}$  was  $-.694$ . The next step was to determine if the  $Z_{obs}$  value is statistically significant. According to Pallant (2002), "If the  $Z_{obs}$  value that you obtained is between  $-1.96$  and  $+1.96$  then you cannot say that there is a statistically significant difference between the two correlation coefficients". Therefore, the null hypothesis (no difference between the two groups) was not rejected since the value of  $Z_{obs}$  that is  $-.694$  was not beyond the specified values. The investigator could conclude that correlation difference between middle and high school students was not statistically significant.

In general, it seems that the results of this study are in line with what other researchers have attained. There is a positive correlation between self-efficacy and English achievement test. The correlation between high school students' self-efficacy and their English achievement test ( $r=.41$ ) was stronger than that of middle school students ( $r=.30$ ). With regard to the strength of self-efficacy, the middle school students ( $M=3.18$ ) are slightly more efficacious than high school students ( $M=3.03$ ). English achievement scores of middle school students ( $M=18.37$ ) were also higher than those of high school students ( $M=17.32$ ).

### **DISCUSSION**

Second and foreign language learners, instructors, and other language practitioners are completely cognizant of the existence of learning self-efficacy. Many research studies have been replicated investigating the association between self-efficacy and language ability in various contexts, sometimes they found a relationship, and other times failed to find one. In this study, the investigator tried to add to the body of existing literature about the relationship between self-efficacy and language ability. Previous studies indicate that there is a statistically positive relationship between students' self-efficacy and language ability (Huang & Shanmao, 1996; Templin, 1999; Templin, Guile & Okuma, 2001; Cotterall, 1999; Rahimi & Abedini, 2009).

This study was conducted to investigate the relationship between self-efficacy and language achievement test in a foreign language environment. Data were gathered from 138 middle and high school students in Iran. A thirty-four item questionnaire was used to measure self-efficacy, and students' English achievement grades to measure their English ability. Pearson correlations showed a statistically significant positive relationship between middle school

students' self-efficacy and their English grades ( $r=.30$ ), and a statistically significant positive relationship between high school students' self-efficacy and their English grades ( $r=.41$ ). The first and second correlations were changed into Z-scores to find the statistically significant difference between the two correlations. The analysis conducted showed that there is not a statistically significant difference between the two correlations ( $Z_{obs} = -.694$ ).

There was a statistically significant correlation between students' self-efficacy beliefs and their English grades. However, when we calculated the coefficient of determination of correlations for the first two questions, the shared variance for the questions was 0.09 and 0.16 respectively. It means that there is not much overlap between the two variables. Self-efficacy beliefs help to explain nearly .09 and .16 per cent of the variance in respondents' scores on the English achievement test. This is not a respectable amount of variance explained when compared with some other studies conducted in this field. When we take a closer look at the data, we can see that means of both questionnaire and English grades were high for both middle and high school students. The problem here is that self-efficacy beliefs contribute to high language ability in some students, but fails to do so in some other. So, according to the results of this study, at least in some cases, there is not a large correlation between self-efficacy and English achievement test and there may be some other factors which are more important than self-efficacy with regard to English proficiency. Therefore, considering success in English proficiency as a result of self-efficacy must be looked at cautiously.

### **CONCLUSIONS AND IMPLICAIONS**

Teachers and school or institute authorities have to strive to enhance learners' perception of self-efficacy. Many studies have been conducted to enhance or alter students' self-efficacy by a variety of methods. Schunk and his colleagues have offered some useful strategies that can be utilized in a classroom environment. Teachers have to set proximal rather than distant goals for students (Schunk, 1983), combine process goals with progress feedback (Schunk & Swartz, 1993), choose peers with similar characteristics as models (Schunk & Hanson, 1985; Schunk, Hanson, & Cox, 1987), provide effort attributional feedback for students' improvement (Schunk & Cox, 1986), and make learners to self-evaluate (Schunk & Ertmer, 1999). These methods are considered to boost learners' sense of self-efficacy. Therefore, teachers have to cultivate academic self-efficacy in their students. Pajares (2006) believes that this can be done through providing students with successful experience, nurturing optimism, and emphasizing students' skill development. It is recommended teachers provide students with effective modeling practices and select peers for classroom models properly to make sure students view themselves as well in learning ability as to the models. Measuring students' self-beliefs can help authorities to have important insights about their students' academic motivation, behavior, and future choices. For example, a low self-efficacy perception can cause maladaptive academic behaviors, ignorance of courses and careers, and decreased school interest and achievement (Hackett, 1995). Students who possess low self-efficacy perceptions in a specific task are unlikely to choose that task, and they will more rapidly quit when they face difficulty.

The efficacy beliefs of teachers are also relevant to students' achievement. Efficacious teachers build a classroom environment in which academic objectives are met. There also exists emotional support and encouragement necessary to meet challenges and achieve academic mastery. All teachers strive seriously to nurture the self-beliefs of their students since it is apparent that these self-beliefs can have useful or harmful influences. Teachers who only consider teaching as nurturing their students' cognitive skills or who are of the opinion that cultivating their students' often-fragile egos is not their responsibility have to rethink their role as educators of children.

Due to the fact that, young children are incapable of having proper self-appraisals, they mostly count on the judgments of others to build their own confidence and self-worth. When parents and teachers give children challenging tasks and meaningful activities that can be performed successfully and support these efforts with encouragement, they help children to develop a powerful sense of self-efficacy. Parents play an important role in raising self-efficacy of students. Parental involvement and producing of congenial school environments will result in arousal of children's interest in schooling and make them develop high academic self-efficacy. Both the home and the school have the burdensome responsibility of developing physical and psychological environment and of creating a friendly home and school environment, as these are necessary for raising the academic self-efficacy of the children.

The effect of self-efficacy on achievement does not end with schooling. Therefore, schools have the extra responsibility of preparing confident and efficacious individuals for future. As Albert Bandura (1986) has emphasized, “educational practices should be gauged not only by the skills and knowledge they impart for present use but also by what they do to beliefs about their capabilities, which affects how they approach the future. The students who develop a strong sense of self-efficacy are well equipped to educate themselves when they have to rely on their own initiative” (p. 417).

These implications suggest that future research must be focused on the creation of congenial school and home environment, development of teaching skills, and educational practices that are aimed to nurture self-efficacy while at the same time to encourage the adoption of a mastery goal.

### LIMITATIONS OF THE STUDY

One of the limitations of this study was that the number of schools and classes from which the data were collected. In addition, the participants of the present research were all female students in the same district of Tehran. Also, it was not possible for the researcher to randomly select the students, so he chose intact classes. Therefore, it was difficult to generalize the finding of this research to the entire population of students in Iran. Another limitation of this study was the administration procedure. Some of the students did not cooperate with the researcher and they did not take the questionnaire seriously. This may have deviated the results of the study. Last but not the least, the use of questionnaire as the only means of data collection has its own limitations. Although questionnaires are widely used as a data collection procedure in conducting studies, it cannot be used as the only source of the information. However, questionnaire is the only instrument available for collecting self-report data.

## ABSTRACT

This article aims at investigating the similarities and differences between first language (Arabic) and second language (English) acquisition in the context of Arab Learners of English ALEs. The author compares and contrasts the target languages (Arabic and English) to identify the similarities and differences in the acquisition of L1 and L2. The analyses of the linguistic items taken from L1 and L2 indicate that there are similarities and differences in the acquisition of both Arabic Language as an L1 and English Language as an L2. It is also indicated that L1 has positive and negative impact on the acquisition of L2 as well.

**KEY WORDS:** *First Language Acquisition, Second Language Acquisition, Similarities, Differences, Errors/Mistakes, Overgeneralization, and Crosslinguistic influence*

## INTRODUCTION

Ervin-Tripp (1974, p. 205) came to the conclusion that the first and the second language learning is similar in natural situations. Others, such as Taylor (1983, p. 146), found credible evidence that second language learners use many strategies similar to those used for learning a first language. He found that elementary and intermediate students of ESL use overgeneralization and transfer in learning the target language. When he examined the students' errors, he found that "reliance on overgeneralization is directly proportional to proficiency in the target language, and reliance on transfer is inversely proportional". In other words, early learners transfer and later learners overgeneralize.

This article presents the first and second language acquisition theories aiming at finding the similarities and differences in the acquisition of L1 and L2. This paper is divided into five main sections: section one is the introduction, the literature review is presented in section two, section three is the analysis and the discussion, the conclusion is presented in section four, and finally, the references are in section five. The following section presents the literature review.

## LITERATURE REVIEW

First, a comparison is made between first and second language acquisition. In this comparison, similarities will be presented first, followed by differences between acquiring the L1 and the L2.

### *Similarities between First and Second Language Acquisition*

Ervin-Tripp (1974) challenged the idea that it is not logical to develop a similar theory for first and second language acquisition. She explained that the notion that L1 and L2 acquisition have little in common theoretically has been based on two common misconceptions: the first one is that; the foundation for the L2 is built largely from a transfer

of the rules of the L1. The second misconception is that only the L2 is constructed from prior conceptual knowledge within the learner.

In a discussion of the first misconception, Newmark (1983) argued that learners, who have a need to perform before they are ready, will revert to the L1 syntactic rules more as a result of ignorance than of interference. Their dependence on L1 seems to occur predominantly at the beginning of the acquisition process when there is an intense desire to communicate. Sometimes beginners' level learners will use not only the L1 structures with the L2 words, but the L1 words as well.

According to the second misconception, researchers agree that the L1, like the L2, is constructed from prior conceptual knowledge. Bruner (1978, p. 247) referring to the L1, observed that "language emerges as a procedural acquisition to deal with events that the child already understands conceptually and to achieve communicative objectives that the child can realize by other means".

Similar to Ervin-Tripp (1974), O'Grady (1999) mentioned that, if the human brain is equipped to handle language, then certainly this ability is not confined to the L1 only but it can be for the L2, the L3 and so on. In a study of American children learning French in Geneva, carried out by Ervin-Tripp (1974) to show that the brain uses many similar strategies for L2 acquisition, she mentioned that the subjects in her study used three sources for acquiring French. The first source was peers (where they interact in and out of the classroom); the second source was school (where content-area subject matter was taught in French); while the third source was home (where there is exposure to parents who often spoke French to servants and to the mass media)

Richard-Amato (2003, p. 31) confirmed learners may depend quite heavily on first language knowledge to communicate in the target language at first, but they begin to work within the framework of the target language once they are able to form hypotheses about the new language. He also found that learners make errors mainly due to overgeneralization of the newly acquired structure.

In an attempt to investigate the reason behind overgeneralization and transfer, Richard-Amato (2003, p. 31) mentioned that Taylor pointed out that overgeneralization and transfer are the result of the necessity to reduce language to the simplest possible system. He (Taylor) also referred to Jain's (1969) observation that this phenomenon, overgeneralization, represents an effort to lessen the cognitive burden involved in trying to master something as complex as language. It can be concluded from what is mentioned above that the second language learner like the first language learner, attempts to "regularize, analogize, and simplify" in an effort to communicate.

#### ***Differences between first and second language acquisition***

In general, because second language learners are usually older when they start acquiring a second language they are more developed cognitively than first language learners. Marinova-Todd, Marshall, and Snow (2000) suggested that old learners appear to have distinct advantages in several areas: they tend to learn more quickly than first language learners, they have greater knowledge of the world in general than first language learners, they have more control over the input they receive related to L2 than first language learners, they have the ability to learn and apply rules which facilitate the acquisition process, they already have a first language from which they can transfer strategies and linguistic knowledge.

Some researchers do not support this: Richard-Amato (2003) pointed out that being older may not always be advantageous in learning a second language; Long (1990) mentioned that it seems that older learners have some maturational constraints affecting the language acquisition process; MacIntyre and Charos (1996) mentioned that old learners may find themselves afraid to make errors; Newmark (1983) commented that old learners may have poor attitudes and lack motivation, depending on their feelings and their condition in learning L2; Schachter (1974) and Kleinmann (1977) added that older learners may avoid using certain structures altogether because they are not part of their first language repertoire.

To sum up, the similarities between first and second language acquisition appear to lie in the process itself, and the important differences between first and second language acquisition development appear to centre on affective

factors, cognitive functioning abilities, and certain kinds of knowledge. In the following, the differences and similarities between Arabic language and English language will be presented.

### ***Differences and similarities between Arabic language and English language***

Khurma and Hajaj (1997) mentioned that most common errors committed by Arab learners of English, especially in writing, are related, to the sentences: punctuation, capitalization, word order, expansion, and the use of verb in forming the tenses. For the sake of efficient discussions in section 3, in this section these related problems are presented, in general to give an explanation for the differences and similarities between the structure of linguistic items in L1 and L2.

#### ***Types of mistakes:***

In this section the researcher presents two main types of problems that face Arab learners of English in learning English language as L2. The first one: Problems arise from Arabic interference, which cause (interlingual mistakes). The second one: Problems attribute to the English language itself (Non-Arabic background) which cause (intralingual mistakes).

Types of mistakes committed by Arab learners of English are many and varied. Mistakes are originated in Arabic language will be listed under "Sources of Difficulty" in each sub-section below, but few examples will be given as an introduction, followed by detailed discussion in section 3.

#### ***Statements:***

*Type of mistake*

*Omission of be and have.*

*Verb-subject instead of*

*Subject-verb.*

*Repetition of the subject as a pronoun.*

*Lack of subject-verb agreement.*

*Wrong word-order.*

*Examples*

*\* Ahmed in the house.*

*\* The book with me.*

*\* Was the man a doctor.*

*\* The only son in the family he creates a lot of troubles.*

*\*There is no machines in the field.*

*\*They were drinking enjoyable their tea*

#### ***Negation:***

*Not the man doctor.*

*He does not gone.*

*Not lost anybody his book. Instead of. No one/ Nobody lost his book.*

#### ***Questions:***

*Type of mistake*

*Wrong word order.*

*Difficulty with do.*

*Use of wrong verb form.*

*Wrong question tag.*

*Examples*

*\*Can ride the children?*

*\*Why we learn English?*

*\*Do I must study this lesson?*

*\*Have they never go to a restaurant?*

*\*You visited him, isn't it?*

#### ***Commands:***

*Type of mistake*

*Omission of do.*

*Use of no instead of not.*

*Use don't let's instead for let's not*

*Examples*

*\*Not play here.*

*\*No play here.*

*\*Don't let's go away.*

#### ***Exclamations:***

*Type of mistake*

*Omission of verb.*

*Use of how instead of what.*

*Examples*

*\*How beautiful the girl.*

*\*How a beautiful girl.*

*The differences in forming the simple sentence in English language and Arabic language*

Khurma and Hajaj (1997) mentioned that there are differences in sentence type and structures in both English and Arabic. For example:

a) Arabic belongs to a family of languages, the Semitic family, the members of which have little in common with the Indo-European Languages to which English belongs.

b) All sentences in English-a part from the imperative and question forms that require yes-no answers- have an explicit subject at the beginning, while Arabic has two types of sentences:

- |                      |    |                      |
|----------------------|----|----------------------|
| 1. Nominal sentences | —→ | beginning with noun. |
| 2. Verbal sentences  | —→ | beginning with verb. |

c) Strictly speaking, Arabic has just two tense\_ one indicating finished time or past action and another indicating unfinished or present ( and future) action. Such tenses as the present perfect are non-existent in Arabic.

d) An Arabic grammar has three parts of speech: noun, verb and adjective. Whereas English includes heterogeneous groups each of which belong to a different part of speech in English.

e) Arabic is an inflectional language with

- Prefixes, infixes and suffixes to denote
- Gender (masculine and feminine)
- Case (genitive, subjective and objective)
- Number, tenses etc.

#### *Major sentence types in L1 and L2*

For the purpose of explaining the problem of interference, and for convenience I will use we will use the following terms will be used to refer to the major sentence types:

a) Statements (including negatives): in which the subject is always present and preceded the verb, e.g. The boy will visit his aunt.

b) Questions: which are marked by one or more of the following:

- 1 - **Yes-no** answers. e.g.  
Will you visit us today? Yes, I will.
- 2 - A question word at the beginning e.g.  
Who came here yesterday?
- 3 - Arising intonation, e.g.  
You will speak to the boss?

c) Commands or imperative: in which the subject is implicit or understood, E.g. take this with you.

d) Exclamations: e.g. What a lovely day!

e) Social formulas, e.g. How do you do?

#### *Cross-linguistic influence of L1 in Acquiring L2*

Mourssi (2013c) mentioned that transfer is one of the most important elements which affect interlanguage forms. Investigating it can lead to a better understanding of the source/origin and the development of interlanguage. Researchers were doubtful about the issue of transfer, but some of them have said that it is related to language acquisition and should be discussed. Lado (1957) believed that people rely on their first language when they learn the target language. On the other hand, other researchers Dulay and Burt (1974, p. 24) said that transfer has nothing to do with interlanguage.

In general, Odlin (1989, p. 6), and Larsen-Freeman and Long (1991, p. 5) mentioned that “the study of transfer, or crosslinguistic influence, is peculiar among language acquisition and the phenomenon of language use”. In particular, Jarvis and Pavlenko (2008, p. 4) argued that crosslinguistic influence refers to the influence of one language on another in an individual mind. They illuminated several areas of meaning and crosslinguistic influence which had not been carefully looked at before. Mourssi (2013) referred that Jarvis and Pavlenko (2008) presented interesting findings and an analysis of the relationship between language transfer and SLA. Based on Odlin’s (1989) claims, and Jarvis and Pavlenko’s (2008) findings, the researcher found the positive and negative impact of L1 in the acquisition of L2 in the context of ALEs.

### ***The Importance of Grammar in Learning L1 and its Impact on Learning L2***

Mourssi (2013a, 2013d) mentioned that prescriptive Arabic grammarians think that grammar is the only element which shows how language is used. They also view the traditional grammar of any language as a set of rules, and the major concept in learning language is to learn its grammar first. According to them, the most common and appropriate learning strategy of learning is memorization, which is reflected in the way they learn L2. They think that memorization helps learners to achieve the tasks required in learning the target language better than any other strategy. This affects the methods of teaching followed by teachers of English for Arab learners who try to achieve the objectives of the target task in a proper and a suitable way which matches learners' attitudes. Similarly, it affects the way Arab learners of English acquire a second language in general and second language grammar in particular. This view is also reflected in the SLA research done based on samples taken from Arabic speakers of English (Mourssi, 2012b, 2013b).

Learning English (as an L1 or L2), grammar can be viewed in different ways. Hymes (1972) states, English speakers need to know the rules of grammar with the rules of language use in order to communicate in a language. Dickins and Woods (1988, p. 630) believe that the role of grammar is to convey and interpret meanings. While Fuller and Gundel (1987, p. 70) suggest that grammatical rules (patterns that are studied by syntacticians and morphologists) were basically designed to help people get their meaning across clearly and accurately.

Furthermore, Mourssi (2013) referred that a number of linguists claim that grammar is essential for appropriate communication. Lock (1996, p. 267) posited that language is a resource for communication and claims that grammar lies at the heart of communication and is not an optional add-on to communication. Similarly, Leech and Svartvik (1982, p. 4) viewed grammar as the focal part of language which relates to phonology and to semantics as well. Harmer (1991, p. 23) believed that knowledge of grammar is essential for competent users of a language. Larsen-Freeman and Long (1991) asserted that grammar is one of three interconnected dimensions of language which include: grammar, semantics and pragmatics.

Similar to the perspectives offered by Arab language grammarians, Klein (1986) postulated that in order to learn a foreign language, learners should have the ability to analyse the linguistic input in the target language. More recently, Gao (2001, p. 326) describes grammar as a catalyst for second language accuracy and fluency.

Ismail (2010, p. 143) demonstrates that Arab learners of English had positive views about the use of the CCCC grammar model, which is presented in four stages: Confrontation, Clarification, Conformation, and Consolidation. The author also highlighted certain students' beliefs about the importance and the positive influence of explicit grammar teaching for learning the conventions of sentences and utterances. In the following section, discussion will be presented.

## **DISCUSSION**

In this section, a detailed explanation for each types of mistake related to Arabic language as an L1 will be presented first, followed by a comparison between L1 and L2. First, types of mistakes related to L1.

### ***Types of mistakes related to Arabic language***

#### ***Statements***

Where ALEs commit different types of mistakes which include: omission of be and have, verb-subject instead of subject-verb order, repetition of the subject as a pronoun, lack of subject-verb agreement, and wrong word-order (Kharma & Hajaj, 1997). These types of mistakes will be presented one by one in the following.

#### ***Omission of be and have***

Sources of difficulty: This kind of mistakes is frequently made by Arab learners of English in the earlier stages more than advanced stages of learning. It is caused by the absence in Arabic nominal sentences in the present tense of an equivalent of the English verb to be.

- \* The boy active. الولد نشيط. /al-waladu nashit/ The boy is active.
- \* With me a book. معي الكتاب. /ma i Kitabun/ I have a book.

*Verb-subject instead of subject-verb order*

This is very common mistakes committed by ALEs. We get sentences like these:

- \* Reads the boy his lesson. يقرأ الولد درسه. /yaqr'u al-waladu darsahu/ The boy reads his lesson.
- \* Laughs the boy. يضحك الولد. /yadhaku al-waladu/ The boy laughs.

This also applies to the first two patterns when the verb *be* is in the past and future.

- \* Was the man a doctor. كان الرجل طبيباً. /Kana-r-rajulu tabiban/
- \* Will be the boy a man. سيصبح الصبي رجلاً. /sa-yusbihu as sabiyu rajulan/

It is worth mentioning that the intermediate students are committing a few mistakes due to Arabic interference because the mistakes occur in translation from Arabic into English. For example:

- \* I was agreed with you
- \* Was giving the lecture.
- \* left us and ran away.

*Repetition of the subject as a pronoun*

This mistake is probably due to the fact that every verb in Arabic is considered to have a subject, especially in nominal sentences where the predicate is a verb.

The boy is running. الولد يركض. /al-waladu yarkudu/

However, the learners start the sentence with a noun and that the predicate in the verbal sentences is made up of the verb and its subject. Also, these mistakes could occur due to transferred into English.

- \* Amal and Farah they were here an hour ago.
- \* The only daughter in the family, as I mentioned before, she creates a lot of troubles for her parents.
- \* My parents, if they have enough money, they will travel to the UK.

*Lack of subject-verb agreement*

This is an area where one does not expect any mistakes from an Arab Learners of English ALEs in whose language agreement between subject and predicate /verb permeates the whole language and covers: Numbers as in English, Gender and Case. For example:

- \* Children does not care about their future.
- \* This reports contains the all the details.
- \* Women has the right to elect.
- \* The girl were on her way back home.
- \* They reads a story every weekend.

This kind of mistakes (in the last example given) may occur due to the fact that the (s) of the simple present tense is associated with the (s) of the plural, and the inflectional area which is often disregarded or forgotten.

In the first three examples, the mistakes may be explained in terms of coordinated elements. Also, it might be explicable if the subject and the verb were far apart from each other. For example:

- \* The flight between Muscat and Cairo were run per week.
- \* The young boy who was standing with his brother were talking on the phone.

*Wrong word-order*

- \* He can learn from how to win. \* I took from him his ball. \* My friend has also a bike.

*Negation: Source of difficulty*

a) Negation patterns in English and Arabic differ widely, and has not impact on the process of learning English negation by Arab Learners of English in particular. The following mistakes occur due to Arabic interference (in early stages).

- \* Not the man doctor. \* The man not doctor. \* I not went. \* He write not his homework.

b) Mistakes may be common to many other linguistic group learning English as a foreign language.

- \* He don't go. \* He doesn't goes. \* He do not goes. \* He did not goes. \* He did not went. \* He went not. \* He not takes/took his breakfast. \* He is may (be) studying at home.

c) Certain type of negations that may constitute some difficulty to Arabic-speaking students. One special type of negation is the use of, no, nobody, no one, none, and nothing.

*No* has the Arabic counterpart /la/

I have some money.

عندي بعض النقود /'indi ba'du nuqudin/

I have no money.

لا نقود عندي /la nuquda indi/

(Literally: \*No money with me)

Nobody/ No one lost his book can have the Arabic equivalent:

لا أحد فقد كتابه / la ahada faqada kitabahu/

(Literally: \*Nobody/ no one lost his book)

But is more commonly rendered as:

لم يفقد أحدا كتابه /lam yafqid ahadun kitabahu/

(Literally: \*Not (+ past) lose any body his book)

*Questions: Sources of difficulty*

Comparison of question patterns in English and Arabic reveals the following differences.

a) A big problem is word-order, especially when there is an auxiliary verb or be or a modal in the English statement:

*Yes\_No questions:*

- \* Can ride the children? \* Has been the teacher looking.....?

*Wh questions:*

- \*What her fate will be? \*Where the boys are going?

b) The use in English of the operator **do**, and its absence in Arabic.

*Type of mistake*

1- Inversion without do:

2- Omission of do:

3- Redundant do:

*Yes-no questions:*

\*Go you to school every day?

\*Know the girls many games?

\*Do I must study this lesson?

\*Did Maha was eating an

apple?

*Wh-questions:*

\*What bought the girl?

\*Why ran the girl to school?

\*Why we learn English?

\*What Nabil and Isam

bought?

\*Who did want to eat?

\*What do they have found?

4- Use of do instead of be:	*Does the house almost built? *Does the boy playing football?	_____
5- Use of be instead of do:	*Is the girl know many languages? *Was he know the answer?	_____
6- Omission of be:	_____	*How the student going? *What Fatima eating?
7- Redundant be:	*Are the children can ride? *Is the teacher has been looking?	*Who is wanted to eat? *What are they have stolen?
8- Use of do or be instead of other auxiliaries:	_____	*What were they ate yesterday? *Why does he going home?

c) As elsewhere, the Arab Learners of English are liable to use the wrong verb form in the formation of questions. For example:

- \* Does he knew the answer? \* Has the teacher been look at their notebook?
- \* Do the boy know the answer? \* Is the teacher teaching?

d) The Arab Leaners of English are usually confused about question-tags, and he may use only one (isn't it- alaysa kadalik?) in all cases.

#### *Commands: Sources of difficulty*

It seems that the problem with commands lies in the formation of the negative, where there are three areas of difficulty.

a) Omission of **do**:

- \* Not play here. \* Not eat too much.

b) Use of **no** instead of **not**:

- \* No play here. \* No smoke cigarettes.

c) Use of **do not let's** for **let's not**:

- \* Do not let's go away. \* Do not let's be late.

#### *Exclamations: Sources of difficulty*

a) The main mistakes that occurs here is the omission of the verb:

- \* How beautiful the girl! \* How fine the boy.

b) Another mistakes occurs when *how* (used with adjectives and adverbs) is confused with *what* (used before noun), especially when the noun preceded by an adjective.

- \* How a long journey! \* How a beautiful girl!

#### *Social formulas*

"Social formulas are simple acts of communication whereby people establish and maintain friendly relation with one another." Both English and Arabic employ a wide variety of social formulas (Kharma and Hajaj, 1997). Example: How do you do?

There is no special problem for Arab learners of English in this area except differentiating between friendly and formal formulas. Its solution depends on mastery of the forms and using them in the appropriate context.

#### *Comparison between L1 (Arabic Language) and L2 (English Language)*

### Statements

#### Statements in English language

In English the basic statements sentence patterns are the following:

1 – Subject be Adverb	John is there /in the garden.
2 – Subject be Complement	John is kind. ( adjective)
	John is a doctor (noun)
3 – Subject Linking Verb Complement	John looks sad
4 – Subject Intransitive Verb	The boy laughs
5 – Subject Transitive Verb Direct Object	The boy reads a lesson
6 – Subject Transitive Verb Direct Object adverb	The boy put the book in the desk
7 – Subject Transitive Verb Direct Object Complement	They made him a leader
8 – Subject Transitive Verb indirect Object Complement	She gave me a present.
9 - There be Subject Adverb	There is a man at the door.
10 - It be Adjective that	It is important that you come on time.

#### Statements in Arabic

a) The first two patterns are:

(Subject be Adverb) → Ahmed is in the house. أحمد في البيت /ahmadu fi-l-baiti/

(Literally: Ahmed in the house.)

(Subject be Complement) → The boy is active. الولد نشيط /al-waladu nasitun/

(Literally: The boy active.)

In the past, future, infinitive, gerund forms and often in the form of participle, the verb *be* appears in Arabic (it acts as auxiliary and belongs to a special group of verb called أفعال ناقصة)

b) The third pattern (Subject Linking Verb Complement):

Ahmed looks sad. أحمد يبدو حزينا /ahmadu yabdu hazinan/

OR يبدو أحمد حزينا /yabdu ahmadu hazinan/

c) The same apply to the fourth sentence pattern (Subject Intransitive Verb)

The boy laughs. الولد يضحك /al waladu yadhaku/

OR يضحك الولد. /yadhaku al waladu/

d) The fifth pattern (Subject Transitive Verb Direct Object) has a variant with the verb *have*. In Arabic the verb

(أملك) / Amaluk/ (own) is used,

I have ( own/ possess) a book.

أملك كتابا / amliku kitaban/

e) Sentence patterns 5 and 6 – (Subject Transitive Verb Direct Object Adverb) are also quite similar in English and Arabic, except that in Arabic the verb may begin the sentence:

e.g. the boy is reading his lesson .

الولد يقرأ درسه / al-waladu yaqrapu darsahu/

The second form is preferable when the verb is in the past or future, and when the subject is a pronoun, or an indefinite noun:

The boy read his lesson.

قرأ الولد درسه /qara'a l-waladu darsahu/

سيقرأ الولد درسه /sa-yaqra'u-l-waladu darsahu/

f) Sentence pattern 7 (Subject Transitive Verb Direct Object Complement) is also quite similar in English, e.g.:

The committee elected Salim chairman.

اللجنة انتخبت سليما رئيسا

/ al-lajnatu intakabat saliman ra'ison/

g) Sentence 8 (Subject Transitive Verb Direct Object Complement) is also quite similar in English and Arabic In Arabic the sentence may begin with a verb.

The school gave Aziz a prize.

المدرسة أعطت عزيزا جائزة /al-madrasatu a'tat' azizan ja'izatan/

h) As for sentence 9 (there be Subject Adverb) the Arabic equivalent, (يوجد /yujadu/), of *there is/are* is not frequently used in the surface structures.

There is a man at the door.

يوجد رجل بالباب

/ yujadu rajulun bi-l-babi/

i) The impersonal pronoun *it* in English have a counterpart in Arabic, but it doesn't follow exactly the same English pattern.

It is important that you arrive on time.

Usually has the Arabic counterpart:

أنه من الأهمية بمكان أن تصل في الوقت المناسب.

/inna-hu min-al-ahammiyyati bi makan an tasila fi-l-waqt-l-munasib/

(Literally: \* It's of great importance that you arrive on time)

### *Negation*

#### *Negation in English*

a) English contains an auxiliary or model verb, e.g (be, have, shall, will, must, may, etc.) is negated by inserting the negative participle *not* after the auxiliary verb, e.g.

John is playing football.

John is not playing football.

b) Statements with one finite verb (other than *be*) it is negated by inserting the auxiliary *do* and *not* before the verb, e.g.

John plays football.

John doesn't play football.

We come to school every day.

We don't come to school every day.

c) The verb *be* is always negated with the participle *not* only.

Mary is a clever teacher. Mary is not a clever teacher.

#### *3.2.2.2 Negation in Arabic*

a) *Not* in English has several substitutions in Arabic, namely:

لا, ليس, ما, لا la/, /ma/, /laysa/, /lam/, /lan/

b) Arabic employs no counterpart for *do*

c) The negative particle is always placed before the verb in verbal sentences and before the subject in nominal sentences.

أحمد يلعب الكرة / ahmadu yal'abu-l-kurah/

(Ahmed is playing/ plays football)

أحمد لا يلعب الكرة / ahmadu la yal'abu-l-kurah/

(Literally: \*Ahmed not plays/ not is playing football)

d) The particle /laysa/ is employed in nominal sentences.

Whereas /ma/ and /la/ use in both types of sentences.

/lam/ and /lan/ negate only the verb and indicate time-reference.

أكل أنور برتقالة / akala anwaru burtuqalatan/

(Anwar ate an orange)

لم يأكل أنور برتقالة / lam ya?kul anwaru burtuqalatan/

(Literally: \* Not (+past) eat Ahmed an orange)

### *Questions*

#### *Questions in English*

The major types of question in English: These are tag-question, consisting of an operator, plus pronoun with or without a negative particle.

a) Did you take the book?

b) Did you take the book or the pen?

- c) Who took the book? d) Who did you meet?  
e) When (Why/ how) did you go to see John?  
f) The lesson hasn't finished, has yet? The lesson has finished, hasn't yet?

These are declarative question, which are exceptional types of *yes-no* questions.

- g) You have got the book? They will be there. I suppose?

#### *Questions in Arabic*

The previous questions are similar to their counterparts in Arabic, e.g.:

- a) هل أخذت الكتاب؟ /hal akadta-l-kitaba/?  
(Literally: \*Take you the book instead of did you take the book?)  
b) هل أخذت كتابا أم قلمًا؟ /hal akadta-l-kitaba am qalamam/?  
/akadta kitaban am qalamn/?  
(Literally: Took you a book or a pen? Instead of did you take a book or a pen?)  
c) من أخذ الكتاب؟ /man akada al-kitaba/  
(Literally: who took the book)  
d) لم ينته الدرس أليس كذلك؟ /lam yantahi-d-darsu, alaysa kaddalik/?  
(Literally: \* Not (+ past) end the lesson, isn't it?  
e) أخذت الكتاب؟ /akadta-al-kitaba/?  
(Literally: took you the book instead of did you take the book?).

#### *Commands*

##### *Commands in English*

Khurma and Hajaj (1997) mentioned that in English, commands are type of statement sentence which have no explicit grammatical subject and have an imperative finite verb (the base form of the verb). In English commands follow the same order as in statement sentence. We find the following patterns:

- |  |                        |
|--|------------------------|
| 1 – Verb adverb                        | Go away                |
| 2 – Verb Complement                    | Be reasonable          |
| 3 – Verb Object                        | Take it                |
| 4 – Verb Object adverb                 | Take it to the water   |
| 5 – Verb Object Complement             | Take him prisoner      |
| 6 – Verb Indirect Object Direct Object | Give him another drink |
| 7 – Verb                               | Jump                   |

-To make the pattern negative we add (do not, or don't)  
e.g. don't go away

-Also, we can add to the pattern (let us or the negative let us not)  
e.g. let's go away.

##### *Commands in Arabic*

In Arabic, the statement sentences follow almost the same pattern except the nominal sentence where the verb /Kun/ (be) is used

- a) (Be ready.) /kun musta 'iddan/! كن مستعدا  
b) /kud hada/ (Take this.) خذ هذا

To make the pattern negative, we add (no) la:

/la ta?kud hada/ (Literally: no take this) لا تأخذ هذا

- The Arabic equivalent to the (let us) pattern is realized by (li) meaning (let us)

/li nadhab li-s-suqi/ (literally: let us go to the market – place) لنذهب إلى السوق

#### *Exclamations*

##### *Exclamations in English*

Exclamations resemble (*wh*) questions but are not followed immediately by a finite verb. In English the commonest exclamations – words are what and how e .g.

What a beautiful dress

#### *Exclamations in Arabic*

In Arabic it is expressed by ( ni ma ) ( how good ) , ( bi sa ) ( how bad ) ( ma ) ( how )

نعم , بنس , ما

/ni'ma-r-rajulu 'amru/ نعم الرجل عمرو

- How good the man Amro instead of How good Amro is!

/bi'sa ma sana'a a mru/ بنس ما صنع عمرو

- How bad what did Amro instead of how bad is what Amro did?

#### **CONCLUSION**

The analyses of the linguistic items taken from L1 and L2 indicate that there are similarities and differences in the acquisition of both Arabic Language as an L1 and English Language as an L2. It is also indicated that L1 has positive and negative impact on the acquisition of L2 as well. It is also concluded that Foreign Language Learners depend on their first language when they analyse the linguistic items of target language. Finally, it is concluded that the similarities and the differences indicated in the acquisition of L1 and L2 shows the importance of grammar as an essential element in the acquisition of Arabic Language as an L1 and English Language as an L2.

### ABSTRACT

This paper is a state of art on the spread of English language around the world resulting in different varieties known as World Englishes (WE) with the review of its origins and states of change until the neo-colonial era. When considering the growth of English, the imperial power of some countries having English as an imperial language is considered influential (Pennycook, 2007). Also, a number of models for the varieties of English, the most significant of which is Kachru's, are discussed in this paper. The last part of the paper reviews the implications of WEs in ELT.

**KEY WORDS:** World Englishes, imperial power, ELT, Nativeness vs. nonnativeness, English varieties

### INTRODUCTION

English language has expanded dramatically around the globe during the past decades. When considering the growth of English, the imperial power of England and more recently the US, English as an imperial language itself, and decolonization must be taken into account (Pennycook, 2007). Each of these issues will be reviewed in this paper.

There are different varieties of English which can be seen and heard today: Indian English, Australian English, Singapore English, British English, American English, Irish English etc. Kachru discusses these varieties of English (World Englishes) in terms of some diasporas; Two main types of which were the first diaspora as a result of the immigration of the English to settler colonies in Australia, North America, and New Zealand (where English was brought in by the native speakers from Europe), and the second diaspora in British colonies such as Africa and Asia where the language was adopted from different users of English who weren't often native speakers (Kachru, Kachru, & Nelson, 2006; Kachru, 2011).

There is a "naming Disease" (Anchimbe, 2009, p. 274) related to the interpretation of the term "World Englishes". While some scholars refer to English as a lingua franca and a subcategory of English as an international language which is itself an alternative terminology to ESOL (English for speakers of other languages) (Halliday, 2009), some others (e.g. Trudgill & Hannah, 2002 cited in Jenkins, 2006) believe that international English is the local Englishes spoken by nonnative speakers and a great many also put the native speakers in this category. Researchers sometimes use "English as a lingua franca" for "English as an international language" to avoid confusion. Bolton (2004) describes three different though interrelated interpretations of the term *World Englishes*: 1) it can be regarded as an umbrella term including all varieties of English around the world also sometimes called "World English", "international English", or "global English", 2) in a narrower sense, it can refer to the specific new Englishes in Africa, Asia, and the Caribbean also called "nativized", "indigenized", "new Englishes", or "institutionalized English" (see the outer circle model of Kachru's), and 3) it may refer to the *Kachruvian* approach to the study of English.

Another problem is related to the notion of Standard English (SE) to distinguish between native and nonnative speakers of English and also referring the compromised superiority over other varieties of English. Some scholars critique the SE as it is underestimating local norms and being monocentric by relying too much on American or British norms. Halliday (2009) claims that while nativeness vs. non-nativeness has been refuted by some researchers, it still serves as a basic criterion for labeling English speakers around the world.

## ORIGINS OF ENGLISH LANGUAGE

Estimating the exact birth date of a language is impossible to a great extent since languages undertake numerous alterations and a variety of variables are associated with the evolution of different languages. In addition, almost always languages have a mutual influence on each other (Kachru et al., 2006). By all these, Kachru et al. elaborated on the origins of language in his *Handbook of World Englishes* extensively in terms of four Diasporas. Like High German, Low German, Dutch, Faroese, Swedish, Norwegian, Danish, and Icelandic, and Gothic English, now extinct, which belong to the Germanic family of languages, English is a member of this family as well. The root of Germanic languages goes back to Proto-Germanic, which was not a written language. Moreover, Romance and Germanic belong to the Indo-European family of languages. A number of other languages are also Indo-European such as Northern India, Persian, the Slavic languages, Greek, Armenian, the Celtic languages. Indo-European languages seem to date back at 3000 BC, located in Eastern Europe, just north of the Black Sea (Ukraine) (Kachru et al., 2006). People from the original Indo-European tribe emigrated east (into Persia and India), north (to Russia and the Baltic regions), and west (to Greece, Italy, Western Europe, and the British Isles). Always looking for new lands, the Germanic tribes emigrated to the Western Europe and settled in northern Germany, the Low Countries, and southern Scandinavia and England. The Celts had to assimilate to Germanic languages and the ones who didn't adopt Germanic languages moved west and south into Cornwall and Wales and Scotland. That's why today's Irish (Gaelic), Welsh, and Scots Gaelic, are believed to have been remained from the first inhabitants of England i.e. Celts. Germanic invaders had contributed to an Anglo-Saxon language, Old English (also known as Anglo-Saxon) dating back to 450–1150 (Kachru et al., 2006). Old English contained of a lot of inflections and conjugations, three genders, a lot of subcategories of nouns, verbs, and adjectives, and four cases.

Early Modern English was created at the same time as the Age of Discovery. At the age of discovery, Britain attempted to rule the whole world by discovering new areas. Ships and tools were more advanced than before and in order to communicate with new people of the discovered lands, a lighter language with less complex morphology and sounds (e.g. the velar fricative [x], spelled *gh*) was derived from the Old English resulting in Modern English that we have today. Using more of monosyllabic words, simpler morphology, and easier pronunciation are the major characteristics of modern English.

## CHANGES IN ENGLISH LANGUAGE

Change in one language occurs so stealthily that is only noticeable during long time periods and across generations. Though, it must not be forgotten that languages change *constantly* (Hudson, 2000). There are three commonly known periods of change in the history of English language: Old English (until about 1100), Middle English (from 1100 to about 1500), and Modern English (1500 until present).

Like most languages, Modern English differs from the old one in various aspects. One way to find out how different an old version of a language such as English was, one can refer to the literature of that language. Another important factor affecting change in languages is the influence that they have on each other. According to Kachru et al. (2006), English has adopted not-originally-Germanic new words from:

- the other languages in the same region such as Latin or Celtic (e.g. *York, bin*),
- languages with high prestige such as Latin (e.g. *mile, pit, cheap, wine*),
- religious language: with the arrival of Christianity in Britain in 597, English vocabulary was influenced significantly (e.g. *bishop, human, angel, grammar, elephant, talent, rule*),
- Scandinavian languages, prior to the Norman Conquest, through Viking sailors (e.g. *law, die, rotten, odd*),
- the Romance and Celtic languages. The fact that only Germanic has the strong/weak division, irregular verbs, among Indo-European languages, is due to the effect of Celtic and Romance languages (e.g. English place-names with *-by* which are Danish in origin: *Rugby, Derby*).

Hudson (2000) lists eight causes of language change some of which may affect languages at the same time:

1. Ease of articulation, which seems to be the reason for some phonological changes in languages such as assimilation, deletion, alternation, insertion, dissimilation, metathesis, and chain shifts.
2. Expression of new meanings, for the expression of new things, events, and ideas sometimes some words or grammatical features are borrowed from other languages.
3. Desire for novelty is the reason most jargons and the slang were born.
4. Regularization, associated with human children's language learning capacity and creativity aspect of language
5. Redundancy reduction
6. Metanalysis related to backformation
7. Obsolence of meaning, in that obsolete meanings disappear from language when they are not used anymore.
8. Language contact which is, unlike all the above changes, an external cause. Intimate and long contact with one language often results in extensive language change (p.424). For example, a great number of French words came into English after the Norman conquest of Britain and the resulting contact between English and French languages. On the other hand, the use of English as an international language has affected a lot of other languages around the world.

Widdowson (1994) asserts that speakers of English in the postcolonial societies may change and localize English at the grammatical level to fit it into their own contexts and local needs and whereby to own the language and keep away from the norms of native English speakers. Colonizing groups had various attitudes toward spreading English in their colonized societies (Anchimbe, 2009). If the colonizing groups were reluctant in passing their language to their colonies, the colonized people would have no access to the language and inevitably had to fit it to their purposes. This is how some Pidgins and Creoles were invented. Under the reverse situation, learning the colonizing language would be a mean to convey democratic ideas resulting in the advent of new native varieties of the language in such areas. Although exposure to English during colonialism was based on political factors, the use of English was also influenced by the ecological and sociocultural situations of colonized groups.

#### **USAGE DOMAIN OF LANGUAGES**

The usage domain of English is perhaps the main reason for the dominance of English over Welsh, Scottish and Irish in England. There are two important kinds of usage domain for languages. The first domain is "H", used for High languages, which is the variety of language used in formal, written, official, legal, and formal domains such as standard French or standard Arabic. The second domain is called "L", for Low languages, which is the everyday language used in informal settings, family and friends. There is usually a conflict between two languages to gain the domain power to be the High language. There seems to be different reasons why a language is regarded as the High language e.g. greater force of arms or economic power, strength as a result of more population, novelty coming with a new language and culture. The less powerful language is the Low language (substratum) and the high language becomes the superstratum language. In most cases, after some time, the substratum language fades away leaving some shades (Kachru et al., 2006). For instance, the Indo-Europeans immigrated into India from Europe and displaced the Dravidian languages of Indians with Sanskrit and pushed the Dravidians southward traces of which have remained today. The reason is that the Indo-Europeans were more advanced with a higher culture, and regarded as more powerful and H language. Meanwhile, the effect of L languages on the H languages must not be overlooked (e.g. words for transferring alien concepts such as *canoe*), although it is far smaller than the influence of H on L.

In the Middle Ages, among English, Latin, French, Welsh, and Irish, Latin was one of the H languages. As an advantage for all H languages, Legal and religious documents were almost always written in Latin, and its translations were found in other languages. Around 1400, English was regarded as the H language in England due to its power in trade and transportation as well as its population, and political control. However, French and Latin had the full control of H functions, the language of law and religion. Later, by the fifteenth century English was regarded as the language of law.

## MODELS OF ENGLISH VARIETIES

Traditionally, a distinction has been made between ESL (English as a Second Language) countries, where the language has official status, EFL (English as a Foreign Language) countries where this is not the case, and ENL (English as a Native Language) countries. However, this model has recently been criticized due to its limited application in a context of multilingualism.

Kachru coined the term "World Englishes". The term "English languages" goes one step further than "World Englishes" or "EIL" and implies that varieties of English have already progressed into different languages. Meanwhile, Kachru points out that the English varieties still have more similarities than differences to "mother" English.

There are alternative models presented by Gorlach (1990) and McArthur (1987) cited in Bauer (2002). The former model goes from the most widespread variety of English (in the center) to the most local varieties (round the rim of the center). The latter is rather similar but the difference is that unlike Gorlach's model, the hub of the circle is seen as being a standard in this one. McArthur also includes creoles like Tok Pisin along with other regional varieties. Instead of showing origins and influences, these models portray a set of differing standards for English holding the common heritage of world English at the hub. They fail to show that there are two very different types of English i.e. varieties spoken primarily by native speakers of English and varieties originally spoken by second-language learners of English (Bauer, 2002).

Kachru (1985) proposed a model of concentric circles (the "Inner," "Outer," and "Expanding" Circles) to describe the spread of English worldwide based on the historical context, status, and functions of English around the world. In his model, Kachru takes some sociolinguistic aspects of English in postcolonial societies into account as opposed with standardization, codification, and linguistic creativity. The Inner Circle demonstrates the societies where English is the first language e.g. the USA, the UK, Canada, Australia, and New Zealand. The Outer Circle shows the postcolonial Anglophonic contexts such as Nigeria and Zambia in Africa, and India and Singapore in Asia. The Outer-Circle is a multilingual community in which English is only one of the languages spoken as an official, co-official, legal, or educational language. English language functions within a non-English culture as a second language (ESL), resulting in the advent of significant variations in English. The Expanding Circle refers to those areas where English is an international and a foreign language (EFL) e.g. English in Japan, Korea, Saudi Arabia, and China (Kachru et al., 2006). He also made a distinction between genetic nativeness and functional nativeness in terms of range (functions of English in societies) and depth (English use by people from different levels of society basilectal varieties to the acrolect).

The Inner Circle societies provide norms such as text books (norm providers) and the Expanding-Circle societies accept these norms. Some Outer-Circle societies such as India and the Philippines sometimes try to establish local norms and hence are called norm-developing. These circles share a number of characteristics and the status of English in each area might change over time.

The Three Circles Model (Kachru, 1985)

Although Kachru's model was criticized for emphasizing on nations and overlooking some areas and simplifying linguistic diversity (Jenkins, 2003), it was quite influential in discussing varieties of language. Modiano (1999) proposed the model of "English as an International Language" (EIL) with centripetal Circles emphasizing on English proficiency as opposed to the geographical view of world Englishes. Higgins (2003) claims that the use of English

in outer-circle countries such as India, Malaysia, and Singapore is not clear because it is different from interlanguages and at the same time different from native varieties. She believes that in categorizing people in terms of English language, we ought to consider their linguistic properties rather than their social identities.

McKay (2011) makes a distinction between a monolithic model of English versus a pluricentric model. In the former the native speaker is an authority and code while in the latter model, the most remarkable proponent of which is Kachru, language contact necessarily entails language change and it is natural to have different varieties of English as a result of its vast spread. This shows that the identity of nonnative English speakers must not be overlooked as being only the norm and standard consumers of native speakers.

### **INTERNATIONAL VS. INTRANATIONAL VARIETIES**

It is also possible to examine the distinction between second and foreign language considering a pair of concepts advocated by members of the East-West Center in Hawaii: *intranational* and *international* languages (Smith 1981 cited in Stern, 1983). The main purpose of the distinction between these two concepts is to show that countries like Britain or America cannot claim to own the English language and have proprietary rights to determine standards of the language. Unlike international language vs. intranational language distinction, the second vs. foreign language learning distinction shows that there is a specified speech community or communities for each reference or contact group. English can be referred to as an intranational language when it is learned and used for wider communication within a country for educational, commercial, and political purposes. For example, English has the status of an official language in Nigeria or Zambia without specified reference group. Also French in Ivory Coast holds the same intranational function (Stern, 1983). On the other hand, when English is learnt in many countries across the world without reference to specified English-speaking territories and as a means of international communication, it is regarded as an international language.

Closely related to the intranational vs. international varieties of English is the concept of "linguicism" employed by Phillipson (1997). He asserts that we can have intralingual and interlingual Linguicism. Linguicism can exist among and between speakers of one language it is called intralingual. For example, when one dialect is privileged and regarded as the 'standard'; and when Linguicism exists between speakers of different languages and is regarded as a standard variety or a variety with high prestige, it is called interlingual. For example, when one language such as Cantonese remains as a mere dialect unsuited for a range of literate or societal functions comparing with English as the language of modernity and progress. Both of these two types of linguicism lead to stigmatizing, downgrading or vanishing a language.

### **LINGUISTIC IMPERIALISM**

Phillipson (1997) defines linguistic imperialism (LI) as a theoretical construct to show linguistic hierarchization, why some languages happen to be used more than others, what structures and ideologies are used more than others, and what structures and ideologies facilitate this processes, as well as the role of language professionals. He also regards Linguistic Imperialism as a subtype of *linguicism*. Linguicism draws upon the sociology of language and education in a way that languages can contribute to unequal access to societal power. In this sense, language is used as a mean to hold and transfer power. There are organizations and budgets which are specialized to achieve this goal. For example, the British Council are exercising 'English Language Imperialism' to maintain the global status of British English as opposed to the spread of American English (Phillipson, 1992).

Phillipson's use of the term 'linguicism' demonstrates a biased system through which a scheme of linguistic hierarchization holds people in their assigned positions based on language use (Jambor, 2007). In other words, linguistic power facilitates the maintenance of hegemony. Cultural, economic and political dimensions mainly shape Kachru's inner/periphery circles of language speakers – relationship and the inner circle countries seem to have political, economic and cultural influences on the outer and expanding circles. Linguicism may be overt or covert, conscious or unconscious.

Knowles cited in Jambor (2007), defined language imperialism as the transfer of power (either military or economical) and some aspects of the dominant culture from a dominant language to other peoples. In most cases this

transfer may not be imposed by the dominant language culture: rather, it may be demanded by the inferior group as a source of prestige, high status, or perceived beauty. Some of the most successful imperial languages are Latin, Arabic, and English. Traditionally, languages were spread due to a superior military power, but recently, economical power is regarded as the source of power.

According to Philipson (1997), much of his inspiration for linguistic imperialism was drawn from Western scholarship, work in peace and development studies, education and social theory, and work on language in the French empire. Also he was inspired by some thinkers and authors at the receiving-end of imperialism such as many African and Indian sociolinguists. Meanwhile, he extracted some ideas from the human rights law against racial, sexual, and linguistic discriminations. Therefore, Philipson is one of the proponents of the smaller language speakers' right such as indigenous language speakers.

## STANDARD ENGLISH

It is likely to assume that varieties of English are new versions of the standard language spoken by native speakers of English. However, some of these varieties are chronologically older than some native Englishes such as Indian English being older than New Zealand English. Due to some facts like the ones mentioned above, Standard English seems to be a controversial issue.

Randolph Quirk is regarded among the first scholars who coined “varieties” of English referring to the English “standards” (Kachru et al., 2006). He believed that English does not necessarily belong to the native English speakers. English in one area cannot exclusively be regarded as more correct than in the other areas because there is no established and accepted criterion for the priority of English in one area over another.

Trudgill (1998) emphasizes on communicability instead of Standard English which depend mostly on societal prejudices according to Anchimbe (2009). By communicability, Trudgill means English can be spoken in any accent only if it is comprehensible. She also emphasizes on degrees of accent tolerance at the onset of communication and later adaptation and accommodation. All native speakers of English can be regarded as the native speakers of non-standard dialects; hence, it is not unacceptable to regard them as the L2 speakers just like non-native speakers.

On the other hand, Bolton (2006) reports that Standard English should be defined in an endonormative way rather than exonormative (determined from outside). He further mentions that the use of non-standard varieties of English may lead to a lack of intelligibility. Ur (2010) believes that the need to have codification for an international variety of English in grammars and dictionaries is inevitable. ELT teachers and textbook writers need criteria for teaching and designing materials out of the most common features of English around the world. However, due to the variety of divergent dialects and accents within a native language, it looks impossible that we be able to create a united set of standards (Trudgill, 1998).

Some members of the Outer Circle such as Kachru (1985) have started challenging the exocentric norms and rethinking the question of standards. English is used by people of Outer and Expanding Circle for the purpose of interacting with others from outer and expanding circles. In most of the interactional situations, no one from the Inner Circle is even involved or even relevant (Kachru, 2011). By all these, there is still a dominance for English and American varieties of English. The reasons for this dominance can be political, military, economic, success, and cultural influences and powers of English native speakers like the Latin and the Roman in the past (Crystal, 1997). According to Crystal (2003) cited in Crystal (1997), English language has spread around the world in such a way that it cannot be regarded as owned by any single nation. In line with Crystal, Phillipson (1992) considers a more comprehensive view of power called imperialism or linguistic imperialism. He attributes the dominance of English to imperialism and asserts that scientific imperialism, media imperialism, educational imperialism, cultural imperialism, and linguistic imperialism are all different types of imperialism being expressed by language. As a result, English as a lingua franca represents the linguistic imperialism and dominance around the world. Linguistic imperialism is also associated with racism, sexism, capitalism, and linguisticism.

In order to make the best of English in areas where it penetrated into, it is needed to be localized, domesticated, and regionalized to that community's need instead of the standard variety. Nativization or indigenization is a kind of adaptation taking place when a language, like English, is used in a different context and fits to its needs in a way that a distinct variety emerges after some time (Richards & Schmidt, 2002).

#### **NATIVENESS VS. NON-NATIVENESS**

The issue of the Standard English is closely related to the idea of nativeness vs. non-nativeness which was coined after colonialism in the 1960s and 1970s bifurcating English speakers into two categories: the norm-setter and the norm-receiver respectively. The native speaker's variety of English is often considered as the Standard English. However, since the non-native varieties have the native speakers of their own, this dichotomy is not accepted as it was in the past (Anchimbe, 2009). Seidhofer (2005) states that English functions as a global lingua franca but as a consequence of its international use, English is also shaped by its nonnative speakers as much as by its native speakers.

In SLA, when one accepts the notion of the native speaker, he or she must have inevitably accepted that only authentic and naturally occurring language should be taught because only native speakers are authentic and can teach English this way (Widdowson, 1994). On the other hand when the emphasis is put on the context of learning in SLA, because the non-native speaker is familiar with the context of language learning, native speakers do not gain the advantage. Linguistic imperialism or native speakerism impose that the native-speaker is the ideal norm and criteria for EFL/ ESL learners. This way, native speakers, who are only a very small minority nowadays, become the authority while many nonnative speakers who happen to become the majority are excluded and underestimated. Also, native speakers themselves speak in various accents and dialects which can be difficult to understand. That's why a native speaker with any ethnic accent may not be an appropriate model for non-native speakers. Even if native speakers can be true models and norms for learning English, in EFL situations, it is not feasible to employ a native speaker teacher and as it is apparent that the majority of EFL teachers are nonnative (Ur, 2010). On the other hand, Ur (2010) believes that it can be discouraging for EFL learners to try hard to become a native speaker because it is impossible to gain an exact native like proficiency no matter how competent they are. In return, Ur (2010) suggested that EFL or ESL teachers should be fully competent without emphasizing on their nativeness or non-nativeness.

#### **NON-STANDARD VARIETIES**

Sometimes the term *stigmatized varieties* is used for varieties other than the Standard language to show social dialects for different groups such as poor or working class, ethnic or racial groups (e.g. African American Vernacular English), regional varieties, and pidgins and Creoles (Tollefson, 2007). They are called stigmatized varieties because they are considered to be unattractive and the deficient versions of the standard. English, like other languages, changes "systematically, pervasively, and constantly" (Hudson, 2000; p. 452). Some factors which affect the change in speech communities are: the population size, the degree of social relationships, removal from general standards, and subordinate bilingualism (Hudson, 2000).

*Vernacular language* is another term used for non-standard varieties. It generally describes the mother tongue of a socially or politically minority group in the context of a more powerful group with a different language. In order to emphasize linguistic autonomy and a parallel position, the term *indigenous* is sometimes used instead of Vernacular to refer to the language of the native inhabitants of a particular region (King, & Benson, 2008). The term *ethnic group* is also sometimes used in Africa for local languages and the term *ethnic minority* is used for the same related concept in Asia.

#### ***Pidgin and creole***

Yule (1985) defines a pidgin as "A variety of a language which developed for some practical purpose such as trading among different languages with who had a lot of contact." (P. 233) Thus, pidgins have no native speakers. When a pidgin develops beyond its role as a trade language and becomes the first language of a social community it is called a creole e.g. Hawaii . Creole develops as the first language of pidgin speakers. Unlike pidgins, creoles have a large number of native speakers e.g. a French based creole spoken by a lot of people in Haiti or English based creoles used in Jamaica. Creoles may evolve as a result of the Creolization process; however, some members of a society may try to use fewer creole forms (decreolization) which is called the post creole continuum.

#### **WORLD ENGLISHES AND ELT**

Application of language varieties and the Standard English in ELT classes can be confusing and must not be taken for granted. The relationship between WEs and ELT in ELT is connected with the medium of instruction in the

classroom, the implicit economic and social value of standard varieties of English, the notion of native and nonnative speaker, and globalization which affects language policies.

Phillipson (1992) mentions the role of language pedagogical practices and ELT specialists in the “hegemony” of English. ELT professionals play important role in the progress and spread of English around the world. According to Tollefson (2007), in choosing the language variety to be used in ELT classes, we must consider two points: first, the variety used by teachers and students as the medium of instruction in the classroom and second, the target language variety of the learners. Most textbooks are either American or British English (as standardized varieties) oriented. In such areas, teachers often teach the British or American Standard English found in textbooks while they speak in the local variety and accent different from the so called standard (Anchimbe, 2009).

Other related issue is the medium of instruction which can be the use of English, bilingual approaches in ELT classes, or non-standard varieties. Auerbach (2000) found that using L1 in the classroom is beneficial at the beginning stages of second language learning for learners with little English knowledge, motivates the weak students who had experienced several language learning failures, improves retention and progress, aids communicative and learner-centered approaches, and is culture friendly. Due to some political reasons, medium of instruction in most ELT settings is standard varieties which are often regarded as the varieties of the upper middle class, while other varieties (stigmatized varieties) are believed as Low languages leading to educational and employment failure of their speakers (Tollefson, 2007).

There is a negative attitude toward including stigmatized varieties in ELT classrooms in that they are assumed to hinder English language learning. Brown (2001) states that a native speaker teacher is better at understanding EFL textbooks which are generally written in one of the Standard varieties of English. Also, there is a negative attitude toward nonnative teachers and underestimating their abilities in comparison with native speaker teachers. On the other hand, adhering to the standard varieties of English leads to the overestimation of errors and overcorrection in the classroom.

Kachru (2011) adds that the American, Australian, British, Canadian and New Zealand norms are different from each other in many ways yet they can interact with each other pretty well. Also it has been observed and documented that varieties (accents or dialects) in different areas of the pluricentric communities such as England cannot always understand each other. It doesn't seem to be possible to impose a standard for all the English speakers around the world based on the Inner Circle norms while the Inner Circle communities include some variations in their regional and social dialects the same as the Outer and Expanding Circles.

Incorporating World Englishes (WE) in ELT profession can also influence the EL teacher training. EFL teacher trainees should be aware of world varieties of English in their training programs. Some language and literature departments such as universities in India and several universities in the USA (e.g., African-American, African, Asian-American, Indian or South Asian) have incorporated WE literatures (such as various Spanish, French, or Arabic) in their undergraduate curricula.

## CONCLUDING REMARKS

In addition, assigning exocentric norms can be a great danger to mutual intelligibility. Smith (1992), cited in Kachru (2011), claimed that the more the exposure to different varieties, the more accommodation strategies to these variations in accent, lexicogrammar and discoursal strategies will take place. Internet and media play significant role in this vein. A number of dictionaries have been published incorporating the impact of different varieties in wider dissemination e.g. *Encarta World English Dictionary* included East Africa, Hong Kong, Hawaii, Malaysia-Singapore, South Africa, South Asia, UK Black English and US African-American English in 1999; *The Macquarie Dictionary* in 1997 included lexical items from South-East Asian Englishes (Kachru, 2011).

Interlanguage analysis was the major concern in the past with little attention to the learning processes, individual variables, learners' identity and the social context of English language learning. Recently, student identity constructing in the second language has become an issue (McKay, 2011), part of which can be the inclusion of ethnic varieties in the classroom to make students feel at home and help them build self-confidence.

When one particular group's discourse dominates other groups and make them feel inferior or deficient (McKay, 2011). When compare themselves with native speakers of English as ideals, English learners and bilingual teachers feel inferior and this makes them incapable of participating in most new methods of language learning and teaching like critical thinking.

## BIO DATA

**Parviz Maftoon** is Associate Professor of teaching English at Islamic Azad University, Science and Research Branch, Tehran, Iran. He received his Ph.D. degree from New York University in 1978 in Teaching English to Speakers of Other Languages (TESOL). His primary research interests concern EFL writing, second language acquisition, SL/FL language teaching methodology, and language syllabus design. He has published and edited a number of research articles and books. He is currently on the editorial board of some language journals in Iran.

**Laleh Toupa Esfandiari** is currently a Ph.D. candidate of TEFL at Islamic Azad University, Science and Research, Tehran, Iran. She is an English language teacher and supervisor with the work experience of over 12 years. She is also a simultaneous interpreter and a travel agent. Her interested research areas are Individual Differences, BICS and CALP skills, and the neurobiological bases of language learning.

## PROFITIOUS MULTIPLICITY OR SPLIT AND CONFRONTATION? TWO RADICAL FEMINIST READINGS OF *THE STORM* BY MCKNIGHT MALMAR

Sonia Sarvipour, Ph.D. in English literature

Email: sarvipour@yahoo.com

A. Hossein Joodaki

University of Lorestan, Khorramabad, Iran

### ABSTRACT

Whether Looked at as a heaven-sent privilege bestowed on feminism as multiplicity, or a many-headed monster within, that incarnates as a widening gap that wastes feminists' enormous energies in confronting each other, diversity and difference appear as an indispensable element deeply rooted in feminism. The long standing titles as liberal feminism, radical feminism, Marxist feminism, Psychoanalytic feminism, echo-feminism and Postfeminism, to mention only some out of a longer list, can attest to the diversity. It Permeates the feminist space so inclusively that it leaves almost no recess intact, splitting, among others, postfeminism into postmodern and third-wave feminisms, and radical feminism into the hardly reconcilable offshoots" of radical-Libertarian feminism and radical-cultural feminism. Focusing on two antithetical readings of *the storm*, this article attempts to show how radical-libertarian and radical cultural feminisms diverge in their encounter with a wide range of phenomena covering from sex and gender through family to literary criticism.

**KEYWORDS:** radical feminism, radical-libertarian feminism, radical-cultural feminism, literature, the storm

### INTRODUCTION

Umbrella terms can hardly contain the rich diversity that continues to live, grow and develop underneath, almost indifferent to, and sometimes even, unconscious of the attempts made and energies spent to impose unity, homogeneity and sameness. Diversity seems to be everywhere, and multiplicity feeding on diversity and difference, is as omnipresent. It penetrates deep down the schools, isms, outlooks, policies and agendas for action. Religions are not immune to its influence, philosophies cannot duck its glaring gaze and approaches cannot stand its forking advances.

Feminism for one harbours a rainbow of principles, assumptions, concepts, terms, guidelines, descriptions, definitions, positions and finally, labels. Essentialist feminism, anti-essentialist feminism, liberal feminism, radical-libertarian feminism, radical cultural feminism, black feminism, Marxist feminism, socialist feminism, multicultural feminism, global feminism, psychoanalytic feminism, postmodern feminism, third-wave feminism which also drags behind such labels as first-wave and second-wave feminism, as well as pre feminism, care-focused feminism, ecofeminism and finally posfeminism all serve as labels that are devised by diverse feminist thinkers and critics to shed light on an aspect of feminism interconnected to the other aspects as it may be, refuses total identification with them. In her *Feminist Thought*, Rosemarie Tong, well aware of the diversity and multiplicity enveloping the feminist space, asserts that,

Since writing my first introduction to feminist thought nearly two decades ago, I have become increasingly convinced that feminist thought resists categorization into tidy schools of thought. Interdisciplinary, intersectional, and interlocking are the kind of adjectives that best describe the way we feminists think. There is a certain breathlessness in the way we move from one topic to the next, revising our thoughts in midstream. (Tong, 2009:1)

The multiplicity discernible at the heart of feminism is neither limited to, nor stops at the level of, the categories listed above. It further divides each category into conflicting branches. Ecofeminism, as an interdisciplinary aspect of

feminism moves further into other three branches of spiritual ecofeminism, transformative ecofeminism and global ecofeminism. So is radical feminism. Defining its borders against liberal feminism's emphasis on "eliminate[ing] discriminatory educational, legal and economic policies" (Hole and Levine, 1971:81), and laying emphasis, instead, on uprooting family and organized religion as powerful means in the hands of the patriarchal system to oppress women, radical feminism appears to be a unified body of theory and practice. However, that is only a mirage. Further investigation into the nature of radical feminism proves that it is deeply divided within. The gap between the two main branches of radical feminism, namely radical-libertarian and radical cultural feminism is so wide over such core concepts as sex, gender, reproduction and motherhood that reconciliation between the two is hardly in perspective.

True that the proper domain of feminist activity and theorizing is social, political, economic and natural life; however, none of these aspects of life can dispense with literature. Neither can literature manage without them. Hence, the feminist tackling of life questions will bear its implications on literature, just as its interaction with literature will both reflect its view of social and political life and leave behind its imprints on them.

*The storm* by Kathleen M. Monroe engages in questions like sex, gender and family which prove to be fundamental questions to both branches of radical feminism and the ground on which most of the controversy and heated debates between the two branches occur. Thus, reading the story from their viewpoints can pinpoint the bones of contention, the points of departure and the multiplicity that lurks behind the mirage of unity. The comparison and contrast will hopefully show how each branch constructs its version of truth; how and why disagreements arise between the two, and how the storm can metaphorically represent real life situations and question that of interest though they are to the practitioners of branches, illicit conflicting responses and answers from them. Arguments offered by outstanding radical feminists such as Kate Millett, Shulamith Firestone, Marilyn French, Mary Daly, Margaret Atwood and Adrienne Rich serve as the ground in which this article embeds its assertions.

#### ANDROGYNY VS. FEMALENESS

Concerning gender, the radical-libertarian and radical-cultural feminists do not cultivate the same assumptions; on the contrary the ideal gender women should finally assume is a point of departure between the two main branches of radical feminism. Each has its own agenda, argument, and reasons to support its argument against the other. Radical-libertarian feminists call for androgyny while radical-cultural feminists support femaleness as the gender women should come to have if they are to defy the patriarchal system.

As a forerunner of radical-libertarian feminists' direction on the question of gender, Jorgen Freeman in a then heretic step enthusiastically admired, for her androgynous qualifications what the patriarchal hegemony would consider as a 'Bitch'.

What is disturbing about a Bitch is that she is androgynous. She incorporates within herself qualities defined as "masculine" as well as "feminine" A Bitch is blatant, direct, arrogant, at times egoistic. She has no liking for the indirect, subtle, mysterious ways of the "eternal feminine". She disdains the vicarious life deemed natural to women because she wants to live a life of her own (Freeman, 1973: 52).

Not all radical-libertarian feminists adopted exactly the version of androgyny that Freeman was professing. They made some changes to it. However all agreed that androgyny is a guaranteed way to help women shun the patriarchal yoke. Represented by Alice Echols, all radical-libertarian feminists were convinced that whatever physical dissimilarities may differentiate women from men, they do not determine one's gender; rather, gender is a social construct heavily depending upon the current ideology and power structure that penetrate into a surety's texture. "Women" can simultaneously assume a feminine as well as a masculine gender (Echols, 1983: 445). In line with Freeman and Echols observations, Sulamith Firestone, an outstanding radical libertarian feminist, also called for androgyny. Defining male Psychology and response as "objective, logical, extroverted, realistic, concerned with the conscious mind (the ego) , rational , mechanical , pragmatic and down- to – earth , stable" and female response to reality as " subjective , intuitive , introverted , wishful , dreamy or fantastic, concerned with the subconscious (the id), emotional , even temper a mental (hysterical)" (Firestone , 1970 : 175), she encourages women to construct for themselves an identity that bridges between the two genders, leading to an androgynous identity that can harbor conflicting and contradictory masculine and feminine traits .

Radical-cultural feminists such as Marilyn French and Mary Daly , on the contrary seem to reproduce the male/female binary opposition in their writings , albeit Privileging feminine gender over the masculine gender which is the favorite gender canonized by Patriarchy . For instance, in her *Beyond Power*, French equates femaleness with "Love and compassion and sharing and nutritiveness [sic] (French, 1985:443) as opposed to the masculine values of hatred and possessiveness and struggle and competition and selfishness and ego centrism, and thus asks for a feminine

gender that would put right the wrong that masculine line gender has done the world. Not necessarily the same but closely related with gender is the question of sexuality and consequently that of a family based on heterosexual love and natural reproduction to which now this article turns.

### **HETEROSEXUAL LOVE, ENCOURAGED? DISCOURAGED?**

In their attempt to develop their ideal female identity which thanks to its superiority to the now-dominant masculine identity will both promote women's status and build a far more desirable world for both men and women to live in, the radical- cultural feminists tried to enhance the borders that separated women from men to create a female space within which women would rather turn to themselves than directing their love, energy and attention outside, to men. In a typical move a group of feminists called Radica lesbians offered a sketch of their desirable self-referenced identity which can display their position regarding sex, gender, family and related questions.

Only women can give each other a new sense of self. That identity we have to develop with reference to ourselves, and not in relation to men. This consciousness is the revolutionary force from which all else will follow, for ours is an organic revolution. For this we must be available and supportive to one another, give our commitment and our love, and give the emotional support necessary to sustain this movement. *Our energies must flow toward our sisters, not backwards towards our oppressors.* As long as women's liberation tries to free women without facing the basic heterosexual structure that binds us in one-to-one relationships with our oppressors, tremendous energies will continue to flow into trying to straighten up each particular relationship with a man, how to get better sex, how to turn his head around-into trying to make the "new man" out of him, in the delusion that this will allow us to be the "new woman." This obviously splits our energies and commitments, leaving us unable to be committed to the construction of the new patterns which will liberate us (Radica lesbians, 2000: 236 emphases added).

Thus, radical-cultural feminists reject heterosexual love in favour of lesbianism and auto –eroticism because heterosexuality signifies nothing more than "male sexuality" (Echols, 1984:59) to them. It underlies all sorts of woman oppression because it confines each woman individually within the space of a "one-to-one- relationship" with a man who is, by what can be inferred from the quotation above, stronger and also thanks to his firm connection with other men who control the whole system, defeats, and overpowers her and exploits her as an object rather than treating her as an equal partner.

By generalization, to radical-cultural feminists, what goes on in heterosexual love, goes on in and permeates all aspects of heterosexual life in a heterosexual family. A woman snared in her "one-to-one relationship with {her} oppressor" is objectified and exploited in all levels and the objectification will be a multi-dimensional one. The result will be an economic, social, political, cultural, educational, and psychological oppression of women universally.

Concerning sexuality, radical-libertarian feminists adopt radically different positions from that of radical-cultural feminists. One representative voice heard among others is that of Gayle Rubin.

From Rubin's point of view sex is allowed in all its imaginable forms in chiding among others casual sex, heterosexual, homosexual and bisexual intercourse. She believes that taboos and prohibitions enveloping sex must be eliminated.

Sex is not simply a name for "sins, disease, neurosis, pathology, decadence, pollution or the decadence, pollution or the decline and the decline and fall of empires" (Rubin,1984 :278) ;rather, whatever form it takes, sex is a great – source of pleasure and the undeniable right of every woman to experience. As Tong (2009:67) puts it: "For Rubin, all sex was good; no judgments should be made about the rightness or wrongness of any form of sex."

Although they encouraged heterosexuality among other forms of sex as an experience to enjoy if that was what women would choose, radical libertarian feminists were severely against natural reproduction, motherhood, giving birth and establishing a traditional family consisting of a man, a woman and their children born through pregnancy and biological motherhood. Rather, they insisted on artificial reproduction; reproduction only for pleasure. In addition, there will be no need of a man and a woman as the building block of a reproductive family. Rather, a woman can choose to have her artificially-gestated child with another woman, with a man and another woman, with two men or whatever combinations they choose.

Radical-cultural feminists, on the other hand, for all their insistence on “femaleness” and independence of man, refuse reproductive technology. In what seems a paradoxical move, they turn to natural reproduction as the only sources of power women have to exert on men in their fatal struggle. A typical radical-cultural feminist on the question of reproduction, Azizah Alhibri writes that

Technological reproduction does not equalize the natural reproductive power structure-it *inverts* it. It appropriates the reproductive power for women and places it in the hands of men who now control both the sperm and the reproductive technology that could make it indispensable .... It liberates them from their humiliating dependency on women in order to propagate. (Alhibri, 1984:266)

Both as a source of power and a source of deep natural pleasure, motherhood and natural reproduction are estimated high in the topography of radical-cultural feminism. According to Adrienne Rich, “In order to live a fully human life we require not only control of our bodies... we must touch the unity and resonance of our physicality, our bond with the natural order” (Rich, 1979: 31). The Paradox lies in their simultaneous flee from men and their craving for pregnancy which is possible only through dependence on men. Thus, traditional families consisting of a wife, a husband and the children seem inevitable.

### **THE STORM: THE WINDY BATTLEFIELD OF CONFLICT AND CONFRONTATION**

*The Storm*, a short story by Mcknight Malmar depicts a family, newly constructed and apparently firms enough to stand the storms that usually uproot families. Jannet, the newly-married wife loves her husband, Ben, wholeheartedly. Romantic, hetero-sexual love seems to have permeated the whole family atmosphere and the young couples have their residence in a big mansion far from the maddening crowdedness of urban life.

All is calm and quiet except for those occasions on which Ben receives a letter. Jannet is never so curious or suspicious to inquire into the identity of the one who writes and sends Ben the letters and that remains a mystery until near the end of the story. However, she notices how the reception of each letter upsets Ben and makes a disturbed and absent-minded creature out of him for almost a week and how the whole family atmosphere changes by the unwelcome arrival of each letter.

One day, Ben, the stingy husband, in a generous move buys Jannet some books, biscuits, confectionery and a ticket to send her on a journey to her sisters. Jannet is supposed to spend a month there, but the kind-hearted, loving and devoted woman can hardly tolerate so long away from her husband. Therefore, she decides to go bank a week sooner than Ben expects her, without letting him know about it to give him a big lovely surprise. She arrives on a harsh stormy evening, pushing her way through the strong wind and rain which wets her from top to toe. When the wind slams the door behind Jannet, to her astonishment, she finds out that the lights are turned off. She calls Ben, but there is no response. She picks up the phone to call her much-missed husband, but she finds out that the phone is disconnected. Finding herself lonely and miserable in that dark, isolated, cold mansion, she goes to cellar to find pieces of wood and timber to set a fire with. Opening the trunk, she faces a dead woman put in a sitting position inside.

In her great terror and fright, She rushes out to wish desperately Ben hand been there. She is able to hear strange sounds and once, even to see behind the window what looks like somebody’s face. She nearly dies of terror. After some time, to her great relief, Ben is there, tired, immersed in the rain and gasping. She tells him about what she saw in the basement; while Ben refuses all she says in the name of hallucination, taking her to the cellar even to show her there is nothing in the trunk. Nothing is there of course, no dead body, and they go back to the dining room. In the meantime, she suddenly notices a ring Ben is wearing exactly like the one she saw the dead woman in the trunk had. Understanding what is at stake in a moment of epiphany, she screams. Ben tries to strangle her with his hands, but she is lucky enough to escape from the psychological storm inside the house and take refuge in the terrible storm outside which terrifying as it is, proves to be much safer than the murderous storm within.

Among the numerous aspects of *The storm* that might prove of interest to a feminist interpretation, the questions of identity and heterosexual coupledness, the questions of identity and heterosexual coupledness from a radical-libertarian as well as a radical- cultural feminist point of view are at the center of examination here.

The story receives a considerable amount of its intense effect from the distinction Malmar makes between male and female identities. Developing a masculine identity, Ben is active, strong, intelligent, practical, selfish, egoistic, capable if planning and plotting as well as realizing the plans and plots he makes, independent, cruel, rough, unfaithful, assertive, pragmatic, logical, objective and aggressive. Jannet on the other hand, seems to be exactly Ben’s antithesis in many respects. The feminine identity she represents can be described as passive, weak, gullible, dull, whimsical, unselfish, sacrificing, caring, thinking of no plans and no plots against others and therefore putting

none to practice, dependent, kind. Loving, gentle, careful, cowardly, faithful, easily deceived, emotional, committed to her life and love promises, impotent, psychologically paralyzed, unable to enquire into the nature of events and people, timid, impractical, introversive, intuitive and subjective.

The mere distinction Malmar makes between feminine and masculine identities together with the deep hatred for man and the inclusive support for woman she is capable of engineering to be elicited from the reader, will be received with open arms on the part of the radical- cultural feminists. They will probably foreground such desirable feminine aspects of Jannet's personality as faithfulness, kindness, care, emotionality, honesty, commitment and devotion to compare with Ben's unfaithfulness, dishonesty, indifference, betrayal, lack of devotion, coldness and hateful cruel nature and to show a clear image of feminine supremacy over masculine meanness and inferiority of nature.

However, a group of radical-cultural feminists will probably condemn Jannet (and even Malmar, for creating *this* Jannet) for her lack of intelligence, assertiveness, curiosity, strength, detachedness, will to power and independence of personality. She should not have been so credulous and gullible as to play the part in Ben's plot that he had determined for her. She should not have been so devoted and simple-minded as to do no inquiry into the identity of the one who sent the letters to Ben.

The uprooting attack by radical-cultural feminists on Jannet (and through the creation of Jannet on Malmar) will focus on her choice of a man as the target of her care, energy and love. She should have, instead, turned her attention, care and kindness toward her sister. Instead of making love with Ben, she should have practiced lesbianism. If her life is engendered; if she is nearly murdered; if she finds out that she has been gullible enough to be sent on a planned journey and if she loses a family life to which she was devoted wholeheartedly, that's because she invested her care and love and energy in the wrong place.

The paradox rises when radical-cultural feminists simultaneously call for women's turning away from men and their preservation of the power to reproduce naturally. Their emphasis on sisterhood, lesbianism and concentrating their energy on their female mates leads one to logically infer a deep hatred of heterosexuality and an absolute avoidance of living a heterosexual family life. However, to one's deep astonishment, this is not the case. Radical-cultural feminists insisted on women's reproductive power, probably not aware of the consequences. To naturally reproduce, a woman needs a man's sperm, and that can lead to women's eternal dependence on men; what does not fit the radical-cultural feminists' demand for 'female ness.' Adrienne Rich, an outstanding radical- cultural feminist, had a husband and two children, born naturally to realize radical- cultural feminist, traditionally enough had a husband and two children, born naturally to realize the walking paradox that lives in the heart of radical- cultural feminism.

Therefore, in a radical- cultural feminist approach to *The Storm* Jannet will be simultaneously condemned and admired for her choice of living with Ben. Thus paradoxically, her escape from Ben's house both rescues her from being murdered and introduces her to a storm that deprives her from the power of producing new life which according to radical- cultural feminists is the only advantage women have to help them in the back- breaking struggle for power with men. In addition to her deprivation of Ben who could serve Jannet as the father of her would-be child, escaping from Ben's house into the storm deprives her, a weak, timid, depending, miserable woman, from the protection and support a man's presence could offer her.

Radical-libertarian feminists will oppose radical-cultural feminists in many respects. Setting androgyny as an ideal for identity construction, they will find little in Jannet to admire, in sharp contrast to radical- cultural feminists indeed. A Jannet to admire from their point of view would be one who could combine desirable feminine qualifications with admirable masculine traits. Intelligence, rationality and practicality should have been combined with love, care and consideration, for instance, to set forth a model for women to follow. Malmar's story therefore reproduces the same identities that patriarchy has been producing for thousands of users. *The storm*, from this view point takes side with the patriarchal system by reconstruction and nature. Women represented by Jannet in *The Storm* are timid, credulous, gullible, weak and in want of constant protection and support. Therefore, they should not interfere in affairs that need courage, intelligence, strength and independence. The public sphere with all its social and political space will accordingly belong to men while women should be driven to the "womanish", space which fits their particular identity structure. That is exactly what radical- libertarian feminists will try to eliminate not reproduce as *The Storm* does.

In sharp contrast to the radical-cultural feminist view, radical libertarians will neither criticize nor condemn Jannet for directing her love and energy toward a man. She is free to choose the way she satisfies her desires and discharges her energy. Turning to sisters is only one among many other legitimate choices. She could have turned to autoeroticism as well. She could have chosen casual sex or even to have sex with people for younger or older than her. She could have chosen to have her family life even with two men instead of one, or with two women, or a man and a woman, or any other possible combination. Therefore, Malmar will be exempted from the charge of reproducing a form of married life which has always served, as radical-cultural believe, as a site for woman oppression.

Again, contrary to the radical-cultural belief, Jannet's escape from Ben's house, representing a space controlled by men, should not be considered as depriving her from the only source of power she has, namely, the power to give birth. Rather, it frees her from a stable, powerful anchor which has always served as a crucial component of male superiority and female inferiority. Dependence upon men for their sperm and caring a fetus inside one's womb for nine months together with the paralyzing responsibility of taking care of the baby are exactly the interlinked roots of all discriminations against women. Jannet is so lucky she did not get pregnant by Ben. Out of the house which could function as a place for stifling natural motherhood and biological reproduction, she is free now to enjoy a life not bound to the crippling responsibility of bringing new life to the world. She could instead hope that one day technology could give her a child without the torment of motherhood or wifehood.

## CONCLUSION

*The Storm* as a literary text reveals part of the conflicts and contradictions among the two subdivisions of the same feminist branch to verify the claim that feminism is a space rich with diversity and multiplicity especially if one notices the fact that the story could also metaphorically represent real life situations over which feminism divides and diversifies. Certainly, difference, diversity and even confrontation could be viewed from opposing stances. It can be read as a sign of dispersion which signifies the loss of energy in internal conflicts and the nullification of attempts on the part of those who should have enhanced them. But it can also be interpreted as a sign of richness and the vital flexibility of an approach which is not unaware of the contradictions and paradoxes in the nature of life itself. In the long process of understanding the nature of life, an approach should probably be flexible and therefore multiple and paradoxical if it is to stay.

# THE DKE MODEL REVISITED: LEARNING L2 VOCABULARY PRONUNCIATION THROUGH 1ST- AND 2ND-HAND EXPERIENCES

Ming-Tsan Pierre Lu

University of Texas- Brownsville, USA

Email: MingTsan.Lu@utb.edu

## ABSTRACT

The Designs for Knowledge Evolution (DKE) model was originally proposed by Schwartz et al. (2005) in the domain of statistics learning. In this study, the researcher examined the DKE model in the domain of second language (L2) learning. The researcher applied the DKE model by having 1st and 2nd hand experiences of clicking on words and writing rules. Experimental design was implemented. The study found that adding 2nd hand experience of writing rules improved learning. In addition, the findings also suggest that the implementation of the full DKE model by obtaining both 1st and 2nd hand experiences in our learning activity can eliminate the learning gap between Easterners and Westerners. By examining the DKE model in this experiment, it is proposed that, in a language learning environment, learners provided with both 1st and 2nd hand experiences will get better learning results than those provided with only 1st-hand experience. Instead of implementing traditional instruction methods in English as a second language (ESL) classes, teachers can adapt the DKE model and let students first acquire their 1st and 2nd hand experience before lectures to foster better L2 learning results.

**KEYWORDS:** L2 learning; vocabulary; DKE model; pronunciation; cultural variation; cognition

## INTRODUCTION

### *Importance of the study*

#### *Motivation for better learning*

Cognitive psychology has its limitations on the realm of narrowly defined experimental conditions in research-oriented studies and thus also on the applicable capacities for complex classroom learning (e.g., Cobb, 1992; Lave, 1988). Therefore, the Designs for Knowledge Evolution (DKE) provides not only theoretical framework construction but also practical application capabilities that are designed and developed to be helpful for learners to understand deeper and learn better (Schwartz, Martin, & Nasir, 2005).

#### *Exploring the DKE in the domain of L2*

When Schwartz et al. (2005) proposed the DKE model, they intended to provide an integrative prescriptive learning theory to solve some methodological isolationism problems that Cognitive Psychology research usually has, such as isolation of cognitive mechanisms and isolation of learning outcomes. In their studies, however, the DKE was only implemented and later tested in the domain of statistics learning and teaching. Although Schwartz et al. (2005) mentioned several studies to help form this integrative approach of the DKE model, they merely used statistics learning and instruction as an example to show the effectiveness and advantages that learning may emerge with the DKE. The previous studies of the DKE model have shown the powerful effect that DKE has on statistics learning (Schwartz et al., 2005). Children can deeply understand the concepts of central tendency and variability through the DKE-designed instruction. Furthermore, children who learned these concepts by using the DKE model could outperform college students who have just taken the introductory statistics course in many of these concepts (Schwartz et al., 2005), even in transfer tests that are held several weeks later than the instruction. Therefore, the present study further examines the DKE model to find if it also fits the complex learning of second language (L2). As L2 learning has become an increasingly global trend in today's education, it is important to help instructors effectively teach, and learners substantially learn, a second language (eg. Chaudron et passim, 1988; Lave, 1996;

Harklau, 2002, in Zamel & Spack (Eds.), 2002). By exploring the DKE in the domain of L2 learning, the study hopes to extend the work of DKE in the domain of mere science-related learning to the domain of language learning to benefit ESL and L2 learners and teachers.

#### *Exploring DKE induced by multimedia*

The concepts and tools of multimedia learning have been widely adopted in many learning and teaching circumstances (Mayer, 2001) and have been discussed with many arguments (eg. Salaberry, 2001; Salaberry, 2000). For example, with the advances of computer technology, educators largely utilize and discuss computer-assisted language learning (CALL) to aid L2 learning. Some researchers argue that technologies may not have achieved equal extents of pedagogical benefit in the realm of L2 learning and teaching (Salaberry, 2001). Traditionally, we may use multimedia to convey and receive 1st-hand knowledge, such as listening to a paragraph or to some vocabulary pronunciation on a tape cassette, and 2nd-hand knowledge, such as grammatical rules using a PowerPoint presentation. With the trend of using technologies in language learning, it is not clear what kind of role multimedia plays in the DKE model. This study also intends to explore the DKE with multimedia-triggered 1st- and 2nd-hand experiences.

### **OBJECTIVES OF THE STUDY**

The objectives of the study are: (1) to explore multimedia-induced first-hand experience and second-hand experience; (2) to test the DKE model in the domain of language learning; specifically, the researcher would like to test the DKE model by examining if, for a given time in a language learning environment, learners provided with both first-hand and second-hand experiences will get better learning results than those provided with only first-hand experience; (3) to provide empirical evidence to support the DKE model in the domain of second language learning; and, (4) to further discuss the applications and implications of the DKE model in L2 learning.

### **LITERATURE REVIEW**

#### ***What is DKE?***

##### *Origin of the DKE*

Schwartz et al. (2005) proposed their integrative prescriptive theory that the development of understanding has something to do with the co-evolution of different types of knowledge in response to outside situational stimulation. They argued that for better productive teaching practices, the development of methods and measures that yield prescriptions of learning is essential. And when human beings learn complex ideas (e.g., a complex system, a language, or statistics), multiple cognitive mechanisms and resources get involved because they integrate processes and resources to help with their learning.

##### *Knowledge evolution*

The basic assumption is that human beings' movements from one environment to another help evolve an understanding that can keep on adapting. Therefore, Schwartz et al. (2005) asserted that people's learning should be from both direct experience and communicated experience, and should not be from only either one of them. Learners should not only be able to apply what they have learned but also to evolve new knowledge necessary for the new contexts. As the "goal of school-based instruction should be to prepare students to adapt and learn in the future" (Bransford & Schwartz, 1999, cited in Schwartz et al., 2005, p. 4), this DKE model should be emphasized in today's instructional practices in order to strengthen student's *learning at transfer* adaptation abilities.

#### ***First-Hand and Second-Hand Theories***

The theories of the acquisition and application of first-hand knowledge emphasize direct experience whereas the theories of the acquisition and application of second-hand knowledge emphasize descriptions of experience, which is communicated knowledge.

##### *First-hand experience*

Many people encourage first-hand experience for learning. For example, First Hand Learning, Inc. (retrieved 2007) has been promoting first-hand learning for over 10 years. First-hand learning is learning from direct experience. People figure things out themselves by perceiving the real phenomena around them and thus first-hand learning requires close engagement with the environment. Since learners have their congenital inquisitiveness and curiosities to delve into the world they are interacting with, learners use their own knowledge construction and analytical abilities to connect with the environment. Observations, analyses, and interpretations are important features. Therefore, first-hand learning allows learners to come up with meanings and even questions they may have and, later

on, investigate to find possible answers themselves. For the acquisition of first-hand experience or knowledge, people interact with the phenomena directly. They use a lot of perception and action and tend to get more individualistic, direct, and personal experience. Examples of first-hand theorists include Piaget who did research on children's abstracted understanding and Shepard and Cooper (1986) and Kosslyn (1980) who have largely contributed to imagery studies where perception is emphasized. First Hand Learning, Inc. (2007) states that with first-hand experience, "learners acquire and retain new knowledge most effectively," since this type of learning "makes people think for themselves rather than relying solely on the authority of teachers and textbooks" (2007). Schwartz et al. (2005) argue that first-hand theories are very important to learning, since "no amount of reading is sufficient to learn to drive a car" (p. 7).

#### *Second-hand experience*

For the acquisition of second-hand experience or knowledge, people interpret experiences or descriptions, and often in the absence of original referent (Schwartz et al., 2005). Second-hand information is often presented in a communicable symbolic structure form. Anderson's (1983) research on how people internalize second-hand experience from declarative knowledge (such as words) to procedural knowledge (such as actions) is an obvious example of second-hand theory. As a huge amount of people's knowledge is from second-hand experience, such as reading books, listening to tapes, or watching films, the second-hand theories are also very important to human learning. For prescribing instruction, though, it seems we need to provide the situations where people are able to experience a circumstance, and not just the reading part of the circumstance.

#### *Interaction of first-hand and second-hand experiences*

Schwartz and Black's (1999) study of liquid pouring from different glasses shows that there can be dissociation between the cognitive processes of first-hand and second-hand experiences and the division of them may be of advantage or disadvantage to learning, especially cognition and learning of complex knowledge or systems. In Schwartz and Black's (1996) another study of determining the last gear's clockwise or counterclockwise turn when the first gear's turning was given in a chain of gears, it reveals the interaction of participants' first-hand knowledge and second-hand knowledge. It is obvious that, in this study of gears turning, when people learn they generate first-hand knowledge with perceptual-motor content such as hand gestures to figure out their mental representation of gears' turning directions; and then they induce the second-hand knowledge of the parity rule where they simply count the number of gears presented. Furthermore, both first- and second-hand experiences are imperative just as perception and communication (Schwartz et al., 1995) are both critical to gestural simulation and rule induction. Clearly, from gestural simulations to rule-based descriptions, both first-hand experience and second-hand experience get involved and even more, intertwined, so that the learning and development of complex ideas can be yielded. Therefore, deep understanding postulates both first-hand and second-hand experiences and thus we ought to combine the two in our instructional design.

#### *Features of DKE*

From Schwartz et al. (2005) and the AAA Lab at Stanford University (Complex Learning: Designs for Knowledge Evolution, Retrieved Jan 1st, 2008), the features of DKE can be synthesized to the following points: (1) Learners yield a certain model that can respond to a given situation where they can perceive the differences and create a structured account from what they perceive. (2) Learners examine their models and see what in the models still survives. (3) Learners produce and adapt new models to fit the new context. (4) Learners collocate with their models to further examine useful values that survived.

### **METHODOLOGY**

#### *Participants*

Participants were 49 non-Spanish speaking adults (14 men and 35 women) currently enrolled as graduate students at Teachers College Columbia University, Baruch College City University of New York, and New York University. The mean age of the participants is 26.43 years (SD = 2.78). They were conveniently sampled through friends and various TC-Columbia University mailing lists, and then they were randomly assigned to two groups: the experimental group (1st + 2nd hand group, n1=24) and the control group (1st hand group, n2=25). In terms of their native language, 10 speak Mandarin Chinese, 34 speak English, and the rest stated that their native languages are Taiwanese, Japanese, Korean, or American Sign Language. In this sample, 26 participants stated that they can speak

3 languages (the mode group), 6 can speak only one language, 5 can speak 2 languages, 7 can speak 4 languages, 4 can speak 5 languages, and 1 can speak 6 languages.

### Design

#### *Learning activity section for 1st and 2nd -hand experiences*

In the experiment, the researcher designated a learning activity section in the multimedia instruction of a Spanish vocabulary learning lesson, and it is before the lecture. The section includes 1st hand experience or both 1st hand and 2nd hand experiences. The 1st hand experience in the learning activity has both *perception* and *motor* components where the participants listen to the words' pronunciation (and thus with the *perception* component) and they actively get involved in making pronunciation by clicking words listed on the screen (and thus with *motor* component). Specifically, in the learning activity session, participants in both 1st hand group and 1st + 2nd hand group were asked to press each of the 15 Spanish word buttons presented on the screen, to listen to the words, and to practice each pronunciations.

The 2nd hand experience in the learning activity involves *symbolic* and *communicative* components where the participants interact (and thus being *communicative*) with the multimedia-conveyed information and they were asked to use words and symbols (thus *symbolic*) to represent the knowledge they have acquired from the above experience. Specifically, the 1st + 2nd hand group participants were asked to come up with pronunciation rules in respect of these distinct words and to write down the rules in a given Rule Sheet, whereas the 1st hand group participants, without being given a Rule Sheet, were just asked to listen to the pronunciations without doing any further actions. Yet, both groups had a full 10- minute period before they went on to the lecture section. We need both the mechanisms for developing the first-hand knowledge or both first-hand and second-hand knowledge.

#### *Rationale for the Design*

Many researchers have suggested that using multimedia approach to language learning can help with vocabulary acquisition, reading, and with producing information (e.g., Bransford, Goin, Hasselbring, Kinzer, Sherwood, & Williams, 1986; Bransford, Kinzer, Risko, & Rowe, 1989; Leu & Kinzer, 2003; Glaser, W.C., Rieth, H. J., Kinzer, C. K., Colburn, L. K., & Peter, J., 2000; Salaberry, 2000; Salaberry, 2001). Therefore, for the instrument and the instruction in this design, PowerPoint presentation slides were intertwined with multimedia components. In this design, the reason for a part in the measure (the 5th part on the posttest) asking people to actually pronounce the word, rather than merely testing specific memory for the word pronunciation rules, is based on the knowledge that deep understanding not only involves basic memory, but also has to do with the abilities to perceive, plan, act, and transfer (Schwartz et al., 2005).

### Materials

#### *Materials and apparatus*

The materials used in the study included a demographic survey, the Rule Sheet, a learning activity (see Graph 1 for the sample page of the *learning activity* computer screen), a multimedia-induced lecture (see Graph 2 for a sample page of the lecture program), the retention posttest, and the interview questionnaire.

Graph 1: The Sample Page of the Multimedia-induced Learning Activity Computer Screen

Graph 2: The Sample Page of the Multimedia-induced Lecture Computer Screen

The Rule Sheet is a plain sheet of paper with a big table of 3 rows and 2 columns. The headings for those 2 columns are *Rules* and *Example Words*. On the page of the *learning activity* computer screen, there is a table of 3 rows and 5 columns, listing 15 Spanish words in total. The clear instructional heading of “Click on each word to hear it!” is on the top of the page. Participants could hear the clear pre-audio-taped pronunciation of each word they clicked on. These 15 words, *Juego*, *Ganador*, *Ojo*, *Genio*, *Jirafa*, *Gozo*, *Gusto*, *Gimnasio*, *Gasto*, *General*, *Gesto*, *Jardin*, *Cajero*, *Goma*, and *Gitano*, were selected by the researcher and colleagues who have learned Spanish pronunciation rules and the pronunciation sounds were recorded by a Spanish female native speaker. For both groups, participants had 10 minutes for the *learning activity* session. The instructions were clear and explicit. For example, for the 1st + 2nd hand group, participants received the instructions: 1. *Click on each of these Spanish words and listen to how they are pronounced. Listen to the words more than once if necessary.* 2. *Using the worksheet provided, create a set of rules to describe how the “j” and “g” letters are pronounced in Spanish.* 3. *In this session, you have 10 minutes.* The multimedia-induced lecture was entirely PowerPoint-designed slides. There were 20 slides in total. The instruction for the lecture was also clear. In the beginning, there was a slide stating: 1. *Now you are going to have a lecture about some Spanish pronunciation rules.* 2. *In this session, you have 15 minutes.* Both 1st + 2nd hand and 1st hand groups received exactly the same lecture for 15 minutes. In the lecture slides, there were clear headings, rules’ explanations, and practicing example words with multimedia components. On the retention posttest, the highest possible score with all correct answers is 40 and the lowest possible score with all wrong answers is 0. There are 5 main sections of questions with 40 questions in total. All the answers were graded on a true/false (correct/ incorrect) format. The retention posttest was timed and given to participants in both groups for 7 minutes. The apparatus used were IBM compatible Dell laptops with 13.3 inches monitor. Earphones were tested to ascertain their proper functions before use.

#### *The embodiment of first-hand and second-hand experiences*

The study was designed to allow participants to obtain first-hand and second-hand experiences via multimedia. The embodiment of first-hand experience in this study was the perception and clicking part where participants were asked to look at the screen, to choose a Spanish word listed on the page, then to listen to the pronunciation of the word clicked. The embodiment of second-hand experience in our study was the communication and symbol generation part where participants were asked to not only look at the screen, choose a word, and listen to the pronunciation, but also to write down any possible rules they might generate on the Rule Sheet.

#### **Procedure**

##### *Prescreening*

The study was introduced to participants as research about the characteristics of language learning. Each participant was told that he or she would be filling out a demographic survey, learning something in a new second language using a computer, receiving a brief quiz (posttest) about the materials that they have just learned, and finally filling

out another questionnaire. They were told to try to do their best to learn. From the demographic survey, the researcher made sure that all the participants did not know anything about Spanish and have not learned Spanish at all through pre-screening. Also, the researcher ascertained that all participants can use a computer mouse which is necessary for the study. The experiment took place in a lab room at Columbia University.

#### *Process*

Before the experiment, the participants were first given the pre-screening demographic survey to fill out for 5 minutes. Those who can speak any Spanish or have learned any Spanish were excluded from our study. Secondly, both groups of the participants did a learning activity for 10 minutes. In this 10-minute time period, the control (1st hand) group participants were asked to click on those 15 Spanish words on the computer screen to hear their pronunciations as well as to practice pronouncing the words whereas the experimental (1st + 2nd hand) group participants, in addition to doing what the 1st hand group participants were asked to do, were asked to use the Rule Sheet to write down any rules they might have perceived or generated. Thirdly, a lecture of 15 minutes about the pronunciation rules of Spanish letters was introduced and given to both groups through a designed PowerPoint presentation instruction on the computer. Fourthly, trained graduate research assistants administered a posttest for both groups' participants for 7 minutes. All the above sections were timed to ensure equal time spent for both groups.

And finally the researcher interviewed the participants individually for around 10 minutes when they filled out the questionnaire. Participants were asked to try their best to learn those rules from the lecture and to answer the posttest questions. Data were collected for around eight months.

## RESULTS

### *Quantitative data analysis*

#### *Descriptive statistics*

Table 1 shows that with the random assignment of the experimental design of the study, there were no significant differences between participants in the 1st + 2nd hand group and the 1st hand group. There were 24 participants (49 per cent) in the 1st + 2nd hand group and 25 participants (51 per cent) in the 1st hand group. Among the 1st + 2nd hand group participants, 19 of them were women (38.8 per cent) whereas among the 1st hand group participants, 12 of them were women (32.7 per cent). There was no significant difference in gender between these two groups (Cramer's  $V = .168$ ,  $df = 1$ ,  $p > .05$ ). Among the 1st + 2nd hand group participants, 6 of them (12.2 per cent) whose native language is English whereas among the 1st hand group participants, 5 of them (10.2 per cent) whose native language is English. There was no significant difference in whether their native language is English or not between these two groups (Cramer's  $V = .060$ ,  $df = 1$ ,  $p > .05$ ). In terms of age, the 1st + 2nd hand group participants had a mean age of 26.42 (SD = 2.10) and the 1st hand group participants had a mean age of 26.44 (SD = 3.34). There was no significant difference in age between these two groups ( $F(1, 47) = .001$ ,  $p > .05$ ).

*Table 1: Descriptive statistics of number, gender, and native language between two groups*

	Experimental Group		Control Group		Cramer's V	p-value
	Frequency	Percentage	Frequency	Percentage		
N	24	49.0	25	51.0		
Gender (F)	19	38.8	12	32.7	.168	.240
English	6	12.2	5	10.2	.060	.675

#### *DKE model*

Table 2 and Figure 1 show that the 1st + 2nd hand group participants outperformed the 1<sup>st</sup> hand group in posttest scores by 2.67 points ( $t(37.74) = 2.83$ ,  $p = .007$ ). The 1st + 2nd hand group participants had a mean of 38.75 (SD = 2.27) out of 40 and a range of 8. The 1st hand group participants had a mean of 36.08 (SD = 4.10) out of 40 and a range of 14.

Table 2: Descriptive statistics of age and posttest between two groups

	Experimental Group		Control Group		t (37.74)	F (1, 47)	p-value
	Mean	SD	Mean	SD			
Age	26.42	2.10	26.44	3.34		.001	.977
Posttest	<b>38.75</b>	<b>2.27</b>	<b>36.08</b>	<b>4.10</b>	<b>2.83**</b>	<b>7.855**</b>	<b>.007</b>

\*\*  $p < .01$

Figure 1: Box-Plot of POSTTEST Scores between two groups

There was also a practical significance in the magnitude of the treatment. As the Eta square is .143, the effect size (ES), a measure of the strength of the relationship between these two variables, can be considered medium to large, according to the standard set by Cohen (1988 & 1992) and Judd and McClelland (1989). The Cohen's  $d = .806$  and the ES  $r = .374$  also suggest a large effect size by Cohen's (1988) standard. Therefore, the implementation of the full DKE model with the acquisition of both first-hand experience and second-hand experience during the learning activity has yielded significantly higher posttest results than that with the acquisition of only first-hand experience. This provides evidence for supporting the full DKE model in multimedia-induced language learning and instruction environment.

#### Cultural variation

Since the research team members had noticed the basic difference in participants' test-taking attitude as well as test results between Easterners and Westerners during the experiment and the posttest, I further examined the possible cultural variation by differentiating participants' cultural background. An analysis of variance (ANOVA) was conducted on the posttest score data, with cultural background (i.e. native language being western or eastern) as a between-subjects factor and treatment groups (i.e. 1st hand group or 1st + 2nd hand group) as a within-subject factor. Figure 2 and Table 3 show that there was a significant interaction between cultural background and treatment groups,  $F(1, 48) = 16.48, p < 0.001$ , consistent with the observation that the difference between the cultural background's native language spoken (i.e. being Westerners or Easterners) was large for the 1st hand treatment group but not as much for the 1st + 2nd hand group. Therefore, though the full DKE model seemed to work for both Easterners and Westerners, it in fact fitted better for Westerners. The findings suggest that when provided with both 1st and 2nd hand experiences, Westerners whose native language is mainly English can perform a lot better in the retention

posttest than provided with only 1st hand experience ( $t(47) = 4.81, p < .0001$ ). Easterners whose native language is mainly Mandarin Chinese, however, showed an insignificant higher posttest score ( $t(47) = 1.28, p = 0.207$ ) with 1st and 2nd hand experiences ( $M = 39.00, SD = 1.85$ ) than with only 1st hand experience ( $M = 37.65, SD = 2.60$ ). For Westerners, the large effect size (Cohen's  $d = 2.704$ ) also showed the significant difference between treatment groups in that 1st + 2nd hand participants obtained a much higher retention posttest mean score ( $M = 38.00, SD = 3.35$ ) than 1st hand participants' retention posttest mean score ( $M = 29.80, SD = 2.68$ ).

Table 3: T-tests of both groups between Easterners and Westerners on posttest

	Easterner						Westerner					
	1 <sup>st</sup> + 2 <sup>nd</sup> hand		1 <sup>st</sup> hand		t(47)	ES	1 <sup>st</sup> + 2 <sup>nd</sup> hand		1 <sup>st</sup> hand		t (47)	ES
	M	SD	M	SD		<i>d</i>	M	SD	M	SD		<i>d</i>
Posttest Score	<b>39.00</b>	1.85	<b>37.65</b>	2.60	1.28	0.598	<b>38.00</b>	3.35	<b>29.80</b>	2.68	<b>4.81***</b>	<b>2.704***</b>

\*\*\*  $p < .001$

Again, these findings provide support for the idea that obtaining both 1st and 2nd hand experiences in learning activity can eliminate the learning gap (with respect to L2 learning retention outcomes) between Easterners and Westerners. Therefore, the full DKE model indeed has its effectiveness on L2 learning and teaching.

Figure 2: Posttest scores of both groups between Easterners and Westerners

#### Qualitative data analysis

Since the qualitative data collected by the open-ended interview questionnaire, the researcher uses content analysis techniques suggested by Krippendorff (2004), Neuendorf (2002), and Weber (1990) to classify and explore the textual material to reduce it to more relevant, analyzable, and manageable data. With two raters analyzing the data, the inter-rater reliability is calculated. The Spearman's rank correlation coefficient  $\rho = .95$  (Student's  $t(47) = 20.86, p < .001$ ) indicated high degree of agreement among raters.

*Impact of DKE*

From our interview questionnaire, we have found that the 1st + 2nd hand group learners in general reported and stated positive feedback toward the learning activity with both first-hand and second-hand experiences. The 1st hand group learners, on the contrary, merely mentioned more about the lecture. The importance of the DKE model learning activity therefore is obvious.

*“Are there any things that impress you (that you remember the most) during the activity/lecture/ test? Why?”*

For example, when asked if there are any things that participants remember the most during the activity or lecture or test, many 1st + 2nd hand group participants mentioned the learning activity and its impact. Many have shown their deep processing of the information presented and come up with their possible pronunciation rules generated during learning activity. Examples of their mentioning the learning activity, the revelation of deeper processes, and the positive effects of the impact are: “I make assumptions first.” “Helpful because it gives you a chance to learn on your own, and if you are not able, it still helps you familiarize yourself with the material for learning portion.” “I was somehow able to predict what I would be studying in the activity.” “Pre-activity is self-exploration.” “[the pre-activity]...gives me confidence. It can also help me memorize the rules better.” There are also some other advantages of the DKE model instruction design, as one participant said, “I like the interacted way of learning another language....I have more positive emotion during learning.” Another said, “I enjoyed learning this lesson. Inspired me to want to learn Spanish.”

1st hand group participants mostly mentioned a certain pronunciation rule that they remember the most, multimedia-designed lecture, and other parts of the lecture, such as summary. One said, “The summary of the rules.” “...It organizes the rules, helping me memorize what I have learned.” Another mentioned the lecture, saying “The explanations of the rules of pronunciation.” Many stated in regard to multimedia interfaces and designs, “The PowerPoint is interesting.” “Pictures associated with words....makes me understand the meaning of the words.” “Pictures... it makes easier to figure out their meanings.” Though one 1st hand group participant stated, “I realized I always look for rules in language learning,” we should note that they still perform worse in posttest than 1st + 2<sup>nd</sup> hand group participants. We see the drawback of the emergence of the confusion of direct instruction without first developing 2nd hand experience in the learning activity time. One control group participant stated, “There are pronunciation examples [that] don’t fit the rule.” Another doubted, “Exceptions? Because the sounds didn’t reflect what was taught.”

*“Do you think the pre-activity [learning activity] is helpful or unhelpful for your learning? Why?”*

When the above question is asked, we get all positive answers from both groups. For example, some 1st + 2nd hand group participants said: “It’s helpful. Because I extract these rules by myself correctly, if any. I could memorize these rules easier through deep processing.” “Help myself to focus on the pronunciation difference.” “It’s helpful since I can find the rules by myself.” “Yes, a lot. If there weren’t the pre-activity [learning activity], I wouldn’t be able to pronounce the words. It forces me to memorize words in a short time.” “Yes. Let me use my way to interpret.” “I had to explore and figure out how to come up with the rules in the pre-activity [learning activity]. It helps when I go through learning in the lecture part... Learn how to categorize the pronunciation rules and that is considered useful for future learning. And the memory will last on by self-categorizing the rules.” “Yes! Made me more ready for the new information.” “It was helpful because it was like a quiz. A quiz helped me to feel curious about the correct pronunciation.” Even 1st hand group participants liked the learning activity. One said, “It’s a warm-up that helps me get prepared to learn.” Another said, “Listening and reading are helpful for learning.” Still another one said, “Help me say, speak a new word.” Yet, the 1st hand group participants’ responses mainly are about the benefit of the repetition of clicking, reading, and saying out loud those words presented in the learning activity.

*“For you, was there any benefit to creating the pronunciation rules before you went through the lecture?”*

To further probe the benefits and/or drawbacks of creating the pronunciation rules in pre-activity before learners go

through the lecture, we asked 1st + 2nd hand group participants if there was any benefit, or interfering effect on their experience of the lecture, to creating the pronunciation rules before they went through the lecture. We have found that all participants, except one, thought there were many positive benefits. One said, "I can guess and think first." The influence is significant in terms of deeper processing which leads to better retention: "Helping me to learn faster." "I was able to have a schema to sort out the rules in my mind beforehand." "I was able to test my hypothesis, and confirm my guess....Some of them was not right, but still it was impressive for me that I was able to memorize them well." "Let me think first.... Help me use my words to get the idea." Some participants mentioned the learning activity's benefit in attention. "It helped me listen and pay attention to the words without any instruction of rules." "It helps me focus on the pronunciation in the lecture learning part. And it deepens my memorization when I go through the later activities." In sum, 1st + 2nd hand group participants think it is beneficial to come up with their own rules first and have positive feedback toward the obtainment of both 1st and 2nd-hand experiences before the lecture. They said: "It kept the rules fresh in my memory. Since I had to write them down, I think I remembered them easier." "I feel I am better at self- learning now." "Learn from hearing before learning the rule." "Rules are to be remembered. It's easy to apply on new tasks, easier than 'remembering'."

#### *Impact of Multimedia*

The impact of multimedia-induced instruction is also evident. As mentioned above, many participants also mentioned their impressiveness of multimedia-conveyed information when asked the following question.

*Are there any things that impress you (that you remember the most) during the activity/ lecture/ test? Why?*

Many participants mentioned the PowerPoint's dual channel multimedia nature and its effectiveness of helping learners learn. "The PowerPoint is friendly using and helps us learn. I like to use it." "We learn language not from textbooks." "The rules are taught in a clear way, especially with the software....I can practice the pronunciation by clicking the word on the screen... Because that makes my learning more effective." Some also mentioned why the design of this multimedia-based PowerPoint instruction is effective. "Lecture is with various examples with pictures....the design helps long-term memory." "PPT well done." "Pretty pictures." "Cute pictures... Maybe because of the color." "The lecture... was clearly presented. It was presented in a logical way. So I was able to remember just a few key rules." "You can click the words to hear the sound." "They are interactive." "Combine real pronunciation in the text." In sum, benefits of multimedia-based instruction are its multimedia nature of dual channel stimulation (Mayer, 2001) as well as its influence on memorization of vocabularies in a new language, as one participants stated, "I liked the format- colorful and easy to use and .... I enjoyed learning it because it was a quick way to learn a few things about the language."

#### *Rule generated on rule sheet*

19 out of 24 1st + 2nd hand group participants (79.17 per cent) got all 3 correct rules generated in the learning activity. The 3 possible rules that could be generated were: Spanish *j* sound (/h/) and *g* sounds (/h/ and /g/). They also provided correct sample words from the 15 words provided on learning activity screen. Those who did not get all correct rules were either missed one to two of the pronunciation rules or failed to include correct sample words. The Spearman's rank correlation coefficient is small ( $\rho = .024$ ,  $p = .912$ ) for correct rules generated and their posttest scores. Therefore, there is no association between how many correct rules generated in the learning activity and their posttest scores. An example of correct rules generated is in Graph 3.

*Graph 3: Example of Correct Rules Generated on the Rule Sheet*

**Rule Sheet**

Rule	Example Worm
Spoke 1: 1" x 1/2" x 1/2" (1" x 1/2" x 1/2")	1" x 1/2" x 1/2" (1" x 1/2" x 1/2")
Spoke 2: 1" x 1/2" x 1/2" (1" x 1/2" x 1/2")	1" x 1/2" x 1/2" (1" x 1/2" x 1/2")
Spoke 3: 1" x 1/2" x 1/2" (1" x 1/2" x 1/2")	1" x 1/2" x 1/2" (1" x 1/2" x 1/2")
Spoke 4: 1" x 1/2" x 1/2" (1" x 1/2" x 1/2")	1" x 1/2" x 1/2" (1" x 1/2" x 1/2")

How many worms are in each container?

## DISCUSSION

### *Multimedia-induced instruction*

### Teacher's use of technology

There have been discussions about teachers' problems in using technologies to teach language learning (eg. Kinzer & Leu, 1997). This reveals the fact that teachers may lack of the ability to fully use some types of multimedia technologies (Maloch & Kinzer, 2006) and many of them are unfamiliar with, reluctant of, and even afraid of new technologies (Personal communication with Wen-Zao University President, Dr. Lee, Wen-Ruey, on Jan. 5th, 2007). Therefore, use of technologies for instruction should be carefully examined if teachers are to effectively use multimedia-based instruction and materials to help students obtain first- and second-hand experiences for better L2 learning.

### *Motivation for learner's acquisition of first- and second-hand experiences*

From participants' responses and feedback, we see multimedia-induced stimuli and instruction not only help learner with better perception and understanding, but also enhance learner's motivation of learning and their acquisition of first-hand and second-hand experiences. The finding is in line with Mayer's (2001) in that the stimuli from sounds, images, and other means of channels combined (such as haptic channel, tasting channel...etc.) motivate learners more than single-channel stimulus does. Therefore, how to effectively design the instruction by applying the multimedia principles (Mayer, 2001) to facilitate L2 learning will be a reasonable next research focus.

### *DKE model revisited*

### *The importance of DKE*

A critical aspect of first-hand experience is one's ability to perceive. One is ought to differentiate macro or micro things from one another by noticing the key features of their similarities and differences. By using DKE model, we create an environment of pre-activity where learners learn to perceive first to enhance their first-hand knowledge acquisition, so that students may be able to perceive the foci of points that teachers can or intend to guide students to perceive. Therefore, Schwartz et al. (2005) used a powerful approach to distinguishing contrasting cases to help with people's noticing ability. Learners may not be able to tell the differences at first when presented with contrasting cases, but with time and practice, they start to "notice the features that identify the original" (Schwartz et al., 2005, p. 21). Future development of contrasting cases in language learning deserves study and emphasis. As to the aspect of second-hand experience, one is ought to effectively generate, communicate, and memorize the symbolic rules. By using DKE model, we see that learners can come up with better retention results from the interaction of the stimulus of first-hand knowledge in learning activity. The design can encourage learners to develop more precise and complete second-hand description, and alert them to the importance of communicable knowledge. I argue that with carefully designed learning activity where first-hand experience is obtained along with second-hand experience, the learning process throughout the whole instruction will reach a deeper level of learner's cognition, understanding, and learning in L2 learning.

In terms of the importance of the use of both 1st-hand and 2nd-hand experiences, it is clear that learners need both, and it is just like teachers should provide both. Therefore, an instruction with carefully designed DKE model will certainly facilitate learning.

#### *The effect of pre-lecture activity for L2 instruction*

From this study, it is also clear that the well-designed pre-lecture activity (learning activity) has a powerful effect on L2 instruction. One insight from the study is the class time change for teachers. The East Asian language teachers' traditional method of repetition of vocabulary words, rules, or materials in preview or review sessions before lectures can be altered to be a vivid first-hand and second-hand experience provision session for students according to the DKE model. Meanwhile, with the implementation of DKE model in L2 learning, teachers can sit back and relax to observe the class dynamics and the development of learners' acquisition of these experiences during the session as students are perceiving, making actions, and communicating before the lecture part of the instruction.

#### *Cultural variation between Westerners and Easterners*

It appears that there exists cultural variation in the DKE model posttest results between Westerners and Easterners. Westerners seem to benefit more from the full DEK model. Thus, the study adds to the literature of cultural comparison studies in that Westerners and Easterners are indeed different in how they learn a L2 in a multimedia-induced instruction environment and maybe in how they face retention tests. The findings provide support for the idea that obtaining both first- and second- hand experiences in a designed pre-lecture learning activity can eliminate the possible learning gap (with respect to L2 learning and retention outcomes) between Easterners and Westerners. Therefore, the full DKE model has its effectiveness on L2 learning.

#### *Why did DKE work in L2 learning?*

The DKE model, from this study, basically provides a theoretical basis for L2 instruction using multimedia design. L2 learning, like other science learning in other domains, requires real understanding, deep information processing, and knowledge transferring construction. As Schwartz et al. (2005) suggested that the goal of DKE is "to unite the mechanisms of perceptual learning for developing first-hand knowledge with model building for developing second-hand knowledge" (p. 21), I argue that DKE model should definitely work in L2 learning since L2 learning also features the need of both first-hand experience and secondhand experience components. Language is for communication and thus the adaptation of language environment using the knowledge learned should certainly fit the DKE model's evolution assumptions.

Moreover, the goal of learning should not be merely finding the correlations or mappings between the two. Instead, it should be to seek "how the two forms of knowing can complement one another to make a more profound and multifaceted understanding" (Schwartz et al., 2005, p. 21). Therefore, the DKE model appears to be a promising framework that can integrate different forms of our knowing. It also provides a way for learners to get ready for future learning. As long as educators prepare the activities that help students perceive important aspects of L2 learning data along with the activities that encourage the development of different adjusting models (Schwartz et al., 2005), these activities can prepare learners for future learning.

## **CONCLUSION**

From the results of this study, it can be concluded that the implementation of the full DKE model with the acquisition of both first-hand experience and second-hand experience during the learning activity has yielded significantly higher posttest results than that with the acquisition of only first-hand experience. Specifically, obtaining both 1st and 2nd hand experiences in learning activity can eliminate the learning gap (with respect to L2 learning retention outcomes) between Easterners and Westerners. It is also found that the learning activity session of an instruction as well as the well-designed multimedia-based instruction are both important contributors to the effectiveness of L2 learning. This study provides evidence for supporting the full DKE model in multimedia-induced language learning and instruction environment. Apparently, the full-DKE model which consists of a learning activity session that allows learner's acquisition of both firsthand experience and second-hand experience lets learners process the information longer and deeper. And thus it makes learners learn more effectively in terms of retention results of the materials being learned.

After testing the DKE model in the domain of language learning, we also conclude that by implementing the DKE model, for a given time in a language learning environment, learners provided with both first-hand and second-hand experiences will get better learning results than those provided with only first-hand experience. Educators and learners should apply the DKE model to their L2 teaching and learning.

### **LIMITATIONS OF THE STUDY**

Not all forms of technologies are proper for language instruction. A study by Kinzer, Sherwood, and Loofbourrow (1989) showed that technologies using simulation software may not yield better retention results than expository texts for 5th grade children. There was a significant result in retention scores favoring the expository-text group. They proposed some possible disadvantages in computer simulation instruction, and they include: reading from computer screens and the difficulties of animation in computer simulations of knowledge acquisition for the children. We should therefore be aware of the future designs for DKE using technologies for certain target audience. As situated learning may be the next generation instructional tool and method for language, researchers have to further study and illustrate what types of technologies may be appropriate to help with the emergence of learner's 1st and 2nd hand experiences in language learning. Due to the limitation of time, the study was not able to be carried out over a longer period of time for more participants (for better power for more variables' investigation) and for better instrument and measurement development (eg. the inclusion of more contrasting cases in PowerPoint as stimuli in pre-lecture learning activity). Ideally, we are ought to recruit more participants for some other interesting variables' investigation and to carefully collect participants' retention transfer data after 2 weeks of the treatment. Also, we ought to design and develop pre-tested reliable and valid instrument and measure for the testing of DKE model. However, the statistically significant results undoubtedly encouraged us in believing in the model's influence in L2 learning.

### **FUTURE DIRECTIONS**

We can look at a group with only second-hand experience and compare all three treatment groups to see if the DKE model is indeed better for learning and to see if there are differences between the group that has only the first-hand experience and the group that has only the second-hand experience. However, from a cognitive learning perspective, providing only second-hand experience in the beginning of an instruction may not be appropriate as argued by many researchers (eg. Bransford et al., 1989; Bransford & Schwartz, 1999, ...etc.), especially before the first-hand experience.

Further exploration of the DKE model's transfer mechanisms and learners' usage of transferring knowledge in a new environment when they evolve their knowledge and skills will be beneficial to reveal DKE model's power of knowledge evolution. With the development of distant learning technologies (Leu & Kinzer, 2003), the application of DKE model for language learning in information and communication technologies (ICT) may be interesting to further investigate should we value the impact of multimedia learning in online learning environment.

Unlike mere scaffolding in which a successful one is measured through the performance of a task, DKE model in L2 can further prepare people to learn in the future because it offers mechanisms to aid "future learning and adaptation beyond the performance of the original task" (Schwartz et al., 2005, p. 18). Therefore, a better and more precise measure may be our next task as it will increase the validity of DKE model in L2 learning.

During our data collection, principal investigator and the trained graduate assistants have found that there exists this cultural variation in test taking and responding between westerners and easterners. After conducting analysis of variance, it appears that the DKE model is better for Westerners. One has to be cautious about interpreting the results. Would it be just the measurement issue (i.e. test design)? Or are there other reasons that lie behind for Easterners or Westerners? As some researchers (eg., Chen & Stevenson, 1995; Stevenson & Stigler, 1992) have argued that Easterners may be very good and well-trained test-takers, it should be interesting to see if Westerners and Easterners perform differently under the DKE model mainly because of their different test-taking attitudes, skills, and strategies.

To see if there are differences in cultural or language backgrounds, in the use of technologies, and in the interaction of applications of DKE, we will have to build on the study by having a more complex design of 2x2x2, more participants, and more refined instrument in the future.
