Obviously, the sole aim of literature classes is not to entertain the students, by providing amusing material for the class, but there are crucial objectives that must be fulfilled. Literature classes should boost the creativity of the students and lead them to appreciation of the literary concepts. There also must be certain objectives in teaching literature and the objectives have to embrace "development of knowledge of world of literature, practice in reaching and discussing creative work and introduction of literary concepts" (Muyskens, 1983, p. 413), as well as having this issue in mind that "techniques used in teaching literature must be interesting, in order to make the initial experience with literature pleasurable and material is a part of this" (p. 415). Not only the literary aspects of the text but the linguistic and educational aims are taken into account when a text is prepared for the class, "Typical goals for beginning and inter-mediate high school or college students may include the practice of language acquisition skills, practice in reading comprehension, and the stimulation of literary appreciation" (p. 415). This would ensure the pivotal objective of literature classes, in absorbing the attention of students who are primarily exposed to literary texts. However, there is another challenging task ahead of the literature teachers, preparing educational materials for the class.

Preparation for literature courses is always a hard task to do for the instructors, since this planning is never "cut off from the arbitrary external pressures of time, space, and money.... and the Academic calendar of the semester invariably shapes intellectual and pedagogical decisions" (Showalter, 2003, p. 42). Usually material preparation is mentioned very little in methods of teaching literature and literary texts are chosen, merely, for "linguistic and language skills" (Muyskens, 1983, p. 414). They may be divergent approaches for preparing materials for the class such as teaching from one's own "area of research specialization and making it a subset of research" or making teaching "an exploration for us and students" (Showalter, 2003, p. 45). In this method, teaching is not a static procedure, with fixed materials, but it converts into a literary expedition that engages students, as well as teachers. The outcome of this activity is the mutual interaction between the students and their instructor; it leads to a more fruitful educational goal.

According to Susanne Bock (1995), a suitable material for literature classes must have certain features, materials must,

Activate existing background knowledge (content schemata) by relating the content of the text to the students' own cultural experiences, encourage prediction. Predicting (allowing students to formulate hypotheses about the text before reading commences) is a further way of encouraging students to utilize what background information they possess and arousing their interest in the development of the story and Fill in background knowledge where it is missing through explicit presentation of the cultural, historical, and/or social context of the text (p. 155).

Among the materials which are widely used in literature classes, the anthologies seem to be the most popular form, for the instructors of literature classes. Their availability, canonicity and their adaptability to the semester format of the educational time, make anthologies the best choice as a teaching material. Although anthologies seem to be the best available material for literature classes as they prepare the students for the future standard examinations, by equipping them with the required knowledge of the course, the obstacles such as "cultural and linguistic deficiencies" may interfere with the maximum profit of the chosen materials. But the problem with the entire traditional and old style anthologist is that "they don't develop critical thinking, fostering passive acceptance of authority" (Mojica, 1997, p. 210). More than abolishing the active critical thinking of the students, the canonized anthologies would preserve the existing dominant social disciplines and marginalize the dissident voices. This opposes the true purpose of literature, in generating an unprejudiced world. According to historicists the problem with anthologies is that "teaching anthologies and histories of literature are instruments of indoctrination... preserving the structure and inequality of society" (208). As a result, a new teaching methodology must be defined that transcends the common conventional teaching patterns.

The next part of the research is devoted to finding and presenting some practical methods which could be used in literature classes where the literary competence of the students plays a crucial role, in students' appreciation of the text, in order to challenge the pre-existing methods of teaching literature based on the affiliations of schema theory and interpretive communities; this means using the multiple intelligences of the students and their diverse schema knowledge as a group, to create a more fruitful and flexible teaching strategy.

#### UTILIZING GROUP SCHEMA (COLLECTIVE SCHEMA) AND TEACHING STRATEGY

In moving toward a flexible syllabus in literature classes, the most important issue is to give the students the opportunity to be active, in the process of development of material for the class which will hopefully increase the motivation of the students, continuously, during the course. Giving space to students in preparation of the material does not mean to ignore the authority of the teacher; the teacher must move in a presumed direction to achieve the accepted standards and objectives of the class. Accepting to have a flexible curriculum means that the teachers must be willing to experience more flexible and modern policies of teaching, instead of applying traditional systems, by creating a good relation with students,

It should be clear by now that teachers' relationships with students are central to student learning. Becoming competent and caring mentors for a broad range of students, therefore, means developing specific skills and competencies for teaching... Teachers and prospective teachers, especially those who have not had extensive experience with students of diverse backgrounds, need to learn to understand human differences in order to tap into the intelligence and capacity of all students. This is a life-long journey, and professional development is a central component of the journey. (Neieto, 2010, p. 215)

Accordingly, in the contemporary multi-cultural societies, there is a demand for unprejudiced teaching materials, which would satisfy the diverse interests of the students, without offending them, racially, culturally and socially. To achieve this goal, a very accurate material planning must be designed, by employing the following steps:

-Primary Evaluation: The first step in a literature class is to consider the fact that the best time to evaluate the interests of the students in order to make a meaningful connection of those interests with the aims of the class is the first session. The teacher must try to give introduction to the subject in a well organized pattern to draw the attention of the students to the issues which are of great significance for

the progress of the course. This includes the objectives of the course, the desired frameworks of the course and the patterns of educational evaluation.

- Utilizing Multiple Intelligences: According to Gardner (1983), in "Frames of Mind", the notion of intelligence means: "human ability to solve problems or to make something that is valued in one or more culture" (p. 12) and this means no matter how a problem is solved, as long as individuals may find different solutions for that. Based on this assumption, Gardner names some types of intelligences such as musical, logical-mathematical, special, intrapersonal and interpersonal intelligences. It is also significant to consider that individuals may have different strength and talent in using their intelligences. According to Pool (2000) benefitting the Multiple Intelligences in the class will give the students a chance to "immerse themselves into the intelligence areas" and at the same time the teacher may experience a new technique of teaching where he/she could "cooperate with colleagues to develop a menu of appropriate strategies and secure resources for each intelligence"(12). To schedule the class based on the multiple intelligences concept means to respect the diverse discrepancies of the individuals' understandings and their unique cognitive ability. By considering the shared schemas of the students about certain fields of human knowledge, a fruitful teaching strategy could be planned.

-Multi-Dimensional Schedule: According to Nieto the syllabus of the course is usually prepared based on the official programs of the educational systems and usually presents a one dimensional program where the desires of students are neglected, "the curriculum in schools is at odds with the experiences, backgrounds, hopes, and wishes of many students. This is true of both the tangible curriculum as expressed through books, other materials, and the actual written curriculum guides, as well as in the less tangible and 'hidden' curriculum as seen in the bulletin boards, extracurricular activities, and messages given to students about their abilities and talents"(p. 166) . The teacher must remind the students that there is not going to be a rigid syllabus in the class and the significant points that will be covered are to be reviewed in the class. Afterward, the students are asked to find different ways to go through the important subjects, on their own way. Of course, the teacher must be an active monitoring agent in the class, by guiding the students toward the objectives of the class. Flexibility of the teacher in planning the syllabus is very crucial, in achieving the aims of the class.

-Group Construction: in this method, the teacher must divide the students to groups, according to their common interests based on their group schemas or their shared knowledge that they bring to the classroom. The teacher may group the students based on other forms of literary materials such as movies, plays, music or even a popular writer may serve as the basis of constructing a team, in the class. The more homogenous the groups are, the more challenging, the desired objective become. Of course, there may be some difficulties in classes where students may be of different age groups or belonging to different cultural, social or racial communities. Therefore, the Maximum profit of this method is gained in a racially, socially, culturally homogeneous groups. According to Nojournian,

One of the basic approaches to teaching literature is to develop and transform the individual appreciation to a group one. Experts in education call this process, the process of move from individual to collective response. Students are encouraged to share their views with others and they are supposed to discover that this will only deepen the level of understanding and appreciation of the text. (p. 128)

- Challenging the Pre-established Literary Canons: the most popular materials for teaching literature are anthologies which are divided into different canonized issues such as thematic, women's, ethnicities and focus anthologies. In this method of teaching, the most important aim of the teacher is to use anthologies as a supplement for the class activities instead of making it the dominant authority, in the class. The teacher may choose some of the materials from anthologies, but that does not mean that they should be the governing element of the teaching.

-An Active Participation of the Students in the Progress of the Course: the teacher may use other forms of arts such as painting, music, movies and plays in order to activate and deepen the literary knowledge of the students. Again the role of the teacher is not neglected in this method but the teacher acts as a mediator in transmitting the knowledge to the students. Using another form of art in relation with literature, may help the students to widen their knowledge of literature, as well as expanding their range of vocabulary in EFL literature classes. According to Tarakcioglu (2003), "students get familiarized with more and more vocabulary and structures as well as the variety of their applications in different situations. In this way, they gradually manage to express themselves, in a variety of ways articulately and appropriately" (p. 218). The instructor may select a literary material, depending on the subject of the course; it may be a poem, a play or a short story and ask different groups to find the other versions of that literary work. For example, the group who are in the music group may find the related piece of music which seems to be in close relation with the features of the text. The teacher and other students may observe the information that students have brought to the class, as their shared interest and knowledge; and then it is the time when teacher start to present his own lecture about the topic, in order to achieve the objectives of the class.

-Utilizing New Forms of Technology: nowadays, many educational institutions are equipped with high tech instruments; however, many developing countries lack the simplest educational facilities. Nonetheless, even the simplest computer- aided activities along with audiovisual and transparencies might be used in the class to facilitate, not only the process of increasing aesthetic knowledge of the students about the literature, but strengthen their listening and speaking skills, as well as improving their linguistic competency, through authentic material.

-Encouraging Critical Thinking in the Students: based on the postmodernist assumption about the subjectivity of interpretations and glorification of individualism in this theory, the teacher of the literature class must encourage students to express their feelings about the literary text, scrutinized in the class. The appropriate opportunity must be provided for the students to analyze the literary materials, based on their own understanding of literature; but of course, again it is the responsibility of the teacher to guide the students to the desired goals of the class. There are always preferred versions of literary appreciations that are advocated by specified social groups. It is teacher's duty to provide an explicit framework for the class, based on social paradigms. This would not imply the thorough agreement with dominant educational discipline. They would encourage students to contemplate on different issues of their societies, under the direct supervision of the instructor.

-Participation of Students in the Assessment Process: here, the students may have the opportunity to have an active share in assessment process. The teacher may prepare some questionnaires about each group's seminars and activities with relation to the students' area of interest. Each group which had the most approving scores (evaluated by providing more beneficial information to other students, having more common points with the literary texts that the teacher had supplied for the class and the capacity to deepen and sharpen the groups' schemas) would have a better chance to get the higher point. Of course some portion of the mark is attributed to the teacher's opinion about the students and their group work.

Whatever the targets of the class are, the educators have the responsibility to prepare students to live successful lives, by obtaining a chance of employment for financial self-support, competent participation in the community and contributions to society; to achieve this aim, a flexible method of teaching must be utilized.

## CONCLUSION

This research is an attempt to infuse two different theories, for enriching the teaching strategies in literature. By combining the schema theory and the notion of interpretive communities, the researcher wishes to introduce a new word, **Group Schema**, which means the collective knowledge that students bring to the class, in order to create more flexible teaching stratagems, in literature classes. Based on the schema theory, the meaning of a text resides not in the text solely but it is created by the interaction of the text and the prior knowledge that readers bring to the text, which is influenced by the social, cultural, racial background of the individuals, as well as their personal diversities. According to the concept of interpretive communities, the strategies of signification or construction of meaning is based on the collective reading policies of the society which is a dynamic process. In moving toward a flexible teaching strategy, there must be a constant evaluation of student's demands in the class, not to ignore the authority of the teacher, in guiding the students to the pre-assumed objectives of the class. On the whole, in this method of teaching, all the pre-established canons and traditional systems of teaching are challenged, in favor of a more flexible teaching strategy to formulate new versions of materials which are related to literature, like music and movies. This would result in creation of an enriched educational environment, under the monitor of the instructor.

## THE ATTITUDES OF EFL LEARNERS TOWARDS USING MIND MAPPING SOFTWARE ON THEIR READING COMPREHENSION

Mahsa Hariri

University of Guilan, Rasht, Iran

Email: mahsa.hariri@yahoo.com

### ABSTRACT

Nowadays, the technological developments are one of the inseparable parts of teaching especially in English language teaching programs. Reading as one of the important and purposeful macro skills of literacy is mainly based on the interaction of an active reader and the text in order to get the meaning (Alderson & Urquhart, 1984; Koda, 2005). And as many stated, the comprehension is the most important part of reading (e. g. Pressley, 2006). There are lots of modern devices which suits reading comprehension. Mind mapping softwares are among them. This study aimed to search the attitudes of 31 EFL female students towards the use of mind mapping softwares on reading comprehension activities. They were sophomore students of business management at Hakimian university, Bojnourd, Iran. The research was conducted through an attitude questionnaire and the data was analyzed by calculating the frequencies of the answers to these 17 questions in the Lickert type. The results showed that the participants' attitudes were significantly positive towards the use of mind mapping softwares on their reading activities in order to enhance comprehension. Most of them found them an interesting tool, although expressed that it is more difficult to design a mind map by software in comparison to its handmade designation. They emphasized on some of the advantages of software mind maps like sharing or even designing their mind maps with others via internet.

**KEYWORDS:** Attitudes, Mind Mapping Software, Reading Comprehension, Female Learners

### INTRODUCTION

In second language learning programs, reading English texts has a significant role. Reading can be regarded as especially important because it is assumed to be one of the central means for learning new information (Grabe & Stoller, 2001). It is one of the essential macro skills especially for students who study English as a part of their education and they might be required to read textbooks, carry out research, prepare reports, etc. Therefore, they need to comprehend successfully as well as to read effectively. Nowadays, the progress of the technology has made some changes in different aspects of our life and in education as a part of it. This technological development is extended to the ELT and particularly in the scope of reading comprehension, too. There are lots of reading strategies which governs by technological tools as computers, web, etc. Graphic organizers, concept map, and mind maps are among them.

When you want to express your ideas and concepts, you can demonstrate them visually in the form of a mind map (Buzan & Buzan, 1993; Wycoff, 1991). "A mind map is a colourful, visual form of note-taking that can be worked on by one person or a team of people. At its heart is a central idea or image. This is then explored by means of branches representing main ideas, which all connect to this central idea." (Buzan, 2004, p. 10). Actually the origins of mind mapping belongs to the note takings of some genius people like Da Vinci, Edison, Einstein and Michaelangelo, that were investigated by Buzan in 2003. In fact Tony Buzan involved with mind mapping strategy by studying the techniques they used in their notes; that it was a proven for the use of both halves of the brain by them that resulted some kind of creativity (Hofland, 2007).

The flexible links of mind maps, capacity of using images, colors, and lots of other useful options facilitate different actions as brainstorming, analyzing, comprehending, etc. One hundred uses of mind maps are mentioned by Congdon (2011), Foreman (2009), etc. There are two kinds of mind maps: hand-made mind maps and software mind maps. Thanks to the progress of technology, nowadays there is a chance to design mind maps by computers. Among the increasingly number of mind map software programs, we can mention some of them like, Free mind map, Buzan i mind map, personal brain, mind manager, x mind. It's a fact that there are some benefits of computer mind mapping over manual mind mapping. There are lots of quotations that state this superiority, but lots of them bode in cases like:

"However, the areas where computer Mind Mapping can offer a significant improvement to personal productivity are the areas of: automatic Mind Map generation; Mind Map editing; data storage; data retrieval; text input; and the organisation of data." (Buzan & Buzan, 1996, p.274).

The mind maps created by computer software are printable and you can make copies for the use of a group of people. It may occur most of times that when designing a mind map, you realize that it takes more space to complete it, so in manual working you are forced to redraw it in a bigger paper; but in the computer ones you can continue without any worry about its small size, because the computer can magnify the branches and sub-branches (it is known as Mega Mind Map) (Buzan & Buzan, 1996). It must be mentioned that you can also see the overall mind map simultaneously. In other words, they are macro and micro manager of the information. They also make the opportunity to draw the branches and sub-branches separately and then link them to the main theme which is located in the center. The computer mind maps are portable, so they have the ability to be used or edited by other soft wares. Drawing a mind map by aids of computers is faster than handmade ones, even with few tool requirement and they can be saved in computers with their vast memory capacity. It is clear that working with a computer, will make the opportunity of recoloring and repositioning the mind maps, as the mind map soft wares have a toolbar to control these options. They can also record the ideas that are produced spontaneously during brainstorming. Mind map soft wares are capable to receive the key words and to place them in central theme or sub-branches. Organizing and reorganizing information are important advantages of computer mind maps, as Buzan and Buzan (1996) mention:

"An integrated data organisation environment allows you to group files into directories, sub-directories and sub- sub directories, etc., enabling you to locate easily and with instant retrieval capability items from any category" (p. 277).

The recent computer mind maps do not give just one version of mind map for inputs, in fact they enable us with a variety of mind map forms for an indicate data. In other hand, their show is equipped with the mood of presentation in a 3D view to give more insight to audience. As Buzan and Buzan (1996) avouch for the appropriateness of using mind maps for the aim of lecturing as it makes a balance between spontaneous and fresh talk and the clear and well-structured one. It's certain that the computer made mind maps have the capacity of transferring via internet or share them online for the use of working purposes or group discussion. One of the superiorities of software mind maps that are provided by the aid of computers over hand writing mind maps is that when you want to design a mind map, you may study for many times after starting a mind map, so software mind maps give this chance to you to avoid rewriting while your information

increased in intervals. This editing process is available in the stage of editing the not precise structures and also the ideas that are located in not appropriate places.

#### **REVIEW OF THE RELATED LITERATURE**

A few numbers of studies have been devoted to incorporate the use of mind mapping soft wares in order to improve learners reading comprehension, and as we said, this study is an attempt to fill the gaps in this realm. Some of the past studies in this scope are presented below.

Kim and Kim (2012), in a study to find the educational outcomes of using digital mind maps in elementary level classes, perceived its positive effects for example in memorizing vocabularies and they also introduced mind mapping as a tool that suits with different learning styles. Benavides et al (2010), searched on the effects of mind mapping software on reading comprehension for the students of Bachelor degree in English attending reading and writing in English II course at Universidad de Oriente Univ, San Miguel. The data in this dissertation analyzed in three parts: contrastive analysis of students' assignments, questionnaire, and content analysis. The results in the first part showed that 17 students out of 25, had progress in visualizing skill and determining important skill. The results of questionnaire showed that 100% of the students considered the Mind Mapping Software as a good tool for the improvement of reading comprehension skill and as a technique to summarizing reading and to organize the ideas. And the last part indicated synthesizing skill is the highest and most complex form of comprehension.

Ellozy and Mostafa (2010), in an attempt searched to find the effects of using E-maps in developing critical reading skills of seventy first year Egyptian students who enrolled at the American University in Cairo. The results showed that the majority of the participants found it as an active tool to enhance critical thinking and its visualization feature led them to a better communication. In fact it improved their analytical and synthetic skills. Liu, Chen, and Chang (2010) studied the effect of computer-assisted concept mapping strategy on reading comprehension of EFL learners and the results showed that its positive effect appeared more in low-level students than the high-level ones. Also it showed that it increased the participants' use of other English reading strategies—listing, enforcing, and reviewing. Tucker, Armstrong, and Massad (2009) in a survey discovered that 41 percent of respondents in business use either hand-drawn maps or mind mapping software. Their results indicated that in education 43 percent (about 75 percent of it is related to female and about 25 percent to male), in government 10 percent, and in other sectors it is 0.06. Ruffini (2008), tried to test the effects of using e- maps to organize and navigate the online content of twelve students and finally reached to the positive effects. Bidarra, Guimarães, and Kommers (2000), in a study on mind mapping and the creation of Hyperscapes, found that they can give learners control over multimedia materials and improve motivation.

#### **RESEARCH QUESTIONS**

The purpose of this study is to shed light on the attitudes of Iranian EFL learners towards the use of mind mapping software on their reading comprehension. In other words, this study attempts to find answers to the following research question:

1. What are the attitudes of Iranian female EFL learners towards using mind mapping software as a tool to improve their reading comprehension?

#### **METHODOLOGY**

In order to find the purpose of this study which aimed to investigate students' attitudes towards using mind mapping software while reading comprehension, the quantitative data of the participants were gathered through a questionnaire.

##### ***Participants***

The participants of this study were 31 female students of business management at Hakimian University of Bojnourd, Iran. They were participating in general English course as their compulsory one. It must be mentioned that these students passed the pre-university general English in their previous semester and they are familiar with mind maps and how to use them in comprehending reading text since they have been taught to use mind maps and have used them for 16 sessions in their last semester. The general English semester lasted two hours per week for 16 weeks and this is their second semester they participating in the university. Their ages ranged from 18 to 23 and we selected just female students as the limitation in the number of male students in this university and in this field of study forced us.

##### ***Instruments***

As mentioned before, the quantitative data of this study was collected through an attitude questionnaire. The questionnaire was composed of 17 questions in relation to the use of software mind maps in reading comprehension activities. The questions are close-ended and the responses are based on 4-point Likert scale, that 1 stands for "strongly agree", 2 for "agree", 3 for "disagree", and 4 for "strongly disagree". The questionnaire was designed by the researcher with some inspirations from the questionnaire prepared by Hariri and Tahriri (2013) and studied by another EFL instructor of university to be confirmed. Also the questionnaire was piloted on another group of 15 students in the same university and with the same field of study to be informed of the possible problems and to correct them. It must be mentioned the participants were familiar with mind mapping, especially hand-made ones from their last semester but at the number of treatment sessions in this semester for using mind map soft wares were 14 sessions and in each session 15 minutes were allocated to it. In this treatment period, the students got familiar with mind map soft wares and cooperated to do it in the class for the reading texts of their course book. The main textbook that was considered for this semester was "Inside Reading 2" (intermediate) by Lawrence, Zimmerman, and Zimmerman (2012). They also tried designing mind maps by their own computers out of the class in the home.

##### ***Procedure***

The rational for selecting these participants was based on the fact that the researcher was the teacher of this class in the current and previous semester and they practiced mind maps in their last semester as an extra activity for each session. So, there was no need to introduce mind maps to them as they were familiar to it from their last semester. The data gathered by the researcher herself as the teacher of this class. It must be mentioned that the participants taking part in the study were aware of the intentions of the study and were guaranteed that their responses did not have any effect on their course score.

##### ***Data Analysis***

After the data from the questionnaire were gathered, they were analyzed by determining the frequency for each of the questionnaire's

questions. At the end, the results were presented in the form of table too.

## RESULTS AND DISCUSSIONS

As we said, the answers of the questionnaire were based on the Likert scales, these answers are showed in Table 1 below:

*Table 1: Students' Responses to Attitudes Items about the Use of Mind Map Software in Reading Comprehension*

Items	Students' Responses							
	1 Strongly Agree		2 Agree		3 Strongly Disagree		4 Disagree	
	F	%	F	%	F	%	F	%
1	2	10%	6	30%	3	15%	9	45%
2	4	20%	11	55%	3	15%	2	10%
3	6	30%	10	50%	3	15%	1	5%
4	4	20%	10	50%	2	10%	4	20%
5	5	25%	8	40%	3	15%	4	20%
6	0	0%	3	15%	7	35%	10	50%
7	5	25%	10	50%	1	5%	4	20%
8	4	20%	12	60%	1	5%	3	15%
9	4	20%	13	65%	1	5%	2	10%
10	4	20%	5	25%	4	20%	7	35%
11	5	25%	3	15%	5	25%	6	30%
12	6	30%	7	35%	2	10%	4	20%
13	5	25%	6	30%	3	15%	6	30%
14	6	30%	10	50%	2	10%	2	10%
15	5	25%	10	50%	2	10%	3	15%
16	3	15%	4	20%	5	25%	8	40%
17	4	20%	10	50%	3	15%	3	15%

According to the early questions of the questionnaire, most of the participants indicated that software mind maps are more interesting than handmade ones but both of them help the learners in their reading comprehension. They said that training how to mind map by a software needs lots of training and special courses. Most of them mentioned some superior characteristics of software mind mapping on handmade ones (item 12), as sharing knowledge of a reading passage along peoples along world (item 4), or communicating with other students (item 13). They consider it as a new way of working on reading comprehension and most of them were disagree that using mind maps in reading comprehension is a waste of time and few of them felt isolated when practicing reading by mind map soft wares. Half of them in item 10 expressed that mind map soft wares are complicated to use but the rest were disagree, as in the item 11, half of them were not the type to use soft wares. Most of the participants (80%), stated that they are pleased to use mind map soft wares for their reading comprehension in the future especially at their own homes. But most of them considered the designation of a mind map by soft ware more difficult than its handmade one (item 16) but it is more useful for solving the post-reading questions (item 17).

As we mentioned earlier, there are few studies conducted to investigate the role of mind map softwares on the students reading comprehension, but the findings of this research is in line with the results of some of the studies mentioned in the literature review as Benavides et al (2010) who expressed the positive role of mind map soft wares in summarizing, organizing and summarizing a reading passage which help increasing the comprehension. Also it is in line with Liu, Chen, and Chang's (2010) study that proved mind map softwares had positive effects on low-level EFL learners. This study also reached to some further information about the attitudes of the participants towards paper made mind maps and software mind maps that they stated although the mind maps designed by a software are more interesting than the handmade mind maps, but it needs to be instructed in order to design a mind map with a software.

## CONCLUSION

The present study aimed at examining the attitudes of 31 EFL female university students that their proficiency level was mainly elementary towards the use of mind map softwares on their reading to improve their comprehension. Due to the approximately positive conclusions of the study, it may be premature to state that there is significant attitudes of these university EFL learners towards using mindmapping softwares in the reading comprehension. Most of the participants said that they enjoyed using mind map softwares and they will use it in the future but it needs some instruction to gain a good command of it. Nevertheless, further research replicating this study should be carried out in the future to conclusively determine the authenticity of such relationship. One of the limitation for doing this study was the use of computers to work with mind maps in the class by the participants, and as in that university there were no facility for this issue to prepare computers for each student and all the students were not able to have personal laptops and bring them to the class, so the researcher used her personal laptop and showed the content via a projector.

## APPENDIX

### Questionnaire of Learner's Attitudes towards Using Mind Map Software in Reading Comprehension

Age: .....

Instruction: Please read the following questions and choose one answer from strongly agree (1) to strongly disagree (4).

**strongly agree      agree      disagree      strongly disagree**  
**1                      2                      3                      4**

No.	ITEM
1	The mind map soft wares are more interesting than the handmade ones.
2	I need do a lot of training in a course which uses mind mapping software to understand how to use them.
3	Mind maps (whether soft wares or handmade) help me to have better reading comprehension.
4	I enjoy sharing my knowledge of a reading passage with peoples all around the world via mind maps software.
5	As a new way of reading, I think mind-mapping soft wares are interesting.
6	Using mind map software in a reading process is a waste of time.
7	Mind map soft wares provide me with learning opportunities that I have never tried before in usual reading classes.
8	I felt isolated when I participated in a course using mind map soft wares.
9	It is easier for me to comprehend what I've read through mind map soft wares than without them.
10	The mind map soft wares are complicated to use.
11	I am not the type to do well with soft wares.
12	There are lots of advantages in designing a mind map by software than handmade.
13	Software mind maps are more suitable to communicate more with other students than the handmade ones.
14	In the future, do not want to use mind map soft wares.
15	I would like to be able to use mind map soft wares at home.
16	Designing a software mind map is easier than its handmade one.
17	When I use mind map soft wares for a reading passage, I'm more able to solve post-reading activities.

## ON THE EFFECT OF ASSESSING THREE KINDS OF FORM-FOCUSED INSTRUCTION ON EFL LEARNER'S ACADEMIC ACHIEVEMENT

Seyyed Ayatollah Razmjoo, Ph.D  
*Shiraz University*

Moslem Sadeghi, Ph.D Candiadte  
*Shiraz University*

### ABSTRACT

This study investigates the nature of three types of focus on form in three communicative classrooms on English as a Foreign Language milieu. The study was conducted with intermediate participants in a private language institute in Bandar Abass, Iran. Based on a mixed method, containing both quantitative and qualitative data collection and analysis, the effectiveness of input-enhancement, dictogloss, and consciousness-raising was traced through a pre-test-post-test design and a two-week classroom observation. SPSS analysis revealed input enhancement and consciousness-raising had significant effects on the gain scores of two groups. The study also showed that there was more viable teacher-learner interaction involving "use of preposition" in consciousness-raising than the two other tasks. The study suggested that Iranian EFL learners could benefit more from consciousness-raising task if appropriately incorporated into classroom activity.

**KEYWORDS:** Task-based instruction, Form-focused instruction, Input enhancement, Dictogloss, Consciousness-raising

### INTRODUCTION

In recent years, the tendency toward task-based instruction has increased. Task-based instruction has been recommended as a way forward in English Language Teaching. Ellis (2003) believes that "task-based instruction (TBI), as an offspring of the strong version of communicative language teaching, with an emphasis on meaning over form, fluency over accuracy, experiential approach over analytic one, has been glorified, denigrated, proscribed and prescribed quite furiously by different perspectives. The immediate mastery over authentic language use, attainment of communicative competence and performance, numerous supportive evidence from Second Language Acquisition theories, all in all seem to herald a new panacea to the ailment of language learning". Focus-on-form instruction in second language teaching is defined by Long (1991, pp. 45–46) as an attempt that "overtly draws students' attention to linguistic elements as they arise incidentally in lessons whose overriding focus is on meaning or communication". This definition of focus-on-form is in line with Spada (1997) of the concept of form-focused instruction (FFI) in which FFI refers to "pedagogical events which occur within meaning-based approaches to L2 instruction but in which a focus on language is provided in either spontaneous or predetermined ways". This new approach encourages learner to acquire communicative and grammatical knowledge. So, FFI or focus-on-form deals with any pedagogical effort which is performed to draw learner attention to form either explicitly or implicitly.

#### *Statement of the Problem*

TBI, however, has confronted many criticisms in its own turn. One of the most critical issue that has been pointed to, is the role of "grammar instruction". TBI, in stark contrast to task-supported instruction based on the Cognitivist Approach, is heavily grounded in Implicit Learning Model, based on Interactionist view. Although the latter is predominated theory-wise, in practice it failed to account for various aspects of language learning, such as: development of linguistic competence and accuracy, lack of idiomaticity or sociocultural appropriateness, and the hazard of fossilization that may induce a false, pidginized glib. FFI is proposed as a viable solution to compensate these deficiencies. At the heart of FFI is the "focused task", a task which is designed to induce learners to process or produce a linguistic form. This approach should not be confounded with traditional approach to grammar, in which the teaching of grammar was equated with "forms only" in an isolated, decontextualized and artificial manner to memorize grammatical forms, devoid of any meaning, through controlled drills and exercises such as: repetition and substitution. On the other hand, FFI is meaning-oriented and endeavours to draw learners conscious or subconscious attention into grammatical points while they are engaged in negotiation of meaning to achieve a communicative purpose. In this way, input can promote both meaningful interaction and acquisition of salient linguistic forms.

#### *Theoretical Framework*

As it is claimed the most prevalent and valid conceptualization of FFI in SLA research realizes at three levels:

- 1- Proactive conceptualization at syllabus design level (Williams & Doughty, 1998),
- 2- Reactive conceptualization at methodological process level (Long & Robinson, 1998),
- 3- Postactive conceptualization or after-task-completion (Skehan & Foster, 2005).

At the level of syllabus, 'task' could be designed in such a way that incorporates a specific linguistic structure. Structure-based communication task is a focused task that can be implemented through task-naturalness, task-utility and task-essentialness (Loschky & Bley-Vroman, 1993). Comprehension or interpretation task is another important alternative in FFI. At the level of methodology, FFI could be performed either implicitly (e.g. recasting and clarification) or explicitly (through metalinguistic comment, query). Postactive FFI aims to observe and identify learners error and diagnose them either through direct correction or indirect, delayed feedback.

The current study concentrated on the second level of FFI namely, 'reactive conceptualization at methodological process level' in which three kinds of presented task were performed explicitly or implicitly. Teachers involved in this study provided different tasks at this level of focus on form which were focused on 'preposition'. For instance, the first group of learners was benefited from comprehension activities by focusing on the input in input enhancement task. The second group was benefited from production activities by concentrating on the output in dictogloss task (by reconstructing the text as closely as possible to the original version in a collaborative work). The last task made a language point the topic of language and raised the explicit attention of learners to the form in consciousness-raising task. So, in all of these tasks learners implicitly or explicitly concentrated on form and exchanging of information for obtaining meaning or communication purposes.

### LITERATURE REVIEW

We begin our overview of task-based instruction with the two most prevalent and well accepted definitions of a 'task' provided by Ellis and Nunan. Ellis (2006) defines task in the following way: "A task is a work-plan that requires learners to process language pragmatically in order to achieve an outcome that can be evaluated in terms of whether the correct or appropriate propositional content has been conveyed. To this end, it requires them to give primary attention to meaning and to make use of their own linguistic resources, although the design of the task may predispose them to choose particular forms. A task is intended to result in language use that bears a resemblance, direct or indirect, to the way language is used in the real world. Like other language activities, a task can engage productive or receptive, and oral or

written skills and also various cognitive processes". Nunan (2006) believes that "a task is a piece of classroom work that involves learners in comprehending, manipulating, producing or interacting in the target language while their attention is focused on mobilizing their grammatical knowledge in order to express meaning, and in which the intention is to convey meaning rather than to manipulate form".

Most of the studies carried on the task investigated the effectiveness of focus-on-form instruction in three kinds of task namely, input enhancement, dictogloss, and consciousness-raising. A number of research studies investigated the effect of input enhancement on noticing and language acquisition. For example, Jourdenais et al. (as cited in Ellis, 2003) used a think-aloud procedure to determine whether the highlighting of target forms would affect learners' on-line processing of forms, found that the think-aloud protocols of students exposed to enhanced text contained significantly more episodes related to the target forms than the group who did not have enhanced texts.

In dealing with 'dictogloss', Swain and Lapkin (as cited in Fotos & Nassaji, 2011) compared Grade 8 French immersion student's performance of an information gap task involving a picture-story and dictogloss task where they first listened to the story and took the notes before attempting to reconstruct it. They predicted that because the dictogloss task afforded the learners a linguistically-encoded content, they would have more time to attend to form (a corollary of accuracy) than in the information gap task where the information was supplied pictorially and thus had to be encoded linguistically by the learners. However, there were no statistically significant differences in the frequency of 'language-related episodes'. On the other studies relating to dictogloss, Kowal and Swain (as cited in Ellis, 2003) found that Grade 8 French immersion students both noticed and produced exemplars of the present tense when working in pairs to reconstruct a text that had been devised to practice this structure.

The last pieces of research studies pertains to the consciousness-raising (CR) tasks which were conducted by Ellis and Fotos (as cited in Ellis, 2003) to examine whether the grammatical understanding that resulted from learners performing a CR task was as good as that resulting from traditional grammatical explanations provided by a teacher showed that the CR tasks used in this study led to a good understanding of the target grammar points and resulted in plentiful meaning negotiation. On the other study, Sheen (as cited in Fotos & Nassaji, 2011) compared direct and indirect consciousness-raising in a six-week beginners' French course for Japanese students, reporting that students in the two groups did equally well in written post-test of the structures taught.

One of the Researches which examined the effect of task repetition on learning enhancement in EFL learners was conducted by Ahmadian. Ahmadian (2012) considered the significance of repetition of the same or slightly altered tasks at intervals. He considered how teachers might develop the pre-, while-, and post-task phases of lessons. He ultimately found that instead of focusing upon the performance of tasks in isolation, the concept of task repetition moves the focus of debate clearly towards the pedagogic use of tasks within lessons.

#### **OBJECTIVES OF THE STUDY**

This study examined the effectiveness of focus-on-form instruction in three kinds of task (input enhancement, dictogloss, and consciousness-raising) at methodological process level. Thus, this study investigated three groups of EFL learners who dealt with three different kinds of task to focus on form adopted in classroom. "Preposition" used for the form in focus since most of EFL learners encountered with different problems in accurate use of prepositions due to their low saliency and insensitivity of learners.

#### **SIGNIFICANCE OF THE STUDY**

In recent years, language teaching and learning have trends toward communication dimension of language via focus on form. This kind of focus as an active and meaning-based to language teaching and language learning. Various researchs and studies were conducted in EFL milieu concerning the effect and nature of explicit and implicit focus on form. It is one of the concern of EFL teachers that how much learners' attention is directed to communication by focusing on form. As Sheen (2003) points out that "the debate revolve around the degree to which teachers need to direct learners' attention to understanding grammar whilst retaining a focus on the need to communicate".

#### **RESEARCH QUESTIONS**

This study sought to find the answer for the following questions:

- a) Do different types of focus-on-form have different effects on EFL learner's academic achievement?
- b) Which type of focus on form affects students' use of English preposition the most ?

#### **METHODOLOGY**

This study conducted through a mixed method. The choice of the methodology was mainly in line with Ellis' (2003) recommendation for research on tasks: "FFI studies could be examples of hybrid research, or a combination of confirmatory and interpretive paradigm". Such a procedure added more to the depth and credibility of the results. Thus, this study was carried out in two phases: a quantitative phase followed by a qualitative one. Data were collected and analyzed through both perspectives. The quantitative phase involved administration a pre-test-post-test design. At first, a pre-test administered to capture pre-existing differences among groups and to make them statistically equivalent from the outset. Later on, two weeks of instruction based on FFI were followed. At the end of intended instruction post-tests administered to measure any changes in the learner's accurate usage of preposition (gain score) which in turns indicated the effectiveness of instruction. The second phase, a qualitative data collection, involved classroom observation and note-taking in order to address the second research question, which mainly aimed at revealing if three different types of tasks would lead to more meaningful interaction containing using prepositions or not.

#### **Participants**

This study drew on convenient sampling. The researchers used the available sample at an institute in Bandar Abbas, Iran. Although this type of sampling is the weakest or the least desirable type of sampling but as Miles and Huberman (as cited in Dorney, 2007) claim that "convenient sampling is the most common sampling strategy, at least at the postgraduate research level. It is not purposive but largely practical: the researcher uses those who are available". Three major groups (classroom) of learners, who were studying at the same levels, *intermediate level or Real course* at level 8, were chosen for this study. Thirty-five participants (two groups each with 12 participants and one group with 11 participants) participated in this study. They studied at three different classes with three different teachers (each of teachers had more than three years teaching experience in language institute) although all of the participants were at the same level (8) and studied the same textbook (Real). Then, three different tasks (input enhancement, dictogloss, and consciousness-raising) were allocated for three groups (each class or group was allocated one task).

### Materials

Tasks were the core material for this study. Three kinds of task were considered: input enhancement, dictogloss, and consciousness-raising. These tasks were extracted from textbook under the instruction. The textbook used for this course was *Real* (Craven, 2008). This book has communicative themes realting to social, travel, work, study, and etc.

Input enhancement involves "typological enhancement of input to draw learners incidental attention to salient features of target language that may be left unnoticed otherwise" (Fotos & Nassaji, 2011). Here, the teacher provided a short text in which prepositions were bolded and learners were exposed to 'bold prepositions' (e.g. appendix C, task 1). The second group was benefited from dictogloss. As Nassaji (1999) explains dictogloss as a technique in which "the teacher reads a short text twice and at a normal speed to group of students. The students are instructed to listen very carefully and to write down as such information as they can as they listen to the story. When the reading is finished, the students are divided into small groups and are asked to use their resources to reconstruct the text as closely as possible to the original version. Finally, the students are asked to compare and analyze the different versions they have produced". So, in this study, the teacher read a short text (e.g. appendix C, task 2) for learners twice at a normal speed. The learners listened carefully and took notes, e.g some key phrases. Then, they reconstructed the story later. Here, the aim was to test whether the learners could product "preposition" accurately or not.

The last group was benefited from the instruction of consciousness-raising task. Consciousness-raising (C-R), as an explicit focused task with linguistic content, required learners to use their metalingual ability to move beyond semantic processing to syntactic processing through negotiation of form. As Ellis (2003) mentions that "C-R tasks seem to be an effective means of achieving a focus on form while at the same time affording opportunities to communicate". In this group, learners should concentrate explicitly on the preposition on the text which was provided by the teacher. For instance one of the task implemented in the class by learners presented in appendix C, task 3 in which learners should underline time preposition on the text firstly and then write the time phrase in the provided table.

### Instruments

Tests constituted the main instruments for this study. A pre-test (appendix A) administered at the beginning of the research constructed based on a focus on different usages of prepositions. This test was extracted from the book of *Grammar in Use* (Murphy & Smalzer, 2009) and given to three teachers who cooperated in this study in order to judge whether it was at the level of student or not. In order to have a more reliable test, it was administered to the similar group of students (studied at level 8 of *Real* course) before the beginning of the study. Post-test (appendix B) was another instrument followed the same format and from the same mentioned resource although the questions were different. Observation of the researchers during classroom constituted another instrument for gathering in-situ data. Lincoln and Guba (as cited in Aray, Jacobs, & Sorenson, 2010, p 424) introduced the concept of human as instrument to emphasize the unique role that qualitative researchers play in their inquiry.

### Procedures for Data Collection and Data Analysis

Data were triangulated through classroom observation and field note-taking of interaction between teacher-student, and two tests (pre-test, post-test). Three instructors administered the pre-test on the same day and allocated the same amount of time for students at the beginning of the study. Pre-test included 15 blanks and each correct answer received one positive score total of 15 scores. Researcher spent eighteen session of class observation (six sessions for each teacher) which lasted ninety minutes for each session. Although the teachers followed a set routine of communicative instruction in their classes, some of the times of the classes were allocated to dealing with provided tasks (focusing on form) through communication. During classroom observation, the researchers endeavored to capture as many relevant teacher performances as possible, including their use of materials, classroom management in interaction with students.

Data were transcribed and codified. A post test was administered by three instructors after two weeks instruction and the criterion for scoring procedure was the same as pre-test. Mean scores were calculated for correct and wrong use of form for each of the task for pre-test and post-test separately. The researcher compared mean scores of each group in the form of paired t-test in pre-test and post-test to obtain the amount of progress in learning for each group. The level of significant was pre-set to .05 ( $p < .05$ ). Percentages for learning gains (progress from pre to post-test) were calculated for each kind of tasks.

## RESULTS AND DISCUSSION

This section involves findings from both phases of research. First, the quantitative phase is examined. Findings from the current study indicated that two tasks out of three tasks which focused on form affected on EFL learners academic achievement. Table 1 shows that learners had progress from pre- to post-test (learning gains) for input enhancement.

Table 1: Learning gains from pre to post-test for Input Enhancement

Input enhancement	N	Mean/15	SD	SEM	t	p
Pre-test	12	8.41	2.50	0.722	4.213	0.001
Post-test	12	11.16	2.20	0.637		

As indicated in 'table 1', the learners' mean, which was only 8.41 out of 15 on the pre-test, increased to 11.16 out of 15 on the post-test. The learning gain from pre- to post-tests is highly significant ( $t = 4.213$ ,  $p < 0.001$ ); it indicates that students made impressive progress on this task from pre- to post-tests as a result of FFI (instruction of input enhancement).

Results from dictogloss task indicated (table 2) that learners had less or no progress from pre-to-post test.

Table2: Learning gains from pre to post-test for Dictogloss

Dictogloss	N	Mean/15	SD	SEM	t	p
Pre-test	12	8.50	2.57	0.743	0.484	0.638
Post-test	12	8.75	2.38	0.689		

As illustrated in 'table 2'. The learners' mean, which was 8.50 out of 15 on the pre-test, increased to 8.75 out of 15 on the post-test. The learning gains from pre- to post-tests are less or no significant ( $t = 0.484$ , and  $0.638 < p$ ); it indicates that students had less or no progress on this task from pre- to post-tests as a result of the instruction of dictogloss task. The learning gains made from pre- to post-test for consciousness-raising task as they are presented in 'table 3' showed that learners had highly progress in this kind of task.

*Table 3: Learning gains from pre to post-test for Consciousness-raising*

Consciousness-raising	N	Mean/15	SD	SEM	t	p
Pre-test	11	8.36	3.10	0.936	4.737	0.001
Post-test	11	12.27	2.72	0.821		

Table 3 indicated that the learners' mean, which was only 8.36 out of 15 on the pre-test, increased to 12.27 out of 15 on the post-test. The learning gain from pre- to post-tests is highly significant ( $t = 4.737$ ,  $p < 0.001$ ); it shows that students made impressive progress on this task from pre- to post-tests as a result of the instruction of consciousness-raising task.

The researchers observed two weeks of classroom instruction. The main goal of this phase was to examine which type of focus on form (FOF) motivated more opportunities for learners to use preposition. Below, there are three examples taken through filed-noting during classroom observation. They also revealed the type of classroom interactions between teachers and learners.

*Example on: Input enhancement*

Attention may be drawn to a target form via typographical means such as underlining, color-coding, or bolding target structures that appear within a meaningful setting. For instance, in this study the teacher administers a text contains some bolded items (preposition). He asks his students to first read the text individually. Later he asks them to be paired and look more carefully at the bolded items. There is some discussion between students (student-student interaction). Teacher adds more explanations on the board and gives some oral examples.

\_Teacher (to the class): do you understand it?

\_Class: YES!

In another situation, the teacher brings a picture to the class. By using picture, teacher wants to learn using the correct form of "preposition" for *directions*. He writes every preposition with different color beside each picture. He addresses to students:

\_Teacher: Look! *On* (blue color) the left is kitchen.... and *on* (blue color) the right is the dining room. There is bathroom just *at* (red color) the top of the stairs and living room here just *at* (red color) the bottom of stairs. *Opposite* (yellow color) to our room is Abigail's room and *next to* (green color) Abigail's is your room.

\_Student: Excuse me! Use *on* for top and right and *at* for bottom and left.

\_Teacher: Pay attention to color...

\_Student: Pardon me! You mean we use *on* for the left and right directions because you use the same blue color and *at* for the top and bottom because you use the same red color.....

\_Teacher: Right! You got it.

Although some understanding-checking questions popped up during the instruction, examples of initiation or use of preposition by the learners were rarely observed in this classroom.

*Example two: Dictogloss*

In the beginning of the class, teacher and students review some points related to the previous lesson. Then, the teacher informs students that they are going to have a new classroom activity.

He presents oral introduction and make students understand what they are going to learn in this lesson. After that, He reads the provided text for students loudly with a normal speed twice.

T: We'll have a dictation, a new one. I'll read a text aloud and omit some parts of it, the preposition. You have to write the correct prepositions while you are writing the text.

Teacher divides students in four groups (each group contains three students) and requests students to cooperate with each other. He only observes discussion of the students for reconstructing the text and finding the correct preposition. At the end, students try to sort every part of the text in the separate sentence.

\_Students: We find appropriate prepositions and separate each sentence.

\_Teacher: Good! I'll explain them on the board.

After the dictogloss, the teacher turns to the board and organizes them in categories and adds more explanation (Teacher-whole class interaction).

*Example three: consciousness-raising*

The pedagogical grammar hypothesis and its consciousness-raising techniques are the undeniable forefathers of focus-on-form theory and techniques. Rutherford and Sharwood Smith (1988) define consciousness-raising as "the deliberate attempt to draw the learner's attention specifically to the formal properties of the target language" (as cited in Gascoigne, 2001).

For performing consciousness-raising task in the current study, the teacher asks learners to work in pair. He gives them a text followed by a table. The students are asked to read the text and organize the prepositions in the pre-made table. Then the teacher asks every pair to read one of the examples and explain if it's a time preposition, place preposition or other types.

\_Student A: "*On*" Thursday, 24<sup>th</sup> May, but we say "*in*" June?

\_Teacher: great! And why?

\_Student A: well.....we use "*in*" for months?

\_Teacher: Good! And?

\_Students: but for time, sorry date (?), we should use "*on*"

\_Teacher: can you give me an example about your own birthday?

\_Students: I was born on April 23d, 1987? But, I was born in April

\_Teacher: yeah!

In another situation, students discuss about a subject. Teacher goes near to them.

\_Teacher: What's the matter?

\_Students: We have a discussion about using the right preposition for university.

\_Teacher: and did you reach an agreement?

\_Students: Which one *on*, *at*, or *in* can we use with university?

\_Teacher: Do you study at Azad university (Student A)?

\_Student A: Yes

\_Teacher: How about you, do you study at Azad university or at Payame-noor university (Student B)?

\_Students: Thanks. We got it. We must use *at*.

\_Teacher: So, would you like to continue our discussion about other prepositions such as...

Pertaining to consciousness-raising task, the teacher tried to develop students basic abilities to understand what they listen to or read and to convey information, knowledge, and ideas by actively interacting with the students and creating positive attitude toward communication through dealing with everyday's life matters. It could be observed that learners were more prone to initiate and use preposition while working with consciousness-raising task.

### Discussion

The discussion section is devoted mainly to summarize and discuss the results obtained from the effect of three kinds of task on EFL learners' academic achievement. The researchers considered this question that do different types of focus-on-form have different effects on EFL learner's academic achievement? They examined the results of the study and realized that the learners who were benefited from two types of task instruction pertaining to input enhancement and consciousness-raising had better progress in their learning. According to the results, students made significantly fewer errors on the post-test than on the pre-test for each of these tasks. For supporting this claim, results obtained from pre-test showed that in pre-test about 56% of participants in input enhancement, 56.6% of participants in dictogloss, and 55.7% of participants in consciousness-raising correctly answered the questions pertaining to prepositions, while these results for post-test were 74.4% for input enhancement, 58.3% for dictogloss, and 81.8% for consciousness-raising respectively. These findings confirmed that using different types of focus-on-form had different effects on the performance of learners. This matter was evident in the progress of learners from pre-to-post-test due to their benefiting from each of these tasks instruction separately. So, dealing with different tasks had different effects in learners academic's achievement.

Considering the second question of the research that which type of focus on form affects students' use of English preposition the most? The researchers endeavored to consider both qualitative and quantitative finding of the study. Although the main focus was on qualitative approach. Pertaining to quantitative results in the form of numbers revealed that the learners who were benefited from conscious-raising task had better performance in dealing with preposition from pre-to-post test compared to two other groups. In the qualitative phase, The field-notes made by the researchers during classroom observations indicated the low frequency of teacher-learners interaction during two types of task, input-enhancement and dictogloss. It is suggested that learners didn't find many opportunities to use preposition during these two FOF. However, a considerable meaningful interaction was engendered during consciousness-raising which went beyond the understanding-checking on the part of teachers. These findings are in line with Ellis (2003) idea about the effectiveness of consciousness-raising task as he believes "C-R tasks seem to be an effective means of achieving a focus on form while at the same time affording opportunities to communicate". This could be a viable, yet not totally generalizable, answer to the second research question which aimed at finding which types of three FOF encouraged more interaction and use of preposition on the part of learners. It could be concluded that "use of preposition" is more motivated via tasks like consciousness-raising in EFL classrooms.

### CONCLUSION

Grammar instruction continues to be a controversial area of research in applied linguistics. As a celebrated approach toward grammar instruction in a communicative-oriented language teaching, Focus-on-form received positive attention due to its balanced approach toward fluency-accuracy and its applicability in EFL contexts. The present study attempted to examine the efficiency of three models of FoF; namely input enhancement, dictogloss, and consciousness-raising; on learning "*preposition*". To achieve this goal, three intermediate classrooms (35 EFL learners) in a private language institute, where the main focus is meaning-based communication, were chosen.

Based on quantitative (pre-test post-test design) and qualitative data collection (observation and field notes), results revealed that EFL learners who were exposed to input enhancement and consciousness-raising task instructions had better progress in appropriate use of preposition compared to the other group who received dictogloss task instruction. Findings from the current study have correspondent to the effectiveness of consciousness-raising task instructions in enhancing learning in learners in some of the previously conducted studies in this area such as, the work of Ellis and Fotos (as cited in Ellis, 2003), and Sheen (as cited in Fotos & Nassaji, 2011) and the effectiveness of input enhancement task in increasing learning in the work of Jourdenais et al. (as cited in Ellis, 2003). Meanwhile, the analysis of classroom observations indicated that more meaningful interaction was engendered during performing consciousness-raising task than the other two tasks. The current study suggested that Iranian EFL learners could benefit more from consciousness-raising task if appropriately incorporated into classroom activity. However, since this study was conducted on a small-scale with a limited sample, generalization should be done with care with different contexts and participants.

**Appendix A**

**Pre-test**

Full name: \_\_\_\_\_ Term: \_\_\_\_\_  
Course: \_\_\_\_\_ Time: **20 min**

Select an appropriate preposition from the following list for each sentence.

Preposition list: **at, in, by, on, on time, to, in time, of, about, with, for.**

1. Three people were taken ..... the hospital after the accident.
2. You can rent a car ..... the airport.
3. I just started working ..... the sales department.
4. Write your name ..... the top of the page.
5. Can I pay ..... credit card?
6. They sent me a check ..... 200 dollars.
7. Raschel showed me some photos ..... her family.
8. I'll see you ..... Friday morning.
9. I want to deal ..... some problems.
10. If something happens ....., it happens at the time that was planned.
11. There is somebody ..... the building.
12. When you leave the hotel, please leave your key ..... the front desk.
13. Who was responsible ..... all that noise last night.
14. Lisa is upset ..... not being invited to the party.
15. I'm in hurry. I want to be home ..... to see the game on television.

**Appendix B**

**Post-test**

Full name: \_\_\_\_\_ Term: \_\_\_\_\_  
Course: \_\_\_\_\_ Time: **20 min**

Select an appropriate preposition from the following list for each sentence.

Preposition list: **on, at, for, in, to, in time, of, about, on time, with, by.**

- 1- Don't go out ..... the train. Wait until it stops.
- 2- How did you get here? Did you come ..... train?
- 3- The company closed down because there wasn't enough demand ..... its product.
- 4- Don't meet me ..... the station. I can get a taxi.
- 5- Amy works at a bank and her brother is ..... the medical school.
- 6- The bus was late this morning, but it's usually ..... .
- 7- I'm going ..... vacation next week.
- 8- There has been an increase ..... the number of traffic accidents recently.
- 9- The police want to question a man in connection ..... the robbery.
- 10- Thank you. It was very kind ..... you to help me.
- 11- I didn't do it ..... purpose. It was an accident.
- 12- It was a lovely day. There wasn't a cloud ..... the sky.
- 13- I've thought ..... what you said, and I've decided to take your advice.
- 14- Will you home ..... for dinner.
- 15- I don't like going out ..... night.

**Appendix C**

**Task 1: Input Enhancement**

- **Please read the following text and pay attention to the bold words.**

So, welcome to English Studies International everyone. My name is Anna and I'm the director of studies. All right, so the first thing is

what's happening today? So **from** 9 am **until** 10.30, you'll do some tests. **After** you've done the test, **at** half past ten, you can have a break. **After** the break **at** 10.45, Rebecca will be waiting **for** you **in** reception to give you your books. **At** 11 o'clock, please come back here **to** the Learning Center, and Stewart, the Manager, will give you an introduction **to** the Learning Center. **At** half past eleven you will meet Christine. Christine will talk to you **about** the social programme **at** English Studies International. These are all the activities that you can do **after** school. So that **until** midday. Then **at** midday, I will come back. You will meet me again and I'll give you your timetables. Then you can have lunch **in** the canteen. During lunch, Berit will be **in** her office if any of you have accommodation problems. Then, this afternoon you could either listen to a talk **about** London or you could do a conversation class if you know London already.

**Task 2: Dictogloss**

- **Please listen to me carefully. I read the text twice and you listen to me, after I finished my reading you should discuss about it in group and reconstruct the text.**

Before we begin the first activity, I'd just like to talk about a few classroom rules. You know, to help your learning. These are rules for all my students. Ok, so, the first one- the most important rule- when you're in here, inside the classroom, you must speak English. You all have lots of different first languages so it makes sense to use English to each other. A second rule is about being on time in the morning. Lesson start at 9 o'clock so you must get here on time- before 9 is even better- so we can all start studying together. It's not really very polite to arrive 20 minutes late because it disturbs the people who did come on time. It makes things hard for your classmates. And another thing is mobile phones. You mustn't use your mobile during the lesson. Again it's not very polite. In fact, please turn your phone off completely during the lesson.

**Task 3: Consciousness-raising**

- **Please underline the time expression in this passage.**

I made an appointment to see Adam at 4 o'clock on Monday 13th May to speak about my application for a job. Unfortunately, he was involved in a car accident in the morning and rang to cancel the appointment. I made another appointment to see him at 11 o'clock on Thursday 23th May. However, when I got to his office, his secretary told me that his wife had died at the night and that he was not coming into the office that day. She suggested I reschedule for sometimes in Jun. So, I made a third appointment to see Adam at 2 o'clock on Friday 12<sup>th</sup> Jun. this time I actually got to see him. However, he informed me that they had now filled all the vacancies and suggested I contact him again in 1988.

- **Now, write the time Phrases into this table.**

## ABSTRACT

Launching and developing the virtual and electronic education in universities and educational institutions, and generally, the higher education system, has been regarded by education scholars, communication and information technology professionals, and policy makers and those involved in the teaching and learning activities. Traditional training, despite its prominent role in history and authenticity throughout the years in training, learning and human knowledge, no longer is sufficient to meet all the educational needs of diverse clients from training in the era of information and communication such as continuous education, lifelong learning, and in-service training. At the same time, the use of faculty and students of modern communications technology and e-learning has always faced with the problems. The main objective of this study is to investigate the barriers and strategies for the development of e-learning among the students of physical education in Hamedan province in Iran. The scope of this study is Bu Ali Sina University and, Hamedan Azad University, Iran. Information for this study has been developed using a survey and the questionnaire technique. The questionnaire consisted of two parts: personal information including gender, age, educational level, GPA and University; and, e-learning barriers in the form of four barriers and 35 items. Then the reliability coefficient was determined using Cronbach's alpha (0.92) and the questionnaires were distributed among physical education students (especially) higher education students. To investigate the hypothesis, inferential statistical techniques such as the Kolmogorov – Smirnov test (KS), one-sample t-test and independent t-test were used. The results showed that infrastructure and equipment barriers, credit and financial barriers, educational and administrative barriers and human barriers of physical education students are involved in e-learning. The results also showed that among Bu-Ali Sina University and Azad University, there is no difference in the field of e-learning barriers, educational and administrative barriers, credit and financial barriers and human barriers. However, there are differences in the perception among Azad University students and Bu-Ali Sina University in the infrastructure and equipment barriers.

**KEYWORDS:** Barriers, e-learning, students, physical education

## INTRODUCTION

Emergence of communication networks such as the internet, along with advanced tools and educational facilities, caused the method of teaching to be changed. It enables a wide range of knowledge seekers, from near and far distances, to enjoy training network; and, with methods different from conventional types implement scientific programs. This new method of learning is called e- (virtual learning), today is known as the most advanced teaching methods and it is benefiting from variety of advanced technologies, such as networking, databases, and knowledge management, etc. (Galusha, 1997).

The international dimensions of education and the need for it is imminent, that is, while e-learning development is still serving his childhood, it sets universal and effective influence on the world of education. Despite the great discussion of this phenomenon, it still has a great impact on vocational training and its various international aspects (Jokar, 2007).

Ballard (2000) argues that Information deforms modern Technology Educational institutions through new methods of watching and learning; it teaches students new ways of teaching and knowledge transfer, and it teaches teachers and managers new ways of organizing educational systems. However, the universities will be successful in the information age which their changed structure for the integration of distance learning courses. Those institutions that do not alter the structure may be overlooked by educational planners (Scott, 2000). E-learning has been continuously introduced as an alternative way to enhance traditional approaches. E-learning uses network technologies for the creation, enrichment, provision and facilitating of learning at any time and place (Abdon et al, 2007).

The issue of quality education has always been considered and is gaining more importance day by day (Abdon et al, ibid). Since the dominant mode of teaching and learning is teaching in the classroom, today new communication methods and spaces are provided which would allow teaching - learning process outside the classroom. Recent advances in computer and information industry, entry of information networks and communication technologies has faced the designers, planners, managers and executives of educational programs with new methods and procedures. Penetration of new information technologies in educational institutions has changed the simple relationships between the teaching and learning. With the development of information and communication technology at the Universities, it is expected that learning models to be evolved and more attention should be paid to the revision of the curricula (Fathnejad and Mokhtari, 1386).

However, computer-assisted learning also has its own limitations, such as lack of a good substitute for the teacher, Human and emotional interactions as well as classroom face-to-face communication (Twomey, 2004). Other limitations in the use of computers in Iran higher education are: lack of proper understanding of virtual learning environments, lack of proper infrastructure and telecommunication, lack of enough bandwidth to transmit and receive information. Moniee (2004) in his article argued that system of supply and demand for higher education still does not have an accurate understanding of virtual spaces and it is not well acquainted with the features and functions; and, basic IT skills are not still well known (Moniee, 2004). In this system, the success of learner is associated with technical skills in the use of computers and networks (Shuster, 2003). In addition, high rate of received messages and sending the solutions is a time consuming activity

and it requires information management skills (Twomey, 2003).

Three different evolution waves have been identified in the history. The first wave, that included some enhancements in cities and developments in rural areas, continued till 17th century. Then, the second evolution wave, which is termed 'industrial revolution', came into existence as the second great transformation that history ever had. And thus, for nearly three centuries ago, the evolution of these two waves with different velocities simultaneously continued till now (Toffler, 2002).

Today, with the incredible advances in information technology, preparation and distribution of information has become a new trend. As the second wave expanded and strengthened the human power, the third wave, by making the best use of computer, enhanced intellectual power and it gradually replaced hand workers with knowledge workers. The third wave, as the fundamental principle of the second wave, is moving toward greater diversity. In the first wave of civilization, people were not so dependent on the time because the works did not have a lot of continuity but in the second wave of civilization, delay of an employee or a worker could impede the work of many others. The third wave has personal and particular timing not public and general timing (Toffler, 2002).

## REVIEW OF LITERATURE

The international dimensions of education and the need for it is imminent, that is, while e-learning development is still serving his childhood, it sets universal and effective influence on the world of education. Despite the great discussion of this phenomenon, it still has a great impact on vocational training and its various international aspects (Shuster, 2003).

Esmaeeli Salumahaleh (2013) discusses the issues and obstacles of e-learning implementation in cultural, educational and technology dimensions in higher education. Analysis of this study shows that, in scholars and students' view, the problems related to telecommunication infrastructure and lack of access of students to computers and communication lines, are matters that cause e-learning not to be implemented successfully in Iran. According to experts, it covers a broader range of issues; they mention other obstacles and challenges for e-learning implementation such as: stakeholders' reaction to e-learning approach, inability of this approach in the transfer of university culture, particular challenges of implementing the first time, the issues facing electronic writing lesson plans, problems of telecommunications infrastructure, failure of proper facilities, as well as software and hardware costs, the social deficiencies of this type of distance learning and inadequate access of students to facilities.

Naghavi (2007), in his study, discussed about 'the Attitudes of Faculty and Graduate Students of Agricultural Extension and Education toward Distance Learning via the Internet'. Additionally, he considered the proficiency level of Information Technology of faculty and graduate students as a necessary element of e-learning development; moreover, he investigated the barriers of the expansion of this type of education (Naghavi, 2007).

In another study on the barriers to the development of the e-learning on the educational system in Iran, these barriers were divided into six categories:

- technological;
- Cultural and social;
- Pedagogical;
- Legal and administrative;
- Strategic; and,
- Economic (Houseinilorgani et al, 1387).

In other studies, including Frazeeen (2004), it has been shown that implementing e-learning would be merely successful when the courses are theoretical.

Mirzayi (2013), in his study entitled the barriers of e-learning development in higher education in students view, has stated that the new information technology has an extraordinary ability to change or adjust teaching and learning activities in all educational institutions and it provides facilities for developing scientific environments that were not possible before. For this reason, many of the universities tend to start using the electronic courses by information technology for e-learning and online learning. However, several studies indicate that the development of e-learning in the educational system is faced with many problems; and unfamiliarity of policy makers and educational planners with these systems can impose a lot of costs for educational institutions.

Esmaeeli Salumahaleh (2013) in his paper entitled "Barriers to the development of e-learning in the teachers' service training" came to the conclusion that technical factors have the highest contribution to the development of e-learning barriers in teachers' service training educational, and respectively cultural, social, educational, economic, legal, administrative and strategic factors are in the next priorities.

Research results by Mirzayi (2013) showed that agents like evaluation, resources management, program management, means of communication and dialogue, learner-centered agent and flexibility, respectively, affect the pedagogical barriers of e-learning.

The major issues, problems and serious challenges in the higher education system are growing demand to enter into this system, entering the information age, the need to achieve information literacy, production rate and the need to design a system of continuous and lifelong education, User-centered education, expansion of educational justice, to stay ahead of fast caravan of dramatic changes in the global education system and finally potential to attract students from other countries which the development of e-learning is an appropriate response to address these challenges (Musakhani, 2005).

Iran, in terms of population, is the world's youngest country in which 70% of the population is under 30 years of age. On the other hand, young people have a higher tendency to continue academic education. Due to recent developments in this world and entering the information age in which knowledge provides the highest value, we are faced with a challenge that utilizing e-learning can overcome it (Montazer, 1388).

Distance learning has its roots in ancient times and some experts believe it is related to the time of Plato and his student Dionysius, but since the evidence shows the first distance education methods has been performed by making the use of mailing a question and answer exchange by post in the years since 1728 have. Since then education has performed many forms like extensive, academic guidance, through

correspondence, tape recorder, television programs, and recently, video and satellite. But new forms of distance education, with the use of modern computer technology and, more importantly, the Internet were a new phenomenon (Angle, 2000).

Kurtus (2000) and Beneke (2001) have mentioned that the main issues of virtual learning are lack of social interaction and the interval between students and faculty members' activities. According to them, students can't interact with friends and classmates when faced with possible problems and images and texts may not satisfy the learners. Some researchers asserted cases such as illiteracy in Educational Technology, lack of training in this area, inexperienced faculty members in the effective use of new technologies, and their resistance for virtual courses as the main issues of e-learning (Anstead et al, 2004; Alston et al, 2003; Kelsey et al, 2002; Dillon and Walsh, 1992).

Oliver (2002) in a study entitled 'quality assurance of E-learning in Australian higher education' discusses the factors leading to successful adaptation and sustainable use of virtual learning in higher education in Australia.

In some studies, lack of social participation and social interaction between students and professors have been considered and their results suggested that students, in e-learning, do not possess the possibility of interacting with friends and classmates and getting help when they are faced with problems and then, probably images and texts may not be satisfying for them (the students). So, the students are deprived of the sense of community in e-learning; and, the students' sense of resentment and despair in e-learning courses is more in comparison to traditional courses (Kurtus 2000; Beneke 2001; Lieblein 2000).

Frazeen (2006), in his final dissertation, entitled 'effective factors in quality of web-supported learning' considers the relationship and impact of several basic factors. He divided these elements in following six groups: organizational and educational factors, instructor, students, technology and educational designing (Frazeen, 2005).

Howard (2009) in his study entitled 'investigation of ICT infrastructure and human resource capacity in Liberia' concluded that the development of ICT in this country is depended on the improvement of the following factors: telecommunication infrastructure, human resources, economic, social and information-technology-based curriculum planning.

Kurtus (2000) in his researches, about Development, establishment and application of E-learning, stated that in the E-learning readiness of human resources, these items are essential and effective: physical, cognitive, emotional, social and cultural factors. A glance at the recent changes in educational system shows that most of these changes in the phase of educational technology utilization have focused on acquiring early technology skills.

Panitz (2008) in his study, about the advantages of electronic and participatory learning about motivating the learners, stated that working students, had less interest in face to face education (Panitz, 2008).

Chahill (2008), based on Duderstat (2001), in this regard, stated that the higher education must meet these changes and they should invest in capacities which make the new types of learning, independent of time and place limitation, possible, in order to create a persuasive view in their future in the next millennium (Chahill, 2008). Gamble (2009) in his research entitled 'The learning effects in a multicultural environment' compared and investigated the impacts of an E-learning course that was held in China and the US (Gamble, 2009).

## **RESEARCH QUESTIONS**

Are infrastructure and equipment barriers, credit and financial barriers, educational and administrative barriers and human barriers of physical education students involved in e-learning?

## **RESEARCH METHODOLOGY**

### ***Research instruments***

This research is a descriptive survey. The most common approach for collecting data in the survey is questionnaire (Kurlindger, 1997).

### ***Research Participants***

In the present study, the population is all the students of physical education at the Azad University of Hamedan and Bu-Ali Sina University in the bachelor and master degrees levels that some of them are selected by sampling and their comments were utilized. To determine the sample size in this study Farmers and Morgan formula were used. Based on population, physical education students of Islamic Azad University, Hamedan were a total of 290 subjects which 165 were selected as the sample based on Morgan and Farmers formula. Physical education students of Bu Ali Sina University were a total of 267 cases which 155 subjects were selected. Finally, the questionnaires were distributed and collected and 150 questionnaires from Azad University students and 120 questionnaires were collected from Bu-Ali Sina University which, totally, 270 patients were considered as the sample size.

### ***Data Collection Method***

According to the research objectives, the best possible way to collect data was using questionnaires to examine physical education students' attitudes and views about e-learning barriers. The questionnaire was researcher-made and they are composed of two parts: the first part was on the individual characteristics including age, gender, educational level, GPA and university education and the second part contains barriers in e-learning consisting of 35 questions. The questionnaire is divided into four categories including barriers to infrastructure and equipment (technical) with 12 items (questions 1 to 12), credit constraints (financial) including 8 questions (from 13 to 20), educational and administrative barriers with 6 items (from questions 21 to 26) and, human barriers with 9 items consisting questions 27 to 35. Responses based on a Likert scale have five values including very low, low, medium, high, very high, which is graded in the order of importance from 1 (very low) ... to 5 (very high).

### ***Research Procedure***

To evaluate the accuracy of the indicators, criteria, and items in the survey formal validation and experimental validation method were used. Therefore, the research instrument (questionnaire) was given to 15 physical education experts and computer science experts. Then points were collected, evaluated and finally, used in the modified questionnaire. The experimental validation of the collected data was compared with solid and uncertain data in the pre-test stage.

In this method, for determining the reliability of the questionnaire Cronbach's alpha coefficient is used, so that the alpha coefficient derived from a total of 30 questionnaires by SPSS equals to 0.92 indicating the reliability of the survey instrument to measure the variables.

In this study, the analysis of the obtained data was used using descriptive and inferential statistics. For data analysis, the descriptive statistics such as the mean, median, mode, standard deviation, variance, minimum and maximum are used and inferential statistics, such as Kolmogorov-Smirnov test (KS), one-sample t-test and independent t-test were used.

## RESULTS AND DISCUSSION

As is shown in table 1, the highest frequency goes to the students who are aged between 20 to 30 years (67 percent) and the lowest frequency goes to the students who are 41 to 50 (4.8 percent).

*Table 1: Statistical description of the students' age*

age	frequency	percentage
20 - 30	181	67.0
31 - 40	76	28.2
41 - 50	13	4.8
Total	270	100

Median: 28

Mode: 25

Maximum: 46

Minimum: 20

Characteristics related to gender have been shown in table 2 which 39.6% are male students and 60.4 percent of them are female.

*Table 2: Statistical description of student gender*

gender	frequency	percentage
Male	107	39.6
female	163	60.4
Total	270	100

In table 3 it can be seen that 39.3 percent of students are studying in bachelor and 60.7 in MA degree in physical education.

*Table 3: Degree statistical description*

degree	frequency	percentage
Bachelor	106	39.3
Master	164	60.7
Total	270	100

In table 4 it can be seen that 55.6% of the students are from Azad University and 44.4% of them are enrolled in Bu-Ali Sina University.

*Table 4: University statistical description*

University	frequency	percentage
Azad	150	55.6
Bu Ali Sina	120	44.4
Total	270	100

### *E-learning barriers*

Table 5 shows the survey data related to e-learning barriers in physical education students' perspective. In the table, the mean and standard deviation of the e-learning barriers are also mentioned.

*Table 5: useful markers of different e-learning barriers*

e-learning barriers	mean	SD
Azad	3.51	0.628
Bu Ali Sina	3.6	0.479
Total	3.56	0.568

Before examining research hypotheses, it is necessary to check the normality of research variables by using Kolmogorov-Smirnov. Table 6 presents the study of normal variables.

*Table 6: the study of normal variables*

variables	Z test	Sig.
E-learning barriers	0.874	0.429
Infrastructure and equipment barriers	1.435	0.063
Credit and financial barriers	1.346	0.054
Educational and administrative barriers	1.367	0.056
Human barriers	1.026	0.243

According to the above table, it is concluded that the significance levels of all variables is more than 0.05. Therefore, the data are normalized variables and the normality of the variables justifies the use of parametric test in order to deduce the research hypotheses.

#### First Research Hypothesis

$H_0$  : Infrastructure and equipment barriers play a role in physical education students' e- learning.

$H_1$  : Infrastructure and equipment barriers do not play a role in physical education students' e- learning.

To test the above hypothesis, the parametric one-sample t test was used. This test was used for quantitative variables and to assess the effectiveness or ineffectiveness of a variable in the evaluated condition. Table 7 shows the descriptive statistics related to the first research hypothesis.

Table 7: Descriptive statistics of infrastructural barriers

Mean	SD	Standard error mean
3.58	0.665	0.04

The table above shows that the mean range of questions relating to the above hypothesis is 3.58 and standard deviation is 0.665. This shows that the mean is higher than average. Table 8 presents the confirmation of the first research hypothesis.

Table 8: Results of one sample t-test to evaluate the role of infrastructure and equipment barriers in e-learning

Test value = 3						
Up	down	Mean difference	Sig.	Freedom rate	T test	Result
0.668	0.509	0.589	0.001	269	14.549	$H_1$ is confirmed

Obviously, the obtained significance level is much smaller than the 0.05 which shows that there are significant differences between the mean values. On the other hand, since the mean of samples in table 8 is somewhat higher scores Value (mean = 0.589), so, the infrastructural barriers and equipment are involved in e-learning of physical education students. Therefore, the first hypothesis of this study is confirmed and the null hypothesis is rejected.

#### Second Research Hypothesis

$H_0$  : Credit and financial barriers play a role in physical education students' e- learning.

$H_1$  : Credit and financial barriers do not play a role in physical education students' e- learning.

To test the above hypothesis, the parametric one-sample t test was used. This test was used for quantitative variables and to assess the effectiveness or ineffectiveness of a variable in the evaluated condition. Table 9 shows the descriptive statistics related to the second research hypothesis.

Table 9: Descriptive statistics of credit and financial barriers

Mean	SD	Standard error mean
3.69	0.669	0.04

The table above shows that the mean range of questions relating to the above hypothesis is 3.69 and standard deviation is 0.669. This shows that the mean is higher than average. Table 10 presents the confirmation of the first research hypothesis.

Table 10: Results of one sample t-test to evaluate the role of credit and financial barriers in e-learning

Test value = 3						
Up	down	Mean difference	Sig.	Freedom rate	T test	Result
0.779	0.618	0.669	0.001	269	17.153	$H_1$ is confirmed

Obviously, the obtained significance level is much smaller than the 0.05 which shows that there are significant differences between the

mean values. On the other hand, since the mean of samples in table 10 is somewhat higher scores Value (mean = 0.669), so, credit and financial barriers are involved in e-learning of physical education students. Therefore, the first hypothesis of this study is confirmed and the null hypothesis is rejected.

### Third Research Hypothesis

$H_0$  : Administrative and educational barriers play a role in physical education students' e- learning.

$H_1$  : Administrative and educational barriers do not play a role in physical education students' e- learning.

To test the above hypothesis, the parametric one-sample t test was used. This test was used for quantitative variables and to assess the effectiveness or ineffectiveness of a variable in the evaluated condition. Table 11 shows the descriptive statistics related to the third research hypothesis.

Table 11: Descriptive statistics of administrative and educational barriers

Mean	SD	Standard error mean
3.53	0.835	0.05

The table above shows that the mean range of questions relating to the above hypothesis is 3.53 and standard deviation is 0.835. This shows that the mean is higher than average. Table 12 presents the confirmation of the first research hypothesis.

Table 12: Results of one sample t-test to evaluate the role of administrative and educational barriers in e-learning

Test value = 3						
Up	down	Mean difference	Sig.	Freedom rate	T test	Result
0.633	0.433	0.533	0.001	269	10.491	$H_1$ is confirmed

Obviously, the obtained significance level is much smaller than the 0.05 which shows that there are significant differences between the mean values. On the other hand, since the mean of samples in table 12 is somewhat higher scores Value (mean = 0.533), so, administrative and educational barriers are involved in e-learning of physical education students. Therefore, the first hypothesis of this study is confirmed and the null hypothesis is rejected.

### Forth Research Hypothesis

$H_0$  : Human barriers play a role in physical education students' e- learning.

$H_1$  : Human barriers do not play a role in physical education students' e- learning.

To test the above hypothesis, the parametric one-sample t test was used. This test was used for quantitative variables and to assess the effectiveness or ineffectiveness of a variable in the evaluated condition. Table 13 shows the descriptive statistics related to the forth research hypothesis.

Table 13: Descriptive statistics of human barriers

Mean	SD	Standard error mean
3.42	0.69	0.04

The table above shows that the mean range of questions relating to the above hypothesis is 3.42 and standard deviation is 0.69. This shows that the mean is higher than average. Table 14 presents the confirmation of the first research hypothesis.

Table 14: Results of one sample t-test to evaluate the role of human barriers in e-learning

Test value = 3						
Up	down	Mean difference	Sig.	Freedom rate	T test	Result
0.507	0.342	0.424	0.001	269	10.109	$H_1$ is confirmed

Obviously, the obtained significance level is much smaller than the 0.05 which shows that there are significant differences between the mean values. On the other hand, since the mean of samples in table 14 is somewhat higher scores Value (mean = 0.533), so, human

barriers are involved in e-learning of physical education students. Therefore, the first hypothesis of this study is confirmed and the null hypothesis is rejected.

#### **Fifth Research Hypothesis**

$H_0$  : There is not any significance between e-learning in Azad University and Bu Ali Sina University students.

$H_1$  : There is significance between e-learning in Azad University and Bu Ali Sina University students.

To test the above hypothesis, the parametric independent T test was used. Table 15 investigates the differences related to the e-learning barriers among these two groups.

*Table 15: Differences between two independent groups of the fifth research hypotheses*

variables		Loon Test		T-test			
		F test	Sig.	T-test	Freedom Level	Sig.	Mean Difference
Learning barriers	variances equality	7.047	0.008	- 1.52	268	0.129	- 0.105
	Lack of variances equality			-1.57	267.41	0.118	- 0.105
Infrastructure and equipment	variances equality	8.25	0.004	- 2.86	268	0.004	- 0.23
	Lack of variances equality			- 2.95	267.34	0.003	- 0.23
Credit and financial	variances equality	0.264	0.608	- 1.21	268	0.227	- 0.099
	Lack of variances equality			- 1.22	262.76	0.223	- 0.099
Administrative and educational	variances equality	3.95	0.048	- 0.24	268	0.807	- 0.025
	Lack of variances equality			- 0.24	265.65	0.805	- 0.025
human	variances equality	11.326	0.001	- 0.81	268	0.416	- 0.068
	Lack of variances equality			- 0.83	267.63	0.403	- 0.068

Table 15 shows that significance levels of Loon test for all variables except credit and financial variables is less than 0.05 indicating the lack of equality of variances between the two populations of the studies (Azad University and Bu-Ali Sina University). Thus one of the conditions of independent parametric t-test, except in the case of credit and financial variables, are not observed, whereas in credit and financial variables, the equality of variances must be reported. However, the significance level of the t-test in the bottom row in all variables apart from the infrastructure and equipment barriers is more than 0.05, which shows that with 95% confidence there is no difference in the field of e-learning barriers among Azad and Bu-Ali Sina University students. However, there are differences regarding infrastructure and equipment barriers among Azad and Bu-Ali Sina University students' perception.

#### **CONCLUSION**

New information technologies have great ability to change or reform teaching and learning activities in all higher education institutions and provide opportunities for the design of new media which have not been possible before. For this reason, many universities in Iran want to set up electronic courses using information technology capabilities in the form of e-learning or online learning. However, the review of researches shows that e-learning development in educational systems is faced with many problems that policy makers and planners' unfamiliarity with their education can impose heavy costs on educational institutions. This paper aims to familiarize planners, policymakers, students and faculty on issues ahead of physical education students' use of e-learning.

The first hypothesis results showed that barriers of infrastructure and equipment are involved in physical education students' e-learning. Strengthening and developing telecommunications infrastructure in educational institutions and to provide access to the networks in mentioned institutions is one of the important steps in the development of electronic learning, because the effectiveness of e-learning depends on the availability and reliability of the software and hardware and lack of good telecommunication infrastructure strongly affects the relationship between the learner and the educational system.

The results of the second hypothesis showed that credit and financial barriers are involved in physical education students' e-learning. Zhang et al (2002) and Wilson and Moore (2004) considered the cost of internet access development of virtual training as problematic. They believe the price of internet access is still high; so many students cannot easily use method as a low-cost method. Providing sufficient funds for facilities and e-learning tools is a serious need for universities.

The results of the third hypothesis showed that administrative and educational barriers are involved in physical education students' e-learning. The nature of academic disciplines in planning for the use of e-learning is important. E-learning can be an alternative to traditional training and should be focused on courses and subjects that traditional education system is not able to meet their troubles.

The results of the fourth hypothesis showed that human barriers are involved in physical education students' e-learning. Investing in the education of manpower and training of skilled manpower is another important issue the development of e-learning. The development of e-learning will fail without a skilled and capable workforce and the traditional system resistance will increase and entry to higher education information technology will make be harder. The difference between traditional classroom training and e-learning is like the difference between driving a car and flying a helicopter, while some of the skills acquired but these skills are not enough.

#### **Implication of the Study**

Finally we can say that universities and educational institutions cannot overcome obstacles to the development of e-learning without

adopting a holistic and integrated approach; and, policies for directing and providing the necessary resources to facilitate the development of e-learning should be determined. The present study deals with barriers and limitations in the commissioning and development of e-learning course in Hamadan Universities and more research should be done in this area.

#### Recommendations

1. The users' skills and technical knowledge of the English language and mastering of software, hardware and networking are necessary factors for the development of web-based training in Iran. Before planning for the development of e-learning, students' familiarity and mastery of computer skills and attending in workshops will be indispensable.
2. Since the shortage of qualified, proficient and competent teachers and experts in the field of e-learning and electronic content production is obvious, it seems training interested teachers and experts is essential.
3. Now, software and educational content and material for the development of e-learning in many academic disciplines have not been developed yet. Necessary steps should be taken in this regard.
4. Based on the research findings, low speed and inappropriate connection are the main problems in the development of e-learning. Accordingly, improved communication infrastructures in Iran to increase internet speed are essential in Iran. Although effective actions have been done in this regard, it's not enough for the development of e-learning and investment is needed.
5. In Iran, training the teachers for optimal use of e-learning software is a must. Many professors are both distrustful of e-learning and novice of the necessary software.
6. Given the practical nature of academic fields, holding troubleshooting classes alongside electronic-training sessions is a necessity.
7. Strengthening the Internet Security Systems Network to increase safety and protect the content, material and tests is a necessity in the E-learning network. Currently, e-learning applications and software can easily be penetrated.
8. Currently, many of the students do not have access to high speed Internet at home. It is necessary to provide facilities to access electronic education.
9. Since Most of the agricultural fields and trends have a lot of practical and laboratory courses and the possibility of holding a full curriculum does not exist in electronic form, the future researchers should study on blended learning which, to a large extent, solved the electronic learning problems.
10. It is recommended that e-learning is used in colleges with purely theoretical courses like Literature College and researchers in the above fields investigate in the field of e-learning.
11. It is recommended that in future studies, in most aspects of the operation studies the research team should be composed of students, teachers, advisors and one of the faculty members of Computer and Information Technology to provide technical advice in the field of e-learning infrastructure and operational mechanism.

#### Research Limitations

This study was done in the context of Hamedan Province and it is limited to merely Hamedan universities. Additionally, since the issue of e-learning is a rather new challenging topic introduced by the government, some political limitations are standing against electronic education development. For instance, the high cost of developing enough infrastructures to develop any kind of electronic learning should be financed by the government and yearly budget which is considered another limitation in this research.

**ABSTRACT**

Among other factors such as culture that have an impact on the minds of the translators when producing the Source Text are ideological and time-factors. The present study attempts to identify the ideological terms that were translated from English to Persian. This study also examines the strategies used by the translators. To this end, the translations of Webster's novel, which were translated before and after the Islamic Revolution in 1975 in Iran, are investigated. The data analysis is performed based on Fairclough's model (1989). The results show that to overcome cultural and-ideological misunderstandings, the translators adopted many strategies such as addition and omission, and they intentionally or-unintentionally ignored the needs of children who are the readers of the Target Text. Overall, it was found that the Islamic Revolution had a crucial impact on the nature of used strategy by translators of novels written for children.

**KEYWORDS:** Source Text, Ideological Words, Fairclough's Model, Translation, Target Text

**INTRODUCTION**

Book translation for children is not a straightforward matter. Beyond the forces of manipulation and profit, there exist several other problems connected with the actual translation process (Khawira, 2010). Because of the limited experience and background knowledge about children, translators encounter an array of problems adapting the target text to the level of children's understanding. Cultural differences between the Source Text (ST) and the Target Text (TT), which may even lead to censorship, should also be considered. Such cultural and ideological differences among Iranian and other cultures can result in mistranslations and likely breakdowns. In this regard, Sertkan (2007) points out that "the act of translation is not an innocent one since the translator is influenced by his/her own cultural values and his/her ideology, which causes him/her to 'manipulate' the source text by making some additions, omissions, adaptations (P. 6). However, the translated CHLT may cause breakdowns concerning morals, ideologies, and social customs, especially if the source and target cultures have little in common. To solve this problem, Puurtinen (2000) holds that Critical Discourse Analyses (CDA) aims at revealing how ideology affects linguistic choices made by a text producer and how language can be used to maintain, reinforce or challenge ideologies" (P.178).

**REVIEW OF LITERATURE**

***Ideology***

Ideology is one of the most frequently used notions in the academia, particularly in the social sciences. Mason (1994) defines ideology as a "set of beliefs and values which inform an individual's or institution's view of the world and assist their interpretation of events, facts, etc" (P. 25). Van Dijk (2000) also holds that ideology is mostly associated with "systems of ideas, especially with the social, political or religious ideas shared by a social group of movement" (P. 5). In addition, Hatim (2000) defines ideology as "a body of ideas which reflects the beliefs and interests of an individual, a group of individuals, a societal institution, etc., and which ultimately finds expression in language" (P. 218). Therefore, the term 'ideology' encompasses a range of beliefs, ideas, attitudes, and interests held by an individual, a group of individuals, institutions, and so on. An important point in Hatim's (2000) definition is the relationship between ideology and language in that the latter becomes a medium for the expression of the former.

***Ideology and Discourse***

It is worth noting that language has a crucial role in the expression of ideology. As far as language is concerned, the concept of discourse should not be overlooked. Language and discourse cannot be thought as separate areas, and it is through language and discourse that ideology finds expression. Discourse is a term that is widely used in the contemporary human sciences, and it is "used to describe any organized body or corpus of statements and utterances governed by rules and conventions of which the user is largely unconscious" (The Penguin Dictionary of Critical Theory 2000, P. 100). As it can be seen in these definitions, discourse embodies what is 'social'. This social aspect is emphasized by Fairclough (1989). Fairclough (1992) believes that "discourse *constitutes* the social. Three dimensions of the social are distinguished-knowledge, social relations, and social identity" (P. 8). In this respect, discourse as a discursive language has a crucial role in the expression of ideology. Therefore, many scholars highlight the relation of discourse and ideology (Fairclough, 1989; Van Dijk, 2000; Wodack, 2002).

***Ideology and Manipulation***

Lefevere (2004) is one of the representatives of the manipulation school in translation. He believes that translation consists of four systems: ideology, poetics, register and language, and points out that the translator should not only translate words and sentences but also the ideology, poetics, and register. After adopting the contributions to translation studies made by Even-Zohar (1990) and Foucault (1980), Lefebvre (2004) tries to study translation in the context of politics, ideology, economy and culture, and discuss further factors that restrict the rewriting in the translation. In Lefevere's (2004) words, translation is a rewriting of the original text. All rewritings, whatever their intentions, show a certain ideology and poetics and as such manipulate the literature to function in a given society in a given way. In this regard, rewriting is manipulation, undertaken in the service of power, and in its positive aspect can help the evolution of literature and society. Beside, rewriting can introduce new concepts, new genres, new devices, and the history of translation is also the history of the literary innovation, of the shaping power of one culture upon another (Lefevere, 2004).

***Ideology and Translation***

Sertkan (2007) states that "The 'cultural turn' is a term used in Translation Studies to describe a shift of emphasis towards the analysis of translation from the perspective of cultural studies" (P.6). Baker and Saldanha (2009) also hold that the practice of translation was for a long

time, and in some cases remains, deeply implicated in the religious ideology, as it can be seen in the grim fate of translators such as Tyndale in Britain and Dolet in France. As Claramonte (2003) explains the interaction between ideology and translation, it is of interest to many contemporary authors who tackle it from different perspectives. Furthermore, Schäffner (2003) elucidates the relationship between ideology and translation. Schäffner (2003) argues that:

"The relationship between ideology and translation is *multifarious*. Any translation may be reproduced as ideological since the choice of a source text and the use to which the subsequent target text is put is determined by the *interests, aims, and objectives of social agents*. But ideological aspects can also be determined *within a text itself*, both at the lexical and grammatical level"(P. 23)

## METHODOLOGY

### *Theoretical framework*

The present study examined three different Persian translations of Jean Webster's novel "*Daddy Long Legs*" before and after the Islamic Revolution in 1979 to find the breakdowns and to explore the strategies used by translators to translate the text using the method of Critical Discourse Analyses (CDA) as proposed by Fairclough (1989). To achieve the results, this paper employed three values of words such as experiential, relational, and expressive values.

### *Corpus of the Study*

This study focused on the ideological manipulation in the translation in general, and examined the ideological manipulation in the translation of children's novels in particular. As the methodological tool for examining this factor, the researcher used the Fairclough's (1989) model of CDA since it is more comprehensive with respect to Van Dijk and Wodak's method for examining the ideology of the translator. The samples were extracted from the novel: Webster, J. (1912). *Daddy Long Legs*. Chales L. Webster Publisher.

### *Design of the Study*

The study aimed to identify the ideological terms used in English to Persian translations of children literary text. One of the major concerns of the translation studies was to examine the quality of a translation, especially the ideological manipulation. This study is a descriptive research and had a quantitative design. It dealt with the translation of CHL and compared three Persian translations (including Dana, 1340; Mahdavian, 1375; Solimani, 1388) with the novels written by Webster *Daddy Long Legs* as the original text to find the strategies used to translate the ideological terms before and after the Islamic Revolution in 1979. A method of CDA introduced by Fairclough (1989) was used to start the study. Afterward, the data sources were completely read to find the breakdowns and the strategies used by the translators to deal with such breakdowns.

### *Procedure of the study*

The steps used to perform the present study were as follows: First, the source text and then the translations were carefully read by the researcher and the other research aide with an eye on Fairclough's (1989) three classes of word values namely experiential, relational, and expressive values. Afterward, lexical items (words, phrases, and expressions) that sounded 'different' were extracted from the translations text. Next, the collected data was compared with the corresponding terms in the ST.

### *Data analyses*

In the present study, CDA was used as a methodological tool for the identification of the 'manipulations' that appeared to have an ideological stance in the target texts. The analyses of the three different versions centered around three main word values introduced by Fairclough (1989) including *experiential, relational, and expressive* values.

## RESULTS AND DISCUSSION

To answer the first question regarding whether the ideological terms are used in the translation of children literature texts from English into Persian text, the present study considered the "*Experiential values, Relational values, and Expressive value of words*" based on Fairclough's (1989) model:

### *Experiential values:*

#### *Sample:*

"The only drawback to my perfect, utter absolute happiness was the fact Mr. Lippett couldn't see me leading the **cotillion** with Jimmie McBride"(Webster, 1912, P. 200).

- 1- "تنها نگرانی من در این شادی و خوشی و لذت این بود که مادام لپیٹ در آنجا حضور نداشت مرا با جیمی ماک براید ببیند که چگونه رقص را افتتاح کردم." (دانا، 1340: 155)
- 2- "تنها چیزی که شادی عمیق و فوقالعاده ام را خدشه دار می کرد این بود که خانم لپیٹ در مجلس نبود که من و دوستانم را ببیند." (مهدویان، 1375: 110)
- 3- "تنها نقص این شادی کامل و بی نقص این بود که خانم لپیٹ نمی توانست خوشحالی من و جیمی مک براید را ببیند." (سلیمانی، 1388: 145)

Through transliteration and gloss use the back translation to be easily understood, the above extract is from part '31<sup>st</sup> December'. In Mahdavian's ideology for rendering the ST to the TT, he translated '**cotillion**' to 'مجلس نبود که من و دوستانم را ببیند', his addition in the target text was an appropriate example of paraphrasing strategy. In this way, the story became closer to the target-language audience. In the Persian and Islamic culture, '**cotillion**' is also not a lawful action, and has negative impact on the children's belief. Therefore, Mahdavian's strategy became closer to the target-language audience. Solimani's manipulation to render the ST was similar to Mahdavian's strategy, whereas in Dana's strategy, she did not consider the Persian children's needs. She should submit a better term that was closer to the TT culture and lacked the bad effect on the Persian children. As a result in the first question, the words '**dance**', '**ballgame**', '**Bless**', '**cotillion**', '**monkeys**', '**مشروب**', were the ideological terms that the translator manipulated. Such terms were summarized in Table 1. The following abbreviations used to describe the results:

EE: Euphemistic expression  
EV1: Experiential value  
EV2: Expressive value  
RV: Relational value  
TT1: Dana's Target text

TT2: Mahdavian's Target text

TT3: Soleimani's Target text

OR: Original word

Table 1: Ideological terms according to Experiential value of Fairclough's (2001) model

OR (EV1)	TT1	TT2	TT3
Alcohol	مشروب	الکل	مشروب
Monkey	—	میمون	—
Cotillion	رقص	حذف	خوشحالی
Bless	خدا ترا حفظ کند	خدا پشت و پناهت	خدا پشت و پناهت
Dance ,ball game	در مجلس بال	ضیافت و بازی	جشن
Dance	رقصیدن	حذف	پیش آنها باشد

**Relational value:****Sample:**

"Jimmie McBride is going to have a college friend visiting him part of the summer, so you see we shall have plenty of men to **dance** with" (Webster, 1912, P. 90).

1- "جیمی مک براید یک نفر از رفقای دانشکده اش را دعوت کرده که بیشتر تابستان با آنها باشد بنابراین بقدر کافی مرد بر هست که با ما برقصند". (دانا، 1340: 195)

2- حذف (مهدویان، 1375: 180)

3- "جیمی مک براید هم قرار است از یک نفر از دوستان دانشکده اش بخواهد که مدتی از تابستان پیش آنها باشد". (سلیمانی، 1388: 191)

This example is from part "2<sup>nd</sup> June". Translator 1 strategy for ideological manipulation was literal translation. According to the Islamic culture and law, the word '**Dance**' is not appropriate for children literature. She had to submit a word that considered Persian children's needs and had to make the translation closer to the target language culture, especially with regard to its bad effect on the Persian children. Translator 2 omitted this sentence and translator 3 omitted the word '**dance**'. As a result in the first question, the words '**dance**', '**ballgame**', '**Bless**', '**cotillion**', '**monkeys**', '**مشروب**', were the ideological terms that the translator manipulated. These terms were summarized in Table 2. Therefore, in the first hypothesis, the words '**sauced**', '**samples**', '**naughty puppy**', '**bottle of rum**', '**dance**' were manipulated since they were considered the ideological terms.

Table 2: Ideological terms according to relational value of Fairclough's (2001) model

OR (RV)	TT1	TT2	TT3
Dance	رقصیدن	حذف	پیش آنها باشد
Care-time	زندگی آزاد و بیقید	حذف	فارغ الیال
Bottle of rum	حذف	حذف	بطر رام
Naughty puppy	حذف	توله سگ	توله سگ شیطان
sauced	شاشیده	خیس کردن	حرف بی ادبانهای زدن
Samples	خانم سمپل	خانواده سمپل	خانم سمپل
Run away	قاجاق شویم	جیم شویم	فرار کنیم

**Expressive value:**

"Bless you my child" (Webster, 1912).

1- "خدا ترا حفظ کند". (دانا، 1340: 200)

2- "خدا پشت و پناهت دخترم!" (مهدویان، 1388: 180)

2- "خدا پشت و پناهت بچه جان" (سلیمانی، 1375: 193)

This portion was extracted from part "3<sup>rd</sup> August" the word '**Bless**' had the religious connotation, and translated to '**خدا**'. This word did not appear in the ST. In the present study, the expressive value was to do with the persuasive language pertaining to the constant emphasis

on the belief in God and the idea that God was the sole source of power and authority, and the three translators chose the addition strategy to translate this ST item. Table 3 shows the words that the translators manipulated:

Table 3: Ideological terms according to expressive value of Fairclough's (2001) model

OR (EV2)	TT1	TT2	TT3
Monkey	حذف	میمون	حذف
Bless you	خدا ترا حفظ کند	خدا پشت و پناهت	خدا پشت و پناهت

To answer the second question, the following table provides the descriptive statistics on the strategies used in the three translated version's of the English book.

Table 4: Descriptive statistics of the translation strategies in the three translated versions

Strategy(EV1)	TT1	TT2	TT3
Addition	33.3 0/0	26.6 0/0	39.9 0/0
Omission	33.3 0/0	39.9 0/0	19.9 0/0
adaptation	0 0/0	0 0/0	19.9 0/0
Literal translation	33.3 0/0	33.3 0/0	19.9 0/0

In the version translated by translator 1(1340), the target text (TT1) strategies on addition, omission, and literal translation were identical. 33.3 percent of the 100 percent was related to addition, omission, and literal translation and TT1 did not use adaptation strategies, whereas in the version translated by translator 2 (1375) (TT2), the most used strategy was the literal translation with 39.9 percent out of 100. Similarly, there was no adaptation strategy such as translator 1 strategy. In the target text (TT3), translator 3 strategy, the strategy used most was addition. Therefore, the strategy of the ideological manipulation was different according to the period of time, i.e. before and after the Islamic Revolution in 1979. With respect to the third research question regarding whether a different strategy used in the ideological manipulation before and after the Islamic Revolution in 1979, this study considered the three word values in Fairclough's model, and analyzed the strategy of the ideological TT1 (Dana, 1345) before the Islamic Revolution with the strategy of TT2 (Mahdavian, 1375) after the Islamic Revolution.

Sample text:

"To Princeton, to attend a **dance** and a **ballgame**, if you pleased!" (Webster, 1912, P. 101).

1- "برای اینکه در مجلس بال آنها استفاده کنیم". (دانا، 1340:250)

2- "برای شرکت در ضیافت و بازی". (مهدویان، 1375:200)

3- "تا با اجازه شما در جشن آن دانشگاه شرکت کنیم". (سلیمانی، 1388:210)

This extract was from part "24<sup>th</sup> April". The extracted words, **dance** and **ballgame** were kinds of dance that were popular in the foreign culture, unlike the Persian culture. According to the Iranian culture, men are not allowed to dance. Further, it is prohibited in Persian Islamic culture. Translator 3 translated the words '**dance** and **ballgame**' as 'جشن'; this addition in the TT was appropriate example of the paraphrasing strategy. In this way, the story became closer to the target-language culture. translator 2 translated it as 'وضیافت و بازی' and translator 1 translated it as 'مجلس بال', translator 2 strategy added the words 'جشن'; it seems that this was a sort of distortion that pointed to the intervention of the religious-conservative ideology. In this way, the story became closer to the target-language audience, especially for the Persian children. In Dana's strategy, Persian children's need was not considered; however, she submitted a word that was closer to the target language culture. This study compared the strategies used by three translators, whereas translating Webster's book "Daddy Long Legs". Therefore, once the study compared the translation by Dana (1340), before the Islamic Revolution, and the translation made by translator 2 (1375), after the Islamic Revolution. The strategies used by the translators for the ideological manipulation of the children's novel were addition, omission, adaptation, and literal translation.

## CONCLUSIONS AND PEDAGOGICAL IMPLICATIONS

Three different translated versions of a children's novel before and after the Islamic Revolution in 1979 indicated that during the time Dana (1340) translated this work, there was not so much prohibitions for people on dancing, even in children's novels, whereas during the time Mahdavian (1375) translated the work, the laws changed following the Islamic Revolution in 1979. New sort of power and law were put into effect (Islamic culture). Hence, people's beliefs and thinking that unconsciously affect the ideology of people, in general, and writers, publishers, and translator, in particular differ. Therefore, after lapse of time, some roles such as allowing dance between men and women changed in the Islamic culture. In the Mahdavian version, there was a high distortion of a ST; it was more omission on the ST. The translator omitted the whole term in order to deal with an ideological item or phrase that deviate the norms in the target culture. Furthermore, based on the analysis of fifteen sentences chosen based on three word values of Fairclough's (1989) method, the present study showed that lapse of time had an important impact on changing the ideology of the translators. It was found that the Islamic Revolution had a crucial impact on the nature of used strategy by translators of novels written for children. Therefore, the strategies were utilized by the translators for the ideological manipulation of children novel, and these strategies were consciously or unconsciously changed with the lapse of time and power of the government. Hence, a shift was observed in the application of the strategies before and after the Islamic Revolution. In this regard, the present study suggests some pedagogical implications. It is clear that the translators manipulated the source text because of conscious and unconscious factors. This study identified the ideological manipulation on children novel, in particular children literature in the lexical choices in three different translations' version of the Webster (1912) novel. It may emphasize that further research in the translated children's literature is needed. The researcher notes that very little has written about the theoretical aspect of translating children's literature into Persian, and the constraints that govern any literature entering the Iranian children's literature. In addition, the researcher

intends to highlight the point that requires further research on the translation of picture books and inter-textual references in children's literature. As a result, the present study shed some light on the translation of children literature. It also specifically shed light on the translation of the novel. Moreover, the translators can use the explored strategies for the ideological manipulation of children novel.

## ABSTRACT

There are many researches on thematic progression in English texts, but it is very limited research of the thematic progression in Sundanese texts. This article tries to describe the thematic progression in Sundanese texts which are written by Sundanese female writers. The data obtained from a collection of short stories in Sundanese language which is written by eleven Sundanese female writers. The employed method is descriptive method. The present researcher analyzes and describes the data from eleven paragraphs. The result shows that 27% the Sundanese female writers use simple thematic progression and 73% use multiple thematic progressions. There are three types of simple thematic progression; they are linear theme (9%), constant rheme (9%), or constant theme (9%). The multiple thematic progressions have three different types; two element thematic progression (36.50%), three element thematic progression (18.25%), and four thematic progression (18.25%). It is concluded that the dominant thematic progression used by Sundanese female writers is the two element thematic progressions as the part of multiple thematic progression.

**KEYWORDS:** Thematic progression, Sundanese Female Writers, Sundanese texts, simple thematic progression, multiple thematic progressions

## INTRODUCTION

Indonesia is an island country that has many local languages. Referring to Summer Institute (SIL) International publication, based on the 2000 census, Indonesia has 719 local languages and thirteen of them have died as mentioned the following “*The number of individual languages listed for Indonesia is 719. Of these, 706 are living and 13 are extinct. Of the living languages, 21 are institutional, 97 are developing, 248 are vigorous, 265 are in trouble, and 75 are dying.*”

Sundanese as one of the living languages is the second rank of the speaker population, after Javanese. As the living language, Sundanese should be maintained well to avoid the extinction. That is why the present writer needs to do research on Sundanese language besides she is a native of Sundanese language.

Recently, many researches are on thematic progression in English texts as described by Zhu Yongsheng (1995), his research on *Patterns of thematic progression and text analysis* or Eva Tuckyta Sari Sujatna on *Thematic Progression in Business English Paragraphs* (2011).

This article tries to describe the thematic progression of Sundanese texts which are written by the Sundanese female writers. This research based on the two formulation of the study, they are 1) what thematic progression used by Sundanese female writers? and 2) what pattern of thematic progression used by Sundanese female writers?

The approach applied on this research is Systemic Functional Linguistics (SFL) as found by Halliday. He introduces his approach on his well known book “*An Introduction to Functional Grammar*” which is being revised in 1994 and 2004 with Matthiessen.

This approach concern clause in three different metafunction of meanings, they are clause as message, clause as representation, and clause as exchange. This article observes clause as message in every clause in the Sundanese female writers’ paragraph to obtain the thematic progression.

Clause as exchange concerns mood and residue. Mood itself is represented by subject and finite while the residue is the rest of the mood. The mood type can be classified mainly into indicative and imperative, while the indicative itself classified into declarative and interrogative (Sujatna, 2013: 51).

Clause as representation or transitivity concerns three mainly things, they are process, participants, and circumstances. Processes in Sujatna (2013) which in line with Halliday and Matthiessen (2004) and Deterding and Poedjosoedarmo (2001) are six types. They are material process, mental process, verbal process, relational process, behavioural process, and existential process. Every process influenced the types of the participants.

Clause as message, as the main point of this research, concerns theme and rheme. Theme and rheme in a clause can help readers to understand the message or information in a clause. A theme in a clause comes first and followed by the rheme. It is still be possible in English clauses there is only a rheme without a theme. In Sujatna (2013: 13), she argues that “A writer puts the theme first and this orients the reader to what is about to be communicated.” Theme can be identified as marked and unmarked theme. Unmarked theme is the theme that usually known as subject (grammatical subject). It can be pronouns, proper nouns, nominal group, or nominalization. The marked theme is classified into four types. They are complement as marked theme, adjunct as marked theme, predicator as marked theme, and prepositional phrase as marked theme. Based on the form, the theme can be identified as simple and multiple themes. The simple theme consists of one element while the multiple themes consist of more than one element.

A text can be said as cohesive and coherence text if they (the clauses) tight each other as Hasan mentioned in Paltridge (2000: 139) “*Cohesive devices help a text hang together, or be cohesive. That means they contribute to what Hasan terms a text’s ‘unity of texture’. The schematic structure of the text, in turn, provides a text with ‘unity of structure.’*”

Thematic progression is also known as schematic structure or method of development of a text as Hasan (1989) in Paltridge (2000: 140), “*The notions of theme and rheme are also employed in the examination of thematic progression, or method of development of a text. Thematic progression refers to the way in which the theme of a clause may pick up, or repeat, a meaning from a preceding theme or rheme.*” In other words, the thematic progression consists of theme and rheme that refers to the way in which the theme of a clause may pick up.

Deterding & Poedjosoedarmo (2001) in line with Paltridge (2000) divide the types of thematic progression into *constant*, *linear*, *split* and *zig-zag*. The constant, linear, and split thematic progression could be in theme and rheme so that it becomes constant theme and constant rheme, linear theme and linear rheme, and split theme and split rheme. In this article the present writer divides the thematic progression into seven types. They are: constant theme, constant rheme, linear theme, linear rheme, split theme, split rheme, and zigzag. The followings are the illustration of the thematic progression.

**Constant Theme:**

**Constant Rheme:**

**Linear Theme:**

**Linear Rheme:**

**Split Theme:**

**Split Rheme:**

### Zigzag:

### METHODOLOGY

The employed method is descriptive method. The present researcher analyzes and describes the data from eleven paragraphs. The paragraphs are taken randomly from the eleven Sundanese short stories which are written by eleven Sundanese female writers. The title of the collection of the short stories is *Berlian IICarpon Wanoja*. This book is published in 2013. Firstly, the present researcher, find a paragraph from every short story. Secondly, the present researcher analyzes the paragraph based on the thematic progression. Thirdly, the present researcher classifies them into the type of thematic progression whether they are simple or multiple thematic progressions. Finally, the present researcher can obtain the dominant thematic progression used by the Sundanese female writers.

### RESULT AND DISCUSSION

As the present writer mentioned earlier, this article tries to describe the thematic progression of the Sundanese female writers in their short stories. The data collected are the paragraph obtained randomly, one paragraph from one writer, so that the data becomes eleven paragraphs.

Based on the research, from the eleven paragraphs, the present writer found that the thematic progressions of the Sundanese female writers mainly are simple and multiple thematic progressions as seen in following table.

Table 1: Sundanese Female Writers' Thematic Progression Type

No	Thematic Progression Type	Element of Thematic Progression
1	Simple	- Linear Theme - Constant Rheme - Constant Theme
2	Multiple	- Constant Theme and Linear Theme - Linear Rheme, Constant Theme, and Linear Theme - Constant Theme, Linear Rheme, Linear Theme, and Split Rheme - Constant Rheme, Zigzag, Linear Rheme, and Constant Theme

The table 1 shows that the thematic progression types used by the Sundanese female writers are simple and multiple. From the data, the simple thematic progression identified as linear theme, constant rheme, or constant theme. The multiple thematic progressions identified as two element thematic progressions, three element thematic progressions, and four element thematic progressions. The two element thematic progression found is constant theme and linear theme while the three element thematic progressions found is linear rheme, constant theme, and linear theme. The four element thematic progressions found are two groups. The first group is constant theme, linear rheme, linear theme, and split theme while the second group is constant rheme, zigzag, linear rheme, and constant theme. The following chart is the percentage of each type.

Chart 1: The Sundanese Female Writers' Thematic Progression Type

Chart 1 describes that the multiple thematic progression (73%) is the dominant used by the Sundanese female writers while the simple thematic progression is 27%. The data obtained from the eleven paragraphs. It means that the three types of simple thematic progression, each reaches to 9% as described in chart 2 while the multiple thematic progression which has three different groups is described in chart 3.

Chart 2: The Simple Thematic Progression

Chart 2 shows that the linear theme reaches 9%, constant rheme reaches 9%, and constant theme reaches 9% or one writer from the eleven Sundanese female writers. The following chart is the description of the multiple thematic progressions element chosen by the Sundanese female writers.

Chart 3: The Multiple Element of the Thematic Progression

Chart 3 describes that the two element thematic progression is the dominant one (36.50%) or four writers from the eleven Sundanese female writers. The three and the four element thematic progression reach 18.25% or two writers of each from the eleven writers. The thematic progression chosen by the Sundanese female writer which has two elements are constant theme and linear theme (two writers from eleven writers) and linear rheme and constant theme (two writers from the eleven Sundanese female writers). Totally, the two element thematic progression is four writers (36.50%) from the eleven Sundanese female writers. The three element thematic progression is linear rheme, constant theme, and linear theme (two writers from the eleven Sundanese female writers). The four element thematic progression is two groups. The first group is constant theme, linear rheme, linear theme, and split rheme (one writer from the eleven Sundanese female writers) and the second group is constant rheme, zigzag, linear rheme, and constant theme (one writer from the eleven Sundanese female writers).

## CONCLUSION

Based on the result of the research of thematic progression of the Sundanese female writers, it is concluded that the Sundanese female writers use both simple and multiple thematic progression in their paragraphs. As the result, the dominant thematic progression used by the Sundanese female writers is the two element thematic progression as the part of multiple thematic progressions. As a preliminary study, the present researcher hopes this research can be a trigger for the next research in other languages.

### ABSTRACT

Teaching vocabulary is one of the main components of any language teaching methods concerned with English as a second or foreign language (ESL/EFL). Therefore, this study investigated the role of topic familiarity in developing vocabulary retention and recall through incidental teaching of vocabulary among intermediate bilingual (i.e., Arabic/ Farsi) and monolingual (i.e., Farsi) students. Administering a homogeneity proficiency test (Fowler & Coe, 1975) at the intermediate level, 60 students (i.e., 30 bilinguals and 30 monolinguals) were randomly selected and divided into two groups as the participants of the study. They participated in six weeks of teaching vocabulary while both groups received the same instruction and materials. Two types of topics (i.e., familiar vs. unfamiliar) were adopted among the pool of topics and the participants were taught the intended vocabularies during the research period. Data analysis was administered through Independent Samples *t*-test at the end of treatment period to assess the learners' differences on the level of vocabulary retention and recall. The results showed the difference between the two groups was significant ( $p < .05$ ). In other words, the group who dealt with familiar topics outperformed the group who worked on unfamiliar topics concerned with vocabulary achievement post-test. The results also indicated that bilinguals outperformed monolinguals in vocabulary learning. In sum, it may be claimed that topic familiarity can enhance incidental vocabulary acquisition in reading comprehension skill, especially among bilinguals rather than monolinguals.

**KEYWORDS:** Topic familiarity, vocabulary, bilinguals, monolinguals

### INTRODUCTION

Recently, there has been a spate of interest in how to teach vocabulary and why the rate of second language incidental vocabulary learning is lower for some learners as opposed to others (Widdowson, 1980). Moreover, some factors may contribute to the individual differences observed for vocabulary acquisition through reading, and some can affect language output (speaking and writing). According to Hulstijn (1993), these factors, likely to be involved in reading, are both interactive and compensatory. When a component of processing is deficient, it can be compensated for by other components of processing (Stonovich, 1980, p.65).

According to schema theory (Stonovich, 1980), the degree to which successful compensation may be achieved depends upon previous knowledge. Sometimes the level of reading skills becomes relevant to text processing and comprehension (e.g. when background knowledge is limited); and sometimes the level of background knowledge may be more significant (e.g. when reading skill is limited).

Pulido (2004b, p.37) pointed out that cultural familiarity has direct and positive relationship with vocabulary acquisition. In her work, Pulido (2007, p.14) proved that her students learning Spanish language could guess the meaning of nonsense Spanish vocabulary items better through reading with more familiar topics than less familiar ones.

Background knowledge has been known to influence text processing, comprehension and lexical inferencing during reading (Al-Shumairei, 2006; Othman, 2007; Schmidt-Rinehart, 1994). Thus, this factor should be determinant of vocabulary development through reading as well as reading and listening comprehension. On the other hand, background knowledge has been known to influence language output (speaking and writing) (Pulido, 2004a; 2007). However, this line of research has been scarcely investigated concerned with the impact of topic familiarity on vocabulary acquisition and language output through reading (Nation & Waring, 1997). To this end, the present study considers the impact of topic familiarity on language output and incidental vocabulary retention and recall through reading of familiar and unfamiliar topics (Lewis, 1993).

### *Statement of the problem*

Developing vocabulary knowledge of second or foreign languages has always been the main concern of not only the learners of English but also those who want to learn English language outside the atmosphere for communicative contexts (Nation & Waring, 1997). On the other hand, developing vocabulary knowledge of the students has been the main concern of teachers who teach second or foreign language, and it is surprising for them why the rate of second language vocabulary learning is lower for some learners as opposed to others (Nation, 2001).

The teachers and researchers also wonder if there are any differences in vocabulary acquisition of bilingual and monolingual learners of English as a foreign language (EFL) through reading. Most of previous studies have been done on monolingual language learners (Carrell, 1987). Another point is that most of the studies (Johnson, 1981) were related to the effects of cultural familiarity, proficiency and sight vocabulary on vocabulary acquisition, and some studies (Pulido, 2004a) have focused on reading comprehension as dependent variable.

However, despite the research boom in the area of topic familiarity, on the one hand, and vocabulary acquisition on the other hand, no study has been done on both monolingual and bilingual English learners. This study aims at studying the role of topic familiarity in vocabulary acquisition among bilingual and monolingual EFL learners.

### REVIEW OF LITERATURE

According to Pulido (2007), the hypothesis that vocabulary gain and retention would be superior after reading stories that depicted more familiar as opposed to less familiar scenarios is not consistently supported. First, there was no effect of topic familiarity obtained on the translation measure. That is, for both models, gain and retention of new vocabulary were not affected by the conditions under which the new

vocabulary was encountered (i.e., more vs. less familiar scenarios). Second, on the more robust translation recognition measure, the effects due to topic familiarity were obtained only on the initial measure of gain, when tested concurrently with each of the L2 proficiency vocabularies. That is, at short-term intervals (i.e., 2 days after reading), learners at all proficiency levels demonstrated greater vocabulary gains after reading the texts for which they reported greater levels of familiarity. Thus, this finding provides partial support for schema-theoretic and knowledge-based views of learning and memory, wherein the possession of appropriate background knowledge is assumed to facilitate attention allocation, the construction of mental representation, and in her study, the forging of form-meaning connections for new words. Pulido concluded that at least at time intervals in the short term, it is assumed that greater familiarity (i.e., expertise with the topics depicted within the scenarios) provides a cognitive foothold from which to construct and integrate information about new words.

Ellis (1994) provides another perspective and additional information concerning the role of background knowledge in the process of incidental vocabulary acquisition. This is accomplished via an experimental design that (a) oriented learners to the more naturalistic task of reading for comprehension (as opposed to a task that oriented learners to guess the meaning of unfamiliar and/or target words) and (b) subsequently assessed participants' memory for specific new form-meaning connections that may have been established during reading.

However, in the light of the unexpected two-way interaction between topic familiarity and time obtained in both models when translation recognition served as the dependent measure, it appeared that any effects on vocabulary gain that may be due to topic familiarity are only short-lived. Contrary to her expectation, there was a significant decrease in memory over time (4 weeks) for the target words encountered within the more familiar stories. That is, if there was subsequent learning of the real words corresponding to the underlying concepts of the target words from the more familiar stories, learners may have experienced interference at the second testing interval. So, in her study the hypothesis could not be confirmed, however, as there was no measure administered to detect learner look up or learning strategies between testing intervals.

#### ***Text comprehension and second language vocabulary acquisition***

Mackey (2000) examined the relationship between text comprehension and second language vocabulary acquisition through reading more and less familiar texts. She found out whereas the role of passage comprehension in incidental vocabulary gain and retention through reading was in general robust, the nature of the relationship between passage comprehension and intake was inconsistent, instead fluctuating as function of the reader's background knowledge.

Level of comprehension achieved from reading the brief script-based narrative passage proved integral to incidental gain and retention of semantic feature of new L2 lexical items from the passages. Increases in passage comprehension as demonstrated by the recall of semantic propositions, were accompanied by increases in gain and retention of the target nonsense words that appeared in those passages (Hulstijn, 1992).

According to Pulido (2004a), it is assumed that with greater levels of comprehension contextually relevant passage information becomes and remains more available in working memory. This may have enhanced the potential for relevant background knowledge to be activated during the process of constructing a mental representation of the passage, which, in turn, would have increased the likelihood of successful lexical inferencing to resolve the meaning of any unfamiliar words deemed relevant or important during reading.

According to Koda (2005), the strategic explicit processes that are assumed to have contributed to these lexical gains through reading included, to some unknown degree, (a) noticing that certain words were unfamiliar and that there was a gap in existing knowledge; (b) inferring meaning from context using linguistic and extra linguistic, or background knowledge; and (c) elaborative rehearsal, or attending to the connections between the new lexical forms and their meanings and associating the new words with previous knowledge.

Furthermore, the above insights showed that topic familiarity affected text processing, comprehension, and lexical inferencing and gain, but it did not affect the role that text comprehension played in incidental vocabulary gain, and this was demonstrated by the lack of a significant correlation interaction between passage comprehension and topic familiarity. The greater the level of passage comprehension is, the greater is the gain, regardless of the reader's level of familiarity with the topic. On the other side, there is a direct relationship between passage comprehension and intake of new lexical forms encountered through reading (Richards & Rodgers, 2001).

Pulido (2004a) says, the level of passage comprehension is less closely related to the level of intake, when learners read within the more familiar scenarios than when they read within less familiar scenarios. And as comprehension improves, recognition memory for the target words from the less familiar conditions surpassed memory for the target words from the more familiar conditions. She adds the better comprehend pay less attention to the target words while reading within the more familiar and easier topics. Next, when vocabulary gain is considered, more target words were initially remembered from the more familiar stories.

Wode (1999) claims the construction of a coherent mental representation of a text involves the interaction between explicitly stated textual information and background knowledge. According to Paribakht and Wesche (1999), to the extent that the construction of mental representation of script-based texts improves, the accessibility of lexical form, but not meaning, from those texts also appears to be influenced by the interaction between explicitly stated textual information and background knowledge. The greater the level of comprehension, the greater the chances of making form-meaning connections for new lexical items encountered through reading.

#### ***Content familiarity and reading comprehension***

Al-Shumairei (2006) examined the relative effects of content familiarity and language ability on texts comprehension performance. Al-Shumairei found out, content familiarity was found to have significantly affected the students' overall comprehension performance.

According to Al-Shumairei (2006), the lack of prior knowledge (content familiarity) seems to affect to the low-ability students but not the high-ability students. One possibility is that background knowledge helps readers at a certain proficiency level but not those at other levels. The other possibility is related to language ability effects; that is, the lack of prior knowledge seems not to hinder the high-ability students' performance on the unfamiliar passages as their proficiency level compensates for this lack of familiarity and they perform better (Zimmerman, 1997). Therefore, the knowledge of language including vocabulary and reading skills may help the high-ability students to overcome the unfamiliarity of topic and content. The language knowledge frees the learners' cognitive resources to make effective use of the skills and strategies of their comprehension procedures.

## RESEARCH QUESTIONS

The main questions to be pursued in this study are as follows:

1. To what extent does topic familiarity affect L2 incidental vocabulary retention and recall of intermediate EFL learners?
2. Is there any difference, in terms of vocabulary acquisition, between monolingual and bilingual learners?

## METHODOLOGY

### Participants

The research was conducted with the help of 60 participants majoring in EFL. They were at the second year and enrolled in Reading Comprehension course. They included 30 monolingual Persian speakers and 30 bilingual Arabic–Persian speakers including 34 males and 26 females. The participants were selected on the basis of availability out of 120 students from Islamic Azad University of Ahvaz. The bilingual participants were selected out of a 50 bilingual population and monolingual participants were selected out of 70 monolingual population. The participants' age ranged from 19 to 43 years old.

### Instrumentation

*Translation recognition test:* The test was administrated to evaluate the recall process and vocabulary acquisition of the participants. In this 40-item test, the participants were asked to recognize the equivalent translation of the vocabulary items. In order to have a reliable test, they conducted a pilot study and calculated the reliability coefficient of the test. The test was administrated to fifteen students of the same level of the participants. Using KR–21 formula, the reliability of the test was met at ( $r=.76$ ).

### Materials

1. *Passages:* The texts used for the present study were eight narrative passages, four pertaining to more familiar topics and four to less familiar topics. The texts were selected from Alexander (1967) "*Developing Reading Skills*" and Alexander and Vincent (1986) "*Make Your Point*".

2. *Target words:* Forty lexical items (noun, verb, and adverb), representing concepts frequently associated with the stories, were chosen evenly from among the eight stories, that is, five per story.

### Procedure

This study followed a pre–test and post–test design to evaluate the role of topic familiarity in language output and incidental vocabulary retention and recall through reading among monolingual and bilingual EFL learners in Ahvaz Islamic Azad University. To this end, the participants were divided into two groups of monolingual (Persian speaker) and bilingual (Arabic–Persian speaker) learners i.e. each comprised 30 learners. Then, the researchers examined the level of learners' familiarity and their background knowledge of on the content of the passages through a questionnaire (Al-Shumairei, 2006). This made the researchers sure that the participants were unfamiliar (or less familiar) with four of the text book passages. As mentioned earlier, no participant was expected to know the meaning of any of target words. For this, before reading each text, the researcher derived the target words from the texts and asked the participants about the meaning of these words to know whether or not the participants knew anything about these words, because the researcher was going to study the acquisition of these target words, so these words must not be known before the study.

The study lasted about six weeks (five sessions). In the first phase, two passages (one familiar and one unfamiliar) were provided for participants to be studied and worked on. After studying the texts as reading comprehension activity, providing a 10–item translation–synonym production test (five for familiar and five for unfamiliar text), the researcher asked about the meaning of target words and assessed the vocabulary retention of the participants. Following the retention test, the participants were asked to rewrite the stories using every vocabulary item that they could remember. The researcher did this to evaluate how many of target words the participants could remember and use in the process of rewriting. In the second, third, and forth weeks, the researcher did the same but on the other texts. During the last phase, in the sixth week (two weeks after the last session of treatment) the researcher administrated a forty–item translation recognition test (as a post– test) to assess the recall process of the participants. That is, all participants completed a measure of word recognition memory.

This procedure was piloted by Pulido (2004a, 2007) and Al-Shumairei (2006) in their researches. Before reading each passage, all participants were oriented to the task of reading for the purpose of answering comprehension questions of the passages.

## RESULTS AND DISCUSSION

To test the research hypotheses, the researcher compared monolingual and bilingual students' performance in using topic familiarity, a parametric technique for analyzing the quantitative data. In this study, the independent variable was topic familiarity with two levels including familiar and unfamiliar texts. In this way, the study investigated the role of the two independent variables through *t*–test, in order to find out, whether or not topic familiarity influences learning incidental vocabulary (i.e. , dependent variable) of monolingual and bilingual (i.e. moderate variables) Iranian EFL students at the intermediate level. To do so, the descriptive statistic compared the means of two monolingual and bilingual groups with each other and also presented means and standard deviations of the two groups who focused on familiar and unfamiliar topics in pairs for learning vocabulary achievement.

In this case, the hypothesis of mean equality of two groups was rejected ( $p<0.05$ ), and also the students' mean in using familiar topics (Mean=14.18) was greater than the students' mean in using unfamiliar topics (Mean=11.95). Too, the difference of the confidence interval showed these results based on which the topic familiarity had a significant effect on incidental learning vocabulary and the first null-hypothesis was rejected. The results are shown in Tables 1 and 2 as follows:

Table 1: Descriptive Statistics of Vocabulary Achievement(Pre-test vs. Post-test)

Groups			N	Mean	Std. Deviation	Std. Error Mean
Familiar Topic	60	14.18	3.028		.391	
Unfamiliar Topic	60	11.95	3.175		.410	

*Table 2: Paired Samples t-test of Vocabulary Achievement (Pre-test vs. Post-test)*

	Groups	t	df	Sig. (2 tailed)	Std. Error Mean
Familiar Topic vs. Unfamiliar Topic	3.998 59	.000		.559	

The paired Samples *t*-test was run on to compare the mean score of the bilingual group (A) and monolingual group(B) in using familiar topics in learning incidental vocabulary and it yielded statistically significant difference. The results of *t*-test for the effect of these familiar topics in learning vocabulary as independent variables statistically indicated mean differences. To evaluate the effects of familiar topics on learning vocabulary by bilingual and monolingual students, the sample means of bilingual and monolingual groups were compared.

*Table 3: Descriptive Statistics of Vocabulary Achievement (Bilinguals vs. Monolinguals)*

	Groups	N	Mean	Std. Deviation	Std. Error Mean
Monolinguals	30 13.17	2.601		.475	
Bilinguals	30 14.73	2.741		.500	

Tables 3 shows that bilingual students had a better performance in using familiar topics in learning incidental vocabulary than the monolingual group's and the second null hypothesis was also rejected. Table 4 indicates the results of *t*-test.

*Table 4: Independent Samples t-test on Vocabulary Achievement (Bilingual vs. Monolingual)*

	Groups	t	df	Sig. (2 tailed)	Std. Error Mean
Monolinguals vs. Bilinguals	2.271 58	0.027		.690	

The results of Independent Samples *t*-test showed a significant difference between bilingual and monolingual groups in using familiar topics in learning incidental vocabulary. According to T-distribution table (Hatch & Farhady, 1999, p. 267), a ratio of observed *t* (-2.271) was calculated for a .05 level of probability. The ratio was much greater than the critical *t* (2.000); therefore, the differences between two groups were statically significant. The hypothesis of equality of means of two group was rejected, because the ( $p=0.027<0.05$ ) and also the mean of the bilingual group (Mean=14.73) was higher than the mean of the monolingual group (Mean=13.17).

### **Discussion**

In the present study, in order to measure the short term vocabulary retention of the EFL learners between familiar and unfamiliar texts, four quizzes were administered each session (one at the end of each session). Then they were asked to rewrite the stories (i .e. familiar and unfamiliar) using new vocabulary items (target words). The mean of vocabulary items used in rewriting activities showed that the learners' performance was better on familiar topics in both activities (quizzes and rewriting activities). This showed that all the participants stored vocabulary items of familiar text book contents better than those of unfamiliar texts book contents.

H01. Topic familiarity does not significantly affect L2 incidental vocabulary retention and recall of intermediate EFL learners.

The results appeared to support the schemata theory of reading and research on L2 reading. According to Anderson (1977), schema theory of reading, knowledge of text content can facilitate comprehension during encoding/decoding process by providing a knowledge structure to which readers can compare and fit pieces of incoming information. The results showed that the content familiarity on reading comprehension have significantly affected the learners' overall comprehension performance, and scored higher on the familiar passages, compared with their performance on unfamiliar passages. The findings of the present study are consistent with Al-Shumairei (2006) indicating that background knowledge increases receptive skills, such as passive vocabulary.

Othman (2007) also found that background knowledge and topic familiarity had a significant effect on listening comprehension. Providing the learners with background knowledge as well as systematic knowledge, equips learners with the necessary information to facilitate comprehension of an unfamiliar topic. The findings of this study are also consistent with those of Othman (2007).

Pulido (2003) compared the role of topic familiarity and proficiency on vocabulary acquisition. She got results inconsistent with those of the present study. She found that proficiency had greater effects on vocabulary acquisition, compared to topic familiarity. That is, topic familiarity, according to her results, has little effect on vocabulary retention and recall. But in another study, Pulido (2007) found that cultural and topic familiarity had greater effect on vocabulary acquisition, a finding consistent with those of the present study. As mentioned in the procedure section, every session the participants were asked to rewrite the stories using new vocabulary (target words). The mean of used vocabulary items indicated that they used more vocabulary items of familiar passages (Mean=9.5) than those of unfamiliar passages (M=8.8). These results indicated that topic familiarity has positive effects on elaboration and rewriting the stories using more newly learnt vocabulary items. Comparing the means of quizzes on both familiar and unfamiliar topics indicated that the learners' performance on quizzes (administered at the end of each session) gained higher scores on vocabulary retention and recall on familiar topics rather than unfamiliar topics.

H02: There is no significant difference, in terms of the level of vocabulary acquisition, between monolingual and bilingual learners.

Whether bilinguals or monolinguals are better in vocabulary acquisition is another concern of the present study. The results of *t*-test (Tables

3 and 4) showed that the mean score was higher for bilingual group than monolingual group's mean score. Therefore, bilingual learners used schema and other strategies better than monolingual learners on vocabulary acquisition. It can be implied from the results of this study that bilinguals and monolinguals have different degrees of background application. However, it is necessary to have an adequate explanation in mental factors and strategy use among bilingual and monolingual subjects in the performance of language and vocabulary test. Psychological factors may affect strategy use among bilinguals and monolinguals in the performance on the acquisition of vocabulary items as language element. Another reason may be due to the flexibility of bilinguals' mind which is concluded in Romaine's (1989) study. In discussing that bilingualism affects thought process and language learning Hakuta (1986, p. 15) has pointed out that research on bilingualism in general in the beginning of 20th century was guided by the question of whether bilingualism had a negative effect on intelligence. It was carried out largely on immigrant populations in the United States. More recent work, however, has been concerned to demonstrate a positive effect (Romaine, 1989, p. 99).

A brief glance at the two opposing viewpoints will give an idea of some of the issues on the differences between bilingual and monolingual EFL learners in vocabulary retention and recall. In summary, the results of this research showed that bilinguals outperformed monolinguals. This is consistent with the results of previous study performed by Romaine (1989). He concluded that bilingual persons who are equal in both languages are found to have slightly higher IQ scores than monolingual persons. He also found that bilingualism is associated positively with greater cognitive flexibility and awareness of language.

## CONCLUSION

Incidental or indirect vocabulary learning occurs without the specific intent to focus on vocabulary. During reading, new word meanings are derived and learned even though the reader's purpose for reading is not the learning of new vocabulary. Research on reading and vocabulary learning has identified several factors which contribute to the individual differences observed for incidental vocabulary acquisition through reading. Among these factors are reader's age, reading purpose, inferencing ability, the amount of exposure to unknown words, the amount of verbal ability, dictionary use, and several text and word characteristics (Hulstijn, Hollander, & Greidanus, 1996; Knight, 1994; Swanborn & De Gloor, 2002).

The results indicated that the background knowledge did affect the intermediate bilingual and monolingual EFL learners' vocabulary acquisition. At the end of the course, two sets of post-test from both familiar and unfamiliar texts were administered, and the results of the test were compared to find the effect of background knowledge. The results of the study confirmed that vocabulary acquisition could be improved through familiar topics.

It was discovered through the findings of this study that there is a significant positive relationship between topic familiarity and incidental vocabulary learning. That is to say, when topic familiarity increases, so does incidental gain of new vocabulary. More topic familiar learners demonstrated higher word learning through reading than less topic familiar readers.

Topic familiarity seems to have significantly affected the incidental vocabulary acquisition. While prior knowledge of content seems to have facilitated the reading comprehension and vocabulary acquisition of the students, which was reflected in their performance, the lack of prior knowledge reduced the degrees of both comprehension and vocabulary acquisition.

## Implications

First, language educators need to take advantage of the significant effects of the content familiarity on learners' vocabulary acquisition. Therefore, they should provide low achievers, especially beginners and those at the elementary level, with familiar content in order to enable them to deploy the appropriate skills and strategies to understand the texts and consequently to learn new vocabulary items. Then, they can advance step by step, making the texts more challenging in terms of language difficulty, renewing vocabulary items, and in terms of unfamiliarity of the content as the learners' language ability improves. If the topics and texts are familiar to them, their memory and cognitive resources can be freed somewhat to concentrate on the language-processing aspects such as sentence patterns. They can guess and learn vocabulary items better and better during reading familiar topics. From a parallel viewpoint, the results of this study suggest EFL learners some points. The results indicated that topic familiarity and background knowledge can improve vocabulary acquisition. Thus they can benefit considerably from studying familiar texts and stories to enhance their vocabulary range. More important, bilingual learners benefit from two different languages and consequently they can benefit from two different cultures. So, they may be provided with more familiar texts.

Material designers are well counseled to design their vocabulary activities in such a way that necessitate the employment of background knowledge. Also, they should bear in mind that vocabulary items should be embedded in not only familiar texts but also in a right time and at a suitable level that conforms to the readers' actual potential in cognition, in order for them to comprehend and learn the reading passages and new vocabulary items respectively. That is, material designers should design their materials based on familiar topics for the EFL learners. For example, EFL teachers may use the passages which are familiar and famous for the majority of the learners. They can design the material based on the mother tongue of those bilingual readers for better understanding. Curriculum designers should be aware of some places of our country where there are a lot of bilingual residents who live there to design a complicated and comprehensive plan to aware and select those teachers who are bilingual and teach English in those areas such as Iran.

## Suggestions for Further Research

No experiment is without its limitations. The present study investigated the impact of one reader-based factor of topic familiarity on incidental vocabulary gain. However, other reader-based factors such as proficiency, passage sight vocabulary items, etc. are other variables whose effects on incidental vocabulary gain through reading and its relationship with background knowledge need to be explored.

This study described the gains in knowledge associated with new lexical items in terms of semantic features. Aside from semantic feature, the acquisition of lexical knowledge also consists of learning morphological syntactic, orthographic, and pragmatic features. It is an empirical issue whether or not the same effects associated with the variables of topic familiarity would be replicated when assessing gains of such additional components of lexical knowledge. This matter can be investigated in other studies focusing on incidental vocabulary learning during reading. The brief nature of the texts used in this study may have induced greater levels of use of micro-processing strategies, or more attention to surface structure than might have been the case with the employment of lengthier texts which tend to encourage greater use of macro-processing strategies, or reading to get gist (Swaffar, Arens, & Byrnes, 1991). Future research may also wish to consider the effects of passage length on incidental vocabulary acquisition.

Finally, this study compared Persian speakers as monolingual and Persian-Arabic speakers as bilingual learners. In the future studies, the researchers can compare the speakers of other languages (e. g., Turkish or Kurdish) and also consider the case of gender concerning vocabulary acquisition through reading familiar and unfamiliar topics.

**ABSTRACT**

This article examines the phenomenon of men and women's language. This article focuses on three linguistic features of men and women's language. They are expletives, empty adjectives, and tag questions usage. These three linguistic features used by speakers in their utterances are believed to convey speakers' feelings as well as their social meanings. This qualitative descriptive research socio-linguistically provides the insight of how men and women speak differently through these three linguistic features by Lakoff (1975) and Holmes (2001). The data are taken from a serial film *Friends*. Apparently, the present writer has found out that strong expletives words found in *Friends* characters' utterances are used to show speaker's expression of anger, frightening, start, until frustration and also sometimes to be the curse words to elicit humor. The founding empty adjectives words are to show speaker's expression of joy, interest and also gratitude and speaker's agreement of something. The tag questions are used by speakers not only to show speakers' uncertainty but also to get information more detail, and to involve hearers to agree what speakers have stated before. Another founding mentions that men and women don't speak differently but they just express their feelings in different way through different linguistic features depending on their hearers.

**KEYWORDS:** Expletives, Empty Adjectives, Tag Questions, Gender Marker, Serial Film.

**INTRODUCTION**

In a social interaction, we can find utterances. These utterances are used as a means for humans to express their feelings, besides by using gestures. Through utterances, we can study people's feelings whether they are in sadness, happiness, certainty, or even in an uncertainty. It is because sometimes the utterances contain not only explicit meaning, but also implicit meaning.

In Sociolinguistics, the purpose of the language use as a tool for humans to express their feelings is linked with linguistic features in men and women's language. This linguistic features term was first introduced by Lakoff on her research year 1975 to describe the speech characterization based on speakers' gender. This speech characterization in linguistic features is varied. For example, there is empty adjectives use in people utterances to convey agreement, excitement, etc.

Linguistic features in Sociolinguistics are categorized by speakers' gender. Gender is a system of meaning – a way of constructing notions of male and female – and language is the primary means through which we maintain or contest old meanings, and construct or resist new ones (Eckert & Ginet, 2003). Gender in Sociolinguistics refers to men and women's behavior socially and culturally constructed. In other words, language can be distinguished based on the speakers' gender through different linguistic features usage.

In Sociolinguistics, the different linguistic features usage as a kind of language use for expressing humans' feeling connected to the language and gender issue is shown by the use of 'strong expletives' by men, 'empty adjectives', and 'tag questions' mostly used by women. Strong expletives refer to the language use uttered by the speakers when they curse something really bothering. Empty adjectives are usually found when women want to compliment something they like. Tag questions can be simply considered as yes-no question but, it is a unique one. This question is unique because it has to be preceded by a clause and has its own function in a social interaction.

In short, it is true that from childhood until adulthood or from males until females are believed that they have a different way of speaking from each other. The difference refers to the way of speaking that both reflects and produces a subordinate position in a society. Women's language by Lakoff is rife with such devices as mitigators (*sort of, I think*) and inessential qualifiers (*really happy, so beautiful*). This language renders women's speech tentative, powerless, and trivial; and as such, it disqualifies them from positions of power and authority. In this way, language itself is a tool – it is learned as a part of learning to be a woman, imposed on women by societal norms, and in turn it keeps women in their place. As a result of this argument by Lakoff, there are two most significant theories on social differences between males and females. They are “difference theory” and “dominance theory”.

The “difference theory” between men and women in the same group, living in different or separate cultural worlds resulted that it promotes different ways of speaking (Uchida, 1992). This theory is sometimes called “two-culture theory”. In simple terms, although men and women live in the same environment they establish different relations with society as if each belonged to a different environment and culture, the result of which is consequently reflected in the language of both genders as in other aspects of their lives. So, cross-gender communication is to be taken as cross-cultural or bi-cultural communication. In “dominance theory”, men and women are believed to inhabit a cultural and linguistic world, where power and status are unequally distributed. In this theory, also called power-based theory, the focus is on male dominance and gender division. Thus, this present writer is interested to conduct a mini research about three linguistic features; strong expletives, empty adjectives, and tag questions usage based on speakers' gender in the serial film *Friends* utterances (1994-2004). The present writer found a lot of data about these three linguistic features in the serial film *Friends*. Besides that, the movie doesn't only have rich characters like in a daily life but also various episodes telling about daily issues in real life.

#### **LITERATURE REVIEW**

The investigation and identification of differences between men's and women's speech date back across time until 1970s. Lakoff (1975) first introduced women's language to distinguish men and women's different speech. Lakoff (1975) proposed theories on the existence of women's language. Her book 'Language and Woman's Place' has served as a basis for much research on the subject. She mentions ten features for women's language. As cited in Holmes (1993, p. 314), these ten features are:

1. Lexical hedges or fillers, e.g. you know, sort of, ...
2. Tag questions, e.g. she is very nice, isn't she?
3. Rising intonation on declaratives, e.g. it's really good.
4. Empty adjectives, e.g. divine, charming, cute.
5. Precise color terms, e.g. magenta, aquamarine.
6. Intensifiers such as just and so.
7. Hypercorrect grammar, e.g. consistent use of standard verb forms.
8. Superpolite forms, e.g. indirect requests, euphemisms.
9. Avoidance of strong swear words, e.g. fudge, my goodness.
10. Emphatic stress, e.g. it was a BRILLIANT performance.

Lakoff's hypotheses have both pros and cons. These pros and cons are shown by some research responded men and women's difference in language. First reaction was made by Dubois and Crouch (1975) launching a critique on Lakoff's claims, especially on tag questions. They examined the use of tag questions within the context of a professional meeting and concluded that at least in that context males used tag questions more than females did. Their conclusion was that Lakoff's hypothesis might be biased in favor of highly stereotyping beliefs or folk linguistics. Dubois and Crouch (1975) questioned Lakoff's findings as Lakoff had used introspective methods in her study. They argued that her conclusions were made on uncontrolled and unverifiable observation of others and were based on a highly skewed and non-random sample of people. Despite such and many other similar observations, Lakoff believes that the use of tag questions by women is the sign of uncertainty. Krammarae (1991) discussed the phenomenon of "stranger compliments" from men to women. It is reported that such street remarks are still heard, sometimes with racist as well as sexist overtones. There is, however, the occasional reversal, with women yelling out numbers as men walk by ("Hey, you're at least 9") or appreciative comments on the men's bodies ("Love those abs").

Another research distinguishing language based on gender was conducted by Elizabeth Kuhn (1992). Kuhn examined university professors' use of their authority on the first day of classes to get students to do what the professors wanted them to. Kuhn found male professors displaying more authority than women in both American and German universities at the highest levels in the academic hierarchy. And in both the US and Germany, men still predominate as the recognized authorities in academic and other domains. While analyzing the electronic mails of a number of men and women, Bunz and Campbell (2002) stated that social categories such as age, gender, etc. do not influence politeness accommodation in e-mail. Nemati and Bayer (2007) also studied the same issue about language and gender issue. Their article entitled "Gender Differences in the Use of Linguistic Forms in the Speech of Men and Women: A Comparative Study of Persian and English" was conducted to determine whether men and women were different with respect to the use of intensifiers, hedges and tag questions in English and Persian. To conduct the study, R. Lakoff's (1975) ideas concerning linguistic differences between males and females were taken into account. Their findings of the study did not confirm Lakoff's opinion regarding gender-bound language at least in the three areas and the corpus inspected in this research.

Many studies have been conducted about language and gender in the issue of men and women speak differently like mentioned above. However, there is only a little connected to how men and women speak differently by examining some similar relationship among the linguistic features used in their speech. Thus, to examine Lakoff's hypothesis, the present writer selected three linguistic features, from the list above, namely strong expletives, empty adjectives and tag questions used by speakers in a serial film "Friends" as a means to convey their feelings as the basis of analysis. This research examines whether the speakers based on their gender speak differently – in a way of speaking – or not.

#### **RESEARCH QUESTIONS**

The present research is carried out to study the utterances by speakers in the serial film "Friends" which contain three linguistic features; strong expletives, empty adjectives, and tag questions. The present study, therefore, seeks to answer the following questions:

1. What strong expletives, empty adjectives, and tag questions are used by the speakers in a serial film "Friends"?
2. What are the functions of the strong expletives, empty adjectives, and tag questions used by the speakers in a serial film "Friends"?
3. What are the similarities and differences strong expletives, empty adjectives, and tag questions used by the speakers in a serial film "Friends"?

#### **METHODOLOGY**

The method used in this research is descriptive qualitative method. Qualitative approach is concerned with the process of certain phenomenon (Fanani, 2010). This method focuses on words and description rather than numbers (Maxwell, 2000). Descriptive research method is conducted by making a description systematically, knowing the characteristics and relationship among phenomena investigated. The data are taken from the utterances in a serial film Friends (1994-2004) created by David Crane and Marie Kauffman production. It is one of American blockbuster sitcoms. The film revolves around a circle of friends in Manhattan, a borough of New York City. The episodes provoke issues close to real life issues.

The focus of this study is to find the utterances containing strong expletives, empty adjectives and tag questions and their functions. Social dimension by Holmes (1992, 2001) and context by McManis et al. (1987) are mainly used in this research to examine their functions.

#### **RESULTS AND DISCUSSION**

To answer the research questions, the selected utterances containing strong expletives, empty adjectives, and tag questions are firstly categorized and then analyzed based on speakers' gender and their context by using social dimension by Holmes (1992, 2001). There are four social dimensions used in this research. They are social distance, social status, formality scale, and two functional scales. The social distance is used to measure the relationship among participants. If the speakers are close to each other, the relationship will bear solidarity. If the speakers' relationship to each other is not close, it will result to the existence of power to one speaker in the social interaction. A status scale concerned with participant relationships causing high and low status by looking at the power of the speakers. A formality scale relates to the setting or type of interaction. And two functional scales refer to the purposes or topic of interaction.

To figure out the second research question finding the functions of the use of expletives, empty adjectives, and tag questions, the present writer connects the social dimension to the context theory by McMannis et al. (1987) in order to examine the meanings explicitly and implicitly. There are 4 types of context by McMannis (1987) as follows:

1. *Physical context* includes *setting* and the object or topic that is discussed in the social interaction.
2. *Social context* is context that explains the social relationship and social background between speaker and hearer.
3. *Epistemic context* is context describing one schemata about something discussed in the social interaction owned by speaker and hearer like the similar schemata owned by speaker and hearer about one certain place or object of the discussion.
4. *Linguistic context*, this context explains the relationship between the discussed utterances and previous and also the next utterances as the intended meaning.

Epistemic context is the basic knowledge that shared by the speakers and listeners. Everything that the speakers and the listeners share is related to epistemic context. To answer the third question, the present writer then analyzed thoroughly the data found in the research to find out the similarities and differences between the use of strong expletives, empty adjectives, and tag questions in men and women utterances. To answer the research questions in this paper, the present writer also refers to these two tables below as scales to help determine which expletives are strong or weak, and to classify the function of linguistic features used by speakers in the serial film Friends.

Table 1: expletives words scale (by Klerk in Johnson and Meinhof's article, year 1997: 157-158)

Value of Expletives	Expletives Words
Value of 1	<i>beggar, blinking, blooming, bother, brother, crikey, cripes, darn, dear, drat, flick, flip, fool, golly, gosh, grief, heck, hoender, jeepers, mother, Pete's sake, pluck off, rash, ruddy, Schweppes, shaving cream, sherbet, shirt, shivers, shize, shoot, shot, shucks, sugar, wow.</i>
Value of 2	<i>ass, blast, bull, buzz off, can it, clot, cork up, cow, creep, damn, dog, dozz, egghead, imbecile, gag it, GCM, geez, gits, heavens, holy mackerel, idiot, jis, jislaaik, jissus, jurrah, moron, shiff off, shut up, shut your trap, sow, tripe, twerp, twit, voetsek, vrek, wench</i>
Value of 3	<i>drop dead, 'f, faggot, Glory, god, hell, holy cow, holy mother, jerk, Lord, mess off, Mother Mary, scab.</i>
Value of 4	<i>bastard, bitch, bloody, bulldust, donder, dosball, go suck, slut, stuff you, tit, up yours.</i>
Value of 5	<i>bumface, Christ, crap, drol, dwat, dwax, fart, gwat, Jesus, kak, kaffir, shittoes, siffy.</i>
Value of 6	<i>bulldung, bullshit, moer, shit, shithouse, son of a bitch, wank a plank, wanker.</i>
Value of 7	<i>jerk yourself, piss off, screw yourself, wop.</i>
Value of 8	<i>arse, arsehole, bugger, cock, dick, dickface, dickhead, dildohead, doos, dushbag, fucket, poephol, prick, shitface, shittrap.</i>
Value of 9	<i>cunt, cuntface, cuntsucker, fuck, fucker, fucking, poes.</i>
Value of 10	<i>mother-fucking.</i>

Table 2: List of kinds and functions of tag questions (cited from Axelsson, 2011: 41-45)

Type of Tag	Function	Example
Informational (Algeo 1990: 445)	To get information.	You haven't got the ages of these other guys, have you?
Confirmatory (Roesle 2001: 32)	To get confirmation.	Q: Well I think you did see it, didn't you? no? A: No, well I can't remember. (Roesle 2001: 33)
Involving/facilitative (Roesle 2001: 33)	To involve the listener by them agreeing to a statement.	This is quite nice an anorak, isn't it? (Roesle 2001: 33)
Punctuational (Algeo 1990: 446)	To give emphasizes.	You classicists, you've probably not done Old English, have you? course you haven't. (Algeo 1990: 446)
Softening (Holmes, 1995: 81)	To be polite of to soft harsh statements.	You've got a new job Tom, haven't you? (Holmes 1995:81)
Challenging (Holmes, 1995: 81)	To force a response from a "reluctant hearer."	Q: Now you er fully understand, don't you? A: Yes, Sir, indeed, yeah.
Preemptory (Algeo 1990: 447)	To undermine the hearer by pointing out something they clearly should know.	I wasn't born yesterday, was I? (Algeo 1990: 447)
Aggressive (Algeo 1990: 447)	To undermine the listener by pointing out something they clearly could not know.	Q: I rang you up this morning, but you didn't answer. A: Well, I was having a bath, wasn't I? (Algeo 1990:447)

'Tag questions' are divided into two types (Eckert and Ginet, 2003: 167-168). They are tags containing an inverted auxiliary form,

called as *canonical* tags (Holmes, 1983) or *variant* tags and a pronoun that agrees with the subject of the main clause (anchor) and *invariant* tags. Canonical tags include the auxiliary form followed by the subject of the anchor such as “is it”, “don’t you”, etc. The invariant tags are simple tags like “no?”, “eh?”, “right”, “okay”, “innit?” and “weren’t it?” These tags are not affected by the clause or anchor preceded the tag.

Based on the data analysis, it is resulted that ‘strong expletives’ in the serial film ‘Friends’ are used by both men and women characters in their utterances. They use ‘strong expletives’ to curse, or insult. However, ‘strong expletives’ are mostly found in men’s utterances in the serial film ‘Friends’. So, it can be inferred that the use of ‘strong expletives’ as a means to curse or insult something annoyed the speakers is one of the characteristics in men’s linguistic features.

‘Empty adjectives’ use in the serial film ‘Friends’ shows that not only women use ‘empty adjectives’ but also men do it too. However, the most frequency of the ‘empty adjectives’ use is showed in women’s utterances. It can be said that ‘empty adjectives’ use is categorized as women’s linguistic features to signs agreement of the speakers to hearers. In addition, there is actually a difference between the uses of ‘empty adjectives’ in both speakers.

‘Tag questions’ use in the serial film ‘Friends’ shows that both genders; men and women use tag questions in their utterances. The ‘tag questions’ uses found in data include two types of ‘tag questions’; canonical and invariant tags. Yet, the number of the ‘tag questions’ as the data in this research shows that men use more ‘tag questions’ than women do (10 out of 17). So, it cannot be said that ‘tag questions’ is one of women’s linguistic features. The ‘tag questions’ uses in the data are mostly used as a means to get information and to involve the hearers by them agreeing the statements.

Here are the explanations of the result:

### ***Strong Expletives***

#### ***Strong Expletives used by men***

(1) Season 8, episode 04

[Scene: Joey and Rachel's, Joey is standing at the counter as Ross enters.]

**Joey** : Whoa! What are you doing here? How did your date go?

**Ross** : Great! I'm across the street having sex with her right now. Your story **sucks!**

**Joey** : Hey! Look, if it didn't work it's because you didn't tell it right! Show me how you did it.

**Ross** : No! No, I don't...don't want to.

(2) Season 10, episode 10

[Scene: Monica's apartment. Monica is cleaning with a vacuum and then she cleans it with a dust buster. The guys enter the room.]

**Chandler**: Hey!

**Joey**: (to Chandler) **You son of a bitch!**

**Chandler**: Is it me, or have the greetings gone downhill around here?

**Monica**: (goes to Chandler) Phoebe and Rachel saw you with Nancy today and... em... they think you're having an affair.

**Rachel**: Who's Nancy?

**Ross**: What's going on?

**Monica**: (turns to them) Ok, alright, you guys, you'd better sit down, this is pretty big.

(3) Season 10, episode 07

[Scene: Monica's apartment. Somebody knocks the door]

**Laura**: Oh, it's nothing. I went on a date with a guy who lived in this building and it didn't end very well.

**Monica**: Ohh... that wouldn't by any chance be... Joey Tribbiani?

**Laura**: Yes!

**Chandler**: Of course it was!

**Laura**: Yeah, we had a really great night and in the morning he promised he would call me and he didn't.

**Chandler**: **RAT BASTARD!**

**Laura**: So you're not friends with him?

**Monica and Chandler**: **OH GOD NO! Nope, no, no, no. No! No, no. Nope! No, no, no, no, no, no, no, no, no. NO!** (finally Monica concludes) **No!**

From the data above, ‘strong expletives’ are used by men speakers in (1), (2), and (3). They are *sucks*, *son of a bitch*, and *rat bastard*. They are uttered by men speakers to deliver their anger to insult to hearers (other men). Besides to express speakers’ anger, ‘strong expletives’ are also used to express solidarity (3).

#### ***Strong Expletives used by women***

(4) Season 10, episode 01

[Scene: Mike's apartment]

**Precious**: He proposed to you? This is the worst birthday ever. (she starts to cry again)

**Phoebe**: Look, Precious... Mike's not worth this. You're an attractive, intelligent woman and let's face it, Mike's kind of a wang. I mean, he proposed to me while he was still seeing you... He was gonna break-up with you on your birthday? And, I don't like to kiss-and-tell, but he cheated on you a lot this weekend.

**Precious**: Oh, my God, maybe you're right. Maybe I don't need him. I deserve to be treated with respect.

(Mike enters the apartment.)

**Precious**: **Screw you, Mike!** You're a coward and a bastard, and I hope you rot in hell.

(she slaps him in the face, Mike looks like he doesn't believe what just happened. Precious leaves, and he turns to Phoebe.)

In data (4) above, ‘strong expletives’ is used by a woman speaker delivered to a man hearer to convey her anger to him. The ‘strong

expletives' used above is *screw you*. The speaker is upset because the man, Mike, treated her previous girl bad. Besides to express anger, it can also be inferred that the use of 'strong expletives' there is to show speaker's solidarity uttered by a woman, Phoebe, about what happened to other woman, Precious.

#### **Empty Adjectives**

##### **Empty adjectives used by women**

(5) Season 3, episode 10

[Scene: Monica and Rachel's, Chandler is entering numbers on a calculator as Ross reads off how much he's sold.]

**Joey:** What? Rachel, listen, have you ever heard of Fortunata Fashions?

**Rachel:** No.

**Joey:** Well my old man is doing a plumbing job down there and he heard they have an opening. So, you want me to see if I can get you an interview?

**Rachel:** Oh my God! Yes, I would love that, oh, that is so *sweet*, Joey.

**Joey:** Not a problem.

**Rachel:** Thanks.

(6) Season 8, episode 14

[Scene: Joey and Rachel's, Rachel is balancing an aluminum can on her stomach as Ross enters.]

**Rachel:** Hey Ross! Check it out! I learned a new trick!

**Ross:** Hey uh, I brought you some lunch.

**Rachel:** Ohh! That's so *sweet* of you! Oh yum! (Takes a bite out of the sandwich and starts to get sick.) Did you put pickles on this?

**Ross:** Well yeah!

(7) Season 10, episode 4

[Scene: Joey's Apartment. Joey is in charge to make sure that nobody (Monica, Chandler, Judy, or Joey) leaves the Emma's birthday party while Ros is picking up Rachel who forgot to bring her driving license]

**Judy:** Well, we better get going, it's late. Jack's not allowed to drive at night anymore. He has trouble staying in his lane.

**Jack:** Last winter I went up on a church lawn and drove right through a manger scene. The papers thought it was a hate crime.

**Judy:** Anyway, it was *lovely* seeing you.

**Joey:** Ok! (Opens the door for them)

**Judy:** Bye... Bye dear.

**Joey:** Nighty-night!

**Judy:** Nighty-night!

**Joey:** Bye, bye.

In (5), (6), and (7) the 'empty adjectives' used there are *sweet*, and *lovely*. They are used by women speakers to men and women hearers. The 'empty adjectives' use there is to express their agreement of something and that they are also happy about something offered by the hearers.

##### **Empty adjectives used by men**

(8) Season 3, episode 13

[Scene: Richard's apartment, Richard is giving an apartment tour to his date]

**Richard:** Ah well, this is the living room.

**Richard's Date:** Impressive.

**Richard:** All right. This is the kitchen.

**Richard's Date:** Oh, that's real pretty. Wait a minute, don't I get to see the bedroom?

**Richard:** The bedroom. Well it's pretty much your typical... (opens the door as Monica hides under the covers, and quickly closes the door before his date can see the room.) bedroom.

**Richard's Date:** We're still on this side of the door.

**Richard:** Um-hmm.

**Richard's Date:** Yeah, but I didn't get to see it.

**Richard:** Oh shoot! Maybe next time. (yawns) Thanks for a *lovely* evening. (shows her out)

In data (8) above, the 'empty adjectives' use is uttered by a man speaker to a woman hearer. The 'empty adjectives' used is *lovely*. The 'empty adjectives' use in the data above is to express speaker's feeling as a compliment or gratitude to the woman hearer and also to end of the social interaction.

#### **Tag Questions**

##### **Tag questions used by men**

(9) Season 1 Episode 1

[Scene: Central Perk, Chandler, Joey, Phoebe, and Monica are there.]

**Phoebe:** Ooh! Oh! (She starts to pluck at the air just in front of Ross.)

**Ross:** No, no don't! Stop cleansing my aura! No, just leave my aura alone, *okay*?

**Phoebe:** Fine! Be murky!

**Ross:** I'll be fine, *alright*? Really, everyone. I hope she'll be very happy.

**Monica:** No you don't.

**Ross:** No I don't, to hell with her, she left me!

**Joey:** And you never knew she was a lesbian...

(10) Season 1 Episode 1

*(There's a knock on the door and it's Paul.)*

**Monica:** Hi, come in! Paul, this is... *(They are all lined up next to the door.)*... everybody, everybody, this is Paul.

**All:** Hey! Paul! Hi! The Wine Guy! Hey!

**Chandler:** I'm sorry, I didn't catch your name. Paul, **was it?**

**Monica:** Okay, umm-umm, I'll just--I'll be right back, I just gotta go ah, go ah...

**Ross:** A wandering?

**Monica:** Change! Okay, sit down. *(Shows Paul in)* Two seconds.

**Phoebe:** Ooh, I just pulled out four eyelashes. That can't be good.

*(Monica goes to change.)*

**Joey:** Hey, Paul!

**Paul:** Yeah?

(11) Season 1 Episode 5

*[Scene: Central Perk, all are there.]*

**Chandler:** So, Saturday night, the big night, date night, Saturday night, Sat-ur-day night!

**Joey:** No plans, **huh?**

**Chandler:** Not a one.

**Ross:** Not even, say, breaking up with Janice?

**Chandler:** Oh, right, right, shut up.

**Monica:** Chandler, nobody likes breaking up with someone. You just gotta do it.

In (9), (10), and (11) above, there are 'tag questions' uses. They include canonical and invariant tags like 'was it', and 'huh', 'okay', 'alright'. The 'tag questions' are used by men speakers to express their feeling like confirmatory, and uncertainty to both men and women hearers.

#### Tag questions used by women

(12) Season 1 Episode 1

*[Scene: Iridium, Monica is working as Frannie enters.]*

**Frannie:** Hey, Monica!

**Monica:** Hey Frannie, welcome back! How was Florida?

**Frannie:** You had sex, **didn't you?**

**Monica:** How do you do that?

**Frannie:** Oh, I hate you, I'm pushing my Aunt Roz through Parrot Jungle and you're having sex! So? Who?

**Monica:** You know Paul?

**Frannie:** Paul the Wine Guy? Oh yeah, I know Paul.

(13) Season 1 Episode 13

*[Scene: Central Perk, Phoebe is there with her boyfriend Roger, talking to Rachel and Monica.]*

**Phoebe:** Thanks. Okay, now go away so we can talk about you.

**Roger:** Okay. I'll miss you.

**Phoebe:** Isn't he great?

**Rachel:** He's so cute! And he seems to like you so much.

**Phoebe:** I know, I know. So sweet... and so complicated. And for a shrink, he's not too shrinky, **y'know?**

**Monica:** So, you think you'll do it on his couch?

In data (12) and (13) above, the 'tag questions' use are uttered by women speakers other women hearers. The 'tag questions' uses there include canonical and invariant tags such as 'didn't you' and 'y'know'. In (12), the use of 'tag questions' is uttered by speaker to elicit information of something being discussed. In (13), the speaker uses the 'tag question' there is to involve the hearer by them agreeing to a statement.

#### CONCLUSION

This paper's goal is to examine the use of strong expletives, empty adjectives, and tag questions based on the speakers' gender, their functions, and their similarities and differences.

It can be concluded that the findings of this research include three big points as the answer of the research questions. Firstly, 'strong expletives' found in the serial film 'Friends' include two categories. The first category is 'strong expletives' uttered by a man (as a speaker) to other man (as a hearer) such as *sucks*, and *son of a bitch* (uttered *face to face*), and *crap*, *stupid son of bitches*, *rat bastard*. The second one is 'strong expletives' directly uttered by a woman (as a speaker) to a man (as a hearer) such as *screw you*. Secondly, 'empty adjectives' are mostly found in women's utterances in the serial film "Friends". They are used by women (as the speakers) when they talked to both men and other women (as hearers). The 'empty adjectives' found in this research are *sweet*, *fantastic*, *adorable*, and *lovely* uttered by women speakers to both men and other women as hearers. But, the 'empty adjectives' uttered by men speakers to women hearers is *lovely*. Thirdly, 'tag questions' used by speakers include two types of 'tag questions'; canonical and invariant tags. They are *was it*, *is it*, *didn't you*, *okay*, *alright*, *y'know*, and *huh*. Men speakers use more 'tag questions' women do.

Based on linguistic features' function, it can be inferred that 'strong expletives' are used to express speakers' anger and show solidarity to the hearers that also upset speakers. 'The empty adjectives' used by speakers, mostly women, is to express speakers' joy and to agree something that makes them please. 'Tag questions' in this research are used by speakers to get more information and to involve hearers to agree with what speakers have stated before, as a facilitative.

Another finding in this research is that both men and women are actually use 'strong expletives', 'empty adjectives', and 'tag questions'. However, they are used in different way. Men speakers use 'strong expletives' only to men hearers. Women speakers use

'strong expletives' only to men speakers. Men speakers use 'strong expletives' only to men hearers but, women speakers use 'strong expletives' only to men hearers. It can be said that 'strong expletives' is men's linguistic feature since it is used mostly by men speakers. In the 'empty adjective use', women use it more than men do. Women speakers use 'empty adjectives' to both men and women hearers, but men speakers use 'empty adjectives' only to women hearers. So, it can be said that 'empty adjectives' is women's linguistic feature. 'Tag questions' use in this research is also used by both men and women speakers. Yet, men speakers use it more often than women do. The invariant tags are used by speakers only to close hearers like best friends while canonical or variant tags are used by speakers to their acquaintances as the hearers and when speakers and hearers are in a formal situation like in a work place.

#### Limitations of the study

This study examines the men and women's language and focuses only on three linguistic features usage; strong expletives, empty adjectives, and tag questions. There are some limitations for this study related to the topic discussed in this article as follow:

1. This article considers only at three kinds of linguistic features by men and women in their utterances. And also this article only concerns on the reason of men and women's linguistic features usage seen from social factors. So, the future research is needed to be able to study this issue not only from social factors but also from other factors.
2. The data taken in this article are from a serial film "Friends" scripts. It is suggested the future research take the data from more natural sources by using recording technique and etc.
3. The data in this article mostly describe informal setting like conversation between friends at home, café, etc. So, a less informal setting like in a work place between participants' different social status is suggested to future research.

## ABSTRACT

To examine the impact of transitioning traditional reading comprehension assessments to computer-based, 66 male English as a Foreign Language (EFL) learners aged 8 to 12 years were assigned to take two different twenty-minutes reading comprehension tests with the same level of difficulties on paper and computer screen using scrolling text to navigate through pages. They also completed an attitude questionnaire to reveal their attitudes towards computerized testing. The findings revealed that there are no significant differences in reading comprehension scores across testing modes. In addition, evaluating the Likert type questionnaire revealed that the majority of students prefer to take the test on computer. The findings also suggest that the amount of reading comprehension among children does not differ considerably while switching from paper/pencil-based assessment into computer-based assessment. Hence, schools with no or limited computers and the Internet facilities should not be concerned about the students' performance and their level of achievement.

**KEYWORDS:** computer-based assessment, paper/pencil-based assessment, attitude.

## INTRODUCTION

Computerized testing began in the early 1970s (Drasgow, 2002; Wainer, 1990). Limited computer capability and high costs, however, used to limit the implementation of computerized testing. With the advent of new technologies, computerized testing has begun to be developed and implemented in large-scale testing programs such as licensure, certification, admissions, and psychological tests (Kim & Huynh, 2007). For example, the Graduate Record Examinations (GRE) has been administered in computer-adaptive format for several years. Likewise, in 1998, the Test of English as a Foreign Language (TOEFL) began transitioning to computer-adaptive testing. Recently, the new TOEFL Internet-Based Test (IBT) began administration via the Internet in a non-adaptive format. Increased testing requirements and tight deadlines imposed by the No Child Left Behind Act of 2001 (NCLB) (Public Law No: 107-110) have led to new ways that states can measure student performance more efficiently (Kim, et al., 2007).

The advantages of computers are well known and apparent (Al-Amri, 2009). Computers offer test developers the opportunity to improve their productivity and lead to innovation in their fields. The standardization of test administration conditions is one of the benefits offered by Computer-Based Testing (CBT). No matter what the tests' population size is, CBT helps test developers to set the same test conditions for all participants. Al-Amri (2009) also believed that CBT improves all aspects of test security by storing questions and responses in encrypted databases and enables testers to create randomized questions and answers from vast question pools. Moreover, offering different test formats and the immediate presentation of different types of feedback, either to students or to testers, are other great advantages of CBT. Collecting different performance data such as latency information is a unique feature of CBT (Olsen, Maynes, Slawson, & Ho, 1989). On the examinees' side, they are able to receive greater measurement efficiency and the possibility to take the test at any time. On the other hand, there are some disadvantages that users have to be aware of before opting for computer-based testing, which led many scholars to suggest conducting systematic studies to check equivalency and comparability of paper-based tests and computer-based tests (Parshall, Spray, Kalohn, & Davey, 2002). For example, students need some degree of computer literacy in order to avoid the mode effect on computer-based testing (Alderson, 2000).

## LITERATURE REVIEW

As there has been a growing interest in computer-based testing in large-scale assessments, several comparability studies have involved elementary and secondary students over the past few years. Russell and Haney (1997) investigated the mode effects on middle school students' performances on open-ended items in writing, science, math, and reading, as well as multiple-choice and short-answer items in language arts, science, and math from the National Assessment of Educational Progress (NAEP), and extended writing test items. They found that the effect of administration mode was not significant for the multiple-choice items, but a substantial effect was found for the open-ended items. The results showed that students who were used to writing by the computer performed better when they responded to the open-ended test using a computer rather than using pencil and paper.

Similar findings were found in studies by Russell (1999) and Russell and Plati (2001), who reported that students who were accustomed to writing using a computer performed better on the open-ended tests when they wrote using a computer than when they wrote by hand. Pommerich (2004) investigated the item-level mode effects of English, reading, and science reasoning tests in grades 11 and 12 and found that examinees responded differently to some items under the various interface features, although the mode effect in general was small. Pommerich found that the paging condition group outperformed the scrolling condition group in the reading and science reasoning tests, and the automatic scrolling group performed slightly better than the semi-automatic scrolling group in the English test.

Two comparability studies on the online versions of the NAEP math and writing tests showed that the paper group significantly outperformed the computer group in the eighth-grade NAEP mathematics test, but no mode effect

was found for the eighth-grade NAEP essay test (Sandene, Horkay, Bennett, Allen, Braswell, Kaplan, 2005). The NAEP studies also found that students' familiarity with computers was related to their performance. Particularly, hands-on measures of keyboarding skill were found to be a significant predictor of students' performances on the NAEP online writing test (Sandene, et al., 2005). Although the NAEP studies have directly investigated administration mode effects in the K-12 large scale assessments, the NAEP is a low-stakes assessment and the lack of consequences for its results could affect student motivation to take the test seriously, and the results may not be generalized to high-stake statewide assessments.

Regarding the comparability of these two assessment modes on children as the participants, Barnes (2010) examined the feasibility of using CBA with children who have not yet started the first grade. Kindergarten children were able to perform the assessment nearly as well on the CBA as they did on the traditional paper version of the test. However, most children under four years of age were not able to complete a CBA independently. The children reacted positively to the CBA and seemed to enjoy using the computer, but the test results indicate that the CBA was more difficult and may be measuring something more than rhyme awareness for the preschoolers. In 2005, Sim examined the comparability of CBA and PPBA on 20 children, aged between 7 and 8 of mixed gender. The results showed that the majority of children performed better on paper than computer although there was no significant difference.

In fact, a lot of research works have been conducted to evaluate the comparability of computer based assessment and paper and pencil based assessment. Some studies revealed that there is a significant difference between the two testing modes on test scores (e.g. Scheuermann & Björnsson, 2009; Choi, Kim, & Boo, 2003), while other studies reported opposite or inconsistent results (e.g. Al-Amri, 2009; Boo, 1997). However, unlike the abundance of CBA research done with older or special needs students, there is a dearth of available research focusing on the issues of computer-based assessment with typically developing young children (Barnes, 2010). Therefore, a practical comparison between these two methods needs to be done in order to identify whether the testing mode has considerable influence on the performance of children when they sit for a reading comprehension assessment. In other words, due to the scarcity of empirical research concerning language assessment and use of technology in language assessment in Iran, this study hopes to raise awareness on the use of technology in language assessment in Iranian context.

## RESEARCH QUESTIONS

Specifically, the research questions were:

1. Is there any significant difference between computer-based assessment and paper and pencil based assessment when assessing reading comprehension among primary school students?
2. What is the test takers' attitude towards computer-based assessment compared with traditional assessment?

## METHODOLOGY

### Participants

This study recruited 66 male EFL learners aged 8 to 12 years from one of the well-known language learning institutes to take part in PPBA and CBA as the participants. Since the numbers of students who were at the required level of proficiency and appropriate for this study were not high enough to employ random selection, all of the students who had the requisites to sit for the reading comprehension assessments were selected as the participants. They were chosen from among five different proficiency levels ranging from *High Beginning* to *Low Advanced*. The number of students per class ranged from 5 to 23. It is necessary to notify that every student sit for the required placement tests at the very beginning of his entry into the institute. Hence, there were no worries about the proficiency levels of the children.

### Instruments

Two reading comprehension tests as well as an attitude questionnaire were utilized in this study as the data collection instruments, which are described below in details.

#### Reading Comprehension Test

Based on the proficiency levels of the participants, two different tests with the same level of difficulty containing a reading passage, a short story, and some associated multiple choice items were extracted directly from released *Read Theory* or *English for Every One* organizations. The tests for PPBA and CBA, different in terms of content but similar in terms of difficulty level as well as number of paragraphs and question items, were also checked by the institute teachers to ensure from their appropriateness.

With regard to the CBA, some points are necessary to be referred to in advance. Firstly, the reading comprehension tests were embedded in a dynamic web page with a submit button at the bottom of the page to send the students' entered answers to the website database. Secondly, in order to avoid building a separate website from scratch, the researchers preferred to benefit from the existing online form builders such as Google Drive, Adobe Acrobat Form Creator, and so on which not only allow to use their templates for creating the desired pages, but also offer facilities to the developer to analyze the entered data.

#### The Attitude Questionnaire

After completing the web-based reading comprehension assessment, all students were asked to complete a web-based questionnaire that consisted of five question items. The purpose of this questionnaire was to measure students' attitude toward computer-based assessments. The questions were addressing the extent to which the use of computers has considerable influence on the amount of comprehension when children sit for the reading exams. Since the participants were children of eight to 12 years and there was a great fear about their perception and understanding of the question items, translating the items into their native language (Persian) would resolve this concern and prevent from any kinds of misinterpretation.

A good number of similar questionnaires from the previous studies (e.g. The National Assessment of Educational Progress, 2007; Documents & Resources for Small Businesses & Professionals, 2010; Melhado, 2010) were evaluated to extract the appropriate items for children. Then, the selected items were merged in a well-designed format and checked by the institute's teachers as well to ensure from their appropriateness and the validity of items. The questionnaire was designed according to the Likert scale with 5 question items and four possible answers for each one including *Strongly Agree*, *Agree*, *Disagree*, and *Strongly Disagree*. In other words, based on some researchers' idea (e.g. Chang, 1994; Cronbach, 1950; Adelson & McCoach, 2010; Kulas, Stachowski, & Haynes, 2008), the *Neutral* (*Neither Agree nor Disagree*) option was omitted from the middle of the scale in order to avoid children having spurious answers and instead, specify exactly their viewpoints towards the questions.

To ensure its reliability, the Cronbach's alpha reliability coefficient was calculated. Based on Cronbach's formula, the researcher achieved an alpha value of 0.83, which indicates a very acceptable degree of reliability to be utilized in the study.

#### Procedure

The process of data collection for this study was done during May 2013. Students were given twenty minutes to complete the reading comprehension tests in two attempts of administration, one for PPBA and the other for CBA. At the end of CBA, the students were also given an additional 10 minutes to complete the attitude questionnaire. To control for effects that might result from differences in the computers available within each class, a set of MSI 11-inch laptops were brought into the classes with no external mice. The laptops were chosen among the small and light weighted sizes to be appropriate for children as the participants.

#### RESULTS AND DISCUSSION

In order to answer the first and second research questions, a paired-samples t-test at 0.05 levels of significance was conducted and the frequencies of each item in the questionnaire were calculated respectively. The descriptive statistics for PPBA and CBA is depicted in Table 1.

Table 1: Descriptive statistics for PPBA and CBA

Assessments	Mean	N	SD
Paper/Pencil based Assessment	57.29	66	19.56
Computer based Assessment	63.33	66	23.70

Note: N=Number of the students; SD=Standard Deviation

Table 2 presents the output of Paired-Sample t-test.

Table 2: Paired-Samples T-test Results of comparison between PPBA and CBA scores

	Mean	SD	t	df	Sig.
Paper – Computer	-6.03	26.78	-1.832	65	.072

Note: SD=Standard Deviation; Sig. =Significance value; df stands for Degrees of freedom. \* $P < .05$ , \*\* $P < .01$

The results of Paired-Sample t-test suggest that the amount of reading comprehension among children does not differ considerably while switching from traditional mode of testing into the computerized one.

To analyze the questionnaire, the researcher made use of only the simple comparisons of frequency percentages related to the predefined answers for the questionnaire's questions, namely, *Strongly Agree*, *Agree*, *Disagree*, and *Strongly Disagree*. This measure identified that which item has the most frequency among the others and consequently determined the students' attitude toward CBA. Table 3 and figure 1 represent the descriptive statistics and the column chart associated with the questionnaire respectively.

Table 3: Descriptive statistics for attitude

Mean	SD	N
17.78	2.54	5

Note: SD=Standard Deviation; N=Number of items

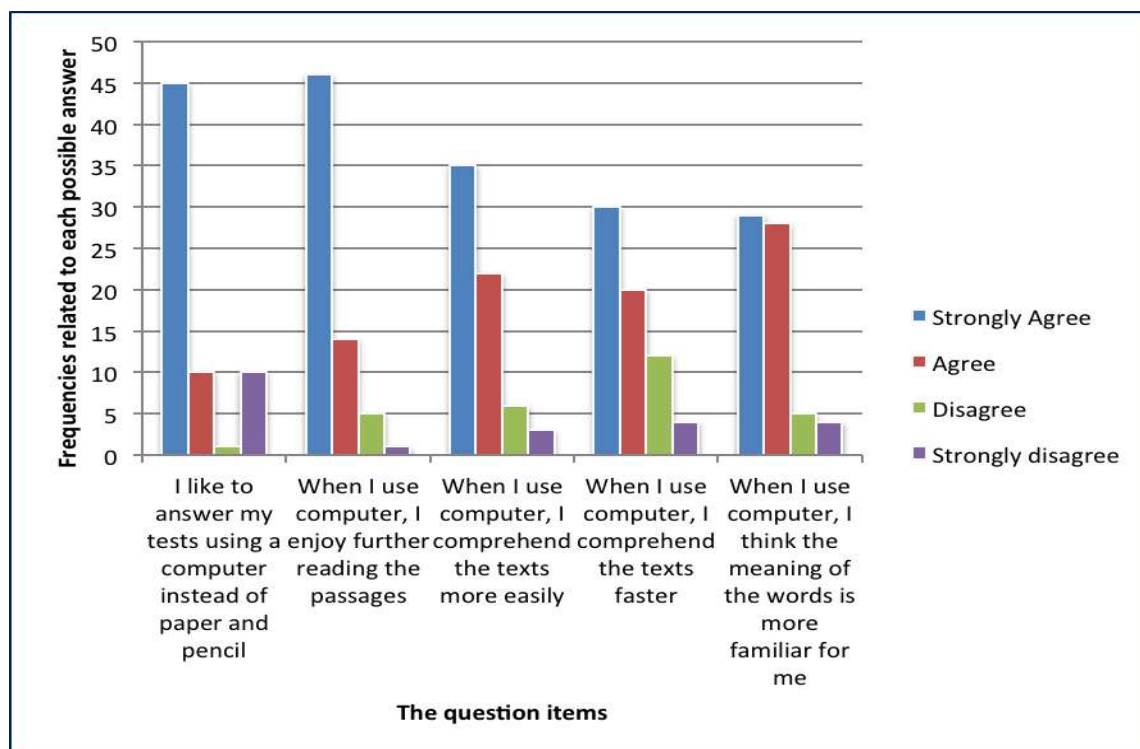

Figure 1: Column chart showing frequencies of each possible answer of the Likert-type questionnaire

Obviously, the first two possible answers, *Strongly Agree* and *Agree*, had the most frequencies in each question, so it is simply concluded that the participants had better feeling and attitude towards administering the assessments using computers. In addition, the researcher's observation at the time of CBA is another evidence for this claim.

Regarding the first research question, the analysis of the results proved that the kind of administration either paper-based or computer-based will not significantly influence the participants' performance in reading comprehension assessments and the existing differences are not considerable and salient but due to chance or other external factors.

This finding is in line with Higgins, Russell, and Hoffmann (2005)'s study who investigated the Effect of Computer-Based Passage Presentation on Reading Test Performance and found that there were no statistically significant differences in reading comprehension scores based on computer fluidity and computer literacy. Likewise, the study carried out by Baumer, Roded, and Gafni (2009) on the Equivalence of Internet-Based vs. Paper-and-Pencil Psychometric Tests, revealed that the modality of administration does not affect test performance. Pommerich (2004) also conducted a research on English, Reading, and Science passage-based tests and found that there were no significant differences in scores across modes for the Reading test. In addition, Al-Amri (2009) investigated the comparability of computer-based testing versus paper-based testing and found that testing mode has almost no significant effect on the overall validity and reliability of the tests. He also asserted that computer familiarity has no influence on students' performance and the other factors such as computer attitude and prior testing mode preference do not have any critical impact on the overall students' performance.

However, this finding may be at odds with some previous studies as well. For instance, Fitzpatrick and Triscari (2005) in their study found that item parameters and cut score results are comparable across administration modes. Likewise, the study performed by Choi and Tinkler (2002) revealed that the computerized Oregon statewide reading and mathematics tests were more difficult for third graders, but the paper version of the test was more difficult for tenth graders. They also found that mode effects were more pronounced in reading tests than in mathematics tests. Similar findings were reported in the study by Way, Davis, and Fitzpatrick (2006), who investigated the comparability of paper and online versions of the Texas statewide tests in mathematics, reading/English language arts, science and social studies at grades 8 and 11. The results showed that the tests were more difficult for the online group than for the paper group and the administration mode effects were more evident for ELA than for other subjects.

Regarding the second research question, the analyses of the attitude questionnaire as well as the researcher's observation at the time of CBA administration identified that children had a better sense and attitude toward taking the examinations using computers.

This finding is consistent with the results of many previous related studies. For instance, Higgins, Russell, and Hoffmann (2005) in their study, which was referred to earlier, examined the attitude of the participants as well. They asked the participants whether they thought it was easier or harder to take the test on computer or paper. Of the 135 students who responded to this item, 82% reported that it was easier to take the test on computer. In addition, students were asked in a selected response format if they would have preferred to take the test on computer or on paper. Of the 161 students who responded to this item, 87% reported that they would prefer to take the test on computer. Likewise, Way, Davis & Fitzpatrick (2006) believed that according to recent surveys, students tested online feel comfortable with taking tests on the computer and tend to prefer it to traditional paper testing. Moreover, the research work done by Chua (2012) showed that the computer-based testing has effectively increased intrinsic and extrinsic motivation of the test takers in challenge, curiosity, self-efficacy, involvement, joyfulness, comprehension and social dimensions. However, answering the test in a shorter time with higher testing motivation level did not help a test taker to achieve a higher score.

The majority of previous studies are in agreement with the above finding. However, there are some other studies which are in contrast with the current study. For example, the results of the study done by Ward, Hooper, & Hannafin (1989) indicated a negative attitude toward computer testing so that seventy-five percent of the computer-tested group either strongly agreed or agreed that computer testing was more difficult than traditional methods. In addition, Durndell & Thompson (1997) and Whitely (1997) believed that females usually have more negative attitudes toward computers than males. Moreover, Sam, Othman & Nordin (2005) in their study found that the respondents had moderate computer anxiousness and medium attitudes toward the Internet. Yet, it is not extravagant to say that almost all of the recent studies have reached the same conclusion as that of the current study; because with the vast development of technology and its usage in the lives of people around the world, the students' positive attitudes towards computerized assessment is not unexpected.

## CONCLUSION

Based on the above-mentioned discussion, it can be concluded that although the mode of testing does not noticeably influence the amount of children's reading comprehension, the teachers, schools and institutes can benefit from technology particularly the computers and internet in their educational environments to promote and encourage students towards assessments. Furthermore, those schools and institutes, which do not have required facilities to bring technology in the classrooms, should not be worried about the students' performance and their level of achievement.

## Limitations and Implications

Due to the nature of the present research, which necessitated providing similar PCs or laptops for a number of students in order to carry out computer-based assessment, there were some limitations in some aspects of this study such as the small sample size, lack of female participation, low speed of internet, and so on. Hence, future research should be conducted on a larger and more diverse sample of students and should be expanded to include students in other grade levels. The number of passages and items should also be increased. The future study with a larger and more diverse sample and more items may show more subtle differences in the performance of participants particularly when female students are also taken part in the study.

The current research can be incorporated into regular classroom settings and English language learning institutes with the intention of improving the quality of learning, teaching, and testing. In the case of classroom scale assessment, teachers can make informed decisions of how they can measure children's reading comprehension especially using computers and technology, which have come to the lives of children around the world in the recent decades, as the alternative tools for traditional assessments. In the case of large-scale assessment, the study may provide a basis for test designers/developers especially in measurement organizations and English language institutes to act according to the results.

#### ABSTRACT

This study was an attempt to investigate the effect of two different types of learning modalities, namely cooperative and competitive, on English as a foreign language (EFL) impulsive and reflective learners' writing achievement. For this purpose, 120 learners from among a total number of 185 intermediate learners studying at Tac English Language School of Tehran, Iran, were chosen all taking a PET (Preliminary English Test) first, for homogenization prior to the study. They also filled out the Eysenck and Eysenck's (1991) Impulsiveness Questionnaire (EIQ), which in turn categorized them into two subgroups within each learning modality setting, consisting of impulsives and reflectives. All in all, there were four subgroups: 30 impulsives and 30 reflectives undergoing the cooperative learning treatment, and 30 impulsives and 30 reflectives experiencing the competitive learning treatment. Part three of the writing section of a PET was used as the posttest of this study, after each group was exposed to the treatment for 18 sessions in nine weeks. At the end of the instruction, the mean scores of all four groups on the posttest were computed and a two-way ANOVA was run to test all the five hypotheses raised in the study. The results showed that the effect of the teaching technique depends on the cognitive style of the learners. However, it was found out that each of the independent variables alone was significantly effective on writing ability of the learners. Specifically, cooperative learning technique was more effective both on reflective and impulsive learners compared with competitive technique. As for the cognitive style, it was revealed that reflective learners performed better both in cooperative and in competitive techniques in comparison with the impulsive learners.

**KEYWORDS:** Competitive Learning, Cooperative Learning, Impulsive Learners, Reflective Learners, Writing.

#### INTRODUCTION

In recent years many attempts have been made to improve the methods and techniques that enable language learners to achieve their goal which is communicating accurately and appropriately in a foreign language. In order to attain this goal, the learners must obtain necessary skills for communicating effectively. These skills are listening, speaking, reading and writing. Among these four skills, writing is very important and needs considerable attention; it has taken a significant place in most language classes and it is often used as a testing device for teachers and sometimes a way of memorizing and learning for learners (Nunan, 1989). In addition to the importance of writing skill in language learning, gaining the ability to write in either the first or the second language is one of the most difficult tasks a learner encounters and one that few people can be said would fully master (Rivers, 1981).

Considering the significance and the difficulty of writing skill, language teachers should pay attention to all of the possible factors which contribute to the teaching of writing and among these factors teachers' awareness of their learners' characteristics and learning styles has a great value. According to Falk (1978), "in order to understand foreign language learning, it is necessary to examine not only the linguistic properties of the language, but also the physical, psychological and sociological characteristics of the learner" (p. 353).

As Celce-Murcia (2001) remarks, "learning styles are the general approaches that students use in acquiring a new language or in learning any other subjects" (p. 359). One of the factors which can be related to learning style is the personality type of different individuals and among all different personality types and learning styles the one which requires more study is perhaps Reflectivity/Impulsivity learning style. Messer (as cited in Jamieson & Chapelle, 1987) believes that "Reflectivity/Impulsivity is the extent to which a person reflects on a solution to a problem for which several alternatives are possible" (p. 532).

In addition to different personality variables and cognitive styles which impact foreign language learning, one cannot ignore the role of the modality of learning. One established dichotomy in this regard is competitive and cooperative learning. Cooperative learning exists when students work together to accomplish shared learning goals (Johnson, Johnson, & Stanne, 2000). And each student can achieve his/her learning goal if the other group members achieve theirs (Deutsch, 1962, as cited in Johnson, Johnson & Stanne, 2000).

Cooperative learning is usually compared with competitive learning. Within competitive situations, individuals seek outcomes that are beneficial to themselves and detrimental to others. The students try to perform faster and better than their classmates and they realize that "they can obtain their goals if and only if the other students in the class fail to obtain their goals" (Johnson & Johnson, 1999, p. 5).

Taking the importance of all mentioned factors into consideration, the teacher should be aware of all possible differences among the learners and also know that, not all learners with different cognitive styles and characteristics benefit from the same way of teaching.

#### WRITING

There is not a complete consensus among researchers to give a clear definition of writing skill, and it has been defined in a variety of ways. Finocchiaro (1988) defined writing as written thinking since students are encouraged to express their ideas, experiences, thoughts, and feelings. Chastain (1988) views writing as "a basic communication skill and unique asset" (p. 244) in process of learning a second language. He further adds that writing with its unique features, contributes to overall language learning. According to Lado (1964), to write is to put down the graphic symbols that represent a language one understands, so that other can read these graphic symbols if they know the language and the graphic representation. Defining in another way, Celce-Murcia (1991) views writing as "the ability to express ones' idea with reasonable accuracy and coherence in written form in a second or foreign language" (p. 233).

This lack of consensus may reflect the complexity of writing skill, and its multidimensional aspects. Writing is so complex that one will not be able to give his/her students simple formula for good writing, and teachers should attract the students' attention to the complexity of the process to help them to pose a better piece of writing (McKay, 1984). According to Harris

(1969), "writing involves the simultaneous practice of a number of varieties of different abilities, some of which are never fully achieved by many students, even in their native language" (p. 68).

Regarding the difficulties of learning and teaching writing skill, the reason that makes the teachers and the learners concern about this skill is importance of it. Writing is a very important skill also for pedagogical purposes. Paulston (1972) asserts, "writing is used as a service activity in educational settings and the value of writing as a service activity is admired by many teachers" (p. 36). Chastain (1988) views writing as a "basic communication skill and a unique asset" (p. 244). In the process of learning a second language, he adds that, writing with its unique features, contributes to overall language learning.

#### *Cognitive Styles*

Of particular interest to personality researchers has been the concept of cognitive style. Cognitive style in Ausubel (1968) view is defined as "self-consistent and enduring individual differences in cognitive organization and to various self-consistent idiosyncratic tendencies, that are not reflective of human cognitive functioning in general" (p. 170).

Since "cognitive styles are usually defined as an 'individual's preferred' and 'habitual' modes of perceiving, remembering, organizing, processing and representing information" (Dornyei, 2005, p. 125), it differs from one person to another and different individuals manifest different dimensions of cognitive style. According to Fontana (1995), there are some dimensions of cognition that are related to education and one of them is the dimension of impulsivity/reflectivity.

#### *Impulsivity/Reflectivity Cognitive Styles*

dimension of reflectivity/impulsivity is concerned with the degree upon which people think about the accuracy of their responses or the speed of answering the questions. According to Srivastava (1997), "impulsive individuals tend to offer the first answer that occurs to them even though it is frequently incorrect, while the reflective individuals tend to ponder various possibilities before deciding" (p. 2).

According to Rashtchi and Keyvanfar (2002) "Reflectivity/ Impulsivity relates to one's degree of contemplation over decision-making and problem solving. In simple terms, a reflective person takes into account a variety of factors before making a calculated decision, while an impulsive person makes quick guesses and relies heavily on his/her hunches" (p.114).

Ehrman and Leaver (2003) view reflectives as the persons who prefer to first think and then respond. They often benefit from relatively complex thinking and tend to work accurately. However, their slowness can result in incomplete work on tests. On the other hand, impulsives respond very rapidly and tend to complete their work fast but often with less accuracy than do reflectives. "They reach decision and report them very quickly with little concern for accuracy" (Kagan, as cited in Jamieson, 1992, p. 492).

#### *Impulsivity/Reflectivity and Second Language Success*

Regarding all the information provided about impulsive and reflective cognitive style, one may conclude that one dimension is better than the other. In other words, reflective individuals perform better than the impulsive ones. But it is not true, since according to Fontana (1995), "all cognitive style theorists stress that ideally we should be able to operate at either end of a dimension, depending on the circumstances" (p. 206).

It is easy to see that there are some situations in which the individual is needed to act quickly, such as some tests with limited time. Consequently, if the individual spends too much time on a test to make sure about the accuracy of answer, s/he may lose the time as well as the chance to learn something through the process of answering quickly and relying on his hunches. In academic settings, a reflective learner might be labeled slow. A very reflective learner may have difficulty finishing a test on time; however, the completed portions are probably correct (Rozenecwajc & Corroyer, 2005).

On the other hand, according to Block and Harrington (1974), impulsives are anxious because stress is induced by the uncertain and ambiguous nature of the situation. Furthermore, impulsive behavior like routine actions and thought processes are sometimes inappropriate and erroneous. Therefore as Fontana (1995) points "there has to exist a means by which, routine behaviors and thoughts can be inhibited and replaced, situationally or long term, by appropriate behavior or thought" (p. 3).

From the above paragraphs it can be concluded that the hypothesis that one style is better than the other is not true, since, it is the individual's ability to change his/her style according to the situation that determines success.

#### *Cooperative Goal Structures*

According to Lin (1997), the cooperative goal structures (win-win orientation) invite the learners to assist each other in reaching the goal. Here, the learners share the same goal and put their effort in reaching that goal by helping each other in carrying out class activities. In this kind of goal structure, the learners are motivated and feel responsible for the outcome.

Johnson and Johnson (1991) emphasize that five basic elements are necessary for effective use of the method. These five elements are as below:

**1. Positive interdependence:** Positive interdependence means that pupils see themselves as linked to the others in the group in such a manner that they cannot succeed unless the other members of the group succeed. (Johnson & Johnson, 1999).

**2. Face-to-Face interaction:** According to Brown and Parker (2009), "face-to-face interaction is an element of cooperative learning by which learners can promote each other's success during discussions and cooperative tasks which includes:

- Orally explaining how to solve problems
- Teaching one's knowledge to others
- Checking for understanding
- Discussing concepts being learned
- Connecting present with past learning" (p. 507).

**3. Individual and Group Accountability:** Individual accountability exists when the performance of each individual pupil is assessed and the results are subsequently reported to both the individual and the group (Johnson & Johnson, 1999). According to Johnson and Johnson (1999), individual and group accountability is described as below:

- "Keeping the size of the group small. The smaller the size of the group, the greater the individual accountability may be.
- Giving an individual test to each student.
- Randomly examining students orally by calling on one student to present his or her group's work to the teacher (in the presence of the group) or to the entire class.
- Observing each group and recording the frequency with which each member-contributes to the group's work.
- Assigning one student in each group the role of checker. The checker asks other group members to explain the reasoning and rationale underlying group answers.
- Having students teach what they learned to someone else" (p. 4).

**4. Interpersonal & Small-Group Skills (Social Skills Training):** According to Brown and Parker (2009), Social skills which must be taught include "Leadership, Decision-making, Trust-building, Communication and Conflict-management skills" (p. 509).

**5. Group Processing:** As Brown and Parker (2009) states, Every so often groups must assess their effectiveness and decide how it can be improved based on the steps described below:

- Group members discuss how well they are achieving their goals and maintaining effective working relationships.
- Describe which member actions are helpful and not helpful
- Make decisions about what behaviors to continue or change (p. 510).

#### *Merits and Demerits of Cooperative Learning*

A number of researchers identified a positive general trend in research examining the effects of cooperative learning on student achievement (Johnson & Johnson, 1989, 1991; Johnson, Johnson, & Stanne, 1986; Ravenscroft, Buckless, McCombs, & Zuckerman, 1995; Sharan, 1980; Slavin, 1995). According to Sharan (1980) some of the benefits of cooperative learning are briefly mentioned hereunder:

- **Celebration of diversity.** Students learn to work with all types of people. During small-group interactions, they find many opportunities to reflect upon and reply to the diverse responses fellow learners bring to the questions raised.
  - **Acknowledgment of individual differences.** When questions are raised, different students will have a variety of responses. Each of these can help the group create a product that reflects a wide range of perspectives and is thus more complete and comprehensive.
  - **Actively involving students in learning.** Each member has opportunities to contribute in small groups.
  - **More opportunities for personal feedback.** Because there are more exchanges among students in small groups, students receive more personal feedback about their ideas and responses.
- Though cooperative learning had been widely accepted and has many advantages, it was by no means a panacea that could solve all the educational problems. There were, like all other teaching methods, limitations in cooperative learning.

Most of the limitations of cooperative learning came from not being able to implement the cooperative structure carefully. If the teachers just put the students into groups to learn and didn't structure the positive interdependence and individual accountability, then it would not be unusual to find groups where one person did most (or all) of the work and the others signed off as if they had learned it or had done the work.

It was also considered time-consuming to teach materials in a cooperative way, although more students might have learned and retained better of the material. This might be true, especially in the beginning when cooperative learning was new to the teacher and to the students (Kagan, 1994).

#### *Competitive Goal Structures*

Competitive situations are ones in which students work against each other to achieve a goal that only one or a few can attain. In competition, students perceive that they can obtain their goals if and only if other students in the class fail to obtain their goals (Deutsch, 1962; Johnson & Johnson, 1989).

The competitive goal structures, according to Lin (1997), require the learners to act against each other in order to achieve the desired goal which is learning. This kind of goal structure invites the learners to compete against each other. It consequently leaves the participants with a win-lose situation.

Based on Walters (2000), since it is probable in the process of using competitive goal structures to ignore some students unintentionally, some factors are nice to be mentioned such as:

- Competition is better to be used for those learners who enjoy competing.
- Competition is better to be formed in a way that all students have the same chance of winning.
- It is better to teach them how to compete against themselves more than each other.
- Reward should be provided for the learners to encourage them in the process of learning (p.98).

#### *Merits and Demerits of competitive Learning*

Competition is not without its advocates, and several reasons for this are offered in the literature. First, competition may generate interest and excitement in topics or tasks that would otherwise be of limited interest to students. Team-based competitive approaches (e.g., class-wide games) may be especially effective at making instructional material more enjoyable and engaging.

Good and Brophy (2008) suggest that competitive classroom activities may be appropriate if all students have a chance to win, and when a team approach is used rather than individually based evaluations. These practices may reduce the likelihood that the same students are always the winners and losers, in which the losers become embarrassed and demoralized. Further, competition between groups (using a team-based approach) may increase cooperation within groups, as students are unified in working towards a common goal (i.e., outperforming the other teams).

Second, competitive approaches may be appropriate within the context of behavior management, such as when the teacher is attempting to

reduce disruptive behaviors and increase positive behaviors. For example, interventions such as the Good Behavior Game and its variations (Tingstrom, Sterling-Turner, & Wilczynski, 2006) use team-based competition to motivate students and modify their behaviors.

Third, some (e.g., Good & Brophy, 2008) argue that competition in the classroom will prepare students for competition in their lives beyond school (i.e., the workplace). The reasoning behind this argument is that if all classroom tasks are cooperative, students may become overly dependent on their classmates when completing academic tasks and may be unable to perform in competitive or individual contexts in the future.

Although competitive learning has some advantages it has its own demerits too. Good and Brophy (2008) summarize several ways in which classroom competition may negatively impact students' development, learning, and motivation. For example, if students become preoccupied with winning or losing the competitive activity, they may lose sight of important instructional objectives and content. From the student's perspective, performance takes precedence over learning.

Further, according to Good and Brophy (2008), inherent in the practice of competition is the necessity for someone to lose. If the same students lose over and over despite their best efforts, they may come to see the world as unfair and are likely to give up when faced with challenging academic tasks, as they have learned that failure will be the outcome no matter how hard they try to succeed.

## RESEARCH QUESTIONS

To fulfill the purpose of the present study the following questions were raised:

- Q<sub>1</sub>. Is there any significant interaction between teaching technique and cognitive type in their effect on EFL learners' writing achievement?
- Q<sub>2</sub>. Is there any significant difference between the effect of cooperative and competitive learning on impulsive EFL learners' writing achievement?
- Q<sub>3</sub>. Is there any significant difference between the effect of cooperative and competitive learning on reflective EFL learners' writing achievement?
- Q<sub>4</sub>. Does cooperative learning have a significantly different effect on impulsive and reflective EFL learners' writing achievement?
- Q<sub>5</sub>. Does competitive learning have a significantly different effect on impulsive and reflective EFL learners' writing achievement?

## METHODOLOGY

In order to find appropriate answers to the posed questions, the researchers followed certain procedures and made use of certain instruments, which are reported in this section.

### Participants

To fulfill the objectives of this study, 120 female intermediate EFL learners with the age range of 15-25, studying in a language school of Tehran, Iran, participated in this research. These candidates were selected non-randomly from the total number of 185 students and among the learners whose scores on the Preliminary English Test (PET) fell one standard deviation above and one standard deviation below the sample mean. It is worth mentioning that the sample PET was run to 30 students in the same language school with similar characteristics to the participants of this study first, and after doing item analyses and also calculating the reliability of the test, and excluding five malfunctioning items, PET was administered to the main candidates.

Also it is notable that in addition to one of the researchers, herself as a teacher and rater, another trained rater who was MA holder in TEFL with five years of teaching experience, participated in this research to correct and score the learners' writing and speaking based on the Akef and Hajhashemi (2012) rating scale for writing and predetermined official Cambridge General Mark Schemes for speaking.

### Instrumentation

To fulfill the purpose of this study, the researchers used the instructional materials and tests as described below.

Preliminary English Test (PET): This test is designed by Cambridge ESOL and is used as a proficiency test for selecting the intermediate sample among the whole participants. PET consists of three main sections: a 35-item reading comprehension test and an 8-item writing test in the first part (1 hour and 30 minutes), a 25-item listening comprehension test in the second part (35 minutes) and a speaking test consisting of four sections in the third part (10-12 minutes).

The Impulsivity sub-scale of Eysenck and Eysenck's Impulsiveness Questionnaire: Eysenck and Eysenck's (1991) Impulsiveness Questionnaire (EIQ) contains 54 items and assesses Impulsiveness (19 items), Venturesomeness (16 items) and Empathy (19 items). A standardized Persian impulsivity sub-scale of the questionnaire consisting of 19 likert scale items was used in this study. Salimi (2001) prepared a Persian version of this questionnaire, and its Impulsiveness sub-scale was validated with 1820 subjects from Tarbiat Modarres University of Iran. It is worth mentioning that the instrument reliability was estimated through Cronbach alpha to be as high as 0.8.

The range of Impulsiveness scores is from 19 to 95. The candidates who got scores from 60 to 95 were considered impulsive, and those who got scores from 19 to 40 were considered reflectives. It should be mentioned that scores from 41 to 59, which show medium impulsivity, were excluded from this study and the needed time for answering the questions of this questionnaire was 10 minutes.

Writing posttest: Part three of the writing section of a PET was used as the posttest of this study. This part contains two questions in which the learners were supposed to write about 200 words that were scored according to the rating scale described below. The needed time for answering the two questions of this part was approximately 45 minutes.

Writing rating scale: In order to rate all the writings used in this study, the researchers used *the Analytic rating scale* selected from what has been designed by Akef and Hajhashemi (2012, p. 243). This rating scale was applied to evaluate learners' general writing ability through assessing different aspects of written scripts such as fluency, structural accuracy, vocabulary (range and appropriateness of vocabulary choices), coherence, cohesion, relevance, organization, and mechanics of writing.

Speaking rating scale: The rating scale used to rate the oral proficiency of the subjects was the predetermined official Cambridge General Mark Schemes for speaking. The rating was done on the basis of the criteria stated in the rating scale including the range of scores from 0 to 5.

American English File student book 3: The main textbook in this study was "*American English File*" by Oxenden and Latham-Koenig (2011). This book consists of seven files and each of them is divided into three lessons of A, B, and C and contains different tasks and exercises for all the four skills of listening, speaking, reading and writing. In this study, in each term, the first two chapters of this book were covered and covering each chapter lasted about seven sessions.

American English File workbook 3: American English File workbook by Oxenden and Latham-Koenig (2011), was also utilized in this study. According to the student book, work book has also seven files, including three lessons of A, B, and C. In this study the first two chapters of the workbook were covered during each term.

Oxford word skills book: Oxford Word Skills by Gairns and Redman (2008) was used in this research. Oxford Word Skills is a series of three books for students to learn, practice, and revise new vocabularies in basic, intermediate, and advanced level. Each book contains 80 units of vocabulary presentation and practice. In this study, eight units of this book were covered during one term in each class.

Story book: Oxford Bookworms Story books are the story-telling series used in this study. These books include original and adapted texts in seven carefully graded language stages, which take learners from beginner to advanced level. In this study, "*Robinson Crusoe*" story book by Defoe (1993) was used. This story book contains nine sub-titles, which the teacher and the learners usually worked on each section every two sessions.

### **Procedure**

Before conducting this study, the researchers piloted the sample PET and after calculating the reliability of the test and running item analysis, the researchers omitted five items which were malfunctioning and again calculated the reliability of the test. Consequently, this time the test showed the acceptable reliability of 0.82.

As the treatments were conducted in two terms, the participant selection procedures were also done at the beginning of each term meaning that, in the first term, the researchers administered the already piloted PET to 95 intermediate EFL learners and 76 participants who scored one standard deviation above and one standard deviation below the sample mean were chosen for the next step.

Afterward, the researchers conducted EIQ among the learners and thereby, selected 30 most impulsive and 30 most reflective learners from the 76 learners as the main candidates for the first phase of this study. All these candidates received the same treatment of cooperative learning during the term.

At the beginning of the second term, like the first term, the above procedures were conducted among 90 learners, 72 learners whose scores fell one standard deviation above and below the mean were selected, and finally after conducting EIQ, 30 most impulsive and 30 most reflective candidates were chosen as the main candidates of the second term and received the same treatment of competitive learning.

It is worth mentioning that in addition to check the homogeneity of the two groups' (cooperative and competitive) writing mean scores across the two terms through a *t*-test, the researchers ran another *t*-test on the mean scores of impulsives and reflectives on the writing part of the PET at the outset of each term to make sure that both of the groups of impulsives and reflectives were the same in their writing ability.

In the cooperative group, the students experienced being in different groups during one term, and even sometimes the group members were changed in one single session in order for the students to learn to work cooperatively with different individuals rather than a specific group. During the whole term, in the first phase, group work was encouraged while competitiveness was de-emphasized and the students had to do the exercises and drills cooperatively and in group.

Also, in the cooperative group, all the time, the students' activities in the groups and their interactions were under the teacher's supervision and the learners knew that they had to do their best in assisting and cooperating with other students, since the teacher considered positive marks for the students' assistance and cooperation in the groups. Immediately after this treatment, the first group of this study which was practicing English in a cooperative way underwent the writing posttest.

In the competitive classes, for some activities, the teacher divided the learners into the groups which included both impulsives and reflectives. These students knew that even if they were in groups, they would be assessed based on their individual efforts and outcomes. Comparing to the previous treatment, this treatment included less group works.

In the competitive group the teacher's instruction method did not change at all; instead, the way the students practiced every single part changed in comparison with the previous treatment. In all of the activities of the competitive classes, each student was only responsible for her own activities and assignments even if she worked in the group, or asked for assistance from her group members; also all the time and in the process of doing all the activities, the teacher encouraged the students to try to be the best one and compete against each other. Being "the best" required the students to be both quicker and more accurate in comparison with their classmates. Each time that the students succeeded to answer the questions accurately and before others, the teacher put a positive mark for them and these marks were counted at the end of the term and affected the total class participation marks of the learners.

### **RESULTS AND DISCUSSION**

This study was an attempt to investigate the effect of two different types of learning modalities, namely cooperative and competitive, on impulsive and reflective EFL learners' writing achievement. The design of this study was quasi experimental posttest only, since the selection of the participants was done non-randomly and the groups were intact ones. The dependent variable was EFL learners' writing while the independent variable was teaching modality having two levels of competitive and cooperative learning. The control variables were gender (female) and the language proficiency (intermediate), whereas the moderator variable was the cognitive style (impulsiveness/reflectiveness).

#### ***Descriptive Statistics of the PET Piloting***

In order to select the participants required in this study, the researchers used a sample of the general English Proficiency Test (PET). Prior to the actual administration, the test was piloted among 30 students to make sure that it could be used confidently for this screening.

Table 1: Descriptive Statistics of the PET Piloting

	N	Minimum	Maximum	Mean	Std. Deviation	Skewness		Skewness Ratio
	Statistic	Statistic	Statistic	Statistic	Statistic	Statistic	Std. Error	Statistic
PET Piloting	30	48	72	60.87	6.771	-.064	.427	-0.149
Valid N (listwise)	30							

As the above table shows, the mean and standard deviation of the PET piloting scores were found to be 60.87 and 6.771, respectively.

As another step, since the writing and speaking parts of the proficiency piloting test were rated by two qualified raters, the researchers also conducted an inter-rater reliability on the scores given by the raters in this study to the 30 participants. The Pearson Product Correlation was run to make sure that the two raters enjoyed a significant degree of consistency in their scoring. Table 2 and Table 3 below show that the two raters demonstrated a significant correlation.

Table 2: Inter-Rater Reliability of the Two Raters for the Writing Part

	Rater 1	Rater 2
Rater 1		
Pearson Correlation	1	.735**
Sig. (2-tailed)		.000
N	30	30
Rater 2		
Pearson Correlation	.735**	1
Sig. (2-tailed)	.000	
N	30	30

\*\*Correlation is significant at the 0.01 level (2-tailed)

Table 3: Inter-Rater Reliability of the Two Raters for the Speaking Part

	Rater 1	Rater 2
Rater 1		
Pearson Correlation	1	.560**
Sig. (2-tailed)		.007
N	30	30
Rater 2		
Pearson Correlation	.560**	1
Sig. (2-tailed)	.007	
N	30	30

\*\*Correlation is significant at the 0.01 level (2-tailed)

#### Descriptive Statistics of the Cooperative Group's PET Scores

As discussed earlier, prior to the selection of the participants, 95 students took a piloted PET at the outset of the first term from whom 60 were chosen for the two experimental groups of impulsives and reflectives undergoing the cooperative treatment. Table 4 displays the descriptive statistics of the scores related to the 95 students.

Table 4: Descriptive Statistics of the Scores Obtained by the 95 Students on the Piloted PET

	N	Minimum	Maximum	Mean	Std. Deviation	Skewness		Skewness Ratio
	Statistic	Statistic	Statistic	Statistic	Statistic	Statistic	Std. Error	Statistic
Pre-PET for the Cooperative Group	95	42	74	60.73	7.007	-.362	.247	-1.465
Valid N (listwise)	95							

Among the above 95 students, a total of 76 whose scores fell one standard deviation above and one standard deviation below the mean were selected. Next, the researchers administered the EIQ, through which she selected 30 most impulsive and 30 most reflective learners from the 76 participants as the main candidates of this study.

To make sure that these 30 impulsive and 30 reflective participants bore no significant difference in terms of the dependent variable of this study (i.e. writing) prior to the treatment, the researchers ran an independent samples t-test on the mean scores of the two groups on the writing part of the PET. The following table reports the result of the t-test.

*Table 5: Independent Samples t-Test of the Impulsive and Reflective Participants in the Cooperative Group Prior to the Treatment*

	Levene's Test for Equality of Variances		t-test for Equality of Means						
	F	Sig.	T	Df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
								Lower	Upper
Equal variances assumed	.562	.465	-.372	58	.711	-.266	.717	-1.70202	1.168
Equal variances not assumed			-.372	57.351	.711	-.266	.717	-1.70237	1.169

According to Table 5, with the  $F$  value of 0.562 at the sig value of 0.465 being larger than 0.05, the variances of the two groups were not significantly different. Therefore, the results of the  $t$ -test with the assumption of homogeneity of the variances were reported here. As the results indicate ( $t = -0.372$ ,  $p = 0.711 > 0.05$ ), there was no significant difference between impulsive and reflective learners' writing pretest scores. Therefore, the researchers could rest assured that any probable difference between the two groups at the end of the study could be attributed to the effect of the independent variable(s).

#### ***Descriptive Statistics of the Competitive Group's PET Scores***

The procedure of participant selection for the competitive group was identical to that of the cooperative group. In this phase, a total number of 90 students took the same piloted PET. Table 6 below displays the descriptive statistics of the scores for these 90 students.

*Table 6: Descriptive Statistics of the Scores Obtained by the 90 Students on the Piloted PET*

	N	Minimum	Maximum	Mean	Std. Deviation	Skewness		Skewness Ratio
	Statistic	Statistic	Statistic	Statistic	Statistic	Statistic	Std. Error	Statistic
Pre-PET for the Competitive Group	90	44	77	60.89	6.666	-.167	.254	-.657
Valid N (listwise)	90							

Among the above 90 students, a total of 72 whose scores fell one standard deviation above and below the mean were selected. Again, the researchers administered the EIQ through which 30 most impulsive and 30 most reflective participants were identified within this sample of 72.

Again, to make sure that these 30 impulsive and 30 reflective participants bore no significant difference in terms of the dependent variable of this study (i.e. writing) prior to the treatment, the researchers ran an independent samples  $t$ -test on the mean scores of the two groups on the mean scores of the two groups on the writing part of the PET. The following table reports the result of the  $t$ -test.

*Table 7: Independent Samples t-Test of the Impulsive and Reflective Participants in the Competitive Group Prior to the Treatment*

	Levene's Test for Equality of Variances		t-test for Equality of Means						
	F	Sig.	T	Df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
								Lower	Upper
Equal variances assumed	2.827	.098	.128	58	.898	.100	.780	-1.46162	1.66162
Equal variances not assumed			.128	56.268	.898	.100	.780	-1.46265	1.66265

According to Table 7, with the  $F$  value of 2.827 at the significant level of 0.098 being larger than 0.05, the variances of the two groups were not significantly different. Therefore, the results of the  $t$ -test with the assumption of homogeneity of the variances were reported here. As the results indicate ( $t = 0.128$ ,  $p = 0.898 > 0.05$ ), there was no significant difference between the mean scores of the two groups' writing prior to the treatment.

Therefore, the researchers could rest assured that any probable difference between the two groups at the end of the study could be attributed to the interaction of the relevant independent variables of the competitive learning or the cognitive type (being impulsive or reflective). Moreover, to show that the writing abilities of the two groups (cooperative and competitive) were the same, prior to the second term treatment, the researchers ran an independent samples  $t$ -test on the mean scores of the two groups on the writing part of the PET.

Table 8: Independent Samples *t*-Test of the Cooperative and Competitive Groups Prior to the Treatment

	Levene's Test for Equality of Variances		t-test for Equality of Means						
	F	Sig.	T	Df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
								Lower	Upper
Equal variances assumed	.377	.540	-.150	118	.881	-.083	.555	-1.183	1.016
Equal variances not assumed			-.150	117.56	.881	-.083	.555	-1.183	1.017

According to Table 8, with the *F* value of 0.377 at the sig value of 0.540 being larger than 0.05, the variances of the two groups were not significantly different. Therefore, the results of the *t*-test with the assumption of homogeneity of the variances were reported here. As the results indicate ( $t = -0.150$ ,  $p = 0.881 > 0.05$ ), two groups of cooperatives and competitiveness were not significantly different regarding their writing skill. Therefore, the researchers could rest assured that any probable difference between the two groups at the end of the study could be attributed to the effect of the independent variable(s).

#### Posttest

Once the treatment in each group was over, the posttest (a writing part of a PET as described in the previous chapter) was conducted. As there were two independent variables of teaching technique (cooperative and competitive) and cognitive type (impulsive and reflective), and one dependent variable (writing) in this study, a two-way ANOVA was needed for the posttest analysis. But firstly the assumptions of normality, and homogeneity of variances were met. The following table shows the descriptive statistics of the posttest scores belonging to the four subgroups.

Table 9: Descriptive Statistics of All Four Subgroups on the PET Writing Posttest

	N	Minimum	Maximum	Mean	Std. Deviation	Skewness		Skewness Ratio
	Statistic	Statistic	Statistic	Statistic	Statistic	Statistic	Std. Error	Statistic
Reflective Cooperative	30	26	32	29.166	1.599	.034	.427	.08
Impulsive Cooperative	30	25	31	28.000	1.553	.177	.427	.42
Reflective Competitive	30	23	29	26.566	1.381	-.400	.427	.94
Impulsive Competitive	30	19	28	23.466	1.833	.291	.427	.69
Valid N (listwise)	30							

According to Table 9, all the distributions were normal as the skewness ratios of all the sets of scores fell within the normality range of  $\pm 1.96$ . Hence, the first assumption is met. The following figures depict the distribution of the scores. The next assumption was checking the homogeneity of variances. In this regard the Levene's test of equality of error variances was conducted. The following table shows the result of the Levene's test.

Table 10: Levene's Test of Equality of Error Variances

F	df1	df2	Sig.
.719	3	116	.542

As Table 10 demonstrates, the variance of the dependent variable across the groups is equal ( $F = 0.71$ ,  $p = 0.54 > 0.05$ ), hence, homogeneity of variances as the second assumption is also met. Accordingly, in order to test the hypotheses, running a two-way ANOVA was legitimized. The following table shows the result of the two-way ANOVA.

Table 11: Tests of Between-Subjects Effects

a. R Squared = .648 (Adjusted R Squared = .639)

Dependent Variable: writing scores

As shown above, the interaction between the two independent variables was significant ( $F = 10.94$ ,  $p = 0.001 < 0.05$ ); therefore, the first null hypothesis stating that *there is no significant interaction between teaching technique and cognitive type in their effect on EFL learners' writing achievement* is rejected. This implies that there is a significant difference in the effect of teaching techniques for impulsive and reflective learners. In other words, the effect of the teaching techniques depends on being reflective or impulsive.

By virtue of this interaction and the main effect of technique, as shown in the fourth row of the above table ( $F = 149.05$ ,  $p = 0.000 < 0.05$ ), the second hypothesis stating that *there is no significant difference between the effect of cooperative and competitive learning on impulsive EFL learners' writing achievement* is also rejected. Table 9 above depicts that the impulsive learners who received cooperative teaching technique outperformed those impulsive learners who received competitive learning practice (28.00 vs. 23.46 respectively). The last column of Table 11 above shows the effect size, (Partial Eta Squared) which has turned out to be 0.56. Expressed in percentage, 56 percent of the variation in the dependent variable is explained by the independent variable. Using Cohen's (1988) criterion, this can be classified as large effect size (1%=small, 6%=medium, 13.8=large). The conclusion is that cooperative technique was significantly more effective for impulsive learners.

Likewise, as the teaching technique main effect turned out to be significant, the third hypothesis stating that *there is no significant difference between the effect of cooperative and competitive learning on reflective EFL learners' writing achievement* is rejected. By retrospect to table 9 above, it can be concluded that cooperative technique has been significantly more effective on reflective learners compared with competitive technique as the reflective learners who were exposed to the former outperformed those who were exposed to the latter (29.16 vs. 26.56 respectively). The effect size also is large based on the observed Partial Eta Squared value (0.56).

As Table 11, the third row exhibits, the main effect of cognitive type was significant ( $F = 53.32$ ,  $p = 0.000 < 0.05$ ) too. This leads to the rejection of the fourth hypothesis stating that *Cooperative learning does not have a significantly different effect on impulsive and reflective EFL learners' writing achievement*. By comparing the writing mean scores of the two groups, impulsive cooperative versus reflective cooperative (28.00 vs. 29.16 respectively), it is concluded that between the two cognitive types who received cooperative teaching technique, reflective learners performed significantly better in the writing posttest. The effect size, (Partial Eta Squared) has turned out to be 0.315. In other words, 31.5 percent of the variation in the dependent variable is explained by the independent variable. Using Cohen's (1988) criterion, this can be classified as large effect size.

By the same token (the significance of the cognitive main effect), the fifth hypothesis stating that *competitive learning does not have a significantly different effect on impulsive and reflective EFL learners' writing achievement* is rejected. Table 9 above shows that competitive technique was significantly more effective on reflective learners' writing compared with the impulsive learners (26.56 vs. 23.46). The effect size, (Partial Eta Squared) has turned out to be 0.315. In other words, 31.5 percent of the variation in the dependent variable writing scores) is explained by the independent variable (cognitive type), which is a large effect size according to Cohen's (1988) criterion.

## CONCLUSION

The present study attempted to investigate the effect of two different types of learning modalities, namely, cooperative and competitive learning on impulsive and reflective EFL learners' writing. Based on the data analyses, the researchers found that the interaction between the two independent variables was significant and cognitive style of reflectivity/impulsivity interacted significantly with the two modalities of learning. It can be concluded that, the effect of the teaching technique depends on the cognitive style of the learners. However, it was also revealed that each of the independent variables alone was significantly effective on writing ability of the learners.

Regarding modality of teaching, specifically, cooperative learning technique was shown to be more effective both on reflective and impulsive learners compared with competitive technique. In other words, both reflective and impulsive learners benefited more from cooperative technique than from competitive technique.

This result is supported by previous researches in the literature; many studies generally portray the higher effectiveness of cooperative learning (Deutsch, Coleman, & Marcus, 2006; Johnson, Johnson, & Stanne, 2000; Norman, 2005) and also certain studies in the context of Iran (e.g. Marashi & Baygzadeh, 2010) showed that cooperative learning led to better results (albeit the personality factor was not included and the dependent variable was overall achievement and not just one language skill).

On the other hand, in contrast with the result of this study, some other researches prove the advantages of competitive learning and claim that competition, in an educational setting, will improve academic achievement in students, motivating them to perform to the best of their ability and leads to better results than cooperation (Hayes, 1976; Michaels, 1978).

As for the cognitive style, it was shown that reflective learners performed better both in cooperative and in competitive techniques; this result is in agreement with some other researches about R/I cognitive style. In a little different research, inductive reasoning was discovered

to be more effective with reflective persons (Kagan, Pearson, & Welch, 1966), suggesting that generally reflective persons could benefit more from inductive learning situations. In another study, Katz (1980) found that reflectives are more attentive and have better short-term auditory and visual memory in different tasks.

#### Limitation of the study

Like any other studies, this study also faced a limitation. The rules and restrictions which exist in some language schools in Iran, did not allow the researcher/teacher, herself being a female, to have male learners in her classes. Hence, the result of this research cannot be necessarily generalized to male EFL learners.

### ABSTRACT

The present study investigated the effects of form-focused instruction (FFI) on teaching English grammar to Iranian learners at the intermediate level. The design of the study was a pre and post-test which dealt with 40 participants at the intermediate level and comprised of two experimental groups. The pre-test on grammatical patterns was administered to assess the participants' knowledge on the patterns in the passages at the beginning of the course. Then they were taught through implicit and explicit Form-focused instruction (FFI) developed by R. Ellis (2004) and Spada and Lightbown (2008). Each group included 20 participants. The implicit FFI group received grammatical pattern instruction through indirect instruction which focused on the use of grammatical patterns in the contexts and reading passages discussion. The explicit FFI group received instructions on how to use the structural patterns and immediate feedback coming from the peers and the teacher in the classroom. The treatment took 10 sessions and ended in a post-test stage to evaluate the course effectiveness. Data were analyzed through Independent Samples *t*-test and results showed that there was a significant difference between the two groups. In other words, the explicit FFI group outperformed the implicit FFI one. Implications of the study for teachers who practice English grammar could be the use of explicit instruction on forms and then put them into practice contextually.

**KEYWORDS:** Form-focused instruction (FFI), English grammar, implicit, explicit

### INTRODUCTION

It is generally agreed that some attention to grammatical form is fruitful, perhaps necessary, but many issues related to the teaching of grammar still need further research and more treatment. One of the most recent trends in applied linguistics is centered on the most effective forms of grammar teaching in the communicative classroom (Doughty & Williams, 1998; Lightbown, 1998). For many years, there was a dichotomy between Focus on Form (Long, 1991) in teaching grammatical structures of a language. Taken these concerns into account, in recent years much has been written, on both theoretical and empirical aspects of the form-focused instruction in second language learning and foreign language learning contexts.

Ellis, Basturkmen and Loewen (2001) found that learners who engaged in communicative, focus-on-form activities improved their grammatical accuracy and their use of new forms. On the acquisition of a particular form through form-focused instruction, noticing, Celce-Murcia (2001, pp. 272-273) explains that through repeated conscious encounters with a particular form the learners' consciousness is raised. This helps the learners to notice that forming late activities ad form and restructure her hypotheses about that, form, and this leads to its acquisition. Focus on form, in part, shows the inefficiency of the current communicative approaches in teaching a language. Celce-Murcia (2001) noted, "considerable research shows that when students receive only communicative lessons, with instruction on grammar points, their level of accuracy suffers" (p. 268). This, in part, shows the significance of grammar and the focus in it. Furthermore, Larsen-Freeman (cited in Brown, 2001) said, "grammar is one of the dimensions of language that are interconnected. Grammar gives the forms or the structures of language but those forms are literally meaningless without a second dimension that of semantics, and a third dimension, pragmatics" (p. 362).

Explicit FFI in instructing grammar means presenting and explaining a predetermined set of grammar rules, usually but not necessarily followed by practice during the teaching period immediately while implicit FFI deal with the correction feedback within the context without direct notice to FFI in a direct corrective feedback mode. The terms implicit and explicit FFIs may be used similarly to Spada and Lightbown's (2008) isolated and integrative FFIs.

### REVIEW OF LITERATURE

Another category is focus on forms versus focus on form. In focus on forms, we teach language features based on a structural syllabus specifying the features to be taught and their sequence. Activities used in this criterion are mostly grammar translations, mimicry, or memorization. Focus on form, on the other hand, is in the instruction whose main emphasis remains on communicative activities or tasks, yet in these activities the teacher intervenes to make students more accurate in language use whenever needed.

The categories focused on this study are implicit FFI versus integrated FFI. Implicit FFI is provided in activities that are separated from the communicative use of language, but it occurs as part of a program that also includes CLT (Communicative Language Teaching) and CBI (Content Based Instruction). In explicit FFI learners' attention is drawn to language form during communicative or content-based instruction.

In English language teaching there has always been an argument among many scholars on the best and effective way to teach grammar. To date, many different methods and approaches have come into and gone out of existence. It is commonly assumed that grammar knowledge is consisted of two types: explicit and implicit knowledge. According to N. Ellis (2005), these two types of knowledge are distinct and exist in separate parts of the brain. Further, R. Ellis (2006) lists seven criteria that can be used to distinguish between explicit and implicit grammar knowledge. These criteria include, among others: level of awareness, accessibility and whether learners can verbalize the knowledge. The distinction between explicit and implicit needs to be considered in relation to another common distinction- isolated versus integrative FFI (Lightbown & Spada, 1990).

Recently, a plethora of studies and reviews on second language acquisition (SLA) research have shown that focus on form instruction (FFI) has potential for learners and develop learners' awareness of target language (Spada, 2006). Long (1991) distinguished "focus on forms" and "focus on form" instruction. Focus-on-forms is evident in the traditional approach to grammar teaching based on a synthetic syllabus. The underlying assumption is that language learning is a process of accumulating distinct entities. In such an approach, learners are required to treat language primarily as an "object" to be studied and practiced bit by bit and to function as "students" rather than as "users" of the

language (Ellis, 2006). In contrast, focus-on-form “draws students’ attention to linguistic elements as they arise incidentally in lessons whose overriding focus is on meaning or communication” (Long, 1991, pp. 45-46). According to Long and Robinson (1998), such an approach is to be distinguished not only focus-on-form but also form focus-on-meaning, where there is no attempt to induce attention to induce attention to linguistic form at all. Implicit explicit FFI are differentiated in terms of a number of characteristics. Ellis (2010) presents these characteristics in Table 1 as follows.

*Table 1: Implicit and explicit forms of form-focused instruction*

<i>Implicit FFI</i>	<i>Explicit FFI</i>
<ul style="list-style-type: none"> <li>• attracts attention to target form</li> <li>• is delivered <i>spontaneously</i> (e.g., in an otherwise communication-oriented activity)</li> <li>• is unobtrusive (minimal interruption of communication of meaning)</li> <li>• presents target forms in context</li> <li>• makes no use of metalanguage</li> <li>• encourages free use of the target form</li> </ul>	<ul style="list-style-type: none"> <li>• directs attention to target form</li> <li>• is <i>predetermined</i> and <i>planned</i> (e.g., as the main focus and goal of a teaching activity)</li> <li>• is obtrusive (interruption of communication meaning)</li> <li>• present target forms in isolation</li> <li>• uses metalinguistic terminology (e.g., rule explanation)</li> <li>• involves controlled practice of target form</li> </ul>

Focus on form can be either explicit or implicit methods use it in line with their principles. In fact, explicitness and implicitness can be put at the two ends of a continuum with differing degrees along it some of the techniques that are usually used to focus on form in class: “recast”, “input enhancement”, and “consciousness raising task”. In recast, “the teacher reformulates what the student has said or written incorrectly in a more accurate, meaningful, or appropriate manner” (Celce-Murcia, 2001, p. 257). In this way, the learner is more likely to notice a particular form. Consciousness-raising task refers to the learners induction of a grammatical generalization from the examples data she has been given. According to Lyster (1998, p.187), among the techniques that focus on form, explicit techniques are more useful and productive. Karbalaee, Pourzargham and Kazemi (2013) studied the role of form focused instructions and noted that focus on form instruction through visual medium enhances grammar, vocabulary and reading comprehension. This instruction provides English as foreign language (EFL) learners with input enhancement as a technique to promote EFL reading proficiency.

Instructors can encourage learners to focus on form in several ways. Ellis (2001a) has distinguished two types within the category of “focus on form” and “focus on forms”. The distinction is Planned and Incidental. Focus on form may be planned and focused on pre-selected structures, or it may be incidental, arising spontaneously at any point in a communicative activity. Advocates of incidental FonF assume that classroom activity is based on communicative tasks and that attention to form should be paid only when grammatical difficulties arise which lead to (or are anticipated to lead to) a communicative breakdown (Barnard & Scampton, 2008). Planned FonF, on the other hand, involves the treatment of predetermined grammatical features, but differs from FonFs because it occurs when the learners’ attention is primarily engaged in processing meaning (Barnard & Scampton, 2008). Various empirical studies investigating FonF in some English as a Second Language context have been recently conducted, notably by Ellis and his associates (Ellis, 2001a and b; Ellis 2002, Karbalaee, Pourzargham & Kazemi, 2013). Moreover, FonF appears to be consistent with current Second Language Acquisition (SLA) theories.

Teachers might design a task to encourage learners to notice forms in the input (e.g., prepositions of location such as in, on, under), or they might explicitly teach these forms and provide opportunities for meaningful practice. Focus on form may be reactive, including explicit corrections to student language, recasts, clarification requests, and other types of feedback. Focus on form is most frequently teacher-initiated, but it is also initiated by learners through questions and requests for explanation. Although second language acquisition research has not definitively answered many important questions regarding form-focused instruction, studies (e.g., Karbalaee, Pourzargham & Kazemi, 2013) have provided promising evidence that focus on form is correlated with more acquisition of new grammar and vocabulary than non-form-focused approaches.

### **Teaching Grammar**

The topic of grammar teaching continues to be a controversial matter in the field of Applied Linguistics and SLA and teachers often take opposing views. On the other hand, the debate on the place of grammar in instruction has played a prominent part in the history of English language teaching. This debate revolved around the question of whether grammar instruction helped learners acquire proficiency in second language acquisition. Further, the study of how learners acquire a second language has helped us shape thinking about how to teach the grammar of a second language (Ellis, 2006). There are many answers to this question which could be placed along a continuum with extremes at either end. At one end are highly explicit approaches to grammar teaching, and at the other end lies implicit approaches that avoid mention of form. N. Ellis (2005) suggests that traditional grammar teaching is viewed as the presentation and practice of discrete grammatical structures. This is, according to him, the view promulgated in teacher handbooks. It contributed to learning but this was of limited value regarding development of communicative ability and fluency (Long, 1991). According to Nassaji and Fotos (2004), for the reevaluation of grammar, FFI is a necessary component of language instruction. It provides EFL/ESL learners with enough positive feedback coming from EFL/ESL teachers and peers. More over, the evidence comes from a large number of laboratory and classroom-based studies as well as extensive reviews of studies (e.g., R. Ellis, 2006) on the effects of instruction over the past 20 years.

### **Form-Focused Instruction (FFI)**

The term “form” is used to refer to structural aspects of language, which includes phonological, lexical, grammatical and pragmalinguistic aspects of language (Ellis, 2001, p. 1). The meaning of the term “focus on form” is best understood when compared to and contrasted with that of the terms “focus on forms” and “form-focused instruction”. The treatment of grammar in second language teaching has received much attention over the years. In earlier approaches to second language teaching, such as the Grammar Translation Method, the Audiolingual Method, the Silent Way and Total Physical Response (TPR), syllabuses were designed around target language grammatical structures, lexis, and functions and notions. In these approaches grammar was typically taught overtly and often separately from meaning (Long & Robinson, 1998, pp. 15-16). This treatment of grammatical structure is known as focus on forms (Doughty & Williams, 1998, p. 3). In more recent approaches to second language teaching, such as Task-based Language Teaching, grammar is treated more covertly and is not taught separate from meaning. This treatment of grammatical form is known as focus on form, and is defined by Long and Robinson (1998, p. 23) as “...an occasional shift of attention to linguistic code features-by the teacher and/or one or more students- triggered by perceived problems with comprehension or production”. Doughty and Williams (1998, p. 211) points out that focus on forms and focus on

form are "not polar opposites". She further stresses that "focus on form entails a focus on formal elements of language, whereas focus on forms is limited to such a focus ...". Doughty and Williams (1998, p. 3) emphasize that the crucial distinction between focus on forms and focus on form is that "focus on form entails a prerequisite engagement in meaning before attention to linguistic features can be expected to be effective".

A further distinction is pointed out by Ellis (2001, p. 15) who states that with focus on form the attention to form must be "brief and unobtrusive". The term 'form-focused instruction' (FFI) is used by some authors as an umbrella term which includes both focus on form and focus on forms. Ellis (2001, p. 2) states that form-focused instruction is a cover term for terms such as " 'analytic teaching', 'focus on form', 'focus on forms', 'corrective feedback/error correction' and 'negotiation of form' ". Ellis (2001, p. 1) defines form-focused instruction as "any planned or incidental instructional activity that is intended to induce language learners to pay attention to linguistic form". Klapper and Rees (2003, p. 287) cite a definition in which form-focused instruction is defined as "... any pedagogical effort which is used to draw the learners' attention to language form, either implicitly or explicitly". Doughty and Williams (1998, p. 4) point out that the term 'form-focused instruction' is also frequently used in literature to refer to instruction which is in fact focus on forms. They emphasize that "form-focused instruction" encompasses both focus on forms and focus on form.

A fundamental feature of focus on form is that at the time when learners' attention is focused on a linguistic form, they must already be familiar with the meaning and the appropriate usage of that form. If information about meaning and usage are lacking, the attention to form would be considered focus on forms. Ellis (2002, p. 420) use the term "form-based instruction" but do not offer a definition for this term. Based on their discussion of different kinds of treatment on forms in second language teaching, it is however assumed that they use this term to be similar in meaning to 'form-focused instruction'. Doughty and Williams (1998) define "focus on form", "focus on forms" and 'form focused instruction' schematically as follows: Sheen (2005) proposes that there is a fundamental difference between focus on form and focus on forms, as far as the theoretical underpinnings of these two approaches are concerned. According to Sheen, focus on forms is based on the assumption that when learners learn a second language in a classroom situation they are learning a skill, and that they are utilizing general cognitive processes to do so. As a skills-learning activity, the focus of forms approach is seen to take place in three stages:

- Learners are brought to understand the grammar, by means of overt grammar explanation, which often includes explanation in the first language and a comparison of the first and target language structures;
- Non-communicative and communicative exercises in which the targeted grammatical forms can be practiced;
- Learners are provided with plentiful opportunities for communication, in which they can use the targeted grammatical constructions, so that the use will eventually become automatic and accurate (Sheen, 2005, p. 304).

By contrast, focus on form, according to Sheen (2005, p. 303), derives from the assumption that first and second language acquisition are to a certain extent similar processes. Both these processes are seen to utilize "exposure to comprehensible input arising from natural interaction". Focus on form is, however, also based on the realization that there are significant differences between first and second language acquisition. Typically, learners' exposure to the target language is insufficient for them to acquire the grammar, and in order to make up for this lack of exposure learners' attention needs to be focused on structural elements of the target language, i.e. there needs to be some focus on form (Sheen, 2005). The above definitions and accompanying discussion of the terms "focus on form", "focus on forms" and "form-focused instruction" were presented in an attempt to point out all possible distinctions between these terms. It is important to note, however, that these distinctions are theoretical distinctions, and that the two approaches are not mutually exclusive in practice. Although it is important from a course design perspective to distinguish between focus on form and focus on forms, and to design materials and classroom methodology according to decisions informed by theory about how attention to linguistic form should catered for, both focus on form and focus on forms could be used in the same course and in the materials designed for it. As stated above, the two terms do not represent polar opposites, but should rather be seen as lying along a continuum.

In another investigation, Ellis (2002) investigated the effectiveness of FFI on learners' free production of target language (TL) and conducted the survey aimed to discover the role of FFI in developing learners' implicit knowledge of target language. He also concluded that effects of FFI were durable. Klapper and Rees (2003) also performed a longitudinal study about the effectiveness of FFI, lasting four years, involving two groups of whose second language was German. One group received focus on forms while the other received focus on form. At the end, the group receiving focus on forms was proved to gain greater proficiency. They concluded that there is still a role for formal (declarative) knowledge of language in contexts where naturalistic input is limited. Lyster (2004) also conducted a comparative analysis of five quasi-experimental studies on the effects of FFI on 49 French immersion classes in Canada, about the effects of FFI on some problematic features of French for English learners (Perfect and past tenses, the conditional, second-person pronouns and grammatical gender.) Overall FFI proves to be useful in learners' improvements. This shows that in cases where the target structure is non-existent in L1 explicit instruction may be very helpful. It is important to know that interpretation of FFI findings should be done cautiously. The reason is that findings are difficult to compare and often contradictory since there are many variables involved. Important factors in succeeding FFI are learners' developmental stage, the structure(s) to be taught, the instructional context and the material. This technique is not based on longitudinal research and the effects of input and output is not measured using automatically produced language and therefore they are not reliable. Also strange methods are used which seem to draw learners' attention deliberately to some forms and make them use them. Also some parallel factors, like the use of computer could facilitate results.

### ***Implicit versus Explicit FFI***

Originally, the notions of isolated and integrated form focus instruction (FFI) introduced by Spada and Lightbown (2008) who have chosen to use the terms isolated and integrated to describe two approaches to drawing learners' attention to language form in L2 instruction. Accordingly, isolated FFI is provided in activities that are separate from the communicative use of language, but it occurs as part of a program that also includes communicative language teaching (CLT) and/or content based Instruction (CBI). In addition, isolated FFI may be taught in preparation for a communicative activity or after an activity in which students have experienced difficulty with a particular language feature (Spada & Lightbown, 2008). They state that in isolated FFI, the focus on language form is separated from the communicative or content-based activity. This approach differs from Long's focus on forms, which refers to language instruction and practice organized around predetermined points of grammar in a structural syllabus, that is, form-based instruction that is not directly tied to genuinely communicative practice. On the other hand, in integrated FFI, the learners' attention is drawn to language form during communicative or content-based instruction. This definition corresponds to focus on form (both planned and incidental) which is called by Ellis (2002) and by Doughty and Williams (1998). That is, although the form focus occurs within a communicative activity, the language features in focus may have been anticipated and planned for by the teacher or they may occur incidentally in the course of ongoing interaction.

#### RESEARCH QUESTION

This study was to investigate whether there was any difference between implicit and explicit FFI in teaching grammar to Iranian intermediate English as a foreign language (EFL) learners.

#### METHODOLOGY

##### Participants

The participants were 40 adult male students, studying EFL at Iran Language Institute (ILI). Their age was ranging between 19 and 25, on average. Initially, the samples were chosen out of 100 students who were willing to take part in the research. They were given Nelson's proficiency test (Fowler & Coe, 1975) and those whose scores were one standard deviation above or below the mean were considered as the participants of the study. The participants were randomly divided into two experimental groups as isolated FFI group and integrated FFI group.

##### Materials

For this study, the text book entitled, "Active Reading 2" developed by Anderson (2007) was selected. The researchers' main criteria for choosing this material was that the text book is designed for the students at the intermediate level and its units included passages on grammatical points. The passages were taught to focus on their structural patterns through FFI.

##### Instrumentation

To have a homogeneous research sample, the researchers used a piloting Nelson's proficiency test (Fowler & Coe, 1975). It included 50 multiple choice items on grammatical patterns at the intermediate level. Its reliability index was calculated through KR-21 formula as ( $r=0.964$ ). The pre and the post-tests of this study were the same. This test was a 40-multiple choice items which cover grammatical patterns of the passages. Its reliability index was calculated through KR-21 formula as ( $r=0.865$ ). The content of the test included the structures chosen to be taught based on implicit and explicit FFI. Most of these structures were subordinate clauses like adjective clauses and noun clauses. Other structures such as subject-verb agreement and tenses were also incorporated in the treatment period.

##### Procedure

The nature of this study is a causal comparative one. Both comparison-contrast and experimental researches are done. The main purpose of this study is to find out whether isolated FFI or integrated FFI have any effect on grammar proficiency of intermediate Iranian EFL learners and if yes, which one of them is more effective. The diagram of the procedure is as follows:

Figure 1: The Design of the Study

In order to collect data from the participants, students of the two experimental groups took a general English proficiency test (Nelson 050 D) as a pre-test at the outset of the experiment in order to ascertain their homogeneity. A pre-test was administered and fifty language learners were selected based on their scores which were within the range of Standard Deviation (SD) around the mean or not. The language learners whose scores were within the following range were selected. The forty participants were categorized into two twenty person groups. In order to make these two groups homogeneous, they were chosen so that the frequency of each of their mark is the same or almost the same. The grammar teaching in the two classes differed according to Isolated and Integrated FFIs.

In implicit FFI class, first the researchers and participants discussed the main ideas and the content of each unit; then they went through the formal structures and grammatical rules. During this task, the researchers did not correct their errors. After the task, the researchers focused on the forms in which learners had problem to use and the forms they did not use at all. In this case the forms in the pre-test which they did not use at all. Their errors were reviewed, given explanations. And the other desired forms, the pre-test forms that learners did not use, were explained briefly and given examples. These techniques were based on Ellis (2006) recommendations.

In explicit FFI class, the learners' opinions regarding the topic were asked and discussed, just like the Isolated FFI one. However, FFI was performed during the task. While performing the activity, the researchers stopped the communication for a little while and introduced the structure and asked learners to use it. If they made errors in the use, the researchers corrected those using implicit recasts and/or some brief explanation of the rule. Nevertheless, the researchers made sure that grammar teaching does not hinder communicative activity for too long. The instruction lasted for 10 sessions in 5 weeks. After that both groups were given the post-test which was exactly a modified pre-test for determining the research hypotheses.

#### RESULTS AND DISCUSSION

##### Results

The descriptive statistics of the two experimental groups who were studying grammar through implicit and explicit FFI are presented in Table 2.

Table 2: Descriptive Statistics (Pre-test)

	Groups		N	Mean	Std. Deviation	Std. Error Mean
Implicit FFI	20	14.1000		3.07622	.68786	
Explicit FFI	20	14.4000		2.92719	.65454	

Table 2 shows both implicit and explicit FFI groups gain homogeneous scores in taking grammar test at the pre-test stage. Since the mean of the scores cannot indicate the significant difference between the implicit and explicit FFI groups, Independent Samples *t*-test was run to clarify actual differences. Results are presented in Table 3.

Table 3: Independent Samples *t*-test (Pre-test)

Groups	df	<i>t</i>	Sig. (2-tailed)	Mean Difference	Std. Error Difference
Implicit FFI vs. Explicit FFI	38	-.316	.754	-.30000	.94952

Table 3 shows that there is not a significant difference between the implicit and explicit FFI groups since observed  $t$  ( $t_o = .316$ ) which is less than the critical  $t$  ( $t_c = 2.042$ ) with  $df = 38$ .

Table 4: Descriptive Statistics (Post-test)

Groups	N	Mean	Std. Deviation	Std. Error Mean
Implicit FFI	20	15.1500	3.57292	.79893
Explicit FFI	20	17.4500	2.45967	.55000

Table 4 shows both implicit and explicit FFI groups gain different scores in taking grammar test at the post-test stage. Independent Samples *t*-test was used to measure the significant differences.

Table 5: Independent Samples *t*-test (Post-test)

Groups	df	<i>t</i>	Sig. (2-tailed)	Mean Difference	Std. Error Difference
Implicit FFI vs. Explicit FFI	38	2.371	.023	2.30000	.96994

Table 5 indicates that there is a significant difference between the implicit and explicit FFI groups since observed  $t$  ( $t_o = 2.371$ ) which is greater than the critical  $t$  ( $t_c = 2.042$ ) with  $df = 38$ .

### Discussion

Although both experimental groups of implicit and explicit FFI who received the same material and time of instruction, the results showed that the explicit group taught through FFI on grammatical patterns outperformed the implicit group receive FFI in indirect way. The result of the present study are matched with Spada and Lightbown (2008) and Karbalaee, Pourzargham and Kazemi (2013) who emphasized that explicit and integrative FFI are more effective than implicit or isolated FFI. They noted that FFI may learners to focus on communicative or content-based instruction of the target language that they may not acquire without guidance. Thus both activities either implicit or explicit are helpful; however, the role of explicit FFI may show the role of instruction that is provided in clear step by step activities followed by both the teacher and learners in the context of communicative activities.

The results of the present study shows that form-focused instruction (FFI) approach and especially explicit modality has been more effective than implicit FFI. This is matched with the results of several studies (e.g., Doughty & Williams, 1998). The findings of this study may be important in the area of second language acquisition that supports the need for pedagogical interventions in order to push L2 learners towards higher levels of proficiency (Ellis, 2006). Generally speaking, FFI includes the ones with incorrect usage, and the ones with incorrect usage, and the ones not used during the task performance but considered useful and natural to use in the selected task. He also states that whether focusing one form intensively or more than one form extensively is a crucial decision in this criterion (Ellis, 2006). MEQ (2002) introduces the task, the program, and students as sources of forms to focus on. Students' immediate needs and their order of acquisition are of utmost importance in choosing the forms to focus on. Also the programs of elementary, intermediate, and advanced learners in courses play a vital role here. In the case of errors, teachers can gather necessary data from learners and plan FFI based on errors they make. Questions regarding grammar should be answered since they reckon awareness and interest in English. Norris and Ortega (2000)'s study is one of the most important studies performed in this area. By comparing the results of forty nine studies to investigate the effectiveness of SL instruction performed between 1980-1988, they tried to figure out which categorization of FFI is more helpful and whether the FFI effects are durable or not. They found out that both focus on forms and focus on form were effective, there is no significant difference between their effectiveness and that explicit attention to grammar structures were more effective than the implicit one and that explicit attention was more effective in focus on forms. Also they found out that FFI effects are durable.

### CONCLUSION

Since the explicit FFI group outperformed the implicit FFI group, we may conclude that explicit FFI holds a wide range of classroom feedback that occurs as the need or opportunity arises, as well as the kind of planned interaction that requires the repeated, but natural, use of a particular language form (Spada & Lightbown, 2008). These activities are focusing of forms in the context of situation to provide enough feedback coming from both teachers and learners on the correction of ill-formed structures, especially, according to Spada and Lightbown (2008) "those for which there is a misleading similarity to the first language (L1), and those that are unlikely to cause communication breakdown" (p. 181).

In sum, the contribution of the present study is two-fold. Firstly, teaching grammar is a conscious activity with clear guidance and pattern practice in a context which is clarified and modified by the teacher. Secondly, the grammatical activities should be put in practice in a

meaningful and contextual manner. Thus the EFL learners learn sentence structures and then they use them in a real context created by the teacher or other peers. Feedback could be provided from three sources to check the correctness of the processes. First from the peers, then from the materials reviewed in the classroom, and finally by the teachers. Teachers should not involve in the process of learning to take the time of the class. They just facilitate the process with a minimum intervening. Teaching grammar through FFI may be a great help to the teachers in EFL contexts. Since in EFL contexts such as Iran language exposure outside the classroom is rare and the learners have to learn formal structures in the classroom and use it in their conversational activities just for pedagogical purposes. Further researches may focus on various areas of teaching language skills such as reading, listening and speaking. This study dealt with male participants; however, females could be participated in the future research to have a comparative study on FFI. The main limitations of the present research were that the small size of the population since the results could be more reliable if we work on the greater research sample.

### ABSTRACT

Reading comprehension ability is a fundamental competency expected from students learning a second language. Furthermore, it is suggested that L2 learners' difficulties in reading skill may be due to lack of ability to write rather than difficulties in reading and syntax. Thus, the current research attempts to investigate whether asking teaching paragraph writing rules prior to reading comprehension will improve the quality of students' comprehension. The participants were 60 Iranian secondary students studying in a school in Iran. The data were collected from 2 separate language institutes that were selected randomly. The findings from T-test showed that participants who received two weeks treatment demonstrated 23% improvement in their reading comprehension skill. Thus, the findings suggested that teaching paragraph writing is supposed to be an effective technique in provoking students to comprehend more easily.

**KEYWORDS:** Paragraph writing rules, teaching, reading comprehension, skills, essay, Iranian secondary learners

### INTRODUCTION

Writing skill is deemed to be difficult for EFL students in the language teaching (Richards, 1990). According to Richard and Renandya (2002), the difficulties include those in (1) generating and organizing ideas using an appropriate choice of vocabulary, sentence and paragraph organization and (2) putting such ideas into an intelligible text. As for Vietnamese EFL students, besides these difficulties, they also have to face many other obstacles when learning to write compositions in English.

Writing is the most difficult language skill to master in both, the native language (L1) and the second/foreign language (L2). This is so because real effective writing requires that we be aware of a series of aspects essential to convey meaning: a high degree of accuracy to avoid ambiguity of meaning, the use of complex grammatical devices for focus and emphasis; a careful choice of vocabulary, grammatical patterns, and sentence structures to create a style which is appropriate to the eventual readers (Hedge: 1988). Besides the linguistic knowledge, cognitive and socio-cultural (discourse and sociolinguistic knowledge) aspects also influence our capacity to produce good written texts. All this takes time, a good training in the writing process, lots of practice, and the writer's intuition and skillful perception to materialize his/her thoughts on paper—if not an innate talent.

Since the theory of "communicative competence" was advanced by Hymes, it has to a great extent encouraged and enlightened many linguists who are not satisfied with the analysis of language merely based on its structures and forms. So, communicative teaching approach gradually came into being. Nowadays, it has been generally admitted that the communicative teaching approach has some merits in the improvement of learners' communicative competence. As one aspect of the communicative competence, the ability of writing can also be greatly improved through this approach. However, the communicative approach is not the cure-all, and it also has some defects of its own.

#### *What is writing?*

Writing is a process, not a —product which has been far from being new. Also, writing is a complex process of exploring one's thought, discovering ideas and generating meaning (Flower and Hayes, 1980). In this way, the writing process is a sharp tool to discover meaning, to perfect a piece of writing both in thoughts and in grammatical accuracy and to bring intelligence to the writing. Therefore, Byrne (1988) declares writing is a process of encoding (putting your message into words) carried out with the reader's expectations; or, as confirmed by Nunan (1999, p. 273), —a complex, cognitive process that required sustained intellectual effort over a considerable period of time.

The concept of writing has been widely discussed by many researchers and there is wide information on the topic. For the purpose of this article, I will briefly make reference to the differences between the spoken and the written language. Then, I will concentrate more on the definition of writing as a means and as an end. As in speaking, the writing ability draws on many of the same linguistic resources, but relies on distinctly different mental processes. While linguists and other scholars have held that speech is primary and writing is a reflection of spoken language, educators have contended that the written language is more correct than the spoken language. Recent studies, however, have tended to reconcile both views. "Neither oral nor written language is inherently superior to the other, but oral and written texts do vary across a number of dimensions, including (but not limited to) textual features, socio-cultural norms and patterns of use, and the cognitive processes involved in text production and comprehension" (Cushing Weige: 2002, 15).

#### *Influence of Writing on Reading*

The influence of writing on reading comprehension has been expressed through the concept in which reading is trying to discover what a piece of written text means by understanding the words a writer is using. When reading, —we don't just wait for the meaning to come to us, we go for it aggressively. We look deeply into the text hunting in certain specific ways searching for clues as to what the writer is trying to say (Peha, 2003:3).

Taking into consideration the effects of writing on reading comprehension, there are a number of studies that fail to show an apparent correlation between these ability with the intention of proving that writers must also be readers and vice versa. For instance, Battle (1986) concluded that freshmen did not appear to absorb reading skills as a function of learning to write. Or, several compositions themselves have not been without ambivalence toward the importance of reading in improving student writing (Tribble, 1996).

Nonetheless, reading can advance learners' ability to write since reading can aid the learners' process of writing as affirmed by Brown (1987, p. 331), —by reading and studying a variety of relevant types of text, students can gain important insights both about how they

should write and about subject matter that may become the topic of their writing. In other words, reading can provide models for writing. Murcia and Olshtain (2000, p. 158) state that:

Many writing course and certainly most autodidactic strategies in writing involve using well-written passages from literature, or passage written by others, as models for one's own writing. Thus, many writing classes begin with reading texts, analyze them, looking at them as models for writing or using them as a piece of communication to response to. For these reasons, reading playing a decisive role in the development of writing ability for reading appears to be an essential pre-condition to produce good writers.

#### ***Importance of teaching writing***

Of all the four language skills, ESL learners often find writing a daunting task owing to its complexity. This is because it does not simply require learners to memorize written symbols and put them on paper. According to Scarcella (1984), writing involves the writer to employ high-order thinking skills as well as communication skills which include conceptualization, inference, creativity, organization, and the summarization of sophisticated ideas. Hence, there is a growing need for teachers to come up with effective writing instruction for L2 learners. It remains crucial for three primary reasons: first, the ability to write well is a fundamental skill for academic or professional success but is a particularly difficult skill for ESL learners to master (National Commission on Writing, 2004). Second, writing can be especially effective in developing learners' academic language proficiency because they will be more eager to explore lexical or syntactic terms in their written work (Weissberg, 1999). The third reason being writing allows students to master various subject matters because it heightens learners' awareness towards knowledge gaps and apply problem-specific knowledge into other areas (Reeves, 2002).

Writing is widely acknowledged as an "intricate" and complex task as well as the "most difficult of the language abilities to acquire" (Allen & Corder, 1974, p. 177). As a means of communicating and a tool of learning a language" (Wolff, 2000), writing is a complex process even in the first language. Undoubtedly, it is more complicated to write in a foreign language.

This study aims to investigate the influence of teaching paragraph writing rules on the reading comprehension of Iranian intermediate students. Having to say this, a teaching design is taken into consideration in which paragraph writing is being taught.

#### ***The Present Situation of the Teaching Design of EFL Writing***

As an indispensable part of EFL, the teaching design of writing not only shares the common characteristic of FL, but also has its unique features (e.g. Li, 2000; Zhang et al, 1995): The phenomena such as general, abstract and scattered teaching content, poor practice, one-sided teaching concept and priority, stereotyped process are very common in teaching practice. Well designed teaching is very rare phenomena. Most classroom teaching of EFL writing turns into instruction of writing theory or mechanics, some even convert into literature appreciation. Many teachers follow the basic routine from "model analyzing → task assigning → composing by students → checking and assessing" which in this paper, this mentioned basic routine form is considered.

#### ***Design of Teaching Activity***

Previous research (Lantolf & Johnson, 2007; Cheon 2008; Mondada and Pekarek Doehler, 2004, p. 501) proves that language acquisition only happens during the practice. So the core of the design of teaching activity in EFL writing is to create and implement communicative task based on real situation.

#### ***Paragraph writing***

The main focus of this research is teaching opinions at the paragraph level and to consider its effects on reading comprehension. Therefore, paragraph writing or the organization of a paragraph is of primary importance. However, writing builds larger units from smaller ones; that is, writers use words to make sentences, sentences to make paragraphs, and paragraphs to make such compositions as letters, reports, and college themes (Hart & Reinking 1990:11). Rajatanun (1988:95) said that a paragraph is a unit of writing which expresses one central idea and consists of two kinds of sentences: a topic sentence and a number of supporting statements.

O'Donnell and Paiva (1993:2-4) provided more details about the essential parts for paragraph writing which include a topic sentence, supporting sentences, details, logical order, logical connectors, a concluding sentence, unity and coherence. The ideas in the paragraph must be presented in logical order by using transition words or connecting words which indicate the relationship between the ideas (chronological, causal, etc.). A paragraph may have a concluding sentence, which restates the main idea in a different way. According to Reid (1994:42), the concluding sentence summarizes the material, offers a solution to the problem, predicts a situation, makes a recommendation, or states a conclusion.

Unity and coherence are also main components of a paragraph, together with the main idea and the supporting details. Even when a paragraph is unified, and the topic sentence is well supported, the paragraph can still "sound" choppy unless the writer uses coherence devices to make the paragraph smoother. Coherence means "to stick together." In writing, it means that one thought flows smoothly into the next. One way to achieve coherence is with the use of connectors called transition words or phrases that link one sentence to another (Wyrrick 1999:211).

Therefore, to produce an effective piece of writing, students should focus on organization by 1) choosing an appropriate topic sentence 2) identifying general and specific statements 3) arranging sentences in order and 4) inserting or deleting some sentences and ending with a concluding sentence.

#### **REVIEW OF LITERATURE**

Consequently, lots of researchers are constantly on the move to discover new ways and methods to teach language writing more effectively. According to Scarcella (1984), writing involves the writer's employing high-order thinking skills as well as communicative skills which include conceptualization, inference, creativity, organization, and summarization of sophisticated ideas. Although the reason for low-efficiency in writing teaching is very complicated, previous studies have found that well-designed classroom-teaching plan is crucial in motivating and developing the writing skills of EFL learners and the implementation of scientific classroom-teaching design is a core element in enhancing the quality and efficiency of teaching practice (Melor Md Yunus et al, 2012).

For many years, the teaching of writing was neglected as a result of concentration on the aural approach (Brookes & Grundy, 2000). It is true that there was a specific demand for spoken language, but the importance of writing should be equally valued. "How to teach writing" in ESL classes is a question that has no definite answer.

Different teachers have different teaching styles and methods. Experts and teachers have stressed many features of ESL writing, and they

have developed a variety of approaches to the teaching of writing. Raimes (1983) presents six approaches to the teaching of writing: the controlled-to-free approach; the free-writing approach; the paragraph-pattern approach; the grammar-syntax-organization approach; the communicative approach; the process approach. Nunan (2003) firstly gives a brief comparison between process and product approaches to the teaching of writing, and then presents the functional grammar approach and the discourse-based approach for writing. He also gives some suggestions on teaching: a writing program should incorporate elements of process and product approaches; a teacher should create his own professional practice in the teaching of second language writing based on the related theories.

We can conclude that writing is of course, not easy and in some way, more difficult than speaking (Norris 1983:63). Writing is more complex in that it tests a person's ability to use a language and the ability to express ideas. As a result, a person needs to write not only coherently but correctly, which requires more time and effort (Liu and Braine 2005:623-624).

Regarding many difficulties in the field of teaching writing, a proper teaching model of writing is selected by which language utilization was somehow facilitated. Since there are many studies done in the field of writing and reading comprehension, there is no study in which the correlation among teaching writing rules and the reading comprehension of intermediate is investigated. Reading comprehension improvement is closely connected to the knowledge of vocabulary, but the main research question in this study is whether writing knowledge and ability affects reading comprehension or not.

As far as we have concerned, reading and writing have a mutual effect. Reading builds the knowledge of diverse kinds to write on or to employ in writing; writing reinforces knowledge in a way that builds schemata to read with. Reading and writing interact with each other, possibly making use of the same cognitive structures to create a text world (Kucer, 1985). Thus, an integrated-skill classroom is an ideal environment to apply Steve Peha's —Read like a writer approach as an integration and reciprocal interaction of reading and writing.

Having the above-mentioned issues in mind, the researchers believe that investigating writing knowledge is a worthwhile enterprise in Iran, not only for pedagogical purposes but also for the insights it affords into the cognitive processes involved in reading and vocabulary acquisition. Any research that attempts to do so may advance our understanding of the nature of writing knowledge and its relation to reading comprehension.

## RESEARCH QUESTION

The research question of the study would be as follows:

Does teaching paragraph writing rules affect on the reading comprehension ability of Iranian EFL learners?

## METHODOLOGY

### *Study Design*

The design of this study was based on experimental research, in which the respondents were divided into two groups of 'experimental' and 'control'. Therefore, first, a pre-test was administered for checking participants' ability to write. Then, participants were divided into two groups; experimental and control. For the experimental group, students were taught the lesson by using paragraph teaching rules while the control group was given a lesson without using this treatment. After accomplishing the lesson, a post-test was given to both groups in order to evaluate their progress.

### *Participants*

60 (sixty) students were chosen as the participants of this research. The participants of this study were selected randomly among the language institutes in West of Iran. The students were picked from two classes consisting of high and lower achievement students in each class. However, the students were put through the research as a group without dividing or discriminating the students according to the race, gender or social background.

### *Instruments*

#### *Pre-test*

A pre-test of reading comprehension was used as the first instrument in this study. The aim of the pre-test was to determine the students' ability to comprehend a text or an essay. In the pre-test, both groups were given an essay where they had to respond to some comprehension questions drawn from the essay in which the researcher provided as the pre-test. Based on the pre-test results, the experiments were conducted where teaching paragraph writing was used in the experimental group whereas for the control group, traditional methods such as traditional reading comprehension were used.

#### *Treatment*

For experimental group, participants received 2 treatments within 2 weeks. **In the first treatment**, teaching writing and paragraph essay rules were introduced to participants. **For the next treatment**, some comprehension questions were given to another group of participants together. Then, the teacher discussed the research procedure for them accordingly. However, for the control group, directed texts with questions were given to participants where they had to respond based on the content given. However, they had to respond everything on their own.

#### *Post-test*

After accomplishing the treatment, a post-test was given to both groups to evaluate their progress. In order to acknowledge the validity and the reliability of the pre-test and post-test as well as the treatments sessions, the materials that have been used by one of the teachers were selected as the instruments for this research.

### *Procedure of the study*

In this study, we are supposed to deal with the effect of teaching paragraph writing rules on reading comprehension of the Iranian intermediate students. To do this, we decide to select two rather similar groups in the form of experimental and control groups in which a pre-test and post-test were administered in each group to examine the amount of reading comprehension progress in the case of teaching writing rules. In pre-test, the scores of each group were obtained rather the same (% 61 for each group). According to our research hypothesis, we predicted that

experimental group will progress more in the case of reading comprehension only if it utilizes the treatment. In the next part the research findings will be depicted.

## RESULTS AND DISCUSSION

The major question addressed in this study was whether the use of teaching writing paragraph rules would improve students' reading comprehension or not. The result of the post-test indicated clearly that the respondents in the experimental group who were exposed to the treatment showed a remarkable improvement in post-test compared to control group who used the traditional method of responding to comprehension questions. Therefore, the result analysis have also answered the research question that teaching writing rules can be used to help students develop their critical thinking skills in reading compared to traditional method.

As the table shows, in pre-test both the control and experimental group obtained rather the same results (61%). In the treatment period, the participants experienced two stages in which guided practice and teaching writing rules were administered in the first stage and comprehension questions were released in the case of second stage of the treatment. Afterwards, a post-test was administered that the control group and experimental group obtained 61 % and 84 %, respectively. As it is depicted in the table 1, a very simple comparison of pre- and post-test results reveals that the post-test scores of control and experimental groups are 61 % and 84 % respectively indicating that the treatment accentuated the research hypothesis and a total of 23 % progress is observed in the case of experimental group scores. Therefore, teaching paragraph writing rules affects positively on the reading comprehension ability of Iranian EFL learners. The differences of the pretest and post-test were listed in the following table:

*Table 1: the results of pre- and post-test and the differences of each*

N o	Group	Pre-test	Action taken	Action taken	Post- test	Differences
1	Control	61%	Guided practice	Comprehension questions	61%	-----
2	Experimental	61%	Teaching writing rules & Guided practice	Comprehension questions	84%	23%

Lastly, as the students came from the various level of proficiency, some of them could not communicate in the target language. However, with the help from the rest of their friends, they were able to engage in meaningful communicative language even though the main objective of the treatment was more on writing and reading skills. In addition, with the use of teaching writing, students were seemed to be actively involved in the classroom activity regardless their different level of proficiency.

## CONCLUSION

Most of the students especially in Iran find reading as the most difficult skill compared to other skills i.e. listening, speaking and writing skills. Regardless of primary or secondary students, reading is the least proficient that most of the students are lacking of. The most common reasons given by the teachers based on their observation of their students are passive participation during interactive activities and lack of ideas. Due to these reasons, the technique of teaching writing was used to boost the students to think critically and actively participate in reading activity conducted in the classroom. This treatment plays a very important role in teaching which may arouse students' thinking skills.

As conclusion, the use of teaching writing had a good impact on students' writing, as it could change the students' perception toward reading from passive participation to actively participate in discussion session. Moreover, teaching writing helped them to improve their critical thinking through stages as they learnt how to organize and developed their existing ideas in writing and reading. It was also proven that to teach writing among Iranian students is more effective compared to traditional methods of writing, which are unable to improve students' interest in writing and reading and create critical thinking environment among the students.

### Study Limitation

Since this is an experimental study and a treatment must be administered, learners may experience many changes during the treatment period. There are two tests, mostly, in experimental researches in which students can get familiar with the test format and general questions. Therefore, this can affect the post-test results which a rather pseudo-achievement may be observed in such cases.

## ABSTRACT

The present study was conducted to examine the relationship between emotional intelligence, motivation and vocabulary knowledge in undergraduate students. To fulfill the purpose of the study, 59 undergraduate English as a Foreign Language students took part in this study. The investigation was done through using two tests and one questionnaire including Vocabulary Size Test (VST) (Nation, 2007), the Schutte Self-report Emotional Intelligence Test (SSEIT) (Schutte et al., 1998), and the Motivated Strategies for Learning Questionnaire (MSLQ) developed by Pintrich, Smith, Garcia and McKeachie (1991). Using the Vocabulary Size Test (VST), the participants were divided into three groups of high, mid, and low. To analyze the data, One-Way ANOVA and Multiple Comparisons (Scheffé) were used. To check the correlation, Pearson correlation coefficient was run. Considering the participants' levels, it was found that motivation had a positive and significant correlation with emotional intelligence in high, mid, and low groups. The findings, furthermore, indicated that all components of motivation had positive and meaningful correlation with all subscales of emotional intelligence in high, mid, and low groups. That is, by increasing vocabulary knowledge, students become motivated to use information consisted in emotion to make effective decisions. In other words, those who are more emotional intelligent and motivated can produce positive emotions in their own and others to ask their questions and expand their vocabulary knowledge.

**KEYWORDS:** Emotional intelligence, Motivation, Vocabulary Knowledge

## INTRODUCTION

In today's educational system, learner is an active participant. In other words, Learners are being asked what they want to learn and are encouraged to set their own goals for pedagogical attainment. Even though these instructional methods add value to the student and his will, these methods may put students who are unable to function well at a disadvantage. That is the instructor's duty and art to handle the class in such a way that neither of the groups feel frustrated, and he should use different teaching methods which meet the needs of both groups of students. Thus, language instructors should apply more appropriate teaching methods by which learners of different styles and personalities benefit, and their self-esteem, self-confidence and motivation increase.

In the last decade or so, a tremendous amount of facts has been discovered on the role emotions play in our lives. Researchers have found that "even more than IQ, one's emotional awareness and abilities to deal with feelings will determine success and happiness in all walks of life, including family relationships" (Gottman & DeClaire, 1998, p. 20). In other words, Goleman (1995), and Salovey and Mayer (1990) asserted that research has demonstrated that EQ can explain success in education and life more than IQ. Salovey and Mayer (1990), also, introduced the term Emotional Intelligence (EI) as the ability to perceive, understand, and manage one's own and others' emotions. In the same year, they defined EI as a type of social intelligence including the ability to manage and control one's own and others' emotions and to make use of the information to lead thinking and acting. It is the potential to perceive and understand the feelings of others and create interpersonal interactions. Then, Goleman (1995) stated that emotional intelligence consists of "knowing what you are feeling, recognizing what others are feeling, managing the feelings in relationships, and using your feelings to motivate yourself--even in the face of frustrations" (p. 43).

In case of motivation, Gardner (1985) defined motivation as "the combination of effort plus desire to achieve the goal of learning the language plus favorable attitudes toward learning the language" (p.10). Oxford and Shearin (1994, p. 12) stated that "motivation determines the extent of active, personal involvement in L2 learning", but Dörnyei (1998), Van Lier (1996), Crookes and Schmidt (1991) warn that it is a multifaceted factor and that "no available theory has yet managed to represent it in its total complexity" (Dörnyei, 1998, p. 131). Also, Tremblay and Gardner (1995) considered motivation in terms of effort, attention and persistence whereas Van Lier (1996) based on work by Vygotsky (1962, 1978) and Keller (1983), lists motivational intensity, affect, and cognition. Ford (1992) also identified three motivational factors which are personal goals, emotional arousal processes, and individual beliefs which direct, energize, and regulate goal-directed activity.

Vocabulary has long been considered as a prerequisite and strong determinant of reading achievement. In this regard, Hui (2004) stated that "without enlarging vocabulary size or breadth, students do not have real reading ability and communicative competence" (p. 477). "It is clear that a large and rich vocabulary is the hallmark of an educated individual. Indeed, a large vocabulary repertoire facilitates becoming an educated person to the extent that vocabulary knowledge is strongly related to reading proficiency in particular and school achievement in general" (Beck, McKeown & Kucan, 2002, p. 1).

## LITERATURE REVIEW

Previous study demonstrated that emotional intelligence is connected with success in many domains, including enhancing performance in interviewing (Fox & Spector, 2000), contextual performance, work settings (Carmeli, 2003), student learning (Brackett & Mayer, 2003), effective teaching (Ghanizadeh & Moafian, 2010), classrooms (Petrides, Frederickson, & Furnham, 2004), academic performance (Gil-Olarte, Palomera, & Brackett, 2006), and cognitive tasks (Schuttes, Schuetplez, & Malouff, 2001). The concept of intelligent was initially identified by Spearman (1904) as Dickens (2007) asserted:

Spearman (1904) first accounted for the observation that people who perform well on one type of mental ability also tend to do well on many others. For instance, individuals who are good at identifying patterns in chains of abstract drawings are also good at quickly sequencing and arranging pictures to tell a story, telling what three dimensional shapes drawn in two dimensions will resemble when

rotated, tend to have large vocabularies and are quick at arithmetic. This pattern of moderate to strong positive mutual relations across the whole spectrum of mental abilities led Spearman to hypothesize the existence of a general mental ability similar to the usual notion of intelligence (p. 1). Thus, vocabulary breadth of EFL learners might be a good predictor of their general intelligence.

Gardner (2001) studied the roles of the student, the teacher and the language researcher in understanding the motivation to learn another language. He highlighted the socio-educational model of second language acquisition. Vaezi (2008) in her research, *Language Learning Motivation among Iranian Undergraduate Students*, explored that Iranian EFL learners had very high motivation and positive attitudes towards learning English as a foreign language and that they were more instrumentally motivated. Thus, she supported the idea of some researchers who believe that in a foreign language setting learners are instrumentally motivated. Ghanizadeh and Moafian (2010) investigated the relationship between EFL teachers' emotional quotient (EQ) and their pedagogical success in language institutes. In addition, the role played by their years of teaching experience in their EQ and the relationship between their age and EQ were also studied. Subsequent data analyses revealed that there was a credible and meaningful relationship between teachers' success and EQ. Furthermore, significant correlations were found between teachers' EQ, their teaching experience, and their age. The results also revealed the teacher's emotional intelligence to be a critical factor in the process of teaching. Skourdi and Rahimi (2010) compared two models of emotional intelligence based upon the ideas proposed in Salovey and Mayer (1990), and Saklofske, Austin, and Miniski (2003) to examine the relationship between emotional intelligence, linguistic intelligence, and vocabulary learning, especially receptive breadth of vocabulary, among EFL learners. A correlational analysis revealed that there was an interesting pattern of significant relationship between emotional intelligence and first language, between emotional intelligence and vocabulary knowledge and between first language and vocabulary knowledge. Moreover, emotional intelligence was found to be a potential predictor for first language acquisition. Parsa, Jahandar, and Khodabandehlou (2013) studied the effect of verbal intelligence on pre-intermediate learners' knowledge of lexicon. The correlation done on the data indicated a positive relationship between verbal intelligence and knowledge of lexicon. Besides, the analysis of the results revealed that participants who had higher verbal intelligence also had higher marks in vocabulary test, and the participants who had lower verbal intelligence had a lower mark in the vocabulary test.

## RESEARCH QUESTIONS

As this review has demonstrated, there are a lot of interesting and challenging works on about emotional intelligence, motivation, and vocabulary knowledge. All in all, considering the aforementioned studies, this paper addresses the following research question:

Q. Is there any profound relationship between emotional intelligence and motivation at different levels of vocabulary knowledge for Iranian EFL learners?

## METHODOLOGY

### Participants

The participants in this study were 82 male and female senior students, majoring in English Teaching at Islamic Azad University. Two classes were randomly chosen at English Language Department of Shiraz University; in one selected class, there were 36 female and 13 male participants, and in the other one, there were 26 females and 7 males ranged from 21 to 29 years of age. Out of all of 82 tests and questionnaires distributed, 78 were returned. After being screened for usability, 59 responses were found to be complete and proper for analysis purposes. The respondents, finally, were 44 female and 15 male participants. Seniors who had passed all reading comprehension courses were selected for this study as it was assumed that they should enjoy some vocabulary knowledge.

### Instruments

Two tests and one questionnaire were employed in this research. The first test was the Schutte Self-report Emotional Intelligence Test (SSEIT) (Schutte et al., 1998), the first was the Vocabulary Size Test (VST) (Nation, 2007); the second one was Motivated Strategies for Learning Questionnaire (MSLQ) (Pintrich, Smith, Garcia & McKeachie, 1991), and the last one was the Schutte Self-report Emotional Intelligence Test (SSEIT) (Schutte et al., 1998) consists of a 33 item self-report measure of emotional intelligence. The items in the SSEIT are prepared on a five-level Likert scale. In this kind of test, Petrides and Furnham (2000), Ciarrochi, Chan and Bajgar (2001), and Saklofske, Austin and Minski (2003) identified some factors. The factors are Perception of Emotions (PE), Managing Emotions in the Self (MES), Managing Other's Emotions (MOE) and Utilizing Emotions (UE). The reliability index of the test was calculated, and it was found to be 0.91.

### Procedure

First, Nation's Vocabulary size Test (2007) was given to subjects to determine their vocabulary size, and the level of their vocabulary knowledge. Second, the Schutte Self-report Emotional Intelligence Test was administered. They were asked to show the extent to which they agreed with the statements by checking one of the five responses in the answer sheet. The responses to this questionnaire ranged from *strongly agree* to *strongly disagree*. Finally, the Motivation Strategies for Learning Questionnaire was used. In order to complete these tests and questionnaire, there was no time restriction.

## RESULTS AND DISCUSSION

Having a glance at the related literature in the area of EI, motivation and vocabulary knowledge, it was showed a clear need to undertake a study in this regard. Thus, the present study focused on the role of emotional intelligence, motivation, and the vocabulary knowledge of EFL learners. It was hypothesized that no relationship exists between emotional intelligence and vocabulary knowledge at different levels of vocabulary knowledge of EFL undergraduate students.

Based on the students' scores of the vocabulary knowledge test, they were divided into three groups of high, mid, and low. At first, the median was calculated to find two midpoints and the mid scores turned out to be 55 and 39. Then, they classified in three groups. Those who got scores 55 or higher were put in the high group, those whose scores were between 39 and 55 were considered as the mid group, and the students with the scores of 39 or lower were put in the low group. In order to see if the difference in the performance of all three groups was significant; in other words, if the cutoff scores for dividing the participants into three groups were appropriate, a One-Way ANOVA was run. Table 1 shows the results.

*Table 1: One-Way ANOVA to Compare the Participants' Vocabulary Mean Scores in the Three Groups*

		Sum of Squares	df	Mean Square	F	Sig.
Vocabulary Knowledge	Between Groups	10819.673	2	5409.836	109.037	.000
	Within Groups	2778.429	56	49.615		
	Total	13598.102	58			

According to Table 1, there was a significant difference in the performance of all the groups of high, mid, and low. Moreover, in order to observe the vocabulary mean scores between the performances of the three groups, a Scheffé test was carried out. The results are shown in Table 2.

*Table 2: Differences in Vocabulary Knowledge among the Three Groups  
Multiple Comparisons (Scheffé) on Vocabulary Breadth*

Multiple Comparisons (Scheffe) on Vocabulary Breadth						
Vocabulary Knowledge (I)Vocabulary Levels		Mean Difference(I-J)	Std. Error	Sig.	95% Confidence Interval	
	(J)Vocabulary Levels				Lower Bound	Upper Bound
High	Mid	21.718*	2.233	.000	16.10	27.33
Mid	Low	13.125*	2.196	.000	7.60	18.65
Low	High	-34.843*	2.382	.000	-40.83	-28.85

\* The mean difference is significant at the 0.05 level

As shown in Table 2, the results indicate a significant difference in vocabulary knowledge scores among the high, mid, and low groups with the level of significance set at  $P < 0.05$ . Thus, it can be concluded that the three groups performed differently. In other words, the cut points to classify the participants into three groups were truly selected. Then, the correlational analysis was run for all these three groups. The results of the relationships among the different components of emotional intelligence and motivation in the high group are reported in Table 3.

*Table 3: Correlations among Different Components of EI and Motivation in the High Group*

		Intrinsic Goal Orientation	Extrinsic Goal Orientation	Task Value	CLB	SELP	Test Anxiety
PE	Correlation	.774**	.609**	.525**	.757**	.322	.144
	Sig. (2-tailed)	.000	.010	.031	.000	.208	.582
	N	17	17	17	17	17	17
MES	Correlation	.833**	.448	.680**	.798**	.319	-.034
	Sig. (2-tailed)	.000	.071	.003	.000	.212	.898
	N	17	17	17	17	17	17
MOE	Correlation	.623**	.591*	.393	.602*	.533*	.176

	N	17	17	17	17	17	17

\*\*Correlation is significant at the 0.01 level

\*Correlation is significant at the 0.05 level

As it can be observed, the correlational findings of the above table indicate that in the high group, the correlation between two of six components of motivation including Intrinsic Goal Orientation and Control of Learning Beliefs, and all the emotional intelligence subscales is high and significant at the 0.01 and 0.05 levels. Moreover, there exists positive and significant correlation between the other components of motivation and all the emotional intelligence subscales. But Test Anxiety has no significant correlation with Managing Emotions in the Self (MES) (-.034). That is to say, with increasing the control of learning beliefs, learners become motivated to use information contained in emotion to make effective decisions. In other words, believing that they are capable to manage emotions in owns and others, and handle relationship, learners manifest more persistence in expanding their vocabulary knowledge.

*Table 4: Correlations among Different Components of EI and Motivation in the Mid Group*

\*Correlation is significant at the 0.05 level

According to Table 4, in the mid group, there exists positive significant correlation among all the components of motivation and all the emotional intelligence subscales. Moreover, there are moderate significant correlations between Control of Learning Beliefs and all the components of emotional intelligence in the 0.01 and 0.05 levels in this group. The results of the analysis in the low group are presented in Table 5.

Table 5: Correlations among Different Components of EI and Motivation in the Low Group

		Intrinsic Orientation	Goal Orientation	Extrinsic Orientation	Task Value	CLB	SELP	Test Anxiety
PE	Correlation	.513*		.271	.525*	.630**	.320	-.194

	N	18		18	18	18	18	18

\*\*Correlation is significant at the 0.01 level

\*Correlation is significant at the 0.05 level

The outcomes of correlational analyses in Table 5 show that in low group, there are positive and significant correlations among all components of motivation-except Test Anxiety-and all the components of emotional intelligence. Test Anxiety has no significant correlation with emotional intelligence subscales. The correlational analysis between total emotional intelligence and total motivation was also run. The results can be seen in Table 6.

Table 6: Correlation between Total EI and Total Motivation in the Three Groups of Vocabulary Knowledge

				Total Motivation
High Group	Total Intelligence	Emotional	Pearson Correlation	.868**
			Sig. (2-tailed)	.000
			N	17
Mid Group	Total Intelligence	Emotional	Pearson Correlation	.742**
			Sig. (2-tailed)	.000
			N	24
Low Group	Total Intelligence	Emotional	Pearson Correlation	.707**
			Sig. (2-tailed)	.001
			N	18

\*\*Correlation is significant at the 0.01 level

As it can be observed in Table 6, the correlational findings revealed that in the high group, the correlation between total emotional intelligence and total motivation was high and significant at the 0.01 level ( $r = 0.86$ ,  $P < 0.1$ ). It means that with an increase in emotional intelligence, students' motivation will be higher. Moreover, there existed a positive and significant correlation between total emotional intelligence and total motivation in the mid group ( $r = 0.74$ ,  $P < 0.1$ ). In the low group, also, the correlation between total emotional intelligence and total motivation was high and significant at the 0.01 level ( $r = 0.70$ ,  $P < 0.1$ ). Thus, the total emotional intelligence scores of the students in the three groups, high, mid and low correlated highly and significantly with the total motivation. That is to say, a credible and meaningful relationship between Iranian EFL university learners' emotional intelligence and motivation mean scores was observed, which implies that those who are more emotional intelligent and motivated can produce positive emotions in their own and others to ask their questions and expand their vocabulary knowledge. Therefore, the results rejected the hypothesis of the study, which assumed that there was no relationship between emotional intelligence and motivation at different levels of vocabulary knowledge. The findings of this study are in line with those of Aki (2006), who figured out that language learning is a concept that depends on both the learner and the instructor when it comes to human psychology and interpersonal communication. According to Aki (2006), "what is important in language learning is not high intelligence values; rather, it is being emotionally intelligent or at best, having the ability to recognize, employ, comprehend and manage emotions" (p. 66). On the other hand, these results are in conflict with what was reported by Vali-Mohammadi and Bagheri (2011). They reported that there was no significant and meaningful relationship between emotional intelligence, motivation and vocabulary size. But there existed some relationship between them when the students were divided into three groups of high, mid and low based on the scores of the vocabulary size test.

## CONCLUSION

This study was an attempt to investigate the possible bond between emotional intelligence, motivation and vocabulary knowledge of EFL university students. Based on the results obtained in this study, one can conclude that there is a significant relationship between students' emotional intelligence, motivation and vocabulary knowledge which indicates that students with greater emotional intelligence and motivation have greater power of learning vocabulary. Specifically speaking, a profound relationship between EFL students' emotional intelligence and motivation was observed which indicates that those who are more emotional intelligent and motivated can produce positive emotions in their own and others to ask their questions and expand their knowledge. In addition, among all components of motivation, it was the Control of Learning Beliefs (CLB) which had the highest contribution. This may be due to the fact that those students, who have a greater control over themselves and their learning, benefit from a higher degree of motivation. They can easily motivate themselves to learn new materials. Besides, those students with a greater ability of managing their emotions have greater power of learning.

Since the outcome of the present study proves a significant relationship between EFL college students' emotional intelligence, motivation and their academic achievement in expanding vocabulary knowledge; therefore, more appropriate courses which aim at improving students' vocabulary knowledge in foreign language should be included in the curriculum so that students' academic achievement will promote as a result.

## Limitation of the Study

Like many other studies, the present study had some limitations which could hinder the generalization of the results to other situations. First and foremost, if a larger sample size were considered, the obtained results could have been more significant and reasonable than they are now.

Second, the present study was conducted on the relationship between emotional intelligence, motivation and vocabulary knowledge, and the results of this study may not be applicable to the other language skills and sub-skills such as grammar, but it can be helpful in conducting other research to explore the relationship between other language skills and personality factors.

### ABSTRACT

This paper seeks to analyze the research article abstracts across three disciplines: applied linguistics, applied economics, and mechanical engineering. The analysis mainly focuses on the rhetorical structure, i.e. the constituent moves and steps. In addition, self-mention of the author as well as the voice and tense of the verbs included in each move are examined. To this end, 21 published abstracts from each field (a total of 63 abstracts), all appearing in established, international journals, were selected. The model proposed by Hyland (2000), composed of 5 moves, was employed as a general guideline and the steps and moves were identified and studied in the three groups of abstracts. The results compared and contrasted the dominant move patterns of each field, their unique moves/steps, the typical voice and tense of verbs employed in each move, and the differences regarding the self-mention. All in all, the findings of this study had important pedagogical implications for the practitioners in ESP and EAP fields.

**KEYWORDS:** cross-disciplinary, research articles, abstract

### INTRODUCTION

The research article (RA) is the most important genre in the academic community. Its purpose, according to Hyland (2000), is two-fold: communicating new knowledge to members of the academic community and persuading them to accept the claims. As a pivotal section of RA, abstract seems to have received increasing attention specially in recent years with the explosion of information in the academic world. What renders abstract its high significance is the unique function it has, namely, "the gateway that leads readers to take up an article, journals to select contributions, or organizers of conferences to accept or reject papers" (Lorés, 2004, p. 281).

Body of research on abstracts includes studies focusing on the analysis of the organizational pattern in terms of its constituent moves (e.g. Lim, 2006) or/and the analysis of the grammatical and stylistic features that characterize these moves (e.g. Pho, 2008). Most of these studies are cross-linguistic, examining the structural variations of abstracts of a single discipline across different languages. Another possible direction of analysis, which has seemingly not received its due attention, is cross-disciplinary analysis which could make great pedagogic contributions particularly to the ESP and EAP classroom. Hence, employing the latter type of analysis, the present study attempts to compare the rhetorical structures and grammatical features of research article abstracts across three disciplines (applied linguistics, applied economics, and mechanical engineering) and discuss their similarities and differences.

### LITERATURE REVIEW

This section will begin by reviewing the most pertinent aspects to the study at hand, namely, genre analysis, research article as a genre, and RA abstract as a part genre. Next, the three most popular models for the rhetorical analysis of RA abstracts are presented. They are Swales (1981) three-move model, Bhatia's (1994) four-move model, and Hyland's (2000) five-move model. Finally, a brief account will be given of a number of studies analyzing RA abstracts.

#### *Genre analysis*

As one of the most significant approaches to text level analysis, genre analysis has aroused great interest, particularly in applied linguistics, where it has been defined as the "study of situated linguistic behavior in institutionalized academic or professional settings" (Bhatia, 1997, p. 181). The reason behind such popularity among applied linguists is perhaps its remarkable pedagogic implications for the practitioners in the communicative ESP and EAP classroom (Brett, 1994). Familiarizing students or novice researchers with appropriate disciplinary conventions like the proper linguistic aspects of communicative functions is an example of such implications.

A genre has been defined by Swales and Feak (2009) as "a type of text or discourse designed to achieve a set of communicative purposes" (p. 1). These communicative purposes, which are reflected in distinctive structural patterns, are both the most important common features shared by the texts belonging to the same genre and, at the same time, the most important unique features differentiating one genre from another (Holmes, 1997).

A genre is mainly described in terms of its rhetorical structure, i.e. its constituent moves. A pioneer in the application of this framework in genre analysis was Swales (1981, 1990). In his studies, he investigated research articles in academic discourse based on 'rhetorical movement' analysis. A move, according to Swales (2004) is "a discoursal or rhetorical unit that performs a coherent communicative function in a written or spoken discourse" (p. 228-9). Simply put, while having its own purpose, each move contributes to the overall communicative purpose of genre (Santos, 1996). Each rhetorical move can be realized through a number of smaller rhetorical elements referred to as 'steps' by Swales (1990) or 'strategies' by Bhatia (1994). Both moves and steps are functional units and can be optional or obligatory in a genre (Samraj, 2009).

#### *Research article abstracts*

As one of the most attended genres in academic writing, research article (RA), has been widely researched and has yielded fruitful pedagogical findings (Yearley, 1981). In early studies it was often confused with register and it was first labeled as a 'genre' by Crookes (1986). Research articles put forward a claim as an explicit, logical argument in a well-defined form of conventional style and format following an established method which has been approved by the academic community (Gilbert, 1976). This standard format includes different sections each of which is considered as a part-genre of the RA (Swales & Feak, 2009).

The abstract, as its primary part-genre, is a brief summary accompanying the RA whose main function is to help readers make a decision in selecting the readings. It has been defined by the American National Standards Institute (ANSI) as "an abbreviated, accurate representation of the contents of a document, preferably prepared by its author(s) for publication with it" (Lorés 2004, p. 281). The acceleration of the

exchange of information in recent years has directed noticeable amount of attention towards abstract. Such attention stems from the crucial role abstracts play in today's research world in which millions of RAs are being published every year. That is, according to Ventola (1994), abstracts have turned into "a tool of mastering and managing the ever increasing information flow in the scientific community" (p. 281).

#### ***Models for RA abstracts***

In his pioneer study on move-analysis, Swales (1981) proposed a four-move structure for RA introductions: 1. Establishing the field; 2. Reporting previous research; 3. Preparing for the present research; 4. Introducing present research. In 1990, Swales posited a revised version of this framework called Create a Research Space (CARS), as a three-move pattern. The CARS model has influenced numerous later studies on the structure of the introduction as well as abstracts (Bhatia, 1997; Samraj, 2002, 2005). This model consists of three rhetorical moves, each of which is divided into several steps as follows:

- Move 1 Establishing a territory
  - Step 1 Claiming centrality
  - Step 2 Making topic generalization(s)
  - Step 3 Reviewing items of previous research
- Move 2 Establishing a niche
  - Step 1A Counter-claiming
  - Step 1B Indicating a gap
  - Step 1C Question-raising
  - Step 1D Continuing a tradition
- Move 3 Occupying the niche
  - Step 1A Outlining purposes
  - Step 1B Announcing present research
  - Step 2 Announcing principal findings
  - Step 3 Indicating article structure

Recognizing RA abstracts as a genre, Bhatia (1994) proposed a four-move model which has been accepted by many scholars (e.g. Swales, 1990; Salager-Meyer, 1992; Santos, 1996; Phantama, 2000; Promsin, 2006). An abstract, according to him, gives information on four aspects of the research article it is describing: 1. what the author did, 2. how the author did it, 3. what the author found, and 4. what the author concluded. Accordingly, his model consists of the four following moves:

1. Introducing the purpose;
2. Describing the methodology;
3. Summarizing the results;
4. Presenting the conclusions;

Finally, a more elaborate model which has been influential for lots of studies is Hyland's (2000) model of RA abstracts (Li, 2011). It includes five moves: Introduction, Purpose, Method, Product, and Conclusion. The functions of the moves and their constituent steps are indicated in the following:

1. Introduction (*Establishes context of the paper and motivates the research.*)
  - Step 1. Arguing for topic prominence.
  - Step 2. Making topic generalizations.
  - Step 3. Defining terms, objects, or processes.
  - Step 4. Identifying a gap in current knowledge
2. Purpose (*Indicates purpose, thesis or hypothesis, outlines the intention behind the paper.*)
  - Step 1. Stating the purpose directly
3. Method (*Provides information on design, procedures, assumptions, approach, data, etc.*)
  - Step 1. Describing the participants
  - Step 2. Describing the instruments or equipment
  - Step 3. Describing the procedure and conditions
4. Product (*States main findings or results, the argument, or what was accomplished.*)
  - Step 1. Describing the main features or properties of the solution or product
5. Conclusion (*Interprets or extends results beyond the scope of the paper, draws inferences, points to applications, or wider applications.*)
  - Step 1. Deducing conclusions from results.
  - Step 2. Evaluating value of the research.
  - Step 3. Presenting recommendations

Compared with the IMRD model, this framework distinguishes the abstract's purpose from the introduction, because it has a different role from the introduction's typical purpose of providing a justification for the research. In this framework, a product move is adopted instead of the result move, as Hyland (2000) clarified that this move can better account for abstracts from the social science fields, which sometimes include not only a statement of empirical results but also a statement of the argument.

#### ***Previous studies***

Most studies analyzing any of the RA sections, including abstracts, have focused on the rhetorical structures of that section in terms of its constituent moves (e.g. Lim, 2006; Samraj, 2002; Yang & Allison, 2003). Apart from that, sometimes these studies have also investigated the grammatical and stylistic features that characterize the moves on the sentence level, such as the uses of hedging (Hyland, 1996), modality (Salager-Meyer, 1992), personal pronouns (Pho, 2008), and citations (Swales, 1990).

Generally, a brief examination of research on abstracts seems to reveal two trends. The first and more popular trend involves the employment of move-analysis in contrastive rhetoric, that is, studying cultural variation in discourse structure. Such cross-linguistic studies mainly compare English abstracts with those of other languages within a single discipline (e.g., Bonn & Swales, 2007; Busch-Lauer, 1995; and Martin, 2003). The second trend which has not been as much probed involves the cross-disciplinary analysis of abstracts. This trend investigates variations of the rhetorical or other features of abstracts from two or more disciplines written in the same language

(e.g., Melander, Swales & Fredrickson, 1997; Pho, 2008; and Samraj, 2005). Since the latter trend is followed by the present study two prominent examples of it are briefly presented.

Samraj (2005) compared RA abstracts from two closely related disciplines: conservation biology and wildlife behavior. Analyzing a total of 24 abstracts randomly selected from two journals, she found that the overall layout of the RA abstracts was similar: Purpose-Method-Results-Conclusion. However, when she examined aspects of the abstracts beyond the traditional moves, differences stood out. The rhetorical structure in conservative biology abstracts included some moves ascribed to RA introductions, for instance, centrality claims, but they were not present in wildlife behavior abstracts. She concluded that the rhetorical structures of even closely related disciplines could vary.

Similarly, Pho (2008) analyzed the rhetorical organization, the linguistic realization of moves and authorial stance in 30 abstracts from three journals in two disciplines: applied linguistics and educational technology. He noted that three moves were found in almost all the abstracts: presenting the research, summarizing the findings and describing the methodology. He also pointed out that the combination of certain linguistic features would help distinguish one move from the other moves, such as the grammatical subjects, verb tense and voice.

In the same vein, as an inter-disciplinary move analysis, this study intends to compare the rhetorical structure and certain grammatical features of abstracts from three different disciplines: applied linguistics, applied economics, and mechanical engineering.

## METHODOLOGY

A total of 63 RA abstracts belonging to the three disciplines of applied linguistics (AL), applied economics (AE), and mechanical engineering (ME) constituted the data for the present study. This corpus consisted of three groups, each containing 21 abstracts which were randomly selected from three leading, internationally accredited journals of the corresponding discipline. Table 1 indicates the names of these journals and the number of abstracts taken from each. In addition, all the articles from which the abstracts were selected were published between 2010 and 2012 in order to control for time differences.

*Table 1: The journals from which the abstracts were taken.*

<b>Applied linguistic (21)</b>	<b>Applied economics (21)</b>	<b>Mechanical engineering (21)</b>
TESOL Quarterly (7)	Journal of Applied Economics (7)	Journal of Fluid Mechanics (7)
The Modern Language Journal (7)	The Journal of Applied Economic Research (7)	Journal of The Mechanics and Physics of Solids (7)
Applied Linguistics (7)	Applied Economics Journal (7)	Journal of Mechanical Engineering Research (7)

Prior to the analysis of the data, a pilot study was conducted on six abstracts (two from each discipline) as a result of which the researchers managed to decide on the model to be followed in their study, namely, Hyland's (2000) five-move model. The reason was that it was found to be most appropriate for the structure of the examined abstracts especially due to the helpful distinction it offered between introducing the background research area and presenting the research purpose. The five moves are Introduction, Purpose, Method, Product, and Conclusion. A move unit can be composed of one or more sentences or at least clauses. The following example illustrates the linear order of these moves in an applied linguistics abstract:

This paper investigates whether any difference exists in the degree of second language attrition between two siblings in terms of grammatical complexity, grammatical accuracy, lexical complexity, and lexical productivity based on their storytelling [M2- Purpose] The subjects' L1 and L2 are Japanese and English, respectively. The siblings (one male, one female) have similar L2 profiles with respect to attained proficiency, including literacy, but differ in age. Their storytelling data was collected over a period of 31 months. [M3- Method] The siblings showed similar attrition patterns with the exception of grammatical accuracy, but the difference surfaced only after the second year [M4- Product] It indicated that the period of disuse was differentially affected according to their ages. The younger sibling's data also suggest that maturational factors may play a role in handling grammatical complexity and accuracy simultaneously. [M5- Conclusion]

All the abstracts were analyzed using this framework. As discussed by Ackland (2009), the identification of moves and consequently the setting of move boundaries in abstracts are usually accomplished through two approaches, one is based on the content of the abstract, called a "top down" approach, and the other is based on linguistic signals, called a "bottom-up" approach. In this study, the textual boundaries of these units were identified primarily on the basis of semantic criteria, that is, the top-down approach. Having identified the moves, steps, and the move pattern in each abstract, the next phase, namely, the grammatical analysis, was conducted. In this phase, the tense (present/past) and the voice (active/passive) of the verbs characterizing each move were identified. Finally, the self-mention of the author (use of personal pronouns) was marked in the abstracts.

## RESULTS AND DISCUSSION

In spite of their distinct features corresponding to the different disciplines they belong to, the three groups of abstracts interestingly showed a considerable degree of conformity. This section begins with discussing these commonalities. Taking a micro view, it then goes on to compare the three groups regarding each move and step in Hyland's (2000) model. Finally, it is wrapped up by pointing out the overall differences between them.

### *Commonalities*

Table 2: The number of abstracts including each move

	Applied linguistics	Applied economics	Mechanical engineering
Introduction (I)	6	10	8
Purpose (P)	21	20	21
Method (M)	17	14	17
Product (R)*	21	20	19
Conclusion (C)	16	17	13

\* In order to be distinguishable from the purpose move, the product move is shown by the letter R (standing for Result) in the move patterns

A number of noteworthy features were found to be shared by the abstracts of the three disciplines. One was that the least frequent move in all the disciplines was introduction. As evident in Table 2, it was included in only 6 AL, 10 AE, and 8 ME abstracts.

Figure 1: The most common move patterns

In addition, as illustrated in Figure 1, the pattern PMRC turned out to be the most frequent move pattern observed in all the three groups with 10 times of occurrence in AL, 6 in AE, and 5 times in ME abstracts. Another common feature was that the introduction move was, in all the disciplines, mainly embodied through its second step, namely, making topic generalizations. In the same vein, the conclusion move was most often realized through its first step, deducing conclusions from results. Finally, regarding the tense and voice of the verbs, present tense verbs in active voice constituted the dominant type of verbs in all the three sets of abstracts (see Table 3).

Table 3: The tense and voice of the verbs

	The voice of the verbs		The tense of the verbs	
	Active	Passive	Present	Past
Applied linguistics	79%	21%	69%	31%
Applied economics	76%	24%	81%	19%
Mechanical engineering	55%	45%	77%	23%

### Move analysis

#### Introduction

This move was present in 10 AE and 8 ME abstracts. Its occurrence, however, was not as much in AL where it was observed in only 6 abstracts. It is also worth mentioning that this move was commonly realized through one step and simultaneous use of more than two steps in the same abstract was hardly ever observed. Furthermore, out of the four steps embodying introduction – namely, arguing for topic prominence, making topic generalizations, identifying a gap in current knowledge, and defining terms, objects, or processes – the second one was most often employed to represent this move. In spite of the similarity of AL and AE in the rare application of other steps, ME abstracts employed them more considerably. Finally, no remarkable difference was witnessed between the three disciplines regarding the tense and voice of the verbs so that, in all the three, the present active verbs dominated this move.

### Purpose

This move, which was realized through the direct statement of the purpose, was included in all AL and ME abstracts and in 20 AE abstracts. A striking point regarding this move was that in some cases it was integrated with method (P+M) and, in some others, with product (P+R) to form one single move. Following are examples of such hybrid moves.

P+M: Adopting the constructionist conception of research interviews, the current study introduces a comparative analysis of two interviews with a multilingual speaker of Korean, English, and Japanese conducted by two researchers who come from distinctive cultural, linguistic, and professional backgrounds.

P+R: Building on models of electoral competition with reputational mechanisms, I show that term limits decrease the vote share of candidates from parties less able to reward or punish candidates. Candidates suffer by not being able to credibly commit to policies far from their own preferences.

More interestingly, each discipline was unique in the application of these hybrid moves so that AL included three instances of P+M and no P+R. AE, on the contrary, had three instances of P+R with no P+M. And, ME abstracts included both moves with three occurrences of P+M and four occurrences of P+R. As for the common type of verbs in this move, present tense constituted the dominant tense in the three groups. However, such conformity did not exist for the voice of the verbs. While in AL and AE almost all verbs were active, in ME there was an equal share of both active and passive voices.

### Method

While equal number of abstracts (17) in AL and ME contained the third move, it occurred in fewer AE abstracts (14). As mentioned earlier, in a few AL and ME abstracts this move was embedded within purpose move to form a single move but such integration was not observed in any AE abstracts. Furthermore, the three steps of this move were rather equally employed in AL corpus. In AE and ME abstracts, however, the application of the last step, i.e. description of the procedure, was much more salient. With regard to the tense of the verbs, in AL, past tense verbs existed almost twice as much as present ones. The case was, however, quite different in AE and ME. The present tense verbs were much more than past ones in these two disciplines. As for the voice of the verbs, active verbs outnumbered passive ones in AL and AE. In contrast, ME abstracts had far more passive verbs than active ones in this move.

### Product

This move was included almost equally in the three disciplines, in 21 AL, 20 AE, and 19 ME abstracts. To reiterate, this move in a few AE and ME abstracts merged with purpose to form a single move but such integration was not observed in any AL abstracts. Furthermore, in all the three disciplines, the present active verbs dominated this move. Nonetheless, some degree of diversity was witnessed involving the intensity of the use of this tense and voice. The proportion of present to past tense was much higher in AE abstracts and that of active to passive voice was much greater in AL as compared to the other two disciplines.

### Conclusion

Among the examined abstracts, 16 AL, 17 AE, and 13 ME abstracts ended with conclusion. There were three steps representing this move, namely, deducing conclusions from results, evaluating value of the research, and presenting recommendations. Interestingly, this move was, in all the three groups, mainly realized through the first step, in some cases through the second one, and rarely through the last one. Finally, no remarkable difference was witnessed between the three disciplines regarding the tense and voice of the verbs so that, in all the three, the present active verbs dominated this move.

### Overall differences

The most significant difference between the three examined groups of abstracts involved the number of identified move patterns for each discipline. As a rule of thumb, the smaller the number of move patterns in a group, the more abstracts having the same pattern, and the more homogeneous that group is, in this respect. As evident in Table 4, the analysis of AL abstracts revealed only 7 move patterns whereas 12 and 14 different patterns were found out in the case of AE and ME respectively. Hence, while AL was relatively homogenous regarding the employed move patterns, AE and ME were more heterogeneous, in this regard.

Table 4: the move patterns identified in each discipline

	Applied linguistics	Applied economics	Mechanical engineering
1	PMRC (10)	PMRC (6)	PMRC (5)
2	IPMRC (3)	IPMRC (2)	IPMRC (3)
3	IPR	IPR (2)	IPR (2)
4	PRC (2)	PRC	PMRCPRC
5	PMR (3)	PRMC	PMR
6	IPMR	PMRCMRC	PMRCMRC
7	IPRC	IPRC (3)	IPMRPMRC
8		IPMR	IPMR
9		PRCM	PRCPR
10		IPMC	PRMR
11		PMRMR	PM
12		IRC	IP
13			PRC
14			PMRMR

The second difference was about the number of moves constituting each abstract, regardless of the repeated moves. As illustrated in Figure 2, most abstracts in AL and AE disciplines were composed of 4 moves. In ME corpus, however, the majority of abstracts included only three moves.

Figure 2: The number of moves included in the abstracts.

The third noteworthy difference dealt with the repetition of a move in the same abstract. This case was manifested in such patterns as PMRCMRC. One possible explanation for such repetition could be a stage-wise report of different phases of a study. This feature was observed in 6 ME, 2 AE, and no AL abstracts.

Next important difference was in the application of the hybrid moves discussed earlier. There were instances of P+M in AL abstracts with no occurrence of P+R. In contrast, instances of P+R were observed in AE with no P+M. And in ME abstracts, both these moves were identified.

Still, another difference which is worthy of attention is that, apart from introduction which was the least frequent move, method seemed to have been less emphasized in AE and conclusion seemed to have occupied this position in ME.

The sixth difference involves the proportion of the passive verbs to the total number of verbs. Although they were outnumbered by the active verbs in all the three disciplines, passive verbs had a relatively much more remarkable percentage in ME as compared to the other two groups. As indicated in Table 3, in ME the passive verbs were almost twice as much as the ones in AL and AE.

And the last but not the least, concerns the self mention of the authors. In both AL and AE, more than half of the abstracts (11) included pronouns such as I, we, our, etc. referring to the author whereas, in ME, less than one third of the abstracts (6) was marked by such self mention.

## CONCLUSION

As discussed in detail, the contrastive cross-disciplinary analysis of RA abstracts revealed the existence of both similarities and variations in the rhetorical structure as well as grammatical features between the abstracts of the three disciplines: applied linguistics (AL), applied economics (AE), and mechanical engineering (ME).

Based on the results of the rhetorical analysis, the main similarities were the position of introduction as the least frequent move and that of PMRC as the most frequent move pattern. This finding shows that, not surprisingly, most RA abstracts follow the pattern which, according to Hyland (2000), is the conventional structure set by the English academic discourse community. In addition, since almost all abstracts in the three groups included purpose and product, these two moves can be considered as obligatory moves in these disciplines.

The major rhetorical difference, on the other hand, was that AL had the least variety of move patterns and no cases of repetition of a move within the same abstract. ME had the opposite position, being relatively heterogeneous in this respect. And AE's position was somewhere in between closer to that of ME. This finding appears to be somehow contrary to the common belief that expects ME as a "hard discipline" (Hyland, 2000, p. 9) to follow more strict norms and conventions in RA writing.

The other important difference involved the use of hybrid moves. As indicated in the results, the method move was in some AL and ME abstracts embedded in the purpose move to form the hybrid move P+M. This was found to be quite in line with both Santos' (1996) and Pho's (2008) findings indicating that method could merge with purpose partially or totally in the RA abstracts of applied linguistics and educational technology. The other hybrid move found in this study was the integration of purpose with product (P+R) in some AE and ME abstracts. This was in line with Li's (2011) findings showing that in his English corpus the product move was sometimes foregrounded in the purpose move. In general, some scholars believe that the phenomena of move merging can be attributed to the condensed structure of the part-genre abstract (Santos, 1996; Pho, 2008).

The last noteworthy difference between the three sets of abstracts regarding the rhetorical analysis was that, apart from introduction, the method move had relatively fewer occurrences in AE corpus and the conclusion move had this position in ME corpus. This can allude to the less salient role of these moves in the corresponding disciplines as these disciplines place less emphasis on them. This finding, also, confirms Ge and Yang's (2005) claim on the existence of a significant difference in the frequency of moves in relation to disciplinary characteristics.

As for the linguistic analysis, the results indicated the dominance of present tense verbs with active voice in all the three disciplines. In spite

of this similarity, the percentage of passive verbs was much higher and the self-mention of the author considerably lower in ME corpus as compared to the other two groups. One justification could be the more intensive use of scientific language in ME discipline as a “hard science” to sound more objective through the greater application of passive structures and fewer cases of personal pronouns.

All in all, this study demonstrated that disciplinary variations could influence the textual organization of the abstract and that, as Melander, Swales, and Fredrick (1997) maintained, disciplinary factors may create preferences for certain rhetorical and linguistic features by members of different academic discourse communities. The findings of this study had important pedagogical implications for the practitioners in ESP and EAP fields. Genre analysis could expose students to and provide them with the explicit knowledge of genre conventions and the mastery of genre knowledge would help students become members of their disciplinary community, and also explore and produce more complex genres (Bhatia, 1997; Hyland, 2002; Loi & Evans, 2010). Moreover, awareness of genre practices would make students benefit from thorough understanding of specific texts and would guide them in producing academic discourse following the required norms and thus would increase their chances for publication and effectively participate in international academic discourse communities.

Finally, the present study was a cross-disciplinary genre analysis of RA abstracts. Future research could take language into account as well and as dual contrastive analysis investigate the effects of both discipline and language in the generic structure of the abstract. In addition, this study was conducted on 63 abstracts from three disciplines. Future research should be conducted on a bigger corpus including more disciplines. Also, while the current study included only written discourse analysis, future studies can take one step further by carrying out interviews with the authors so as to explore the socio-cultural factors more comprehensively.

## ABSTRACT

New word form in information technology is always getting appeared more and more, year by year along the rapid development in high technology in information and communication. The new words appear in many ways such as compounding and derivational. This paper analyzed the regularities from the old meaning to the new meaning related to the form of the words itself. It can be analyzed through source-oriented and product oriented. It will describe how far the old word form involved in making new words in Information Technology. The result shows that compounding take part much more than other process in new word form than derivations. In other hand, borrowing process of new words appeared because of the need for naming a product especially in information communication technology. The result shows that most of compounding words are categorized in product-oriented while derivational words are categorized as source-oriented. Those analyzing may conclude that the motivation of compounding form usually caused by the near concept look like with the two words in compounding. So, compounding become the simpler and easier process to describe the new meaning while derivational form, the words still have the root from the old word and it might be caused by the meaning which still has near meaning with the old word as the source.

**KEYWORDS:** Morphological Regularities, New word-form in IT, Source-oriented, Product-oriented, Meaning shift analysis.

## INTRODUCTION

New words in IT are still being discussed in many theorists whether they have relationship to the old form or not. New word may enrich the vocabularies in such language however it involves the human cognition who made that new word. Some of the words formed by many ways based on the need and the conventional. In the other side, there are lots of new words appeared from joining two old words into compounding process or derivational process. Some has similar meaning but some has far from the former meaning. As stated by O'Grady (1997) that human language makes use of a variety of operations or processes that can modify the structure of a word, either by adding some element to it or by making an internal change to express a new meaning or to mark a grammatical contrast. It is interesting to find out the meaning shift and explore the reason why the new word from. New word appeared can be analyzed in many ways, such as grammatical, morphological, or semantics. This research, the writer wants to describe based on morphological regularities and describe the new meaning from the new word itself.

## LITERATURE REVIEW

### Word-Formation

Formation in new words play important role to decide the meaning and the product or concept as the reference. According to Onysko and Michel (2010) the symbolic quality of language creates a conceptual distance between an utterance and what it stands for. New word appeared in many processes whether those are from the compounding by joining two old words and have relation with the former meaning or have no relationship with the former meaning itself. There are two forms which dominated in new word. Those are compounding and derivations. As stated by O'Grady (1997) that derivation and compounding are the two most common types of word formation in English.

### Compounding

Many theorists stated that compounding are joining two or more words but has different or new meaning. Combining into one word, there are lots of variations, such as noun-noun, adjective-noun, etc.

*Table 1: The example of new word form through compounding*

New word	First word	Second word	Meaning shift
Firewall	Fire	Wall	Kind of protection to computer viruses.
Download	Down	Load	Pick or save file which shared in internet.

As we can see, in the table 1 shows new words are formed by compounding and basically the meaning is far from the meaning in each word, for example *firewall*. This new word from compounding clearly explained the meaning on the analogy of the function of *firewall* itself. As everyone knows, firewall used to protect or blocked computer from virus or bug while we connect to the internet. Although each word; *fire* and *wall* refer to different meaning to the new compounding word *firewall*. Therefore, it makes easier and shorter describing the meaning.

### Derivations

The second form in new word formation based on Tamy's system of recombination is affixations or it usually also called derivations. In this process there is suffix or prefix in the new word form, but it is rarely appeared in a new word in information communication and technology. Take for example *adaptor*. *Adaptor* come from the general word *adapt*+*or* this combination appear with suffix *-or*. This makes change the meaning from old form and also the category of the word, *adapt* is a verb while *adaptor* is a noun. This process emerged because it is used as prototype or norm or probably the morphological idiom status.

### Morphological Regularity

There are two schemes in morphological regularity according to Bybee (2001: 126), the two types schemas are source oriented and product oriented.

### Source-Oriented

Source oriented is the scheme which describes the structural model from the old word to the new word. As stated by Onysko and Michel

(2010), Source oriented schemas are the generalizations over pairs of basic and derived form. Bybee (2003) also stated that a better candidate for source oriented generalization would be an affixation process. Bybee in Onysko and Michel (2010) gives the example of source oriented. From the word *believe* – *unbelievable*. *Unbelievable* emerges from the old word *believe*, it has basic meaning from the old word and model. Another examples are *adaptor*, *modulator*, and *projector*. Those new words formed from the source or old word.

Adaptor = *adapt* as the source word then *-or* as suffix

Adaptor is a charger for electronics such as laptop and it is used to change current AC to DC. This function is to adapt the current DC so that the electricity will get the current as they need. Suffix *-or* may appear because it was used for naming a thing.

#### Product-Oriented

Product oriented means generalization to sets of complex or derived forms. In Bybee (2003) proposal stated that product oriented has similarity with the other or old form. Similarity can be compared by form or meaning, but meaning has stronger influence than form. Bybee also divided similarity into three categories: Phonological connection, semantic connection, and symbolic connection. Bybee found that semantic connection usually used in innovation in language. The new word tried to make similarity to other form or meaning. It also does not mean that this case used to lead semantic change but make it semantically more similar to other word or form. For example; *motherboard*, it is a small tool in a board of computer which has similar function as a mother or has main function. This new word has similar meaning with *mother*.

### OBJECTIVES OF THE RESEARCH

This paper aims to:

1. To classify the word formation and morphological regularities in new word formation in ICT.
2. To know what dominant process happen in new word-form in ICT.
3. To know what dominant type of morphological regularities to new word-form in ICT.

### METHODOLOGY

#### Data Collecting Technique

In this paper, the writer used document in collecting new word in information, communication and technology. The data sources that the writer used are computer magazine entitled *Computer World* published by the YGS Group in Connecticut for three editions in 2013, *PC and Tech Authority* magazine published by *Hay Market Media* in Australia for three editions in 2013, and the others are from computer books.

#### Analyzing Data Technique

The writer clasifies the data based on the category in word formation (compounding or derivation). Then, the writer classifies the data into the type of morphological regularities (source oriented or product oriented). Both classifying counted to find the dominant type and elaborate the reason based on the finding. At the end of analyzing, the writer describes the meaning shift to the each new word form by understanding the source in the contexts and also from the Cambridge learner's dictionary, 3<sup>rd</sup> edition.

### RESULT AND DISCUSSION

The result of this paper shows that most of the new word-form in ICT dominated by compounding. By compounding two words, it is quite easy to describe the meaning that people referred. The important of the new word-form may exist is when the word may represent the meaning in such concept and easy to understand or it might be to shortened the meaning or function of the thing itself. Such as *smartphone*, it will be too long to describe in a word for phone which are able to do so many things not only for calling and texting but also accessing the internet, playing games, and so on. Those functions can be shortened by the word *smart*. Below is the table of the word formation type. While in the derivational process, as the second dominant type in new word formation in ICT, most of the words are noun or name of the certain new things in ICT.

Tabel 2: New Word Form Type

No.	New words	Compounding	Derivational
1	Motherboard	✓	
2	Touchpad	✓	
3	Smartphone	✓	
4	Facebook	✓	
5	Keyboard	✓	
6	Bluetooth	✓	
7	Blackberry	✓	
8	Trackball	✓	
9	Touchscreen	✓	
10	Netbook	✓	
11	Internet	✓	
12	Intranet	✓	
13	Download	✓	
14	Upload	✓	
15	Password	✓	
16	Username	✓	
17	Firewall	✓	
18	Homepage	✓	
19	Processor		✓
20	Speaker		✓
21	Twitter		✓
22	Customize		✓
23	Overhead		✓
24	Adaptor		✓
25	Modulator		✓

*Table 3: Classifying the Type of Morphological Regularities*

No.	New words	Source oriented	Product oriented
1	Motherboard		✓
2	Touchpad		✓
3	Smartphone		✓
4	Facebook		✓
5	Keyboard		✓
6	Bluetooth		✓
7	Blackberry		✓
8	Trackball		✓
9	touchscreen		✓
10	Netbook		✓
11	Internet		✓
12	Intranet		✓
13	Download		✓
14	Upload		✓
15	Password		✓
16	Username		✓
17	Firewall		✓
18	Homepage		✓
19	Processor	✓	
20	Speaker	✓	
21	Twitter	✓	
22	Customize	✓	
23	Overhead	✓	
24	Adaptor	✓	
25	Modulator	✓	

This table shows that new words in ICT are forming from the meaning from the old word or near with the old word definition or function while the source oriented is usually happened in derivational type which still has the structure from the old word.

*Tabel 4: Meaning Shift Analysis*

No.	New words	First word	Second word	Meaning shift analysis
1	Motherboard	Mother	Board	Integrated PCB board to attach all component for computer (PC)
2	Touchpad	Touch	Pad	Place used as <i>mouse</i> in netbook or laptop.
3	Smartphone	Smart	Phone	New gadget which has touch screen picture, and use high technology such as internet.
4	Facebook	Face	Book	Kinds of social media
5	Keyboard	Key	Board	A board to type an alphabet or numeric
6	Bluetooth	Blue	Tooth	Near communication wireless device and may be used to send file each other
7	Blackberry	Black	Berry	Kind of smartphone
8	Trackball	Track	Ball	A tool formed like a ball and used as touchpad
9	Touchscreen	Touch	Screen	Screen in a gadget which is able to control directly by touching the screen
10	Netbook	Net	Book	Small laptop which has good performance in internet
11	Internet	Inter	Net	Data communication international network
12	Intranet	Intra	Net	Data communication local network
13	Download	Down	Load	Copy data from internet network
14	Upload	Up	Load	Share data to internet network
15	Password	Pass	Word	Sort of word used as keyword for computer or kind of tool
16	Username	User	Name	Identity of the user in certain tool
17	Firewall	Fire	Wall	Windows protector for viruses used in computer
18	Homepage	Home	Page	Main page in an application
	<b>Word</b>	<b>Base</b>	<b>Affix</b>	<b>Meaning Shift</b>
19	Processor	Process	-or	Mind in a computer to process the data
20	Speaker	Speak	-er	A tool as loud speaker to up volume speech
21	Twitter	Twit	-er	Kind of social media
22	Customize	Custom	-ize	Standard setting in a software
23	Overhead	Head	-over	Part of printer cartridge
24	Adaptor	Adapt	-or	Tool as charger to change current AC to DC
25	Modulator	Modul	-or	Tool used to send data in high frequency.

## CONCLUSION

Based on the analysis above, it can be concluded that people formed new word may have two process as majority, those are compounding

and derivations. Those used to make easy to remember or it already as schemata in our mind about that word from the old one, such as compounding which formed from two old words become one or derivations process which need suffix or prefix to form a new word. Both compounding and derivations process mostly refer to the product oriented scheme because it needed to naming a new word/ it can be adapt from logical cognitive perspective of human mind. We may conclude based on the analysis above that compounding forms are motivated by product-oriented. People will give the name for the thing based on concept that they want to describe and to make it simpler they just combine two words to memorize easily. In the other hand, source-oriented more often occur in derivational forms because the root still the same but it appear in new word which has similar and entail to the root meaning, process, or characters.

## ABSTRACT

The present study seeks to investigate the effect of the number of the academic achievement tests using a four-choice achievement test on Islamic theology. The tests were constructed by omitting the distracters, so two-choice or three-choice test formats were reproduced from the original. The test was administered to a population of 600 last-year high school students in Andimeshk, a southwest city in Iran. They were selected on a stratified random basis with equal ratio. The obtained results showed the reliability of four-choice, three-choice and two-choice tests items to be 0.77, 0.76 and 0.65 respectively. All of these three coefficients were significant with the probability of  $p \leq 0.001$ . The results of the present research suggested that there was no significant difference between the reliability coefficients of the four-choice, and three-choice tests with the probability of less than 0.05 ( $p \leq 0.05$ ). It also showed that there is a significant difference between the reliability coefficient of the four-choice and two-choice test, and between the reliability coefficients of the three-choice and two-choice test items with the probability of less than 0.01 ( $p \leq 0.01$ ). The pedagogical implication of the study could be the point that instructors who are in some way concerned about the reliability of their tests should as far as possible avoid using two choice items e.g. true false items.

**KEYWORDS:** number of choices, reliability, multiple-choice tests, academic achievement.

## INTRODUCTION

Nowadays tests are considered to be one of the methods for the quantification of the psychological and educational characteristics of individuals. Testing process has been engaged in two distinct aspects during its history of existence and evolution: a) from one hands, construction and development and b) from the other hand, the statistic theory for the analysis of tests (Homan, 1996).

Constructing multiple-choice items continues to be considered as a kind of art in spite of all the tremendous efforts to mechanize and computerize them. The innovativeness and skill required for including concepts in a problem, clarity and expressiveness in phraseology of questions, and finally insight and expertise for producing distracting choices which attract weak examinees all involve planning, and precise, direct analysis of questions (Thorndike qtd in Homan, 1996).

Multiple-choice items may generally include 3, 4, 5 and even 6 choices. But more than 70 years ago, measurement experts discovered that there was a quantitative, logical reasons for constructing four-choice or three-choice items. Although four-choice items are the most commonly used ones, sometimes a three-choice item constructed based on correct scientific and statistic approaches is better than a four-choice or five-choice item which contains some choices.

A variety of psychological tests are used in all aspects of modern life especially in the area of education which tends to employ tests, including academic achievement tests in order to measure any kind of educational changes. These tests include various types, including true-or-false, two-choices, matching, multiple-choice, and short-answer tests (Seif, 2007). Thus, it is important to scrutinize the criteria of a test before it is used to measure and evaluate the learners' aspects such as emotion, aptitude, and academic achievement so that the obtained results can be usable and reliable for the consequent, important planning and decision-making purposes.

Speaking so, some criteria have been developed for validating tests, two of which are by far more important (Pasha Sharifi, 1973): One is the test validity. It means that the score of the test should be consistent with the attribute which the test aims to measure (Pasha Sharifi, 1993). In other words, the appropriates of the test to measure the intended attribute is determined by several methods which include: a) formal validity, b) criterion validity, c) concurrent validity, d) predictive validity, and e) construct validity (Seif, 2007).

The second important criterion of test that should be considered is its reliability. It means the stability of a subject's score in the test a long time. It means that if a test is administered to a certain group of subjects several times, the score will be similar in all times (Pasha Sharifi, 1993). A test reliability can be determined by the following methods:

- 1) Scoring reliability
- 2) Test-retest reliability
- 3) Parallel forms reliability
- 4) Split-half method
- 5) Kudar and Richardson method
- 6) Cronbach's Alpha

The above methods can be used based on the question type and the intended goal, as well as the appropriateness of the method (Seif, 2005). Various studies have been carried out on the impact of the number of choices on the reliability of multiple-choice tests. Some of them are as follow:

Mattson (1952, qtd in Delavar, 1993) presented a theoretical model that could predict the reliability of two to five-choice tests. Based on this model, estimating the reliability of tests containing a higher number of choices was improved. Zimmerman (1953, qtd in Delavar, 1993) performed a study on five-choice tests, which did not support Mattson's model. William and Ebal (1957) performed a study on two, three

and four-choice tests, the results of which did not show any significant difference with their reliability coefficients.

Castin (1970/1972) made a comparison on a sample consisting 207 individuals regarding the test reliability. The results showed that three-choice tests enjoy a higher reliability compared to four-choice tests, but there is no significant difference between them. Stratton and Casts (1980) studied the reliability of 2-, 3-, and 4-choice tests using an economics test on a sample composed of 260 subjects. The results showed that three-choice tests enjoy a higher reliability composed to two-, and four-choice tests.

Steven et al. (1987, qtd in Beiraghi, 1997) carried out a study on 3-, and 5-choice tests regarding their reliability. The results suggested that there was a significant difference between their reliability coefficients. Hadian (1976) performed a study on 3-, 4-, and 5-choice tests. The results showed that three-choice test have a higher reliability coefficient. Beiraghi (1997) also studied a sample of 200 individuals. The results showed that the total score of the subjects on the three-choice tests was higher than that on the four-choice tests, and that there was no significant difference between the reliability coefficients of the three-choice and four-choice tests. Although multiple-choice tests have, undoubtedly, been the most commonly used tests in the past fifty years. This question has been always posed that what the appropriate number of choices in a multiple-choice test should be so that such tests could enjoy the highest possible reliability. Today, multiple-choice tests are used in the area of education more frequently than any other kind of tests for the following reasons:

Firstly, the subject is able to answer a large number of questions in a specified time. In other words, such tests can measure a large number of educational goals, and an important fraction of the subject content in a limited time. Secondly, multiple-choice tests give a lower chance to the examinee to make a blind guess compared to true-or-false tests. The third reason for the frequent use of multiple-choice tests is that they are easier to score, correct and interpret, so they result in economy on human force, time and cost.

It should be also noted that the results of such tests serve as a basis for educational promotion and for admission in university entrance exams, as well as for employment in the public sector organizations. Therefore, the validity and reliability of these tests are emphasized by, and much of interest to testing experts. Also, the condition for the validity of a test is that it can have a desired reliability (Seif, 2011). In spite of the fact that the test reliability is affected by numerous factors, including the difficulty index of the items, homogeneity or lack of the homogeneity among the responders. This question is always asked that how the number of choices can affect the test reliability especially on academic achievement tests.

Up to the present time, studies resulted in contradictory results. With respect to the importance of a test reliability which can lead to its usability or no usability, and the fact that multiple-choice tests are the most commonly used measurement instruments, the present research aims at finding answers to the following research questions and hypotheses:

#### RESEARCH QUESTIONS

- 1) What is the reliability of four-choice tests?
- 2) What is the reliability of three-choice tests?
- 3) What is the reliability of two-choice tests?
- 4) Is there any significant difference among the reliability coefficients of the two-, three-, and four-choice tests?

#### RESEARCH HYPOTHESES

- 1) There is a significant difference between the reliability coefficients of the three-choice and four-choice tests.
- 2) There is a significant difference between the reliability coefficients of the two-choice and four-choice tests.
- 3) There is a significant difference between the reliability coefficients of the two-choice and three-choice tests.

#### METHODOLOGY

The present research is a correlational and comparative study. First, the reliability coefficient of each of the test formats was calculated. Then the correlation coefficients of different tests' reliability was compared using a significance test.

##### *Subjects*

The statistics population of the present research consists of all the male and female last -year high school students in Andimeshk, a southwest Iranian city, in the school year 2011-2012. Their age ranged between 17 and 19. Their fields of study were Mathematics, Experimental science, and Humanities. Out of this population which covered 600 individuals, a sample of 300 individuals -50% males and 50% females- was selected on a stratified and multiple-step sampling basis using the information delivered by the statistics Bureau of Andimeshk Education Office. Then, these individuals were placed in three groups of 200 on a random basis.

##### *Instrument*

The research instrument in the present research was a 35-item multiple-choice academic achievement test on Islamic theology administered in the Entrance Exam for the state-run Iranian universities. The content validity and formal reliability of the test were optimal according to the respective experts' assertions. The first reason for selecting this instrument was that the test had been constructed by the Iranian Organization for the Measurement of Education (IOME), and as a result, it is expected to display a comparatively high degree of psychometric criteria. Secondly, since it was a general test administered to the examinees of different fields in a nation-wide level, it was possible to choose a larger sample of subjects.

##### *Procedure*

Two-choice and three-choice tests were prepared by randomly omitting the distracting choices from this four-choice test. Then, each group resembled randomly to one of the test formats (two-choice, three-choice, and four-choice tests). Scoring the test was performed on a zero and one basis. The total score was determined to range from 0 to 20 (0-20). Each format was scored with respect to the distraction of the negative marks due to guesswork.

The data were analyzed using the SPSS software. The reliability coefficients of each format were calculated by the split-half method (odd-even). The correlation coefficients of difference between the reliability coefficients were calculated by a significance test.

# **RESULTS AND DISCUSSION**

The present research seeks to study the impact of the number of choices on the reliability of multiple-choice tests. The research was done using the two-choice, three-choice, and four-choice tests administered to a sample of 600 male and female students. The research findings are presented in the following tables:

*Table 1: The four-choice test results*

Statistic index/test splits	N	Mean	variance	Std. Deviation	Std. Error	reliability coefficient
Odd half	206	5.25	8.7	2.94	0.21	0.63
Even half	200	4.61	8.32	2.88	0.20	
whole test	200	9.86	26.13	5.11	0.36	0.77

Based on the results of the Table (1), the reliability of the four-choice test was 0.63 using the split-half method. The reliability of the test was calculated to be 0.77 according to Spearman-Brown's formula.

*Table 2: The summarized results of the three-choice test*

Statistic index/test splits	N	Mean	variance	Std. Deviation	Std. Error	reliability coefficient
Odd half	200	7.34	12.55	3.54	0.25	0.61
Even half	200	5.83	11.10	3.33	0.24	
whole test	200	13.17	37.1	6.09	0.43	0.76

Based on the results presented in Table (2), the reliability of the four-choice test is 0.61 using the split-half method, and the reliability of the whole test is 0.76.

*Table 3: The summarized results of the two-choice test*

Statistic index/test splits	N	Mean	variance	Std. Deviation	Std. Error	reliability coefficient
Odd half	200	8.25	7.7	2.77	0.2	0.48
Even half	200	9.25	7.2	2.68	0.19	
whole test	200	17.5	23.26	4.82	0.34	0.65

Based on the results presented in Table (3), the reliability coefficient of a half test is 0.48, and the total reliability of the test is 0.65 using Spearman-Brown's method.

*Table 4: A comparison of the statistic indices of the different formats of the multiple-choice test*

Statistic index/test splits	N	Mean	variance	Std. Deviation	Std. Error	t	Sig.
Odd half	200	10.1	26.13	2.77	0.21	16.98	p≤0.001
Even half	200	13.41	37.1	2.68	0.20	16.45	p≤0.001
whole test	200	17.8	23.26	4.82	0.36	12.03	p≤0.001

The results of Table (4) show that the mean of four-choice tests equals 10.1, and that the means of three-choice and two-choice tests are 13.41 and 17.8 respectively. The results also show that the standard deviations of the four-choice, three-choice, and two-choice tests are 5.11, 6.09, and 4.82 respectively. Therefore, it shows that the mean of the two-choice test is greater than that of the three-choice test, and that the mean of three-choice test is greater than that of the four-choice test.

In this study, as shown by Table (4), the standard deviation of the three-choice test is greater than that of two-choice and four-choice tests. The Table (4) also shows that the reliability of the four-choice test (0.77) is greater than that of three-choice test (0.76) and two-choice test (0.65). The reliability of three-choice test (0.76) is also greater than that of the two-choice test. The findings presented in Table (4) show that

the “t” calculated for the four-choice test is 16.98. Three-choice and two-choice test have a calculated equaling 14.45 and 12.30 respectively. They are also significant with the probability of  $p \leq 0.001$ .

Table 5: A comparison of the reliability of coefficient of tests

Statistic index/ comparisons	df	r	t	$\alpha$
Three-, or four-choice test	197	0.77 or 0.76	0.31	$p > 0.05$
Two-, or four-choice test	197	0.77 or 0.65	3.85	$p \leq 0.01$
Two-, or three-choice test	197	0.76 or 0.65	3.54	$p \leq 0.01$

The results of Table (5) show that a significance test is performed between the reliability coefficients of the four-choice test (0.77) and three-choice test. The observed “t” was calculated to be 0.31, which is not significance with the probability of less than 0.05 ( $p \leq 0.05$ ). As a result, the first hypothesis of the research was not confirmed. Furthermore, the significance test of difference between the two reliability coefficients was done between the reliability coefficients of the four-choice test (0.77) and the two-choice test (0.65) in the respective samples. The observed “t” was calculated to be 3.85, which is significant with the probability of less than 0.01 ( $p \leq 0.01$ ). Thus, the second hypothesis of the research is confirmed.

Similarly, the significance test was done between the reliability coefficients of the three-choice test (0.76) and the two-choice test (0.65). The observed “t” was calculated to be 3.54, which is significant with the probability of less than 0.01 ( $p \leq 0.01$ ). So, the third hypothesis is confirmed, too.

As it was stated, the present research showed the reliability coefficients of two-, three-, and four-choice tests to be 0.65, 0.76, and 0.77. All the three reliability coefficients are significant with the probability of  $p \leq 0.001$ . In this study, there was no significant difference between the reliability coefficients of three-choice and four-choice tests, and between those of two-choice and three-choice tests. Thus, out of the three hypotheses of the research, the first hypothesis was not confirmed, but the second and third hypotheses were confirmed.

The results of the present research are in agreement with Mattson (1952, qtd in Delavar, 1973). Castin (1970/1972), Stratton and Castts (1980), Michel, Max, and William (1991, qtd in Hadian, 1996), Beiraghi (1997). In these studies, it is emphasized that the higher the number of choices is the greater the reliability coefficient of a test is. In addition, in these studies, there was no significant difference between the reliability coefficients of three-choice and four-choice tests. This results was also found in the present research, to some extent. Thus it seems that an increase in the number of choices is one of the factors which affect the reliability of multiple-choice tests, which is emphasized in the literature.

The results of present work is in disagreement with William and Ebal (1957), Zimmerman (1953, qtd in Delavar, 1973), Steven et al. (1987, qtd in Beiraghi, 1997) and Hadian (1996). In these studies, no significant difference was reported between the reliability coefficients of two-, three-, and four-choice tests, but in the present work, there was a significant difference between the reliability coefficients of four-choice tests and two-choice tests, and those of three-choice and two-choice tests.

The results of four-choice tests showed no significant with three-choice tests. A reason for the discrepancy between the results of the present research and the other studied may lie in the difference in methodology, sample size, the test length, use of negative mark, test type etc. Although, reliability is considered to be a psychometric criterion influenced by many factors such as test length, difficulty, index, homogeneity or heterogeneity of responders, it seems that in multiple-choice tests, the number of choices can influence the test reliability. Owing to this fact, test developers should give enough care to the number of choices and their efficacy when they intend to construct these tests. In this way, the test accuracy to measure the intended attribute will increase.

## CONCLUSION AND PEDAGOGICAL IMPLICATIONS

The present study was intended to find a plausible answer to the general research question of if there is any significant difference between the reliability coefficients of the two-choice and three-choice tests. By analyzing the data gathered from this investigation it was concluded that there is significant difference between the reliability coefficients of the two, three and four choice test formats. That is to say, the reliability of four and three choice test item formats have a higher value in comparison to two choice test items. This leads to the conclusion that instructors who are in some way concerned about the reliability of their tests should as far as possible avoid using two choice items e.g. true false items in designing their tests.

## Limitations of the study

Every study essentially faces some limitations. The present study is not an exception since this study was carried out on last-year high school students, the high homogeneity of the subjects may have had some effects on the reliability of the test formats. Therefore, it is suggested that any generalization of the results of this study to upper or lower levels be done with caution. So, it is suggested that more extended studies be done on upper and lower educational levels by experts using longer multiple-choice formats and different subject matters. It is also suggested that academic achievement centers be established in Iran in order to plan and develop tests with higher reliability especially in academic achievement. These centers can design and construct tests with higher validity and reliability using the competent and knowledgeable experts' experiences.

**ABSTRACT**

In the history of psychology, the nature of intelligence has been studied generally from two different perspectives. The first views intelligence as a unitary concept while the second supports multiple concept of intelligence. With respect to the effects of bilingualism on cognitive development, literature prior to the 1960s mostly shows that bilingualism is a negative phenomenon and thus has negative consequences on cognitive abilities while researches conducted after the 1960s mainly indicate cognitive advantages in bilingualism. As such, the primary objective of the present research was to explore the different intelligences in a sample of monolingual and bilingual high school students (fourth grade) of Fars and Khuzestan provinces in Iran. Furthermore, the study intended to investigate how students' intelligences vary with regard to their gender. To fulfill these objectives, 448 monolingual and bilingual students were selected from among 67031 students in the 2012-2013 academic year. The data was collected through Multiple Intelligences Survey questionnaire developed by Armstrong (1993). The findings revealed that the bilingual students rated themselves higher on linguistic, logical-mathematical, spatial, and interpersonal intelligences than monolingual peers while monolingual students rated themselves higher on intrapersonal intelligence than bilingual students. Moreover, the male students gave higher self-estimates for logical-mathematical, spatial, and bodily-kinesthetic intelligences than their female peers while female students gave higher self-estimates for linguistic, interpersonal and intrapersonal intelligences than their male peers.

**KEYWORDS:** Intelligence, Multiple intelligences, Cognitive development, Bilingualism, Gender

**INTRODUCTION**

***Background of Intelligence Theories***

In the history of psychology, an increasing number of studies and researches have been done on human intellectual abilities or talents. To classify psychologists working on the nature of intelligence, Paik (1998) clearly stated that there are two major schools of thought. The first school supports the notion of a unitary concept of intelligence and claims that there is one general form of intelligence referred to as factor 'g' which is difficult to be changed and can be assessed for instance by means of paper and pencil tests (Gardner, 2004). The leading members of this group are Eysenck, Galton, Jensen, and Spearman. The second school supports the notion of multiple concept of intelligence and as Noruzi et al. (2010) argue "these theories suggest that rather than being fixed, unitary and predetermined, intelligence is modifiable, multi-faceted and capable of development (p.161)". In other words, intelligence exists in different forms. The major supporters of this school include scholars such as Gardner, Sternberg, and Thurstone.

***Ideas related to general (unitary) concept of intelligence***

The theory that humans possess general intellectual abilities measurable by psychometric testing, using surveys and questionnaires, dates back to Galton's work in 1869. At that time he believed that human intelligence, being a function of sensory apparatus, was inherited and resulted from evolutionary processes. He tried to devise a set of tests assessing students' reaction times and other simple sensory processes (Cattell & Ferrand, 1896, as cited in Ciancolo & Sternberg, 2004).

Galton (1869) was the first person who coined the phrase "nature vs nurture", an argument which still continues among experts. Defending the 'nature' side of the debate, he summarized his investigation maintaining that genetics played a critical role in an individual's intelligence and later supported this theory with a series of studies on identical twins grown up in separate environments (Fancher, 1985). Galton's innovative assumption supports the "hereditary" psychometric view that intelligence comprises one or more stable, fixed entities in the brain and that it is an inborn characteristic of the individual (Massalski, 2009). Galton believes that individual differences in intelligence are mainly related to sensory skills or capacities, i.e. if an individual possesses more keen sensory capacities, he/she will be more intelligent (Selçuk, Kayılı & Okut, 2003 as cited in Temiz, 2004). Galton's idea and work on human intelligence was a starting point for new theories of psychometric testing on human intellect (Jenson, 1987).

Spearman (1904), inspired by Galton's work, formulated a two-factor theory of intelligence. Supporting the notion of one or a single type of intelligence, he claimed that intelligence existed as a general factor "g" associated to some extent with all mental processes (Gardner, Kornhaber & Wake, 1996) and could be measured and measurement of intelligence is the measurement of the factor 'g' (Gardner, 1983). This generalized mental ability is available to the individual to the same degree in all mental operations. He believed that in addition to the general factor "g", there are also some specific abilities that he called "s" factors, such as verbal, mathematical, and artistic skills which are

related to specific mental operations and vary from act to act. (Cianciolo & Sternberg, 2004). This became Spearman's "two-factor" theory of intelligence.

In order to assess the general intelligence, Alfred Binet together with Theodore Simon devised the first test of intelligence, focusing on verbal abilities, in 1905 (Gardner, 1983). According to Binet, intelligence is realized in mental functions at complex levels such as comprehension and judgment and could be measured (Gardner, 1983; Paik, 1998).

Later, the American psychologist Lewis Terman (1916) at Stanford University revised the Binet-Simon scale, which was renamed Stanford-Binet Intelligence Scales. It became the most popular test in the United States for decades. Lewis Terman was also the first to utilize the intelligence quotient (IQ) score previously developed by William Stern in 1912. Terman developed a new method of scoring intelligence which is calculated by dividing a person's mental age by his/her chronological age and multiplying this number by 100 (Cianciolo & Sternberg, 2004).

Drawing on the Galton's findings, Jensen (1969) strongly supported the hereditary component of human intelligence with cultural forces affecting it only to a small extent. He formulated a model of intelligence in which he separated Spearman's (1904) g factor into two ability sets. Level I abilities included memory functions and simple learning processes while Level II abilities included abstract reasoning and conceptual thought (Jensen & Miele, 2002 as cited in Brian King, 2008).

#### *Ideas related to multiple concept of intelligence*

This school of thought considers intelligence not as one single entity, but as several forms of intelligence. Theories related to multiple concept of intelligence claim that there are different forms of intelligence rather than one general factor ('g' factor).

Thurstone (1938), one of the proponents of multiple concept of intelligence, challenged the single-score concept of intelligence and assumed that there are relatively independent mental faculties (Gardner, 1983). Thurstone, originator of "The Theory of Primary Mental Abilities", argued that intelligence was comprised of seven "primary mental abilities": verbal comprehension, word fluency, number facility, spatial visualization, associative memory, perceptual speed, and reasoning (Thurstone, 1938).

Another theory based on multiple perspectives relates to Guilford's theory. He approaches intelligence as multidimensional and dynamic. Guilford formulated a model of intelligence that consisted of 120 specific abilities. He proposed that each ability was based on the combination of three dimensions: content, cognitive product, and mental operation (Guilford, 1956).

Sternberg (1988), as one of the huge and most known proponents of multiple forms of intelligence, stresses that intelligence should not be reduced to a single overarching construct or general ability. He maintains that the theories based on IQ could not thoroughly account for nature of intelligence. According to Sternberg, the tests of IQ can give you a score, but what they do not give you is an understanding of the mental processes that underlie the score (Sternberg, 1990). Sternberg (1998) also proposes a 'triarchic' model of intelligence. He asserts that individuals have three independent abilities: analytic (judging, comparing, contrasting, etc.), creative (inventing, discovering, imagining, etc.), and practical (applying, implementing, using, etc.).

#### **Multiple Intelligence Theory**

Gardner (1993) challenged the notion of one or a single type of intelligence like the Spearman's general factor or 'g' and the concept of Intelligence Quotient (I.Q.) He claimed that traditional views of intelligence are one-dimensional and I.Q. tests generally concentrate on logical-mathematical and linguistic intelligences. He further (1999) argued that intelligence should not be described as one single entity shown by a score on a regular pencil-and paper test used to predict the students' success in schools. He justifies that these intelligence tests do not measure, for example, the ability of a chess player, an athlete, or a master violinist since these individuals, as well as many others, exhibit intelligences that are not measured by these tests (Gardner, 1999).

Gardner's book "*Frames of Mind*" which was published in 1983 suggested the theory of multiple intelligences (often abbreviated as MI theory). Gardner here maintained that intelligence was not just one single entity but it consists of several independent primary intelligences. (Gardner, 1983) Gardner's theory of multiple intelligences has questioned long-agreed upon assumptions about intelligence and presented an entirely new way of thinking about intelligence. With his new theory, Gardner attempted to develop a new paradigm for intelligence research (1983, 1993, and 1999).

He defined intelligence as "the ability to solve problems or to create products that are valued within one or more cultural settings." (Gardner, 1983 p. 33) But later in the book "*Intelligence Reframed*" intelligence was defined "as a biopsychological potential to process information that can be activated in a cultural setting to solve problems or create products that are of value in a culture" (Gardner, 1999, p. 34).

According to Gardner (1983), any set of abilities or skills must fulfill the following criteria to be regarded as intelligence:

1. The ability must be ingrained in the brain, so that a localized brain lesion could deprive a person of that specific ability e.g., a stroke to the head causing loss of linguistic ability.
  2. The ability is demonstrated by the existence of remarkable individuals such as idiot savants, prodigies and other remarkable people.
  3. The ability must have an identifiable core operation or set of operations e.g., pitch, rhythm, etc. which are core operations of musical ability.
  4. The ability should possess a distinctive developmental path for an individual to become an expert in that ability e.g. the developmental path practiced to become proficient in linguistic ability.
  5. The ability should originate from an identifiable evolutionary history or evolutionary credibility, such that our early ancestors exhibited that ability.
  6. The ability should be supported empirically by experimental and psychological tasks which help explain that the ability is independent of other abilities e.g., a person can walk and talk at the same time because these involve two different types of abilities; linguistic and kinesthetic.
  7. The ability should be supported by psychometric findings e.g., a physicist might score high in mathematical ability but low in Kinesthetic ability.
  8. The ability must be liable to be encoded in a symbol system e.g., particular symbols are used to represent mathematical abilities.
- (Gardner, 1983, 1993, 1996; Gögebakan, 2003; Chen, 2004; Denig, 2004; Tahriri, 2010)

Based on the above-mentioned criteria, Gardner (1983) originally suggested that all normal individuals possess seven independent forms of intelligence: linguistic, logical-mathematical, musical, spatial, bodily-kinesthetic, interpersonal and intrapersonal. He slightly revised his theory in 1999 and added another intelligence type to the intelligence profiles, that is, natural intelligence. (Gardner, 1999; Katzowitz, 2002). Each type of intelligence is discussed below.

**Linguistic Intelligence** is the capacity to use, and manipulate language effectively and productively, orally or by writing, the potential to learn languages and the sensitivity to spoken and written language (Gardner, 1999, Armstrong, 2000). Poets, journalists, and novelists are among those having high linguistic intelligence (Shepard, 2004; Fogarty, 2005; Gardner, 2006).

**Logical-Mathematical Intelligence** involves having the ability to use numbers effectively (Armstrong, 2000), to analyze problems logically, to carry out mathematical operations and to be scientifically minded (Gardner, 1993). The individuals who are clever with mathematical problems, experiments, problem solutions and keen on reasoning logically, clearly and scientifically are those possessing this type of intelligence (Teele, 2000).

**Spatial intelligence includes** the abilities to form mental images, and also to think in pictures and images (Goldman & Schmalz, 2003). Those students who have highly developed senses for color, line, shape, form, space and also have the ability to visualize ideas are talented in this type of intelligence (Armstrong, 1994). According to Teele (2000), the students who are superior in spatial intelligence are interested in art activities, reading maps, charts and diagrams, thinking in images and pictures.

**Musical intelligence** encompasses the capacities to perform, compose and appreciate musical patterns (Gardner, 1993). People like musicians, singers and composers who are capable of manipulating music and combining its elements possess a high level of musical intelligence (Gardner, 2006; York, 2008).

**Bodily-kinesthetic intelligence** involves the skills to use one's whole body or parts of the body to solve problems (Gardner, 1993). It is the ability that enables the individuals to make use of their bodies appropriately. Those possessing this intelligence are successful in classes where physical and hands-on activities are provided (Teele, 2000). Athletes, dancers, surgeons, actors, technicians, typists, etc. are among those having high bodily-kinesthetic intelligence (Stager, 2008).

**Interpersonal intelligence** entails the proficiencies of an individual to understand the intentions, motivations and desires of other people and also to work cooperatively with others. Individuals such as teachers, salespersons, religious leaders and politicians who deal with other people possess a high interpersonal intelligence (Gardner, 1999).

**Intrapersonal intelligence** is defined as, "knowledge of the internal aspects of a person: access to one's own feeling life, one's range of emotions, the capacity to make discriminations among these emotions and eventually to label them and to draw on them as a means of understanding and guiding one's own behavior" (Gardner, 2006; p.17). People with a high intrapersonal intelligence enjoy being alone and can also understand and appreciate their own powers, weaknesses and inner feelings. (Teele, 2000).

**Naturalistic intelligence** is the ability to be aware of, classify, explain, and associate to things and objects experienced in surroundings and nature (Gardner, 1999) and to understand the relationship among species (Raeburn, 1999). This kind of intelligence is displayed in people with jobs such as farming, hunting, gardening and biologists (Teele, 2000).

Thus, Gardner has struggled to justify that the unitary views of intelligence were not adequate measures of a person's intellectual abilities and instead he developed the theory of MI which suggests a multidimensional view of intelligence. Gardner (1993) believes that intelligence is an inborn attribute or faculty of an individual and human cognitive potentials can be better described in terms of several intelligences. In fact, MI theory is not meant to classify students merely into categories such as "linguistic" or "logical-mathematical", but it holds that each person possesses a combination of different intelligences. Any normal individual can develop these skills or abilities to a reasonably high level of competence. Furthermore, several intelligences generally work together to carry out specific tasks (Gardner 1983).

#### ***Bilingualism and Cognitive Development***

According to Lewis (2009, as cited in Buyson, 2010), there are approximately six thousand languages which are used in 193 countries all over the world i.e. the number of languages are thirty times more than the number of nations. Given these figures, it is therefore not surprising that about two-thirds of the world's population grow up in bi- or even multilingual settings (Crystal et al., 2004). Consequently, Bilingualism, bilingual individuals and the acquisition of two languages have become the focus of interest for social psychologists, linguists, sociologists and cognitive psychologists for a relatively long period of time (Guagnano, 2010).

One of the subjects that has attracted the attention of many scholars is the relationship between bilingualism and intelligence. Indeed, the studies and works done in this area can be found in the literature from the early part of 20<sup>th</sup> century (Hakuta, 1986). Interestingly, psychological research on the impacts of bilingualism on cognitive development began with rising interest in psychometric intelligence testing in the early 1920s and continued progressively through the first half of the 20th century (Diaz, 1983). If one were to look at the literature on bilingualism and intelligence, it would clearly appear that the literature prior to the 1960s mostly showed that bilingualism was a negative phenomenon and thus had negative consequences on cognitive abilities. (Baker, 2006).

Yet, the subjects used in the earlier researches and tested by various measures of intelligence primarily composed of bilinguals who belonged to groups of newly arrived immigrants from certain racial groups (mainly southern and eastern Europeans) to the United States. As Brigham (1922; as cited in Hakuta, et al. 1987) stated; these groups were the representatives of the Alpine and Mediterranean races in our immigration who were intellectually inferior to the representatives of the Nordic race which formerly made up about 50% of our immigration (p. 197).

Hakuta et al (1987) asserts "in explaining the poor performance of the new immigrants on intelligence tests, the battle line was drawn between those who believed in genetic versus those who believed in experiential explanations. The hereditarians, who believed that IQ test performance was attributable largely to genetic factors, accounted for the poor test performance of the new immigrants - those primarily from Southern and Eastern Europe - in terms of selective migration (p. 288)." In contrast to the hereditarians, there were psychologists who emphasized the environmental factors associated with intelligence test scores and believed that IQ could be developed through experience. So, they were trying to explain the poor performance of immigrants using experiential factors. They thus inferred that bilingualism - an experiential factor - must cause some kind of mental confusion, resulting in the poor development of verbal skills. (p. 289).

The history of research on bilingualism and cognitive development has generally been categorized into two main periods. Researches conducted primarily before the 1960s and those conducted primarily after the 1960s.

*Studies conducted primarily before the 1960s*

To be brief, it seems that the findings of studies (done toward the end of the 1950s) on the cognitive effects of bilingualism generally revealed that bilingual individuals performed lower than their monolingual counterparts on tests of intelligence. According to Cummins (1979, 1984), these studies broadly concluded that bilingualism resulted in cognitive deficiencies, lower IQ scores, even mental retardation. Indeed, terms such as mental confusion and language handicap were often associated with bilingual children in these studies (Cummins, 1979, 1984) and it was argued that these factors, in turn, negatively affected their academic performance.

In accordance with this view, a number of comparative studies reported that bilingual individuals got lower scores in intelligence tests (Darcy, 1946; Jones and Stewart, 1951; as cited in Grosjean, 1982), lower scores on vocabulary development (Smith, 1949; as cited in Romaine, 1989), lower standards in written composition, more grammatical errors (Harris, 1948; Saer, 1924; as cited in Hakuta et al, 1985) and they had a considerably reduced vocabulary (Barke & Williams, 1938; Grabo, 1931; Saer, 1924; as cited in Hakuta et al 1985) in comparison to their monolingual counterparts.

*Studies conducted primarily after the 1960s*

Peal and Lambert's (1962) prominent study was contrary to the findings of previous researches that implied bilingualism was a detrimental phenomenon and cognitively led to negative effects. Hakuta and Diaz (1985) clearly states; "the results of Peal and Lambert's study showed that bilinguals performed significantly higher than monolinguals on tests of both verbal and nonverbal abilities; the bilinguals' superiority in nonverbal tests was more clearly evident in those subtests that required mental manipulation and reorganization of visual stimuli, rather than mere perceptual abilities." (p.322).

Researches conducted after the 1960s, particularly over the past thirty years, have mainly indicated cognitive advantages in bilingualism. The findings of comparative studies have affirmed that bilingual sample outperformed their monolingual counterparts on measures of intelligence and on nonverbal tests. The bilinguals showed superior performance on cognitive abilities such as advanced concept formation, classification, attentional tasks, divergent thinking, problem solving and different verbal skills. (Pearl & Lambert 1962; Diaz 1983; Hakuta Ferdman, & Diaz 1987; Cummins, 1979, 1991; Wodniecka, Craik, Lou & Bialystok, 2010; Andreou & Karapetsas, A. 2004)

It is worth-mentioning that a large number of studies conducted in the first half of the 20th century were imperfect in that they suffered from a wide range of methodological deficiencies and thus a great many researchers maintain that the findings of the early studies on bilingualism are not typically reliable (Cummins, 1976). In their study, Peal and Lambert, (1962) reviewed the earlier researches and tried to clarify the reasons why the studies before 1960 were negative. In order to discredit their validity, Peal & Lambert argued that these studies suffered from some confounding variables affecting the outcomes of the studies which the researchers failed to control. The major challenges in this field were related to methodological issues such that bilingual and monolingual subjects belonged to different socioeconomic and ethnic backgrounds i.e. in most cases, bilinguals were from low- income families and were recent immigrants to the United States. Additionally, the same IQ tests that were constructed and intended for mainstream monolingual populations were also used with minority bilingual subjects. Peal and Lambert (1962) equally insisted that the subjects were not truly "balanced bilinguals" who are proficient in both their first and second language but probably belonged to "pseudo-bilinguals" who have not yet achieved appropriate abilities in their second language. In this regard, Diaz (1983) states "the degree of bilingualism was determined by "foreignness of parents", family names or even residency which are variables too unstable and inaccurate to be accounted for in a scientific research (p.26)".

Through their authentic study on the comparison between bilingual and monolingual children in 1962, Peal and Lambert found that in contrast to previous researches on bilingualism, the bilingual children outranked monolingual children on both verbal and non-verbal tests of intelligence. The reason behind this difference related to the care which was taken in the way the previous researches were conducted (Hamers & Blanc, 2000). In their research paradigm, Peal and Lambert attempted to compare balanced bilinguals with monolinguals and to appropriately control the socioeconomic status, parental education, years of schooling and other relevant variables which they thought might confound the results (Hakuta et al., 1987).

Since Peal and Lambert's (1962) influential research, a variety of studies have taken into account the effects of bilingualism on the intellectual functioning affirming the cognitive advantage in several cognitive abilities among bilingual people in comparison to monolingual peers. The following literature provides a brief summary of some of the studies regarding the effects of bilingualism on different dimensions of cognitive abilities .

In a study to determine the effect of degree of bilingualism on child's cognitive ability, Hakuta and Diaz (1985) conducted a longitudinal study. The research consisted of 123 subjects of Puerto Rican descent with the mean age of 6 years. They were divided into groups on the basis of their degree of bilingualism which was reliably measured by particular proficiency tests. Their conclusion emphasizes a strong relationship between the degree of bilingual proficiency and a child's cognitive development.

Martin-Rhee and Bialystok (2008; as cited in Quin Yow, 2010) carried out a study aimed at comparing the performance of 4 to 5-year-old monolingual and bilingual children on a series of Simon Tasks on a computer. On each trial, a red or blue square was presented either on the left or right side of the monitor and children were to press as quickly and accurately as possible a left (or right) button if a red square appeared and a right (or left) button if a blue square appeared. On congruent trials, the target matches the side of the correct key press; and on incongruent trials, they mismatch. Quin Yow (2010) states; "according to Simon (1969), in an incongruent trial, the child has to inhibit his response to press the button on the same side of the square and press the button on the opposite side of the square. The correct performance on the incongruent trials required a child to ignore the position of the square and focus only on the color of the stimulus. This additional effort increases the response time in an incongruent trial compared to a congruent trial and is known as the Simon effect. (p.15)" The result of their study indicated that bilingual children performed more rapidly and accurately than their monolingual peers in tasks and processes demanding higher level of cognitive functioning such as selective attention as well as inhibitory control.

Cummins (1979) believes that cognitive benefits of bilingualism will develop if bilinguals achieve a certain level of bilingual proficiency. Accordingly, He formulated "Threshold Hypothesis" which holds child's cognitive development emerges only when a bilingual child attains a certain level of competence in the first and second language. To support the Thresholds hypothesis, Ricciardelli's (1992) conducted a study which involved 57 Italian-English bilingual and 55 English monolingual children. The aim of the study was to investigate the influence of

bilingualism on children's cognitive abilities including verbal and non-verbal abilities, creative thinking and metalinguistic awareness. The results of the study showed that proficiently bilingual children in Italian and English performed significantly better than both English monolinguals and bilinguals who were proficient in English but less proficient in Italian. She concludes the findings appropriately conform to the Threshold Hypothesis.

In order to test metalinguistic awareness, Ben-Zeev (1977) tested Hebrew-English balanced bilinguals and a group of monolinguals in a symbol substitution task to replace words in a sentence. For instance, they were asked to quickly substitute the word "spaghetti" in the sentence "The boy is cold" to produce "Spaghetti is cold" instead of the grammatically correct sentence: "Spaghetti are cold". They were asked to perform the task while violating the grammatical linguistic rules and showing that the meaning of a word was just a convention. In this test requiring awareness and attention to linguistic features, bilinguals were better than monolinguals at understanding that they can arbitrarily change names for things.

Additionally, the majority of studies appeared to confirm positive outcomes of bilingualism on the levels of metalinguistic awareness development. For example, the typically comparative researches conducted on the skill to recognize syntactic errors (Galambos, 1982), the ability to compare words along semantic rather than phonetic features- separating the meaning of a word from its sound (Ianco-Worrall, 1972); the talent to be more attentive to the arbitrariness of names assigned to concepts (Bialystock, 1987, 1988; Hakuta, 1986); the capacity to analyze redundant and contradictory sentences (Cummins, 1978), and many others primarily propose that bilinguals were significantly superior than their monolingual peers. As a whole, based on large literature, one may conclude that the findings on different aspects of metalinguistic awareness were consistent across studies.

Razmjoo (2008) conducted a study which intended to determine the relationship between multiple intelligences and language proficiency among the Iranian Ph.D candidates participating in Shiraz University Ph.D Entrance Exam. He tried to find out whether one of the intelligence types or a combination of intelligences are predictors of language proficiency and to discover the effect of sex on language proficiency and types of intelligences. The results of the study suggested; "there is no significant relationship between language proficiency and multiple intelligences as a g-factor and language proficiency and each of nine-intelligence types. Moreover, none of the intelligence type could predict the Iranian's English language proficiency. Finally, there is no significant difference among the Iranian male and female Ph.D candidates in terms of their proficiency and with respect to the types of intelligences they use (p. 170-171)."

Mazoochi and Saeidi (2013) sought to compare linguistic intelligence of 100 Iranian bilingual (Persian and Turkish) and monolingual (Persian) university students regarding their gender. The major findings of the study were as follows: that there is a significant difference between female bilinguals and monolinguals linguistic intelligence. However the male participants revealed no difference regarding their linguistic intelligence (pp. 329-330).

In an attempt to investigate the students' multiple intelligences according to their preferences and how students' multiple intelligences differ in terms of grade level, Gögebakan (2003) conducted a research with 321 students of three classes from first grade, third grade, fifth grade and eighth grade. Results revealed that the students multiple intelligences differ according to their grade levels. Moreover, regarding gender, the results indicated that male students gave higher self-estimates for logical-mathematical and bodily kinesthetic intelligence than their female counterparts whereas female students gave higher estimates of musical intelligence than male students.

Having reviewed the studies above, there appears a gap in the literature within the context of high schools in Iran. The primary objective of the present research, then, was to explore the different intelligences in a sample of monolingual and bilingual high school students (fourth grade) of Fars and Khuzestan provinces in Iran. The second objective of the study was to investigate how students' intelligences vary with regard to their gender.

## RESEARCH QUESTIONS

This study thus concentrated on the following research questions:

1. What different intelligences do monolingual and bilingual high school students have in Fars and Khuzestan provinces?
2. Do students' multiple intelligences differ with regard to their gender?

## METHODOLOGY

This section discusses the research methodology and procedures of the study. It begins by describing the sample used. Then, it presents data collection instruments and procedures and the statistical analysis of the obtained data. Finally, this section concludes by exploring the results, discussions and limitations concerning the study.

### Participants

All fourth grade regular high school students of Fars and Khuzestan provinces in Iran in the 2012-2013 academic year that amounted to 67031 students were identified as the target population of this study. The sample comprised of 448 monolingual and bilingual students whose ages ranged from 17 to 19. They were selected from 17 high schools by random stratified sampling technique. 251 (56%) of the participants were female and 197 (44%) were male. Only those students who spoke Persian as native language in Fars province were selected as monolingual participants and those who spoke Arabic as native language and Persian as second language in Khuzestan province as bilingual participants. The breakdown of the sample with respect to place of residence and gender is given in Table 1.

Table 1: Distribution of the Subjects by Place of Residence and Gender

		Gender		Total
		Female	Male	
Province	Fars	131	112	243
	Khuzestan	120	85	205
Total		251	197	448

### Instruments

In this study, the data about the intelligence profiles of the participants was collected using Multiple Intelligences Survey. This questionnaire is a self-reported instrument developed by Armstrong (1993) and is based on the Howard Gardener's (1993) theory of Multiple Intelligence and has been used in numerous studies investigating self-estimates of intelligence (Tahriri, 2010). This inventory includes totally 80 items; 10 statements for each of the eight intelligence dimensions based on Gardner's (1993) classification of intelligence types. Respondents check the statements that best describe them, then the scores on each intelligence type are totaled by adding the checked items on the specific intelligence dimension.

The English questionnaire was translated into Persian to ensure the participants' understanding of the items. The translation of the questionnaire was done during the research conducted by Tahriri (2010). Then, two university instructors translated the Persian version of the questionnaire back into English to confirm the reliability of the translation. It is worth nothing that Cronbach alpha coefficient of the overall MI inventory was found to be .84 in Tahriri's study.

In this research, through a pilot study, the Persian version of the multiple intelligence questionnaire was administered to 56 monolingual and bilingual students with a goal of studying its reliability. The test-retest method was used for obtaining evidence for the reliability of the questionnaire. The correlation coefficient was calculated and the reliability was found to be .83. So it seemed to be reliable enough to be employed in the study.

#### **Data collection and Analysis**

In order to gather data, the necessary permission to conduct the study was granted from the offices of education. Before the administration of the Multiple Intelligences Survey, the investigator explained the purpose of the investigation to the respondents in the selected schools and encouraged them to give correct answers. The participants had the option to answer the questionnaire or otherwise. Then, the Multiple Intelligences Survey was administered to them to collect the necessary data. The time of the survey session was at the proper class hours determined by the school management. This investigation was conducted in February 2013. As for the data analysis, the data so collected was coded and entered into SPSS to be analyzed statistically. With the aim of achieving the objectives of the study and for drawing conclusions, descriptive and inferential statistics were employed using central tendency measures (mean and standard deviation) and independent t-tests.

### **RESULTS AND DISCUSSION**

This study was conducted to comparatively investigate the students' multiple intelligence differences in bilingual and monolingual societies in Iran. It also examined whether there was a statistically significant difference between the students' multiple intelligences preferences in terms of gender. The summary of the findings, conclusions and discussions are presented in this section.

#### **Results**

The findings of the study are presented in the order of the research questions introduced above.

#### **1. What different intelligences do monolingual and bilingual high school students have in Fars and Khuzestan provinces?**

The first research question was concerned with monolingual and bilingual high school students' differences on each of the eight intelligence dimensions. To find out the answer to this question, an independent sample t-test was run to compare the monolingual and bilingual students' mean scores for each of the eight intelligence dimensions. Here, monolingualism and bilingualism were independent variables and the eight types of intelligence were dependent variables. The results are shown in Table 2.

*Table 2: Descriptive Statistics and Independent Samples t-test for Intelligence Types of Bilingual and Monolingual Students*

Intelligence Types	Area	N	Mean	Std	t-statistics(t)	df	g
<b>Linguistic</b>	Fars	243	4.47	1.065	-6.894	446	<0.001
	Khu...	205	5.17	1.069			
<b>Logical-Mathematical</b>	Fars	243	5.84	.957	-8.010	446	<0.001
	Khu...	205	6.58	.995			
<b>Spatial</b>	Fars	243	5.49	.942	-8.085	446	<0.001
	Khu...	205	6.24	1.018			
<b>Bodily-kinesthetic</b>	Fars	243	5.28	1.994	-1.099	446	0.564
	Khu...	205	5.29	2.073			
<b>Musical</b>	Fars	243	4.78	2.019	-2.188	446	0.073
	Khu...	205	4.80	2.065			
<b>Interpersonal</b>	Fars	243	5.01	.998	-8.600	446	<0.001
	Khu...	205	5.80	.940			
<b>Intrapersonal</b>	Fars	243	4.82	.992	6.867	446	<0.001
	Khu...	205	4.19	.933			
<b>Naturalistic</b>	Fars	243	4.32	2.029	2.208	446	0.070
	Khu...	205	4.30	2.013			

As can be seen in Table 2, based on students' mean scores, std and p value ( $p < 0.05$ ), there are significant differences among the scores of the monolingual and bilingual participants on each intelligence type. That is, the bilingual students rated themselves higher on linguistic, logical-mathematical, spatial and interpersonal intelligences than monolingual peers while monolingual students rated themselves higher on intrapersonal intelligence than bilingual students.

#### **2. Do students' multiple intelligences differ with**

**regard to gender?**

With reference to the second question whether the students' multiple intelligences differ with regard to gender, another independent sample

t-test was computed to establish if gender differences existed for students' estimates of their own multiple intelligence. Here, gender was the independent variable and the eight types of intelligence were the dependent variables. The results are shown in Table 3.

*Table 3: Descriptive Statistics and Independent Samples t-test for Intelligence Types of Female and Male Students*

Intelligence Types	Gender	N	Mean	Std	t-statistic(t)	df	Sig
<b>Linguistic</b>	Female	251	5.19	1.062	9.958	446	<0.001
	Male	197	4.19	1.032			
<b>Logical-Mathematical</b>	Female	251	5.52	.965	-7.261	446	<0.001
	Male	197	6.23	1.104			
<b>Spatial</b>	Female	251	5.27	1.008	-7.496	446	<0.001
	Male	197	6.01	1.042			
<b>Bodily-kinesthetic</b>	Female	251	5.02	1.008	-10.069	446	<0.001
	Male	197	6.01	1.074			
<b>Musical</b>	Female	251	5.50	2.089	2.168	446	0.077
	Male	197	5.48	2.003			
<b>Interpersonal</b>	Female	251	5.85	.987	7.973	446	<0.001
	Male	197	5.11	.962			
<b>Intrapersonal</b>	Female	251	4.67	1.045	3.275	446	.001
	Male	197	4.34	1.098			
<b>Naturalistic</b>	Female	251	4.68	2.020	-2.235	446	.066
	Male	197	4.70	1.951			

As shown in Table 3, based on students' mean scores, std and p value ( $p < 0.05$ ), there are significant differences among the scores of the male and female participants on each intelligence type. That is, the male students gave higher self-estimates for logical-mathematical, spatial and bodily-kinesthetic intelligence than female peers while female students gave higher self-estimates for linguistic, interpersonal and intrapersonal intelligences than male peers.

### Discussion

The present study intended to primarily explore the students' multiple intelligence differences in bilingual and monolingual societies in Iran. Accordingly, the first research hypothesis of the present investigation was concerned with the differences of multiple intelligences between bilinguals and monolinguals. As the results indicates, the bilingual students were superior in linguistic, logical-mathematical, spatial, and interpersonal intelligences than their monolingual peers while monolingual students were superior in intrapersonal intelligence than bilingual students. Therefore, the first null hypothesis, there is no significant difference between Iranian monolinguals (Persian) and bilinguals (Arabic and Persian) in terms of Multiple Intelligences scores, was rejected.

The findings related to the first research question are in line with the outcome of the study by Mazoochi and Saeidi (2013) who compared the linguistic intelligence of 100 Iranian bilingual and monolingual university students and indicated that there is a significant difference between female bilinguals' and monolinguals' linguistic intelligence.

Additionally, this research also supports most studies conducted after 1960s on the impact of bilingualism on cognition, associating bilingualism with positive effects. To mention a few, this finding is consistent with various studies that indicated the better performance of bilinguals over monolinguals on verbal and nonverbal intelligence tests (Peal & Lambert, 1962), the bilinguals' superiority in tasks and processes demanding higher level of cognitive functioning such as selective attention as well as inhibitory control (Bialystok, 2004; Martin-Rhee & Bialystok, 2008; as cited in Quin Yow, 2010), the bilinguals' skill to be more sensitive to the communicative needs of their conversational partners than monolingual children (Nicoladis, 2008), bilingualism with positive effects on metalinguistic awareness (Ben-Zeev, 1977; Bialystok, 1991) and the positive influences of bilinguals' second language proficiency on verbal intelligence of bilingual children in comparison to the monolinguals and on the individual components of nonverbal intelligence (Sampath, 2005; p.2052).

Furthermore, the second goal of the study was to investigate how students' intelligences vary with regard to their gender. Thus, the second research hypothesis of the present research was concerned with the differences of multiple intelligences between male and female students. As the results indicates, the male students were superior in logical-mathematical, spatial, and bodily-kinesthetic intelligences than female peers while female students were superior in linguistic, interpersonal and intrapersonal intelligences than male peers. Consequently, the second null hypothesis, There is no significant main effect of gender on the students' Multiple Intelligences scores, was also rejected.

With respect to the effect of gender on different dimensions of multiple intelligences, the findings support the outcomes of several studies (Furnham 2001; Furnham, Rakow, & Make 2002; Gögebakan, 2003; Looi, 2005; Ramzi, Abouchdid, & Singhal, 2008; Lin, 2009; Shahzada, Ghazi, Nawaz Khan, & Shabbir, 2011). For instance, the result of Lin's research (2009), with the objective of investigating gender and major differences in self-estimates of different aspects of Gardner's multiple intelligences among 411 pre-service teachers in Taiwan, showed that "males' self-estimates of mathematical, visual-spatial, and bodily-kinesthetic intelligences were significantly higher as compared to the female sample. In contrast, self-estimates of verbal-linguistic and musical-rhythmic intelligences were significantly higher for the female than for the male sample" (p.6).

## CONCLUSION

As the findings of the study reveal, the difference between Iranian monolingual (Persian) and bilingual (Arabic and Persian) participants' scores on Multiple Intelligences Survey questionnaire was found to be statistically significant. In other words, the bilingual subjects gave higher self-estimates for linguistic, logical-mathematical, spatial and interpersonal intelligences than monolingual peers while monolingual students gave higher self-estimates for intrapersonal intelligence than bilingual students. Furthermore, according to the results shown in Table 3, one can understand that there are significant differences among the scores of the male and female participants on each intelligence type in that the male students rated themselves higher on logical-mathematical, spatial and bodily-kinesthetic intelligence than female peers while female students rated themselves higher on linguistic, interpersonal and intrapersonal intelligences than male peers.

It would be interesting to note that this study is intended to be utilized as a theoretical component of the project leading to adjustment in educational policy and program development creating educational equality by particularly emphasizing on dual language or bilingual programs throughout the country. Additionally, the outcomes of MI studies clearly suggest that students have different potentials, interests, skills and styles of learning. Therefore, this study paves the way to improve the teaching styles to match to the students' learning styles and to diversify activities and methods of teaching to improve learning success of students. To put it differently, such studies demonstrating the MI profile of the students may help educators to design a variety of opportunities for students in the classroom to meet the needs of learners with different intellectual abilities.

Admittedly, the most notable limitation of this research relates to the fact that the results were limited by sample size and might not reliably be generalizable to the population of other areas in Iran. That is, the sample surveyed in the present study was not really representative of the whole population with cultural differences in other areas. In this regard, Gardner (1999) maintains that multiple intelligences have a cultural component and the cultural setting influences activation or deactivation of intelligences. Thus, when interpreting the results, it is of utmost importance to view the outcomes of this inquiry locally and not universally. However, further studies investigating various aspects of cognitive capacity in terms of bilingualism and gender and incorporating samples of different locales should be conducted in order to provide reliable results and present a thorough picture of the phenomenon under study.

### ABSTRACT

The aim of this study is to assess the quality of infection control training using distance education and the comparison of such assessment with classroom teaching method for the 20<sup>th</sup> and 21<sup>st</sup> dental students of Hamadan Faculty of Dentistry. This intervention – empiric study was conducted in the Faculty of Dentistry, Hamadan University of Medical Sciences in 2013, Iran. The subjects were 73 junior and senior divided into two groups. The scores of both groups were compared and analyzed to evaluate teaching methods in promoting student information in the field of infection control. The collected information will be analyzed by SPSS19 software, descriptive statistics and statistical tests such as t-test and paired t-test. Distance education used in this study is a type of asymmetric training and the CD-ROM based training was used in implementing and running the e-learning system. The use of distance learning methods (CD-ROM Model) had overall a better effect than the method of classroom teaching.

**KEYWORDS:** Distance Learning, E-learning, Education, Class Teaching Method, Infection Control

### INTRODUCTION

New technology has created fundamental changes in the educational system and it is able to solve many inefficiencies of the traditional educational system (Reime et al, 2008; Chaffin et al, 2008; Kossioni et al, 2013). In recent years, e-learning systems have greatly increased.

E-Learning in the definition means learning the educational basics via the Internet or Intranet or using multimedia such as a DVD or CD-ROM for the learner (Gray et al, 2007). Due to the increasing number of new universities and enrolled students, increasing the need for their presence at the University, shortage of teachers and its subsequent economic issues, the explosive growth of available resources, the use of new teaching methods in the Health Sciences necessitate some opportunities to change traditional teaching methods in the class (Woo et al, 2000). Some of the advantages of distance learning are: easy access to contents anytime and anywhere for students, lack of possible simultaneous presence of all students at a specific time and space, students' participation in their learning process, more repetition of materials if necessary, flexible time of training, lowering the cost (Anaraki et al, 2004; Garland et al 2010; O'Neill et al, 2011). This method has some disadvantages; there should be an easy access to computers and the Internet. The learners are separated from the educators and due to lack of a face-to-face and eye contact some learners may misunderstand the content (Schonwetter et al, 2012).

E-learning method has been considered dentistry and it seems that it has high and growing potential in dental education (Matteos et al, 2010; Richards, 2008; Sitzmann et al, 2006). Determination of the best way for education for today's generation of dentists is not a simple issue; not only educational concepts are important, but the way of education is extremely important (Barnes et al, 2013). Although numerous studies examined the application of these methods and its weakness and strength points of this training method in medical and nursing students, specific research in the field of distance education in dental education is rather low (Barnes et al, 2013).

When examining the literature at the intersection of teaching and learning with information and communication technology (ICTs), one is struck by the relative lack of focus upon the potential problems and drawbacks of the incorporation of technology into educational work-life (i.e. Granger, Morbey, Lotherington, Owston, & Wideman, 2002; Hassini, 2006; Liaw, Huang, & Chen, 2007; Marbach-Ad & Sokolove, 2001; Marbach-Ad & Sokolove, 2002; Mazzolini & Maddison, 2007; Ruthven, Hennessy, & Deane, 2005).

A study done by Gray (2007) in the UK showed that continuous Medical Education of infection control for the dentists has been successful in the case of CD-ROM and this leads to their knowledge increase in this context; additionally, the learners were satisfied in applying this method of teaching (Chaffin et al, 2008). On the other, one of the concerns of today's society is strict observing of infection control and preventing the transmission of dangerous contagious diseases such as hepatitis and AIDS during dental treatments (Abdelaziz, 2011). As a result, training dental students in this context and codifying regular and ongoing courses of infection control training is necessary to be reminded and updated their dentistry (Favretto, 2005). So, to achieve convenient, consistent and low cost infection control training techniques is necessary.

The aim of this study is to assess the quality of infection control training using distance education and the comparison of such assessment with classroom teaching method for the 20<sup>th</sup> and 21<sup>st</sup> dental students of Hamadan Faculty of Dentistry.

## **RESEARCH QUESTION**

The research question of this study would be:

Does the quality of distance learning (e-learning) courses differ from that of traditional classroom teaching methods in terms of control infection for Hamedan dental students?

## **METHODOLOGY**

### ***The Study Population***

This intervention – empiric study was conducted in the Faculty of Dentistry, Hamadan University of Medical Sciences in 2013. The subjects were 73 junior and senior students who no courses in the field of infection control were provided to them. According to the university curriculum, infection control course, which is a mandatory course, was presented to the students. In the first group, 35 students of 5<sup>th</sup> semester attended in a class this lesson through traditional teaching methods (physical attendance in the classroom); and, a trainer taught them 8 sessions in the second semester of 2013 according to the curriculum; and, some teaching aids were used such as preparing PowerPoint slides in class. At the beginning of the semester, a test was taken from the student to determine their level and at the end of the semester final exam was taken from this group of students (Total questions = 30).

The second group consisted of 38 students of 4<sup>th</sup> semester which this lesson was presented in the first semester of 2013 via distance learning method. Before presenting the lesson a preliminary test was taken from this group.

### ***Instruments of the Study***

Shortly, the instruments of this study were tests and a CD-ROM based model of teaching which will be discussed in details here. Two pre-tests were taken to ensure that the two groups are the same in terms of basic data in the field of infection control. Since separating groups in terms of age and gender reduces the studied population, the effect of education was considered regardless of such factors; in fact, the two groups were matched in this regard.

Distance education used in this study is a type of asymmetric training and in implementing and running the above system the CD-ROM based training was used. With this method, students were provided with a self-centered approach (Gordon et al, 2004).

### ***Data Collection Procedure***

As mentioned above, for data collection pre- and post-tests, including 30 items, are used among 2 separate groups of students. In the present study, students' hardware was considered and it was assured that all of them have easy access to computers and skills necessary to use computers. Educational content was similar in both groups based on approved topics of college curriculum in the field of infection control and it was established using reputable books and websites in this context. For example, infection control operation was presented by a qualified person in this area. Before presentation of CD content to students, in a briefing session at the beginning of the semester implementation of distance education was explained to all students.

### ***CD-ROM preparation method***

Desired content was divided into separate sections for training in such a way that each training topic can be presented in two or more 20-minute-parts in order to help the learners learn the training materials eagerly and tirelessly. After planning and organization of training course the content was divided into multiple separate sessions and different ways of presentation were used such as audio and video files to improve education. To this end, the following procedure was used in the preparation of CDs:

1. Text preparation: Headings subject and the main content were shown in the form of a simple text in PowerPoint format slides; and, slides were prepared, based on the standard, in such a way that the text did not exceed 6 lines per page. In training, images and animations related to the topic of the slides were used to attract the learners and prevent them from being fatigue or exhausted.
2. Audio files preparation: The educators explained the educational materials in an appropriate environment and their voices were recorded. Then the recordings were separated regarding each slide. To prepare audio file Wave Pad sound software was used.
3. PowerPoint Audio Preparation: Audio and visual files to PowerPoint were matched with each other using I-Spining Software. Thus, the audio file will appear on the display along with displaying text in PowerPoint according to content being presented by educator at appropriate intervals and by taking the necessary feedback. Thus, the optimal combination of written words and audio along with conservation and recovery capabilities leads to increase the information stored in the learner's mind.

Then all the audio and visual PowerPoint files regarding Infection control training were collected in a file in 6 chapters and the references of materials were also added. Educational set prepared in the form of DVD and was set at the homepage of the University which was entitled 'virtual learning' at the students' disposal.

File size was sufficient that could be readily and easily available for download for all the learners. In a follow-up, the researchers made sure that all the educators had adequate access to educational materials for all training semester (4 months) and the learners had enough time to study training subjects. At the end of the second semester, students will have a final exam. Exam questions were perfectly matched with the first group of questions in terms of complexity and numbers (which was assessed by experienced teachers).

### ***Data Analysis***

The scores of both groups were compared and analyzed to evaluate teaching methods in promoting student information in the field of infection control. The collected information will be analyzed by SPSS19 software, descriptive statistics and statistical tests such as t-test and paired t-test.

## **RESULTS AND DISCUSSION**

In this study, 73 students were tested. Firstgroup, including 38 people,trained under distance education method and second group,including 35 people, experienced the classroom training.The comparison of test results (pre test)of 2 groups showed that the average pre-test scores in distance education (Group 1) is 35.6% and class training (Group 2) is 35.7%. Therefore, a significant difference does not exist between the scores of students in the two educational methods (0.976 = P value) (Table 1).

The mean scores of the studentsinthe final test in the group of distance education was 64.6% and in the case of group classroom instruction 58.5% which statisticallythere is a significant difference between the scores of these two groups of students (0.015 = P value) (Table 2).

*Table 1: Comparison of mean scores of the 2 groups at the initiation of study*

groups	participants	Mean scores (20)	SD	The test statistic	Degree of freedom	P value
e-learning	38	7.13	1.711	-0.030	71	0.976
Classroom-based	35	7.14	1.517	-0.030	70.905	

*Table 2: Comparison of mean scores of the 2 groups at the end of study*

groups	participants	Mean scores (20)	SD	The test statistic	Degree of freedom	P value
e-learning	38	12.92	2.271	2.486	71	0.015
Classroom-based	35	11.71	1.832	2.508	69.828	

According to Table 3, the mean percentage scores of students in Group 1 increased from 35.5% in the initial testto 64.6% at the end of the period. It shows there is a significant difference in terms of their awareness of infection control before and after the training among two groups (0.000 = P value).

*Table 3: Results of the initial and final Test in distance education group*

groups	participants	Mean scores (20)	The test statistic	Degree of freedom	P value
Pre-test of 1 <sup>st</sup> group	38	7.13	-15.077	37	0.000
Post-test of 1 <sup>st</sup> group	38	12.92			

According to Table 4, the mean percentage scores of students in Group 2 increased from 35.7% in the initial testto 57% at the end of the period. It shows there is a significant difference in terms of their awareness of infection control before and after the training among two groups (0.000 = P value).

*Table 4: Results of the initial and final Test in distance education group*

groups	participants	Mean scores (20)	SD	The test statistic	Degree of freedom	P value
Pre-test of 2 <sup>nd</sup> group	35	7.14	1.517	-13.254	37	0.000
Post-test of 2 <sup>nd</sup> group	35	11.71	1.832			

### **Discussion**

According to the results this study, the averagescores of student on the final exam in comparison to the beginning test in the course in both methods had significantly increased. So, both methods were effective in promoting the learner's knowledge and skillsin controlling the infection.In addition, in our study the average final grades for distance education group was 64.6% and for classroom instruction group is 58.5% which can be stated that distance learning method is a more effective method than classroom instruction group.

Among the reviewed articles, the study of Garland and colleagues (2010) andReime and colleagues study (2008)was similar without study(Garland, 2010).The results of these two studies, unlike the present study, did not show asignificant difference between the methods of distance education with traditional methods.

In a study done by Garland,E-Learning was compared with classroom teaching method regarding infection control in the health of students (Garland, 2010). A study done by Reime on infection control training of nursing students was examined; and, distance education (CD-ROM Model)was compared withthe lecture method (Lecture Model) (ibid).While in the present study distance learning is a type of asymmetric CD-ROM-based training and the surveyed study populationsare dentistry students.

In these two studies, unlike our study, a pre-test has not been taken at the beginning.But satisfaction questionnaire of training method was provided and the impact of age and gender in the effectiveness of training methods was assessed in which in this study, due to the limited number of samples, these variables were similar between the two groups.

Also a study ofStizmann and colleagues similar toReime reported that when the training content and the learners are the same, e-learning as classroom teaching method can influence on the students' awareness in training (Gordon et al, 2004). Our study also reported that methods of distance learning and classroom teaching methods were equally effective in terms of various educational concepts (Atack et al, 2008; Ruiz et al, 2006; Woo et al, 2000; Bernardet al, 2004; Gordon et al, 2004).

### **CONCLUSION**

In our study, the presented topics and the trainer for both groups were similar.So, the only variable was the educational method.But unlike the aforementioned studies,method of distance educationwas more effective than the classroom instructionmethod.The difference in the results can be used to explainthat limitations and challenges of distance learning methods should be overcome. The disadvantages of distance education fail for a better distribution of educational contentbetween training clients;this means that despite the collection of appropriate materials, it may not be possible for learners to access to such materials or they may not pay attention to thattraining material (Chaffin, 2008).Other flaw in the mentioned studies is lack of opportunity for asking questions appropriate time (Atack et al, 2008).

Also due to the large units in a semester course for students and the existing constraints in the learning environment usually classes were held in the afternoon that the students were very tired which affected the quality of education. Since the method of e-learning lacks time and space constraints for learners, they can choose their own appropriate time for training. It seems that in our study, these factors led to a more effective approach than that of classroom training.

In a study done by Gray and colleagues (2007), the effectiveness of distance learning methods in the type of CD-ROM in the training of infection control was reviewed both quantitatively and qualitatively. Analysis of test scores in pre- and post-tests revealed that Gray's CD-ROM training method in infection control is significantly associated with knowledge increase in this area (Chaffin, 2008). In this study, the CD-ROM model was used and pre- and post-test was taken from the learners. In our study, the CD-ROM method has been effective in infection control training, but it was not compared with other training methods. Gray (2007) has assessed the client's satisfaction level training course but we have not done that.

According to the study of Schonwetter there are several types of distance education each of which has its own merits and demerits; and, they have their own specific features and needs (Schonwetter et al, 2012). Although CD-ROM approach was not the best one in the various methods of distance education, it was acceptable. Based on the existing facilities at the colleges, it seemed that this approach is most useful regarding student access to the needed tools for this procedure such as broadband (Woo et al, 2000). However, previous studies have reported the effectiveness of the CD-ROM as well (Favretto et al, 2005; Kossioni et al, 2013; Al-Omari et al, 2005).

#### **Limitations of the study**

In our study, to minimize the limitations and problems of e-learning methods educational content was placed on the site and DVD content were delivered to the students. Also, the professor at the beginning of training session held a briefing session for the students and explained about the teaching methods and how to access the content; and, also the course objectives were described. In addition, the teachers and their training methods were introduced to the students to communicate with them in the case of any question. Since this method of training was provided in the form of course curriculum, students had to pass the method in order to pass the course.

EXPRESSIVE SPEECH ACT OF JUDGES' NARRATIVES IN  
X-FACTOR INDONESIA TALENT SHOW ON RAJAWALI CITRA TELEVISI INDONESIA (RCTI):  
A PRAGMATIC STUDY

**ABSTRACT**

This article tends to find out the types of expressive speech act of judges' narratives and politeness strategies and substrategies used in X-Factor Indonesia talent show broadcasted by *Rajawali Citra Televisi Indonesia (RCTI)*. The method used in this article is descriptive method which describe the data systematically, actually, and accurately. The technique of data collecting uses uninvolved conversation observation technique. The use of this technique means that the present writer does not involve in the dialogues. Meanwhile, for the technique of data analysis, the present writer uses pragmatic competence-in-dividing. The data used in this article is judges' narratives of X-Factor Indonesia talent show broadcasted from March 22 to May 3 2013. The main theory of this article is the pragmatic theory of Searle's Speech Act and Brown and Levinson's Politeness Strategy (2007). The result of the research shows that the types of expressive speech act of judges' narratives of X-Factor Indonesia are praising, congratulating, thanking, and criticizing. The politeness strategies of X-Factor Indonesia judges are positive politeness, bald on record, and off record strategies.

**KEYWORD:** pragmatics, expressive speech act, politeness strategy, narrative, X-Factor Indonesia

**INTRODUCTION**

*The Background of Study*

In X-Factor Indonesia talent show, the judging of the commentators or judges plays a very important role in affecting the contestants' performance. This is due to the fact that the contestants must perform better than their performances before. The comments or the judging of the judges can be also called as narratives. According to Chaer (2010: 22), "*narrative can be mentioned as the realisation of abstract language.*" In the realisation, speakers of a language consist of heterogenous community. This results to the diversity of narratives of the language. Further, Chaer explains that language can be abstract because it cannot be observed empirically, while narratives can be observed empirically by listening.

The politeness of one's narrative can be different from the others based on knowledge and social background of that person. This also apply to the judges' narratives of X-Factor Indonesia. Each judge has its own way or strategy in choosing sentences that will be delivering to the contestants. This strategy makes each of judges' narrative different from the others.

Brown and Levinson in Chaer (2010) devide the scale of determining the ranking of politeness of a narrative into three scales. These three scales are determined contextually, socially, and culturally. The three scales are (1) social distance, which is based on the parameter of age, sex, and sociocultural differences; (2) social status of the speaker and the addressee, which is based on the asymmetrical speaker and addressee; (3) speech act, which is based on the speech act relative position between one and another.

This is what makes the present writer interesting to study further about narratives of X-Factor Indonesia judges. This article focuses on the use of expressive narratives and the realisation of politeness strategies.

**THEORETICAL BACKGROUND**

*Pragmatics*

The first theory used in this research is the theory of Pragmatics. There are several definitions regarding pragmatics. According to Leech (1993: 1) "*proposes that one cannot understand completely the characteristic of language, should he/she does not understand pragmatics, that is how language is used to communicate.*" This statement shows that pragmatics cannot be separated form the use of language. In Rahardi (2009: 20), Levinson defines pragmatics as the study of language focusing on the relationship between language and its context. This context has been grammaticalized and codified so that it cannot be separated from its structure of language. This limitation of Levinson can be explained as follow: "*Pragmatics is the study of those relations between language and context that are grammaticalized, or encoded in the structure of language.*"

*Speech Act*

Speech act used in the form of performative sentences is formulated by Austin (1962) as in three different acts, that is, (1) locutionary act, (2) illocutionary act, and (3) perlocutionary act. Locutionary act is an act of stating something as the way it is (*The Act of Saying Something*). Illocutionary act is an act of stating and doing something (*The Act of Doing Something*). Perlocutionary act is an act of affecting someone or the one who listen to the narrative. Perlocutionary act is often called as *The Act of Affective Someone* (the act of affecting someone). Searle in Rahardi (2009) classifies the illocutionary act of narrative into five types of narrative, that is, assertive, directive, expressive, commissive, and declarative. This research focuses on the expressive type functioning of stating or showing the speaker's psychological attitude of certain circumstances as (a) thanking, (b) congratulating, (c) pardoning, (d) blaming, (e) prasing, (f) criticizing, and (g) condoling.

*SPEAKING Theory*

Hymes (1962) in Sumarsono (2011, 335) proposes what he calls as SPEAKING. This stands for “*S*=Situation, *P*=Participant, *E*=End, *A*=Act sequence, *K*=Key, *I*=Instrumentalities, *N*=Norms, *G*=Genre”. The *S* stands for situation which refers to the settings, interactions, and scenes. The *P* stands for participant involved in interactions. The *E* stands for end which refers to the purposes of the interactions. The *A* stands for act sequence which refers to the forms and contents of the interactions. The *K* stands for key referring to the style of how the speaker communicate. The *I* stands for instrumentalities which refer to the media and forms of interactions. The *N* stands for norms referring to the norms of interactions and interpretations, and the *G* stands for *genre* which refers to types of interactions.

#### ***Politeness Strategy***

Brown and Levinson (1987: 60) divides the politeness strategies into five strategies. These five strategies are bald on record strategy, positive politeness strategy, negative politeness strategy, off record strategy, and ‘don’t do the FTA’ strategy.

#### ***Bald on Record Strategy***

According to Brown and Levinson (1987: 69-70), the bald on record strategy is a strategy of saying something clearly. The main reason of choosing this strategy, based on Brown and Levinson (1987: 95) is due to the speaker’s logic of doing FTA to the extent.

#### ***Positive Politeness Strategy***

Brown and Levinson (1987: 101) proposes that the positive politeness strategy is a strategy of doing FTA in the way of saving face or keeping the positive face of the addressee. By doing the FTA, the speaker gives an impression that he/she has the same intention as the addressee of showing friendship between them.

#### ***Negative Politeness Strategy***

Based on Brown and Levinson (1987: 129), the negative politeness strategy is a strategy of saving negative face of the addressee to maintain the free act of the addressee. By doing this strategy, the speaker recognizes and respects the negative face of the addressee.

#### ***Off Record Strategy***

Brown and Levinson (1987: 211) argues that the off record strategy is a strategy of doing FTA indirectly by letting the addressee to freely interpret the speaker’s narratives.

### **RESEARCH QUESTIONS**

According to the explanation above, the research questions of this article are:

1. What types of expressive narratives are used in X-Factor Indonesia judges’ narrative?
2. What types of politeness strategies are used to realize the expressive narratives of the X-Factor Indonesia judges?

### **METHODOLOGY AND TECHNIQUE**

#### ***Method***

The method used in this research is descriptive-qualitative. This method aims to describe the characteristics of the data and the related phenomena systematically, actually, and accurately (Djajasudarma, 1993:8). The word of ‘descriptive’ is derived from a latin word “*descriptivus*” which means ‘analyzing’. A descriptive research is a research of collecting information about the subject of the research and its attitudes in a certain period. The descriptive-qualitative research tries to describe the whole tendency or existing situation, that is the situation as the way it is at the time of the research (Mukhtar, 2013:10).

#### ***Method and Technique Of Data Collecting***

This research uses an observation method. In accordance with the name, this method provides the data by observing the use of language in the real situation. Meanwhile for the technique, the present writer uses tapping technique as the basic. Further, it is also used uninvolved conversation observation technique as the following technique (Sudaryanto, 1993: 133-136). The following technique or the advanced one which supports the research is the technique of uninvolved conversation observation. The use of the technique means that the present writer does not involve in the dialogues or conversations. The present writer does not participate in the conversations. Here, the present writer’s role is as an observer by listening what is said (not what is talked about) by the participants in the dialogue (Sudaryanto, 1993: 134-135). The concept of dialogue falls into a wide definition. It means that the dialogue here refers to an interaction involving at least two participants which happens to be a speaker and an addressee in the way of communicating to each other (two ways interaction) or in the way of contacting (one way interaction). Uninvolved conversation observation technique is used to observe the dialogue between the speakers (judges of X-Factor Indonesia) and the addressees (the contestants) in X-Factor Indonesia Show on Youtube channel of X-Factor Indonesia. After using the uninvolved conversation observation technique, it is used the writing technique.

#### ***Method of Data Analyzing***

In analyzing the data, this research uses pragmatic competence-in-dividing (Sudaryanto, 1993: 15). This method is compatible when the language used as the object of the research has a relationship with the things outside the language itself no matter what the relationship is. Thus, the one which determines in the analysis as the ‘suprasegmental’ key is the addressees, for example in determining the imperative sentence which can affect the addressee.

#### ***Data source***

This research is classified as a qualitative research. The methodology of qualitative one is a procedure which results descriptive data such as written or spoken data in a speech community (Djajasudarma, 1993:10). The data source of this research is transcriptions of X-Factor Indonesia judges’ narratives during the show. The number of the show used in the research is about seven episodes broadcasted from March 22 to May 3 2013, which happens to contain twenty five of expressive narratives.

### **RESULTS AND DISCUSSIONS**

Table 1: The Result of Using Assertive Speech Act of X-Factor Indonesia Judges' Narratives

No	Types of Expressive Speech Act	Amount	Percentage
1	Praising	18	72 %
2	Congrating	3	12 %
3	Thanking	1	4 %
4	Criticizing	3	12 %
<b>Total</b>		<b>25</b>	<b>100 %</b>

Table 2: The Realisation of Using Politeness Strategy in Expressive Speech Act of X-Factor Indonesia Judges' Narratives

No	Types of Expressive Speech Act	Politeness Strategies and Substrategies	Amount	Percentage
1	Praising	Positive Politeness (attend to H (his interests, wants, needs, goods))	6	24 %
2		Positive Politeness Exaggerate (interest, approval, sympathy with H)	2	8 %
3		Positive Politeness Intensify interest to H	5	20 %
4		Positive Politeness seek agreement	1	4 %
5		Positive Politeness joke	1	4 %
6		Positive Politeness be optimistic	1	4 %
7		Positive Politeness include both S dan H in the activity	1	4 %
8	Congratulating	Positive Politeness include both S dan H in the activity	1	4 %
9		Positive Politeness intensify interest to H	1	4 %
10		Positive Politeness Exaggerate (interest, approval, sympathy with H)	1	4 %
11	Thanking	Positive Politeness use in group identity markers	1	4 %
12	Criticizing	Bald on record	2	8 %
13		Off Record Strategy give association clues	2	8 %
<b>TOTAL</b>			<b>25</b>	<b>100 %</b>

Table 2 shows the realisation of politeness strategy of expressive narratives in X-Factor Indonesia judges' narratives. The most frequent of politeness strategy used in the narratives is the positive politeness with the substrategy attend to H (his interests, wants, needs, goods). The data analysis based on the classification of table 1 and 2 as follow:

#### Types of Expressive Speech Act

##### Expressive-Praising

- (1) This narrative is spoken by Anggun C. Sasmi (the International female singer of Indonesia), she is the speaker while for the addressee is Gede Bagus (a contestant from Bali). At the show aired on March 22 2013, he sang a song titled "Aku Sedang Ingin Bercinta" popularized by The Rock Indonesia.

Juri 3 : Gede! (D1.21)  
 Judge 3 : Gede  
 Judge 3 : Gede (D1.21)  
 G : Ya, Mbak. (D1.22)  
 G : Yes, (older woman)  
 G : Yes, Miss (D1.21)

Juri 3 : (Tertawa) Pokoknya/ malam/ ini/ *aku/ puas/ sekali/ melihat/ kamu/ dan /aku/ senang/ karena /kamu/ setiap/ kali/ aku/ kasih/ tantangan/, kamu/ tuh/ mau/ gitu loh/. Gak/ takut/ sama/ sekali/ dan/ ini/ buat/ aku/ kelebihan/nya./ /kamu/ juga/ bukan/ Cuma/ suara./ dalam /mental/ di /kepala/ kamu/ tuh/ mau /banget/ dan/ buat /aku/ seru/ malam/ ini/. **Bangga/ aku/ sama/ kamu./** (D1.23)*

Judge 3 : (laughing) the basic/ night/ this/ I satisfied/ once/ see/ you/ and/ I/ happy/ because/ you/ every/ times/ I/ love/ challenge/ you/ that/ want /like that/ right/. Not/ afraid/ same/ once/ and/ this/ make/ I/ excess/ you/ too/ not/ only/ voice/ in/ mental/ in/ head/ you/ that/ want/ very/ and/ make/ I/ yell/ night/ this/ proud/ I/ same /you/

Judge 3 : (Laughing) The point is, tonight I am very satisfied seeing you and I am happy because everytime I give a challenge, you are so welcomed. You are not afraid at all and this is your advantage to me, you have not only voice but also the spirit in your head that you are so welcomed and you make me rock tonight. I am so proud of you

G : Terima/ kasih./ Mbak/ Anggun/. Terima/ kasih/ semua/. (D1.24)  
 G : accept/ love/ older women/ Anggun./ accept/ love/ all/.  
 G : Thank you Miss Anggun. Thank you all.

The type of expressive speech act-praising in the data (1) is marked by the use of the praising words that is *puas* (satisfied), *senang* (happy), dan *bangga* (proud) (D1.23). The speaker seems to be impressed by the addressee's performance that night.

##### Expressive-Congratulating

- (2) The following narrative is spoken by Bebi Romeo (a male singer of Romeo band) addressed to Nu Dimension (a male group contestant) on the March 22 2013 show. That night, Nu Dimension sang a song titled "Kirana" popularized by Dewa 19.

Juri 2 : Karena /menurut/ saya,/ "Kirana"/ bukan/ lagu/ yang,/ bukan/ lagu/ yang,/ /emmm,  
/lagu/ popular/, tapi /cukup/ pintar/ gitu/ loh/ dengan/ notasi-notasi/ yang/ nggak,/ menurut/ saya/ bukan/ notasi  
/murahan/ gitu./ Dan/ kamu /berhasil/ membuat/ notasi-notasi/ itu/ juga/ dengan/ mahal  
/kedengerannya,/ dengan/ formasi/ grup/ yah./ **Sekali/ lagi/ selamat/ untuk/ Nu Dimension/**  
**malam/ ini./ (D5.3)**

Judge 2 : because/according to/I/ Kirana/ not/ song/ particle /not/ song/ particle /emmm/ song/ popular/ but/  
enough/ smart/ like that/ right/ with/ notations/ particle/ not/ according to/ I/ not/ notation/ cheap/ like that/  
and/ you/ success/ make/ notations/ that/also/ with/ expensive/ listened/ with/  
formation/ group/ well/ once/ too/ safe/ to/ Nu Dimension/ night/ this/.

Judge 2 : Because I think "Kirana" is not a song..emmm, it's not a popular song, but it's smart enough with those  
notations. I think those are not low quality notations. And you are succeeded making those notations into a whole  
new level, they sound high quality with that group formation. Well, once again congratulations  
to Nu Dimension for tonight.

ND : Terima/ kasih /Mas /Bebi. (D5.4)

ND : accept/ love/ older man/ Bebi

ND : Thank you Mister Bebi

In the data (2), the type of expressive speech act-congratulating is marked by the use of the word *selamat* (congratulation). The use of such a word functions as congratulating marker for the outstanding performance of Nu Dimension that night.

#### *Expressive-Thanking*

- (3) The following narrative is spoken by Rossa (an Indonesian female singer) addressed to Fatin (the youngest female contestant) on the March 29 2013 show. That night, Fatin sang a song of "It Will Rain" popularized by Bruno Mars

Juri 4 : Alhamdulillahilahirabilalamin,/ setiap/ hari/ Jumat /saya /mules/ banget/ rasanya/kalau/ Menunggu/ ini/  
Fatin/ ini/, apa/ namanya?/ Pujian /dari/ tiga/ mentor/mereka/ adalah orang-orang/ yang /paling/  
kompeten/. Mau/ mereka/ memuji/atau/ pun/ mengkritik/ itu/ adalah/ satu /hal /pelajaran/ buat/ kita/  
mudah-mudahan/ minggu/ depan/ kita /bisa/ semakin/ lebih/ baik/ lag/i. Amin./ **Terima/kasih/ juga/ buat**  
**/Fatinistik /yang /selalu/ memberikan/ semangat/, terima/kasih /banyak./ Good /Job/ Fatin! (D17.28)**

Judge 4 : thanking god/ every/ day/ Friday/ I/ stomachache/ very/ feel/ if/ wait/this/ Fatin/this/ what/ name/  
compliment/ from/ three/ mentor/ they/ are/ people/ particle/most/ competent/ want/ they/ praise/ or/even/  
criticize/ that/ is/ one/ thing/ lesson/ make/ we/ easy/ Sunday/ front/ we/ can/ more/ more/good/ again/  
amin/ accept/love/ too/ make/Fatinistik/particle/ always/ give/ spirit/ accept/ love/ many/ Good/ Job/ Fatin.

Judge 4 : (Thanking God), every Friday I am nervous waiting for this. Fatin, this is, what is it called? The  
compliments from the three other mentors, they are the most competent people. Whether they praise or  
criticize, it is a lesson for us, so that next week we can be better. Amin, Thank you for Fatinistik that  
always give their support, thank you. God Job Fatin.

F : /Terima/ kasih/. (D17.29)

F : accept/ love/

F : Thank you.

The type of expressive speech act-thanking in the data (3) is marked by the use of the frase 'thank you' spoken by the speaker to the addressee. The speaker thanks to Fatin's fans who always give support to Fatin during the Fatin's performance in X-Factor.

#### *Expressive-Criticizing*

- (4) The following narrative is spoken bay Ahmad Dani (a male singer of Dewa band) to Fatin on the April 12 2013 show. That night, Fatin sang a song of "Arti Hadirmu" by Audi (an Indonesia female singer).

Juri 1 : Komentarnya/... Aaa/, komentarnya/ **kamu/ gak/ cocok/ nyanyi/ lagu/ ini./ (D26.37)**

Judge 1 : comment/.../aa/ comment/ you/ not/ compatible/ sing/ song/ this/

Judge 1 : My comment...aa..my comment is that you are just not right singing this song

F : Oh/, ya /Mas /Dani/. Terima/ kasih. (D27.38)

F : Oh/ yes/ older man/ Dani/ accept/ love

F : Oh/ yok Mister Dani. Thank you

In the data (4), the type of expressive speech act-criticizing is marked by the use of the sentence "kamu gak cocok nyanyi lagu ini" (you are just not right singing this song) (D26.37). The use of this sentence describes that the speaker does not like the addressee's performance that night. The speaker directly gives his critic to the addressee.

#### *The realisation of Politeness Strategy*

##### *Expressive-Praising – Possitive Politeness-notice, attend to H (his interests, wants, needs, goods)*

- (5) The following narrative is spoken by Anngun C. Samsi (an International singer of Indonesia) to Shenna (a contestant from Jakarta) on March 22 2013 show. That night, Shenna sang a song of "Ratu Sejagad" by Vina Panduwinata.

Juri 3 : Shenna,/ aku/ liat/ kamu/ nyanyi/ lagu-lagu/ sedih/ berkali-kali/  
**penghayatannya/ dapet/, dan /kalau/ kamu/ nyanyi/ lagu/ seneng/ pun/ penghayatannya**  
**/dapet./ gayanya/ dapet/ karena/ kamu/ tuh/ memang/.. /Ini/ sebenarnya/ susah/ loh/ buat/ penyanyi/**  
untuk/ nyanyi/ lagu/ yang seneng/ itu/ susah./ Kalau/ nyanyi/ lagu/ sedih/ itu/ gampang/  
sebenarnya/ karena/ mungkin kan/ kita/ bisa/ masukin/, kayak/ nyari-nyari/  
pengalaman/ diri/ sendiri/ yang/ bikin/ kita/ sedih/, tapi/ **gak/ banyak/ orang/ yang/**  
**bisa/ nyanyi/ lagu /seneng/ tuh //dengan/ berhasil/, kamu/ berhasil/ sekali. (D2.20)**

Judge 3 : Shenna/ I see/ you/ sing/ songs/ sad/ times/ comprehension/ get/ and/ if/ sing/ song/  
happy/ even/ comprehension/ get/ style/ get/ because/ you. that/ indeed/ this/ actually/  
difficult/right/ make/ singer/ to/ sing/ song/ particle/ happy/ that/ difficult/ if/ sing/ song/ sad/ that/ easy/

actually/ because/ maybe/ we/ can/ include/ like/ search/experience/ self/ alone/  
 particle/ we/ sad/ but/ not/ many/ people/ particle/ can/ sing/ song/ happy/ that/ with/  
 success/ you/ success/once.  
 Judge 3 : Shenna. I observe that you sing sad songs many times. And everytime you get the  
 messages of the song. Also when you sing happy songs as well you get the messages because you are....Actually,  
 it is difficult for a singer to sing a happy song. It is very difficult but to sing a sad song is very easy  
 since we can add our own experiences that make us sad. Not many  
 actually who can sing a happy song, and it works for you. it really works.  
 S : *Makasih/Mbak/ Anggun.* (D2.21)  
 S : Thank you/ older woman/ Anggun  
 S : Thank you Miss Anggun

In the data (5), the realisation of the politeness of the expressive narrative is marked by the words choice that are bold in the data (D2.20). Those words show that the speaker really likes the addressee's performance that.

#### Expressive-Praising – Positive Politeness-Exaggerate (interest, approval, sympathy with H)

- (6) The following narrative is spoken by Rossa (an Indonesian female singer) to Mikha (the youngest male contestant) after he sang a song of "Sempurna" by Andra and The Backbone.

Juri 4 : **Wow**!, Mikha!/. (D8.1)  
 Judge 4 : Wow/ Mikha  
 M : *Ya, /Mbak.* (D8.2)  
 M : Yes/ older woman  
 M : Yes/ Miss  
 Juri 4 : *Pertama-tama/ saya /suka/ karakter/ suara/ kamu/. Dari/ awal/ kamu/ ada/ di/ depan/ saya/ dan/ cara /kamu/ menyanyi/ malam/ hari/ ini /sama/ sekali/ terlepas/ dari/ yang/ sebelumnya/ yang/ menyanyikan/ lagu/ ini, / dan /dirilis/ sebagai/ album/ mereka, / malam/ hari/ ini/ kamu/ menjadikan/ lagu/ ini/ memang/ lagu /kamu/. Yang/ satu/ lagi/ yang/ pengen/ saya/ komentari/ adalah/ luar/ biasa /panggunnya/ yah/, hanya/ ada/ di/ X Factor Indonesia /deh/ kayaknya./ Keren/ banget/ Kak/ Ari Tulang./ membuat/ kegilaan- kegilaan /di/ atas/ panggung/ ini /dan/ Mikha/ malam/ hari/ ini/ semua/ cewek /atau/ pun/ cowok/ juga/ jerit-jeritin/ nama kamu/. (D8.3)  
 Judge 4 : first/ I/ like/ character/ voice/ you/ From/ beginning/ you/ exist/ in/ front/ I/ and/ way/ you/ sing/ night/ day/ this/ same/ once/ from/ particle/ before/ particle/ sing/ song/ this/ and/ released/ as/ album/ they/ night/ day/ this/ you/ make/ song/ this/ indeed/ song/ you/ Particle/ one/ again/ particle/ I/ comment/ is/ out/ ordinary/ stage/ yes/ only/ exist/ in/ X-Factor Indonesia/ yes/like/. Impressive/ very/ older man/ Ari Tulang/ make/ craziness/ in/ above/ stage/ this/ and/ Mikha/ night/ day/ this/ all/ girls/ or/ even/ boys/ too/ yell/ name/ you/  
 Judge 4 : First of all, I like your voice character. Since the beginning you stood in front of me and they way you sang tonight, regardless the others who sang this song before and it was released as their album, tonight you make this song yours. One thing I would like to comment is that the stage is amazing and it is only in X-Factor Indonesia. It is very impressive that Mister Ari Tulang made this craziness on the stage and Mikha, tonight not only girls but also the boys are yelling for your name.  
 M : *Makasih/ Mbak.* (D8.4)  
 M : Thank you /older woman  
 M : Thank you Miss*

The realisation of the politeness of the expressive narrative in the data (6) is marked by using the interjection "wow". The use of the interjection shows the impressiveness of the speaker towards the addressee. Then, the use of the sentence, "saya suka karakter suara kamu" (I like your voice character) and "Mikha malam hari ini semua cewek atau pun cowok juga jerit-jeritin nama kamu" (Mikha, tonight not only the girls but also the boys are yelling for your name) shows that the speaker exaggerates the addressee's performance in that show that night

#### Expressive-Praising – Positive Politeness-Intensify interest to H

- (7) The following narrative is spoken by Bebi Romeo to Shenna after she sang a song of "Ratu Sejagad" by Vina Panduwinata.

Juri 2 : *Karena/malam/ hari/ ini/ kamu /memang/ superstar/ ya/, kamu/ bagus /sekali/ Malam/ ini, Shenna/. (D2.9)  
 Judge 2 : because/ night/ day/ this/ you/ indeed/ superstar/ yes/ you/ good/ once/ night/ this/ shenna/  
 Judge 2 : Because tonight you ARE a superstar. You are so impressive tonight. Shenna.  
 S : *Makasih-makasih.* (D2.10)  
 S : Thank you, thank you  
 Juri 2 : *Kamu /punya/ suara/ mutlak/ saya/ bilang/. Kamu/ nyanyi/ bintang/ kecil pun, / kamu/ enak/ Shenna/. (D2.11)  
 Judge 2 : you/ have/ voice/ absolute/ I/ say/ You/ sing/ bintang kecil/ you/ delicious/ Shenna/  
 Judge 2 : I must say you have an absolute voice. Even if you sing bintang kecil, you will still sound good**

The realisation of the politeness strategy in the data (7) that shows the expressive-praising is marked by the use of compliment sentences. The choice of using the sentence "Kamu memang superstar ya" (You ARE a superstar) can attract the addressee because she is praised like a superstar. Then, by using the sentence "Kamu punya suara mutlak" (You have an absolute voice) also show the same perception. The speaker uses the word "mutlak" (absolute) to attract the addressee's attention.

#### Expressive-Praising – Positive Politeness-seek agreement

- (8) The following narrative is spoken by Ahmad Dani to Shenna after she sang a song of Ratu Sejagad on the March 22 2013 show.

Juri 1 : *Gimana/ rasanya/ jadi /penyanyi/ jazz?. (D2.1)*

- Judge 1 : how/feel/ become/ singer/ jazz?  
 Judge 1 : How does it feel becoming a jazz singer?  
 S : Ya.... (D22.)  
 S : Yes  
 Juri 1 : Saya/ gak /bisa/ mengingkari/ memang/ kamu/ soulnya/ di/ dalem/ itu /mungkin/ waktu/ mamamu/ ngidam/ kamu/ atau/ hamil/ kamu/ mungkin/ ada/ software-software/ jazz/ yang/ masuk/ ke/ dalam /darahmu/. Jadi/ udah/ build/ in/ di/ dalem/. Jadi, meskipun/ kamu/ gak/ tahu/ itu/ jazz/ tapi/ lagu/ ini /memang/ cocok/ sekali/ kamu/ bawain./ dengan/ ya/ pasti/ karena/ basicnya/ juga/ lagu/ ini /gak/ straight/ pop./ lagu/ ini/ sebenarnya/ ada /basic/ ragtime/, new/ orleans/ juga/. Lagu/ ini/ diaransemen/ new /Orleans/ juga/ cocok./ New /Orleans/ itu /adalah/ kota/ dimana/ jazz/ itu/ pernah/ tumbuh/. Jadi, lagu/ ini/ cocok/ banget /buat/ kamu/ malam/ ini./ (D2.3)  
 Judge 1 : I/ not/ can/ deny/ indeed/ you/soul/ in/in/that/maybe/ time/ your mother/ crave/ you/ you/ or/ pregnant/ you/ maybe/ exist/ software-software/ jazz/ particle/ enter/ to/ in/ your blood/ so/ already/ build/in/ in/ inside/ so/ although/ you/ not/ know/ that/ jazz/ but/ song/ this/ indeed/ suitable/ once/ you/ bring/ with/ yes/ sure/ because/ the basic/ too/ song/ this/ not/ straight/ pop/ song/ this/ actually/ exist/ basic/ ragtime/ new/ orleans/ too/ song. This/ arranged/ new/ orleans/ too/ suitable/ new/ orleans/ that/ is/ city/ where/ jazz/ that/ ever/ grow/ so/ song/ this/ suitable/ very/ make/ you/ night/ this/  
 Judge 1 : I cannot deny that your soul are indeed in that song. Perhaps, when your mother craved for you or was pregnant of you there were jazz softwares that ran into your blood. So it was already built in. So, although you do not know jazz but this song fits perfectly for you. The basic of the song are not straight pop. This song actually has the ragtime basic of New Orleans too. It is also suitable when the song is arranged into New Orleans too. New Orleans is the city where jazz also ever developed. Thus, this song fits perfectly for you tonight.  
 S : Makasih/ Mas/ Dani (D2.4).  
 S : Thanking/ older man/ Dani  
 S : Thank you Mister Dani

The realisation of the politeness in the data (8) is marked by the repetition of the bold sentence (D2.3), this repetition is used to point out the agreement that the speaker really likes the addressee's performance that night.

#### Expressive-Praising – Positive Politeness-joke

- (9) The following narrative is spoken by Bebi Romeo to Fatin Shidqia Lubis after she sang a song of "Mercy" on the April 5 2013 show.

- Juri 2 : Ya/, Fatin/ ya/. Artinya/ 100 /tahun/ sekali/, dunia/ ini /perlu /suara /kamu/. Kamu /bukan/ main/, kamu/ main/ bukan/ malam/ ini/. (D23.6)  
 Judge 2 : Yes/ Fatin/ Yes/ meaning/ 100/ year/ once/ world/ this/ need/ voice/ you/ you/ not/ play/ you/ play/ not/ night/ this  
 Judge 2 : Yes, Fatin, well, it means that every 100 years, this world needs your voice/ you Are outstanding, outstanding you Are.  
 F : Makasih/ Mas/ Bebi./ (D23.37)  
 F : Thanking/ older man/ Bebi  
 F : Thank you Mister Bebi  
 Juri 2 : Papa /seneng/, papa/ seneng./ (D23.38)  
 Judge 2 : Daddy/ happy/ Daddy/ happy  
 Judge 2 : Daddy is happy, daddy is happy

The realisation of positive politeness of expressive narrative-praising in the data (9) is marked by the use of the joke sentence to break the ice. It is used to make the situation more relaxed. In the bold sentence above, the speaker intentionally changes the narrative, "Kamu bukan main, kamu main bukan malam ini" (You ARE outstanding, outstanding you ARE)

#### Expressive-Praising – Positive Politeness-be optimistic

- (10) The following narrative is spoken by Bebi Romeo to Fatin in the show on March 29 2013. That night, Fatin sang a song of "It Will Rain" by Bruno Mars.

- Juri 2 : Heeh/ iyaaa/. Saya/ yakin/, saya/ yakin/ malam/ ini/ pasti/ lebih/ bagus/ versi/ kamu/ dari /versi/ Bruno Mars/. (D17.17)  
 Judge 2 : Yes/ yes/ I/ believe/ I/ believe/ night/ this/ sure/ more/ good/ version/ you/ from/ version/ Bruno Mars  
 Judge 2 : Yes, yes, I believe..I believe that tonight your version is better than Bruno Mars'  
 F : Amin./ ya/ Allah./ Amin./ Alhamdulillah. / (D17.18)  
 F : Amen/ yes/ God/ Amen/ thanking God  
 F : Amen O'God. Amen/ Thanking God

In the narrative (10), the realisation of positive politeness of expressive narrative is marked by the use of a word containing optimism meaning, that is, the word 'believe'. In the narrative (D17.17), the speaker believes in the outstanding performance of the addressee.

#### Expressive-Praising – Positive Politeness-include both S dan H in the activity

- (11) The following narrative is spoken by Bebi Romeo to Alex Rudiart. That night, Alex sang a song of "Beraksi" by Kotak (Indonesia Rock Band)

- Juri 2 : Gak/ apa-apa/ Lex/, intinya/ semua/ masukan/ dari/ juri/ kita/ tampung/ sama-sama/ ya/, untuk/ kita/ lebih/ perbaiki/, untuk/ penampilan/ kita/ kedepannya/. Dan/ malam/ ini/ Papa/ menambah/ singkatan/ Papa/ jadi/ PPBSK/ papa/ dan/ penonton/ bangga/ sama/ kamu./ (D4.16)  
 Judge 2 : not/ what/ Lex/ the core/ all/ input/ from/ judge/ we/ keep/ same/ yes/ to/ we/ more/ better/ to/ performance/ we/ onwards/ and/ night/ this/ Daddy/ add/ abbreviation/ daddy/ become/ PPBSK/ daddy/ and spectator/ proud/ same/ you  
 Judge 2 : It's OK Lex, the point is all input from the judges, we keep it together for

- us so that our performance can be better in the future. And tonight Daddy adds the abbreviation from  
Papa to *PPBSK*, daddy and the spectators are proud of you.  
Al : *Terima/ kasih/ terima/ kasih/ Mas.* (D4.17)  
Al : accept/ love/ accept/ love/ older  
Al : Thank you, Thank you Mister

The realisation of the politeness in the data (11) is marked by the use of the pronoun '*kita*' (we). This shows that the speaker include the addressee into that narrative, and the narrative brings together the speaker and the addressee

#### *Expressive- Congratulating – Positive Politeness- include both S dan H in the activity*

- (12) the following narrative is spoken by Rossa (as the speaker) to Shenna (as the addressee). That night, Shenna sang as ong of *Ratu Sejagad* by Vina Panduwinata.

- Juri 4 : Shenna/ **aku/ sangat/ bangga/ sama/ kamu.** Setiap/ minggu,/ setiap/ kita /berlatih,/ apapun/ yang/ aku/ bilang./ kamu/ selalu/ berusaha/ untuk/ menangkap/ itu/, mengembangkan/ sesuai/ dengan/ jiwa/ kamu/. Dan/ **aku/ senang/ banget/ kerja/ sama/ kita/ berdua/ juga/ selalu/ asik.** Buat/ aku,/ momen-momen/ yang/ aku/ tunggu/ itu/ kalau/ latihan/ sama/ kamu/ dan/ Fatin/. **Congratulation.** (D2.30)  
Judge 4 : Shenna/ I/ very/ proud/ same/ you/ every/ Sunday. Every/ we/ practice/ anything/ particle/ I/ say/ you/ always/ try/ to/ catch/ that/ develop/ as/ with/ soul/ you/ and/ I/ Happy/ very/ work/ same/ we/ together/ too/ always/ fun/ make/ I/ moments/ particle/ I/ wait/ that/ if/ practice/ same/ you/ and/ Fatin. Congratulation  
Judge 4 : Shenna, I am very proud of you. Every week, everytime we practice, everything I say, you always try to catch it, develop it to your soul. And I am very happy working together with you, it's always fun. To me, the moments I always wait for are when I practice together with you and Fatin. Congratulation  
S : *Makasih/ Teh/ Oca.* (D2.31)  
S : Thanking/ older woman/ Oca  
S : Thank you Miss Oca

In the data (12) the realisation of the politeness of the expressive-narrative-congratulating is marked by using the word 'congratulation'. The use of the word 'congratulation' refers to the previous narrative, that is. '*aku senang banget kerja sama kita berdua juga selalu asik.*' (I am very happy working together with you, it's always fun). This shows that there is no distance between speaker and the addressee.

#### *Expressive-Congratulating – Positive Politeness-intensify interest to H*

- (13) The following narrative is spoken by Bebi Romeo (as the speaker) to Nu Dimension (as the addressee). That night, Nu Dimension sang a song of *Kirana* by Dewa 19.

- Juri 2 : Karena /menurut/ saya,/ "*Kirana*"/ bukan/ lagu/ yang,/ bukan/ lagu/ yang,/ /emmm, /lagu/ popular/, tapi /cukup/ pintar/ gitu/ loh/ dengan/ notasi-notasi/ yang/ nggak/, menurut/ saya/ bukan/ notasi/ murah/ gitu/. Dan/ kamu/ berhasil/ membuat/ notasi-notasi/ itu/ juga/ dengan/ mahal /kedengerannya/, dengan/ formasi/ grup/ yah./ **Sekali/ lagi/ selamat/ untuk/ Nu Dimension/ malam/ ini.** (D5.3)  
Judge 2 : because/according to/I/ *Kirana*/ not/ song/ particle /not/ song/ particle /emmm/ song/ popular/ but/ enough/ smart/ like that/ right/ with/ notations/ particle/ not/ according to/ I/ not/ notation/ cheap/ like that/ and/ you/ success/ make/ notations/ that/also/ with/ expensive/ listened/ with/ formation/ group/ well/ once/ too/ safe/ to/ Nu Dimension/ night/ this/.  
Judge 2 : Because I think "*Kirana*" is not a song..emmm, it's not a popular song, but it's smart enough with those notations. I think those are not low quality notations. And you are succeeded making those notations into a whole new level, they sound high quality with that group formation. Well, once again congratulations to Nu Dimension for tonight.  
ND : *Terima/ kasih/ Mas/ Bebi.* (D5.4)  
ND : accept/ love/ older man/ Bebi  
ND : Thank you Mister Bebi

In the data (13), the realisation of the polsitive politeness with the substrategy intensify interest to H is shown by using the bold sentence above (D5.3).

#### *Expressive-Congratulating – Positive Politeness- Exaggerate (interest, approval, sympathy with H)*

- (14) The following narrative is spoken by Rossa (as the speaker) to Nu Dimension (as the addressee). That night Nu Dimension sang a song of *Kirana* by Dewa 19.

- Juri 4 : Nu Dimension, /**wow.** Saya/ bilang/ emang/ kurang/ ajar/ Mas/ Dani/ ini/ tiba-tiba/ bawa/ Dewa 19/, dan/ saya/ setuju/ deh/ dengan/ Mas/ Bebi/ dan/ Anggun./ Apapun/ itu/, meskipun/ bentuknya/ udah /featuring/, tapi/ kalian/ sendirinya/ pun/ bisa/ merupakan/ tontonan /sendiri/ yang/ menarik/ gitu/, dan/ ketika/ dikolaborasikan/, kalian/ bisa/ tampil/ dengan/ apa/ ya/ **Blend/ aja/ gitu/ nggak/ kalah/ pamor/ sama/ Dewa 19-nya/ yang/ emang/ udah/ legend/ gitu.** / **Congratulation.** (D5.7)  
Judge 4 : Nu Dimension/ wow/ I/ say/ indeed/ less/ lesson/ older man/ Dani/ this/ suddenly/ bring/ Dewa 19/ and/ I/ agree/ with/ older bebi/ and/ Anggun/ anything/ that/ although/ the form/ already/ featuring/ but/ you/ self/ right/ can/ is/ performance/ self/ particle/ attractive/ like that/ and/ when/ collaborated/ you/ can/ perform/ with/ what/ yes/ Blend/ just/ like that/ not/ lose/ prestige/ same/ Dewa 19/ particle/ indeed/ already/ legend/ like that/ congratulation.

Judge 4 : Nu Dimension, Wow, I must say that Mister Dani is rude for suddenly bringing Dewa 19, and I agree with Mister Bebi and Anggun. Whatever it is, although it is already a featuring, but you guys yourselves are already an attractive performance and when it is collaborated, you can perform as what?. Just Blending in, as great as Dewa 19 which is already a legend. Congratulation.

ND : *Terima/ kasih/ Teh/ Oca./ (D5.8)*

ND : accept/ love/ older woman/ Oca

ND : Thank you Miss Oca

The realisation of the Politeness strategy of expressive narrative-congratulating in the data (14) is marked by using the bold sentences. The sentences explain the performance of Nu Dimension which is great as the legendary band of Dewa 19.

**Expressive-Thanking – Positive Politeness-use in group identity markers**

- (15) The following narrative is spoken by Rossa (an Indonesia female singer) to Fatin (the youngest female contestant) in the show on March 29 2013. That night, Fatin sang as song of “It Will Rain” by Bruno Mars.

Juri 4 : *Alhamdulillahilahirabilamin./ setiap/ hari/ Jumat/ saya/ mules/ banget/ rasanya/ kalau/ Menunggu/ ini./ Fatin/ ini/ apa/ namanya?/ Pujian/ dari/ tiga/ mentor/ mereka/ adalah orang-orang/ yang/ paling/ kompeten/ Mau/ mereka/ memuji/ atau/ pun/ mengkritik/ itu/ adalah/ satu/ hal/ pelajaran/ buat/ kita/ mudah-mudahan/ minggu/ depan/ kita/ bisa/ semakin/ lebih/ baik/ lag/i. Amin./ Terima/ kasih/ juga/ buat/ Fatinistik/ yang/ selalu/ memberikan/ semangat/ terima/ kasih/ /banyak./ Good/ Job/ Fatin./ (D17.28)*

Judge 4 : thanking god/ every/ day/ Friday/ I/ stomachache/ very/ feel/ if/ wait/this/ Fatin/ this/ what/ name/ compliment/ from/ three/ mentor/ they/ are/ people/ particle/most/ competent/ want/ they/ praise/ or/even/ criticize/ that/ is/ one/ thing/ lesson/ make/ we/ easy/ Sunday/ front/ we/ can/ more/ more/good/ again/ amin/ accept/love/ too/ make/Fatinistik/particle/ always/ give/ spirit/ accept/ love/ many/ Good/ Job/ Fatin.

Judge 4 : (Thanking God), every Friday I am nervous waiting for this. Fatin, this is, what is it called? The compliments from the three other mentors, they are the most competent people. Whether they praise or criticize, it is a lesson for us, so that next week we can be better. Amin, Thank you for Fatinistik that always give their support, thank you. God Job Fatin.

F : */Terima/ kasih/. (D17.29)*

F : accept/ love/

F : Thank you.

In the data (15), the realisation of the positive politeness with the strategy of use in group identity markers in the expressive narrative-thanking is marked by the word ‘Fatinistik’. The word ‘Fatinistik’ is the name for adalah Fatin Shidqia Lubis’ fans (one of the X-Factor Indonesia contestants). The speaker in the narrative (D17.28) thanks exclusively to ‘Fatinistik’ who always give their support to their idol, Fatin.

**Expressive-Criticizing – Bald on record**

- (16) The following narrative is spoken by Ahmad Dani (a male singer of Dewa band) to Fatin in the show on April 12 2013. That night, Fatin sang a song of *Arti Hadirmu* by Audi (an Indonesian female singer).

Juri 1 : *Komentarnya/... Aaa/, komentarnya/ kamu/ gak/ cocok/ nyanyi/ lagu/ ini./ (D26.37)*

Judge 1 : comment/.../aa/ comment/ you/ not/ compatible/ sing/ song/ this/

Judge 1 : My comment...aa..my comment is that you are just not right singing this song

F : *Oh/, ya/ Mas/ Dani/. Terima/ kasih. (D27.38)*

F : Oh/ yes/ older man/ Dani/ accept/ love

F : Oh/ yok Mister Dani. Thank you

In the data (16), the realisation of the politeness in expressive narrative-criticizing is marked by using the bald on record strategy shown by the bold sentence. The speaker directly shows his disappointment to the addressee by saying “*kamu gak cocok nyanyi lagu ini.*” (you are not just right singing this song).

**Expressive-Criticizing – Off Record Strategy-give association clues**

- (17) The following narrative is spoken by Bebi Romeo (an Indonesian male singer) to Fatin Shidqia (a female contestant) after she sang a song of *Arti Hadirmu* by Audi (an Indonesian singer).

Juri 3 : *Ya/ Fatin/ tadi/ aku/ juga/ cari/ waktu/ kamu/ mulai/ nyanyi/ lagu/ ini/ ini/ gongnya/bakal /dimana sih/? Tapi/ tadi/ ternyata/ gak/ ada/ gongnya/ itu./ Tapi/ kan/ malam/ ini/ kalian/ semua/ /diberi /kesempatan/ nyanyi/ dua/ lagu/. Jadi/ walaupun/ tadi/ sebenarnya/ gak/ jelek./ Cuma/ gak/ ada /istimewanya/ penampilan/ kamu./ Itu/ aja. (D26.45)*

Judge 3 : Yes/ Fatin/ a while ago/ I/ also/ search/ time/ you/ start/ sing/ song/ this/ this/ gong/ will/ where/ But/ a while ago/ apparently/ bot exist/ gong/ that/ but/ right/ night/ this/ you/ all/ given/ opportunity/ sing/ two/ song/ so/ although/ a while ago/ actually/ not/ ugly/ only/ not/ exist/ special/ preformance/ you/ that/ only/

Judge 3 : Well, Fatin, I was waiting “the special moment fo the song’ since you began singing that song, wondering where it would be? But apparently, there was no such a thing. But tonight you are given an opportunity to sing two songs. So, actually it was not that bad, it’s just not that special the performance of yours.

F : *Makasih/ Mas. (D26.46)*

F : Thanking/ older man

F : Thank you Mister

The realisation of the politeness strategy in the expressive narrative-criticizing in the data (17) is marked by using the off record strategy of 'give association clues' by associating 'gong' as the climax marker (the special moment). The speaker hoped that there would be a climax part from the addressee's performance, but apparently there was no such a thing. This is shown by the use of the last sentence in the narrative (D26.45), "*sebenarnya gak jelak, cuma gak ada istimewanya penampilan kamu.*" (actually it is not that bad, it's just not that special the performance of yours).

### CONCLUSION

Based on the data classification and analysis, the types of speech act used in the X-Factor Indonesia Judges' narratives are expressive-praising, congratulating, thanking, and criticizing. Furthermore, the most dominant speech act used by the X-Factor Indonesia judges is expressive-praising. It is 18 (72%) narratives from 25 narratives.

For the realisation of the politeness strategy in the expressive narratives-praising of X-Factor Indonesia judges, according to Brown and Levinson (1987), is the positive politeness strategy with the substrategies 'attend to H' (his interest, wants, needs, and goods); Exaggerate (interest, approval, sympathy with H); Intensify interest to H; Seek agreement; Joke; Be optimistic; and Include both S and H in the activity. In the expressive narratives-congratulating, the politeness strategy found is the positive politeness strategy with the substrategies 'Include both S and H in the activity; Intensify interest to H; and Exaggerate (interest, approval, sympathy with H)'. Meanwhile, in the expressive narrative-thanking, the politeness strategy used is the positive politeness strategy with the substrategies 'use in group identity markers', and last for the expressive narrative-criticizing, the politeness strategies used are the bald on record strategy and Off record strategy with give association clues substrategy.

### Limitations Of The Study

This study examines about narratives of X-Factor Indonesia judges and focuses only the use of expressive narratives and the realisation of politeness strategies. There are some limitations for this study related to the topic discussed in this article as follow:

1. This article only focuses on the use of expressive narrative and the realisation of politeness strategies. Thus, for the future study, it can study the speech act as a whole aspect,
2. The data taken in this article are the narratives of both male and female X-Factor Indonesia judges. It is suggested in the future that the narratives data are compared and studied regarding the use of the narratives and the politeness strategies,
3. This research studies the narratives of X-Factor Indonesia judges from pragmatic point of view. In the future, it is suggested that it can be studied by focusing on its style of language.

THE ROLE OF TOPIC IN EFL LEARNER'S READING  
COMPREHENSION AND RECALL

**ABSTRACT**

English as a Foreign Language reading comprehension and recall can be affected by a large number of discursial factors, including |topic" and "title" as representative of the theme of the text. The present study aimed at examining the effect of text topic on foreign language learners' reading comprehension and recall. To this end, the impact of three kinds of text topics, i.e., major topic, minor topic and unrelated topics was measured on foreign language learners' reading comprehension and recall. The materials of the experiment were piloted in advance on learners (n = 100) of the same proficiency level. 99 EFL learners majoring in English language translation in Mashhad Azad University participated in the main study. The instrumentation included CELT (The comprehensive English Language test) and a tailored reading comprehension test consisting of three reading passages. The Multiple Choice reading comprehension tests were administered to 3 homogenized groups each comprising 32, 30 and 36 subjects. Data were analyzed through one-way analysis of variance and post hoc Scheffe tests. The results showed a significant effect of major topic on the reading comprehension performances and recall of the participants.

**KEYWORDS:** topic, reading comprehension, recall

**INTRODUCTION**

Among the four language skills, reading probably plays the most important role in foreign and second language learners' academic achievement. As a result, this skill is worth in-depth investigation from both theoretical and practical perspectives. Researchers have investigated numerous text-related and reader-related factors determining EFL/ESL readers' comprehension.

Readers need to integrate various text-processing skills in order to derive the text overall meaning. Celce-Murcia and Olshtain (2000) emphasize the need for ESL/EFL learners to develop both bottom-up and top-down reading approaches. Before the reading takes place, students' background knowledge about the topic of a text should be activated. This can be performed through the choice of titles, subtitles, headings, captions, etc. These cues may provide a good overview and get the students to activate what they know about the topic and helping them speculate the likely text content (van Dijk, 1977).

Ideas in a text are related to the topic and unified by cohesive devices. Cohesive devices call upon a speaker's background knowledge in a process of comprehension and recall. They enable participant hearers or readers to read between the lines: to make references to preceding discourse, to interpret the relationship of incoming material to the prevailing topic or theme; in short, to follow the links in a chain. As de-Beaugrande and Dressler (1981) state "we impose coherence by establishing a configuration and our prior knowledge of how the world is organized." In other words, listeners or readers must know what is being talked or written about in order to be able to understand the text since each text discusses one particular topic which distinguishes it from another text. Moreover, as Van Dijk (1977) points out, the context is involved in the recognition of the entailment relations in terms of which the topic of discourse is defined. That is, the topic representation is entailed by the joint set of propositions expressed by the sentences in the text only given certain items of real-world knowledge. So 'topic' is a notion which seems to be essential to the concept of cohesion and coherence since "coherence will be envisioned as the outcome of combining concepts and relation into a network composed of knowledge spaces centered around main topics". Hence, it is important for EFL teachers to be aware of the role of the "topic" for texts.

**LITERATURE REVIEW**

Discourse issues have been the center of attention for a long time and every now and then different theories have been put forward by the experts in this field. This importance, however, to a large extent, lies in the crucial role of Discourse Analysis in assigning boundaries for the interpretation of meaning. In this regard, topic can be viewed as one of the most significant discourse boundaries, or to be more explicit, as one of the elements of discourse which constraint the possible interpretations for comprehension of a text. Moreover, a distinction should be made between the topic as the main underlying theme of the text and "the title" as "a way" or "a mode of "representing the topic. (Brown & Yule, 1996). We know that the ultimate goal is the topic, but we have several different possibilities of the title. Since the researchers are going to scrutinize the comprehensibility of journalistic texts therefore the question is what can be chosen as a title for reading comprehension passages which provides both more effective reading comprehension and increase of recalling for the readers. As topic is one point which remains in the mind, the assumption is that the title which is closest to the topic (major topic) might be regarded as the best clue for students' comprehension and recall in authentic issues.

In a series of experiments reported by Bransford and Johnson (1972) subjects were pretested with constructed texts to read, comprehend, and recall. The aim of the experiments was to demonstrate that the comprehension of English texts depends not only on knowledge of the language, but also on extra-linguistic knowledge, particularly related to the contexts in which the texts occur. Predictably, the experiments showed that comprehension and recall of passages were significantly better when subjects were provided, before reading, with what Bransford and Johnson called "The topic of the passage". Correspondingly, there is for any text, a number of different ways of expressing "the topic". Each different way of expressing "the topic" will effectively represent a different judgment of what is being written (or talked about) in a text. There will always be a set of expressions of the topic. In the terms used by Tyler (1978), "the topic" can only be "one possible paraphrase "of a sequence of utterances. What is required is a characterization of "topic" which would allow each of the possible expressions, including titles, to be considered (partially correct), thus incorporating all reasonable judgments of "what is being talked about".

### ***The relationship between topic and comprehension***

As Chastain (1988) believes, all readers can become confused if they are suddenly engulfed with a flood of language without any orientation as to the context or topic. Thus readers (listeners) have to activate relevant background knowledge and use it to anticipate the ideas the message may contain. Joiner(2008), in an article entitled "listening from the inside out", states that establishing a frame of reference enables listeners to develop "frames of expectations" regarding what they are likely to hear, which help them know how to listen and what to listen for.

Understanding is described, according to Brown (1999) as "a process of prediction and sampling rather than a desperate attempt to keep up with the words flashing past." Likewise, Richards (1998) identifies three interrelated levels of processing that seem to be activated in comprehending language; i.e., identifying propositions, interpreting illocutions, and activating real-world knowledge. One thing people commonly do in comprehension is to draw the obvious implications. In short, comprehension calls on people's general capacity to think-to use information and solve problems. Indeed, in inferring what is meant, people consider non-linguistic factors that are far removed from the utterance itself (Dabir, 1991). In the same way, Prabhu (1987) maintains that comprehension draws on extra-linguistic resources to the extent necessary. There is a complementary relationship between linguistic resources and extra-linguistic ones. Likewise, comprehension, according to Riverse, (1981), "requires a deep knowledge of the theme of the speaker's discourse, because much of comprehension is drawing inferences." So a great deal of what we comprehend "is not in the linguistic information we are receiving at all, but is the extra-linguistic knowledge which we have acquired through our life in terms of past experiences.

Prior knowledge plays a supportive role in comprehending a written message. The earliest study on the impact of schemata on reading comprehension dates back to the classical research of Bartlett (1932). In his study, English participants were asked to read and recall a story from an unfamiliar culture, and the major finding was that recall was inaccurate. Distortions found in the retellings of the story conformed to the past experiences of the readers, and additions to and elaborations on the storyline in the retellings caused redundancies. Along the same line, Lee's study (1986) showed that the participants recalled more from content-unfamiliar texts than content-familiar ones. In a study by Carrell (1984) the nonnative readers found to fail to use background information because they were linguistically bound. The nonnative readers tended to process at the word and sentence levels and did not attend to the top level organizational features and background information since the language itself was demanding. Johnson (1982) conducted a study to explore the effect of the cultural origin of prose on the reading comprehension level. The results revealed that the cultural origin of the stories had a greater effect on comprehension than the syntactic or semantic complexity of the text. Some other studies have shown similar effects in that participants better comprehended or remembered passages that were more familiar to them (e.g. Ammon, 1987; Carrell, 1983; Johnson, 1982; Langer, Bartolome, Vasquez & Lucas, 1990). The literature supports the position that content schemata have a greater role than language on reading comprehension and recall. (Keshavarz, 2007) Studies conducted by Koh (1985) and Peretz and Shoham (1990) indicate that participants do not necessarily perform their best on texts with familiar content.

Therefore, both listeners and readers have to activate relevant background knowledge and use it to anticipate the ideas the message may contain. According to Clark and Clark, (1977), "people try to attack all the facts they know about single entity to a single memory. "This allows them to see all the facts about that entity at a glance.

In conclusion, topics serve as devices for categorizing and arranging information so that it can be interpreted and retained. Briefly, "topics" activate participants' background information to which the text must be related in order to be comprehended.

### **RESEARCH QUESTIONS**

The purpose of the study is to explore the relationship between text topics and EFL readers' comprehension and recall of texts. Therefore, the following research questions were formulated. Research questions:

1. Does text topic type have any significant effects on EFL learners' reading comprehension?
2. Does text topic type have any significant effects on EFL learners' recall?

### **METHODOLOGY**

#### ***Participants***

The subjects of the study were 200 EFL male and female senior students (21-30 years old) in Mashhad Azad University who were majoring in English language translation. In order to ascertain homogeneity of subjects in terms of their general English proficiency at the outset of the study, CELT test (Comprehensive English Language Test) was administered to all of the participants. In order to test the homogeneity of the aforementioned group, a one-way ANOVA was run the results of which attested that study. To answer these questions, the Comprehensive English Language Test (CELT) was administered to the students in order to verify their homogeneity. A one-way analysis of variance (ANOVA) was run to compare the means of the three groups. The descriptive statistics in Tables 1 provides an overall view of the participants' performance on CELT and table 2 shows the results of one-way ANOVA consequently.

*Table 1: Descriptive statistics of CELT scores*

Group	Mean	Standard Deviation	Variance	N	Min	Max
1	82.56	26.59	101.02	32	20	120
2	85.3	26.15	685.82	30	29	120
3	96.38	27.21	740.38	36	25	150

*Table 2 : One-way ANOVA CELT by three groups*

Source of Variation	Sum of squares	Degree of freedom	Mean Squares	F Observed	F Critical
Between groups	3728.08	2	1864.04	2.61	3.15
Within groups	67671.39	95	712.33		
Total	71399.47	97			

#### ***Instrumentation***

The instruments were used in this study: one reading comprehension test consisting of three passages. The reading comprehension tests were taken from English journals. The researchers piloted the tests with a sample of learners (n=100) with the same level of English language

proficiency at the same university as the participants of the present study. For each of the texts, 10, 8 and 6 MC test items were developed. The tests were piloted and pre-tested with a sample group of participants (n=100). Concerning the psychometric properties of the reading comprehension tests, the reliability of reading comprehension test, as estimated using Cronbach's alpha, were .69. The test was validated against the reading comprehension sub-test of a TOEFL. The result of concurrent validity of the researcher-made measure on reading comprehension showed an index of 0.73, which is relatively high.

### **Procedure**

#### *Subject grouping procedure*

Ninety nine EFL learners were chosen as the subjects of the study and randomly assigned to three groups. The subjects were all seniors majoring in English.

#### *Test Administration Procedure*

The participants were asked to read the texts and answer the MC items. Then, the participants were asked to read the texts once more and write down what they could remember on their recall answer-sheets without looking back at the text and the MC questions. Here, the purpose was to measure the participants' recall of what they read rather than their EFL writing ability. Therefore, the researchers asked the participants to write their recalls. The time allocated to each test was 45 minutes, which had been determined to be suitable in the pilot study by.

#### *Scoring Procedure*

The MC-test papers were scored based on the number of correctly-answered items. The recall task was scored based on the correct propositions recalled by the participants. For the sake of a consistent scoring procedure, the researchers defined propositions as the relationships between a predicate and its arguments. As G. Brown (1983) maintains, this is the most frequently used definition in the text analysis literature. Then, the recall tasks were scored by the researchers. Each recall task was scored twice, once by each of the two researchers. A correlation index of .79 was found between the scores given to the recall protocols by the two raters. The average of the two scores was considered as the final score assigned to each recall protocol. The scores from the multiple choice test of reading comprehension and the recall tasks constituted the data for statistical analysis.

### **Data analysis**

SPSS was used for statistical analysis of the data consisting of the participants' reading comprehension scores, their scores on their recall scores. To examine the main effects of the independent variables that is topic on the participants' comprehension and recall of the texts, the researchers ran a one-way analysis of variance (ANOVA) twice: once for the data related to the participants' reading comprehension (i.e., the participants' scores on the MC items) and once for the data related to the participants' recall of the texts.

## **RESULTS AND DISCUSSION**

This study was conducted to answer the following questions: 1. Does topic have any significant effects on EFL learners' reading comprehension? 2. Does text topic have any significant effects on EFL learners' recall?

The study included one independent variable i.e. Text topic including texts with major topics, minor topics and unrelated topics. Text readability of 3 selected reading passages of English journals was computed using Fry formula. Table 3 shows the readability indexes of the passages. According to Fry formula reading passages with readability indexes between 3 and 11 are considered to be intermediate.

*Table 3: Readability Index*

Passages	Index
A	6.86
B	4.72
C	4.41

The first research question asked whether there is a significant difference between major topic, minor topic group and unrelated topic group on reading comprehension MC tests performance. Table 4 summarizes the results of the one-way ANOVA.

*Table 4: One-way ANOVA of MC Reading Comprehension Test*

Source of Variation	Sum of squares	Degree of freedom	Mean Squares	F Observed	F Critical
Between groups	772.72	2	386.36	26.80	3.15
Within groups	1369.51	95	14.41		
Total	2142.24	97			

As the table 4 suggests, there is a significant difference between major topic group, minor topic and unrelated topic groups across MC reading comprehension test ( $F = 26.80, p < .05$ )

To further determine where the difference among the effects of text topic types on MC reading comprehension test performance lies, a post hoc Scheffe was run the results of which follow in Table 5.

*Table 5: The summary result of the Scheffe test on the reading comprehension MC test*

Comparisons	Mean Differences	Minimum significant difference 5%	df
Major topic G Vs Minor topic G	6.26*	2.40	60
Major topic G Vs Unrelated topic G	5.71*	2.30	66
Minor topic G Vs Unrelated topic G	0.55 <sup>ns</sup>	2.34	64

Table 5 and figure 1 suggest major topic group (Mean= 12.46) has dramatically outperformed the other two groups (minor topic mean =6.20 and unrelated topic mean = 6.75) on the reading comprehension MC test. According to Table 5, , at the level of 0.05, there was no significant difference between minor topic group mean scores and the unrelated topic group mean scores.

Figure 1: major topic group

The second question in the study addresses the difference in the effect of text topic including major topic, minor topic, unrelated topic) on recall test. Table 4 demonstrates the results of one way analysis of variance to this end.

Table 6 : One-way ANOVA of Recall Scores

Source of Variation	Sum of squares	Degree of freedom	Mean Squares	F Observed	F Critical
Between groups	1206.8	2	603.4	18.6	3.15
Within groups	3079.02	95	32.4		
Total	4285.8	97			

According to Table 6, there is a significant difference among text topic types in the recall test ( $F = 18.6, p < .05$ ). Since the one-way ANOVA demonstrated a significant difference among the effect of the 3 text topic types on recall test performance, a post hoc Scheffe test was carried out to see where exactly the difference lies. Table 7 summarizes the results of the Scheffe.

Table 7: The summary result of the Scheffe test on recall test

Comparisons	Mean Differences	Minimum significant difference 5%	df
Major topic G Vs Minor topic G	5.80*	3.60	60
Major topic G Vs Unrelated topic G	8.29*	3.44	66
Minor topic G Vs Unrelated topic G	2.49 <sup>ns</sup>	3.50	64

In the recall test too, as depicted by Table 7 and figure 2, performance of the major topic group (major topic group mean = 44.22) has been dramatically superior to those of minor topic and unrelated topic groups (minor topic group = 38.42 and unrelated topic group = 35.93).

Figure 2: performance of the major topic group

## CONCLUSION

This study aimed at investigating the usefulness of text topic type for improving EFL learners' reading comprehension and recall. The EFL learners were provided with the same texts with different topics (major i.e. the closest to the main idea, minor i.e. the closest to the supporting idea and unrelated) both to draw the learners' attention to the text and help them comprehend and recall the text more effectively.

The findings of the study provided strong evidence in support of major text topic type in general since major text topic group significantly outperformed both the minor text topic and unrelated text topic groups in the reading comprehension test. In this sense, therefore, the results strongly corroborated those, among others, Johnson (1982), Carrell (1983), Ammon (1987), Vasquez and Lucas (1990), Keshavarz (2007) which advocated the use of content familiar texts for reading comprehension. There are several factors that can account for this effectiveness: The provision of major topic arouses learners' noticing to the main idea of text (Schmidt, 1992). Major text topic successfully draws learners' attention, activates EFL learners' relevant background knowledge, orients them toward the text and helps them to anticipate the ideas in the text. Possible, moreover, major topics can assist learners to immediately connect the text main idea to its supporting ideas and, thereby, comprehend it more effectively but it contradicts with Studies by Koh (1985) and Peretz and Shoham (1990) who concluded that participants do not necessarily perform their best on texts with familiar content. The results of the study further indicated that there was no significant difference between minor text type and unrelated text type groups. This is compatible with Carrell (1984) and Johnson (1982). One possible reason is that all readers can become confused if they are suddenly engulfed with a flood of language without any or the right orientation as to the context or topic (Chastain, 1988).

Another finding of the current study was major text topic group significantly outperformed both the minor text topic and unrelated text topic groups in the recall task. In this sense, the study is in line with Bartlett (1932) who concluded content- unfamiliar texts were recalled inaccurately but it contradicts with Lee (1986) who found that the participants recalled more from content-unfamiliar texts than content-familiar ones

The findings of the present study are compatible with those of Bransford and Johnson (1972) indicating that comprehension and recall of passages were significantly better when subjects were provided, before reading, with "the topic of the passage". One reason for the effectiveness of major text types on the recall task could be that it facilitates the main idea connection. According to research in human memory, it is the depth of the process of reading comprehension which determines the chance for the text to be recalled, i.e. Mental Effort Hypothesis. Learners retain meaning if they are engaged in deep processing which involves exploitation of contextual clues and their previous knowledge (Hulstijn & Laufer, 2001).

Overall, the results of the study support the use of major text topics in general and imply that teachers, materials developers and text designers can take advantage of them particularly when the goal is for them to trigger and promote reading comprehension and recall. Major topics should be available to foreign language learners while they are engaged in reading tasks. The presence of major topics can arouse learners' consciousness towards text, activate the relevant background knowledge and avoid learners from making wrong inferences. However, the findings of this study need to be verified against future research involving texts with other genres or different text readability.

## THE EFFECT OF ALTERNATIVE TEACHING ON IMPROVING EFL LEARNER'S READING COMPREHENSION

Mohammad Aliakbari & Ali Mansouri Chalanchi

Ilam University

maliakbari@hotmail.com, champ-al2010@yahoo.com

### ABSTRACT

The present study intended to examine whether alternative teaching strategy could maximize Iranian English as a foreign language (EFL) learners' reading comprehension better than the traditional single teaching. Employing alternative teaching proposed by Cook and Friend (2004), two intermediate EFL classes (total N=30) who already passed level 5 at a private language institute in Ilam, Iran were selected. They were all female, aged 17-25. Three experienced male teachers aged nearly thirty-nine took part in the study. In one class, reading comprehension was implemented by one teacher and in the other class two teachers cotaught the students. The findings of the study revealed that there was a significant difference between the control and the experimental group in terms of their reading improvement and that experimental group outperformed the control group. This finding implies that the implementation of alternative teaching strategy in educational systems, at least for teaching reading comprehension in an EFL context like Iran, can be contributive.

**KEYWORDS:** Co teaching, alternative teaching, reading comprehension, traditional teaching,

### INTRODUCTION

The second language teaching profession has long been involved searching for methods that would be generalizable across widely varying audiences, and could successfully be used to teach a foreign language to students in the classroom. To meet the demands of the diverse language learners in multiple worldwide contexts, researchers and practitioners have gradually learned from the continued search to realize that "there never was and probably never will be a method" (Nunan, 1991, p. 228) for all learners, and thus come up with a cautiously eclectic, integrated approach aiming to help teachers make enlightened choices of classroom tasks and activities that are solidly grounded in the valuable findings from research on L2 learning and teaching (Brown, 2001).

It can be, more or less, observed that an increasing number of students are placed in an English class with any variety of different knowledge and background that influences their learning a new subject differently. Students with poor performance and other special needs are generally expected to achieve the same level of success as other learners. Accordingly, Reith and Polsgrove (1998) aptly state that, "it is not enough to merely place students within general class settings without providing appropriate training, materials, and support to them and their teachers. "If done so, their failure is the outcome" (p. 257).

Due to overpopulation and misplacement of the learners in large classes, it seems that fulfilling all the responsibilities of teaching including planning, practice, evaluation and above all implementing remedial programs to meet the needs of the learners with poor performance may not be possible for a single teacher. Therefore, there is some intuitive appeal for a new mode of service delivery because greater number of students with instructional problems may be accommodated in general education classes.

Drawing upon the above-mentioned views, among the many ideas and options for meeting these diverse, yet somehow related, challenges, co teaching had received widespread attention and been used by many special and general educators to meet the needs of secondary students. Accordingly, the present study attempts to investigate the possibility of its implementation in Iranian EFL teaching context.

### *Co-teaching definitions and models*

Co-teaching, or having more than one teacher in the classroom has become a popular teaching structure to provide an inclusive setting for special education students while insuring that they are in the least restrictive environment. In the co-teaching classroom there is typically a general education teacher and a special education teacher in the classroom. Co-teaching may also be considered as a strategy which includes mixed-perspectives of two teachers. It is defined as "a restructuring of teaching procedures in which two or more educators possessing distinct sets of skills work in a coordinated fashion to jointly teach academically and behaviorally heterogeneous groups of students in an integrated educational setting" (Bauwens & Hourcade, 1995, p. 46). Elsewhere, Villa, Thousand, and Nevin (2008) reiterate the responsibility shared by the co-teachers. They define it as "two or more people sharing responsibility for educating some or all of the students in a classroom". In contrast, single teaching as Aliakbari and Mansouri Nejad (2010) note, is defined in a way that one teacher is responsible for supervising all tasks of lessons, in the current and relatively traditional teaching model over a specific time.

Co-teaching offers several advantages over traditional single-teacher teaching method, including the provision of multiple learning perspectives (Smith, Hornsby, & Kite, 2000), reduction of teaching redundancy (Hartenian, Schellenger, & Frederickson, 2001), and the promotion of teamwork and communication between teachers (Andrews & Wooten, 2005).

Sharon (1997) identified several alternative models of co-teaching: A: One Group: one lead teacher, one teacher "teaching on purpose"; B: Two Groups: Two teachers teach the same contents; C: Two groups: One teacher re-teaches, one teacher teaches alternative information; D: Multiple Groups: Two teachers monitor/teach; content may vary; E: One group: two teachers teach the same content. Watkins and Caffarella (1999) identified four types of teams based on variations in working style: parallel teaching, serial teaching, co-teaching, and co-facilitation. Friend and Cook (2004) described the more common approaches as One-Teach-One Support, One-Teach-One Drift, Alternative Teaching, Parallel Teaching, Station Teaching, and Team Teaching. Further explanation of their idea is presented below.

**One Teach, One Observe.** One of the advantages in co-teaching is that more detailed observation of students engaged in the learning process can occur. With this approach, for example, co-teachers can decide in advance what types of specific observational information to gather during instruction and can agree on a system for gathering the data. Afterward, the teachers should analyze the information together.

**One Teach, One Drift.** In this second approach to co-teaching, one teacher keeps the primary responsibility for teaching while the other professional circulates through the room, providing unobtrusive assistance to students.

**Parallel Teaching.** In parallel teaching, the teachers are both teaching the same information, but they divide the class group and do so simultaneously.

**Station Teaching.** In this co-teaching approach, teachers divide the content and the students. Each teacher then teaches the content to one group and subsequently repeats the instruction for the other group. If appropriate, a third "station" could require that students work independently.

**Alternative Teaching:** In most class groups, occasions arise in which several students need specialized attention. In alternative teaching, one teacher takes responsibility for the large group while the other works with a smaller group.

**Team Teaching:** In team teaching, both teachers are delivering the same instruction at the same time. Some teachers refer to this as having "one brain in two bodies." Others call it "tag team teaching" (Cook & Friend, 2004). Most co-teachers consider this approach the most complex but satisfying way to co-teach. However, to achieve the desired outcome, this approach is most dependent on the co-teachers' styles (Cook & Friend, 2004).

Among the models specified here, alternative teaching has received special attention. To Murawski & Swanson (2001) alternative teaching is a strategy in which one teacher teaches the large group, while the other teaches or re-teaches the content or the skills to the small group. One major feature of this model is that teachers may regroup students and may alternate roles in teaching the large and the small groups. Friend and Cook (2004) suggest alternative teachers to be used in the following situations:

- In situations where students' mastery of the concepts taught or about to be taught varies tremendously
- When extremely high levels of mastery are expected for all students
- When enrichment is desired
- When some students are working in a parallel curriculum

Inspired by these ideas and recommendation, the present study intended to put the issue under scrutiny.

#### **REVIEW OF THE RELATED STUDIES**

Research on co-teaching has so far examined the effect of co-teaching structures on students' academic learning (Bauwens, Hourcade, & Friend, 1989; Cook & Friend, 1995; Dieker, 2001; Fennick, 2001; Fennick & Liddy, 2001; Rice & Zigmond, 2000; Vaughn, Schumm, & Arguelles, 1997; Zigmond & Magiera, 2001). In a comprehensive study of inclusion in 18 elementary and 7 middle schools, Walther-Thomas (1997) found that the lower student-teacher ratio resulted from the presence of co-teachers in normal-sized classrooms led to strong academic progress and enhanced student self-confidence.

The role of co-teaching has also been manifested along technology. For instance, Jang (2006) incorporated web-assisted learning with team-teaching in seventh-grade science classes, and used a quasi-experimental method, assigning the four sampled science classes into experimental and control groups. The results showed that the average final exam scores of students experiencing the experimental teaching method were higher than the scores of those receiving traditional teaching. However, his study aimed to integrate two simultaneous interventions into courses of science teacher education method in order to explore the effects of such integration on learning technology.

Dahlberg and Hoover (2003) investigated the effects of co-teaching on K6 Student Discipline and Attendance. The results supported the positive impacts of the approach and made it clear that the students felt more connected to school when they were in a co-taught classroom. Further, Students in co-taught settings had fewer behavioral issues in school, and overall had fewer referrals per student.

Maultsby and Barbara (2009) examined the impact of collaborative teaching (co-teaching) on the reading, language Arts and Math achievement of Middle Tennessee students in grades 5-8, as measured by the Tennessee Comprehensive Assessment Program (TCAP) Achievement test. Within the context of this study, the co-teaching model of instruction is defined as the special and general educator, referred to as co-teachers, sharing equitably the tasks of the lesson planning, implementation, and assessment. Six schools participated in the study. Three of the schools implemented co-teaching practices at the beginning of 2008-2009 school years. The remaining three schools did not. The dependent variables were students' reading, language Arts and Math TCAP Achievement test scores over a two year period. The independent variables were gender, ethnicity, disability categories, type of classroom (one with co-teaching practices and one without co-teaching practices), and type of student (student with a disability or student without a disability). Results from a paired samples *t*-test indicated an increase in Math achievement for students with disabilities instructed in classrooms with co-teaching practices and a decrease in Reading/Language Arts achievement for students without disabilities instructed in classrooms with co-teaching practices. No other conditions produced significant increases in this study.

Aliakbari and Mansouri Nejad (2010) studied the effect of co-teaching on learning process in general and the grammar proficiency in particular. To do so, they selected a group of 58 first-grade students studying English in junior high school assigned to two classes receiving two different treatments in grammar instruction. In one group, learners received grammar instruction from co-teachers and in other grammar instruction was delivered by a single teacher. They found that the difference in method of grammar instruction did not lead to significant difference in participants' performance in the grammar test. However, they conducted the study on the basis of team teaching model as an approach in co-teaching. Many studies have been done on co teaching while relatively little attention has been paid to its application in different situations in Iran. Hence, the present study is to investigate the impact of alternative teaching strategy on students' reading comprehension.

#### **STATEMENT OF THE PROBLEM**

A number of studies investigated the influence of different teaching methods on different domains of language skills. However, few studies investigated the effect of co-teaching on language skills such as speaking, writing, listening and more specifically reading improvement. The present study aimed at filling some of the gaps in the area of co teaching by comparing two groups of Iranian EFL learners studying English as a foreign language in a language institute so as to examine whether alternative teaching strategy could maximize EFL students' reading comprehension better than the traditional single teaching. For This purpose, alternative teaching proposed by Cook and Friend (2004) was adopted.

#### **RESEARCH QUESTION**

More specifically, the present study attempted to find an answer for the following research question:

Does implementing alternative teaching model improve Iranian EFL learners' reading proficiency better than the traditional single teacher practice?

## METHODOLOGY

### Participants

Two intermediate EFL classes (N=30) who already passed level five at a private language institute in Ilam, were selected. They were all female, aged 17-25. Because of the inclusion of a few participants, the subjects were intact and therefore no random sampling was made. Three experienced male teachers aged about 39 also took part in the study. All of the teachers had Master degrees in English, language teaching.

### Material and instrument

One of the major challenges in developing a reading comprehension test is to select texts and tasks appropriate for learners at a given level of language proficiency. For this reason, *Interchange* (Richards, J. C., Hull, J., & Proctor, S. (2005) *Interchange: Book 3*. (3rd Edition) Cambridge: Cambridge University Press.) which is generally practiced in language institutes was used as the textbook. The textbook included sixteen lessons, the first five lessons of which were taught to the students during the course.

As for instruments, two tests were employed in the study. A placement test was administered as the pre-test to determine the homogeneity of the students and an achievement test as the post-test to determine whether employing alternative teaching model and single teacher resulted in significant difference in the students' reading proficiency.

### Procedure

The study was undertaken in Tanin Language Institute in the city of Ilam, west of Iran. After administering the placement test, thirty students were assigned to study in level six. Based on their score, the students were equally distributed into two classes, each containing fifteen students. The experimental group was taught by two teachers using alternative teaching model during five weeks on even days wherein one teacher called lead teacher, taught the large group who were supposed to be more talented and the other (co-teacher or supporter) worked with the small group who needed more explanation, and remedial activities. The latter group was taught by one single teacher during the same period. The same content was taught in both classes. The lead teacher and the support teacher made decisions about the content and organization of the lesson cooperatively. They also determined the appropriate structures for alternative remedial or enrichment lessons that would promote student learning. The lead teacher conducted formal teaching, including the entire stages of reading instruction such as pre-reading, reading and post-reading. All the learners were encouraged to participate actively in the learning process. They also implemented supplementary activities for the whole group, small groups or individuals before or after the formal lesson. The support teacher attempted to find out the learners' weaknesses and help them with activities by which they were able to guess unknown vocabularies by known words and grammatical structures which have not been previously learnt and internalized.

## RESULTS AND DISCUSSION

As mentioned earlier, two tests were employed in this study. At the first stage, a pre-test was administered so as to ensure that the two groups were homogenous in terms of their language proficiency. The mean scores obtained through the pretest for the control and experimental group were 69.53 and 71.40, respectively. To see whether the two groups were significantly different or not, T-test was run, the result of which is provided in Table 1.

Table 1: Results of Independent Sample Test on Learner's language proficiency in pretest.

T	DF	Sig. (2-tailed)	Mean Difference	Std. Error Difference
-.621	28	.540	-.4	6.44

Since the value of the T-observed was less than T-critical at  $P < .05$ , ( $t = 0.621$ ,  $DF = 28$ ,  $p < .05$ ), it can be concluded that there was not a significant difference between the control group and the experimental group with regard to their general language proficiency. In other words, the control and the experimental groups were at almost the same level of English competency.

To investigate the effect of alternative teaching strategy and traditional single teacher teaching on EFL Learner's reading comprehension improvement, an identical achievement test based on the content taught during the course was administered to both classes. The mean scores of the control and the experimental groups were further processed to explore whether there is a significant difference between their reading improvements. The results revealed that the mean scores for the control and the experimental group on the posttest was 64 and 77.33, respectively. Therefore, another t-test was run to show if there was a significant difference between the two groups of learners in their achievement scores.

Table 2: Result of Independent Sample test on the Learners' Reading comprehension on the posttest

T	DF	Sig. (2-tailed)	Mean Difference	Std. Error Difference
-2.326	28	.028	-13.33	5.73

Since the T-observed was higher than the T-critical ( $t = -2.326$ ,  $DF = 28$ ,  $p < .05$ ), it can be claimed that there was a significance difference between the control and the experimental group in their reading improvement.

## CONCLUSION

This study focused on the effect of alternative teaching strategy on EFL students' reading comprehension. The data collected and analyzed indicated greater improvement in reading comprehension of the experimental group. Therefore, with regard to the stated research question, it can be concluded that the alternative teaching contributed more to learners' reading comprehension improvement. In other words, the learners in the experimental reading class whose course was taught by co-teachers, performed remarkably better than learners who experienced the reading class course in the control class with single teacher.

One important aspect of the result was that all individuals in the experimental group benefited from the alternative teaching strategy. It can thus be concluded that the learners' engagement and the practice of co teachers can enhance classroom performance and encourage greater student participation.

Further analysis of the results demonstrated that most of the poorer learners in the pretest had a better performance in the posttest: that is, they scored higher on the posttest (see Appendix). These findings are in line with Murawski and Swanson (2001) who underlined the fact that co-teaching had a beneficial effect on students' outcome. Therefore, it can be safely concluded that alternative teaching can be more contributive to the improvement of the learners who take part in co-taught classes.

Although the results of this study indicate the positive impact of the alternative teaching strategy, care must be taken in overgeneralizing the findings in various contexts. Despite its significance, this model requires the co-teachers to work cooperatively and collaboratively to plan appropriate instructional programs and materials so as not to baffle the students in the learning process. Moreover, this study suggests further research to be directed to investigate other variables that might affect co-teaching methods including the culture, genders, and level of learners.

**ABSTRACT**

Genre studies have attracted many researchers' attention. The present study was to observe the differences in generic structure of doctoral dissertation acknowledgement texts written by Persian native and English non-native (Iranian) PhD students. To this end one hundred (sixty in Persian and forty in English) dissertation acknowledgement texts were selected. Hyland's (2004) model was utilized for the study. After analyzing each text, the main moves and their steps were extracted and the frequencies of each one were calculated and compared. Also, a chi-square test was applied to check whether differences between Persian and English texts were meaningful. The results showed that there were some differences but these differences were not statistically significant. In addition, two new steps called "thanking God" and "opening" steps were discovered throughout this study. And the difference in using these steps between Iranian students writing in Persian and English was statistically significant.

**KEYWORDS:** doctoral dissertation, acknowledgement, move analysis, steps, sub-disciplines.

**INTRODUCTION**

With no doubt, writing a dissertation either for a Masters or a Doctorate student is a difficult process requiring not only days and nights of devoted times of the writer, but also the support and encouragement of the people around, academically or otherwise. Acknowledgement is most probably the section of the dissertation that the writer writes with utmost joy. They are read first by the ones who were with the MA and/or PhD students throughout this difficult path. Furthermore, these are the parts of the texts where the writers need to express their gratitude to the ones helped them appropriately considering the very intricate rules of communication (e.g., the face needs of the other and the self, the social context, representation of the self). Therefore, as Hyland (2004) argues, these sections are significant in enabling authors build a credible scholarly and social character in readers' mind.

Despite this important function of the acknowledgments, the analysis of the genre and its components (e.g., the move structure, thanking order and the thanking patterns) has not received a deserved attention in the literature yet. The literature of the acknowledgments comprises very few studies conducted in recent years (i.e., Al-Ali, 2010; Gesuato, 2004; Hyland, 2003, 2004). The common point of research in acknowledgments is that there is a crucial necessity for further research in the area since insufficient knowledge in constructing acknowledgments may lead to improper expressions of gratitude which may result in a reflection of an incompetent academic and social identity of the students completing their Masters and Doctorate degrees (Hyland, 2004).

As Buyukkantarcioglu (1998, p.159) asserts "the choice language is very significant in maintaining social relationships". As for thanking expressions, which constitute the main body of the acknowledgments, the choice of language is especially important. Thanking as inherently being a face-enhancing act, can become face-threatening with an inappropriate use of language, when contextual (e.g., cultural environment) and/or personal factors (e.g., degree of intimacy) are disregarded. In the same vein, Eisenstein and Bodman (1993, p.64) argue that while, as a ubiquitous speech act, the act of thanking can "engender feelings of warmth and solidarity among interlocutors" when properly performed, it can also endanger the course of relations when performed otherwise. Moreover, if the act, expected by the reader/hearer, is not performed at all, the hearer/reader may get hurt or annoyed (Spencer Oately, 2008).

To this end, the current study intends to contribute to the fields of sociology, Persian literature, religion, geography, history, social sciences, and English language Teaching (henceforth ELT), English literature, linguistics and translation in the following respects: In regard to the generic structure analyses of the acknowledgment sections the study will:

- (1) reveal the organization, i.e. the move structure, the thanking order in Persian Literature dissertation acknowledgments, with that of religion, social sciences, geography, history and sociology comparing to English translation, linguistics, English literature and ELT dissertation acknowledgements, and display how they formulate their thanking expressions addressed to the ones supported them in their journey of writing their MA or PhD dissertations,
- (2) act as the recent comparative study in the analysis of dissertation acknowledgments written by Persian native speakers and English non-native speakers.
- (3) raise awareness on the importance of the genre, leading possibly to better organized and written acknowledgments, in which a more unique and creative tone of voice sounds.

**REVIEW OF LITERATURE**

The history of acknowledgments actually goes back to the times when the authors were dependent on the powerful ones in authority in order to publish their academic works (Giannoni, 2002). Though in time the reasons for including acknowledgments in academic papers have changed, they were always a part of published texts appearing either as a part of preface or as a separate section (Giannoni, 2002).

The first study in literature on acknowledgments, as far as the author is aware, is the one conducted by Mackintosh in 1972 (cited in Tiew & Sen, 2002, p.44), where it examines the structure of acknowledgments and determines a three step move as the acknowledgment of the (i) help of individuals, (ii) access to data, (iii) facilities.

In 1987, Ben-Ari, investigates two hundred anthropological ethnographies and defines acknowledgments as genres having a peculiar construct that differ from the main text it is added to. He mainly asserts that (1987, P.65) acknowledgments are:

Formulations that take on an intermediate position between the internal contents of the Ethnography and the people and relationships outside it: They are both an introduction to an intellectual product and a reconstruction of the external contributions that have gone towards its realization.

The literature on dissertation acknowledgements , on the other hand, is quite limited. Despite acknowledgments being a very common section of dissertations (i.e.,80% of MA and 98% of PhD dissertations in Hyland & Tse, 2004) very few studies in linguistics /applied linguistics have examined the structure of the acknowledgments written by MA and PhD students. The literature mainly comprises the studies conducted by Hyland (2003, 2004) and Hyland and Tse (2004), which aim at exploring the structure of the acknowledgments and the patterns of thanking expressions appearing in acknowledgments based on a corpus of 240 MA and PhD dissertations written by non-native speakers of English in six academic fields (i.e. Applied Linguistics, Biology, Business Studies, Computer Sciences, Electronic Engineering and Public Administration).

More specifically, Hyland (2003) focuses on the textualization of the gratitude suggesting that acknowledgments reflect authors' unique rhetorical choices which are shaped by the authors' social and cultural characteristics and by the field they get specialized in. Hyland (2004) generates a content-based framework for acknowledgments by introducing three separate moves ; **Reflective Move, the section where the author comments on her experiences; Thanking Move, the place presenting gratitude to academic assistance, resources, family and friends; and Announcing Move**, the last part including the acceptance of responsibilities for flaws or errors and dedication of the thesis.

In addition to the previous findings on acknowledgements, Hyland and Tse demonstrate the lexico -grammatical patterns of the thanking expressions by categorizing them under five categories as: Nominalization, Performative verb, Adjective, Passive, and Bare mention.

Al-Ali (2004) works on a corpus of 100 acknowledgments written by Arabic native speakers in English within the framework of the move structure proposed by Hyland (2004), the Reflective –Thanking-Announcing Move structure. As one additional move he encounters with the “Thanking Allah” pattern in the Arabic PhD dissertation.

In his latter article, Al-Ali (2010) reviews 100 acknowledgments written in Arabic by students from soft sciences .Examining the acknowledgments, Al-Ali builds a new move structure (see Table 1) for the Arabic acknowledgments, observes the thanking strategies employed in the moves and makes a socio-cultural analysis of the PhD dissertation acknowledgments written by the native speakers of Arabic.

*Table 1: Number of Move components in Dissertation Acknowledgements written in Arabic Source : Al-Ali, 2010:8*

Component Moves of Arabic acknowledgements n: 100	Number of Moves
1. .Opening	25
2.Praising and Thanking Allah(God)	70
3.Thanking Supervisors and other Academics	100
4.Acknowledging Access to Resources	62
5.Thanking for Moral Support	61
6.Invoking and Blessing	68
7.Closing	52
8.Signing off	20

Al-Ali (2010) maintains that the choice of language in acknowledgments very much depend on some socio-cultural and religious motivations .For instance, he (2010:20) reveals that 25% of the acknowledgments written in Arabic start with verses from the Qur'an or sayings of the Prophet, emphasizing the significance of praising Allah and 70% of the acknowledgments include the “Thanking Allah” move. Reporting from Hyland (2005:197) Al-Ali states that meta-discourse of the similar texts show notable differences in accordance with the cultural background of the authors.

One contrastive study in literature, as far as the author is aware, is Giannoni's (2002) study on the Acknowledgement sections of English and Italian research articles. In his article, he compares and contrasts the structure of acknowledgments on the basis of a move structure he develops (i.e.,Introductory move, Main move). His corpus of acknowledgments consists of 100 acknowledgments (50 for each set of English and Italian corpora) collected from 50 English and 19 Italian research journals written in six academic fields (i.e., three social sciences and three natural sciences ).

The study (Giannoni, 2002) reveals that while the Italian acknowledgments are more elaborate than the English ones regarding the move structure, English employs more variation in wording. Moreover, while impersonal constructions are higher in percentage in Italian acknowledgments, English thanking expressions appear more with direct constructions of thanking. One of the findings of the study that Giannoni states is the difference in focus between the corpora. He (2002, p.25) argues that the focus of acknowledgements is on “help” in English acknowledgements, but on the “value” in Italian ones, which might be an indication of the “utilitarian” understanding of Anglo-Saxon academicians and the “value-favoured” understanding among Italian ones.

In Turkish and Iranian context, however, neither acknowledgements of research articles nor dissertation acknowledgements have been investigated in the fields of linguistics, applied linguistics or in English Language Teaching so far. This study will be addressing this gap in the Iranian context and will add a new dimension to the research on acknowledgments by examining the patterns of thanking in accordance with their addresses for the first time.

#### ***The socio-cultural context of the study***

To have a clear conception of the nature of gratitude and thankfulness in Persian dissertation acknowledgments, some light need to be shed on the broader socio-cultural context of thankfulness and gratitude as a communicative event. Fairclough (1995:112-29) emphasizes the centrality of the situational context by looking at issues related to the place of production of the text and the socio-cultural factors that go into producing and interpreting it. As the genre texts under analysis are produced and interpreted in relation to their cultural context, it is necessary to define culture. There are many definitions for culture because it can be conceptualized and defined from various perspectives .For instance, Samovar and Porter (1994) define culture as:

The deposit of knowledge ,experience, beliefs, values, attitudes, hierarchies, religions, roles, [...],and Material objects, and

possessions acquired by a group of people in the course of generations Through individual and group striving (p.11).

The cultural values, which are defined by Samovar and Porter (1994) as 'a set of' organized rules for making choices...' (p.15), specify and even constrain how members behave and interact in particular communicative contexts.

As the texts are produced by Iranian writers, it is supposed that the writers' cultural values and the socio-cultural context are complexly woven into the ideology presented in these texts. In this way, these socio-cultural factors are essential in understanding the writers' communicative purposes as they manifest their effects on the content choice and schematic structure of the texts, which are constructed in these situations (Kress, 1989:19). Therefore, the texts produced by Persian writers are assumed to be influenced by Persian culture-specific conceptual categories that include ,among others, religious affiliations and beliefs ,social customs and hierarchy, as well as commitments related to family, relatives and friends.

Regarding religious affiliations , the vast majority (95%) in Iran is Muslim and Persian speaking. The overwhelming majority of Iranians' practices are governed by Islamic prescriptions (Al-Ali, 2006: 694). In this regard, Harries (1958:40) points out that 'Islamic law embraces the whole range of personal and social life' in Iran. Despite regional differences in the religious specifics of adherents, Islam provides a framework within which Persians from all around the world tend to identify themselves as one people (Harris, 1958). Thus it is likely to argue that Islamic religion is one of the basic features of culture that has influence on the Iranian socio-cultural practices. Their social life, as Castleton (2006:76) points out, is generally regulated by religious percepts to the extent that social values are largely indistinguishable from religious values and practicing a communicative event tends to be derived from an inner need to satisfy religious beliefs.

The Iranian writers share a common heritage of Islamic values , amongst which are 'thanking' and 'paying gratitude'. Consequently, Islamic religion has prescribed a shared body of values and convictions for conduct related to paying gratitude that delineate and constrain the Persians' faith. Gratitude, according to McAuliffe (2003), is a moral marker usually paid in response to kindness. It is 'a spiritual and moral state of mind, spiritual in the sense of acknowledging the believer's obligations to the creator ,and moral in the sense of maintaining rightful conduct in relation to God and to those appointed by God [i.e.people]' (p.370). Gratitude is an attribute of divinity due to the fact that the Holy Qur'an mentioned ninety-nine names and titles for Allah(i.e .the most beautiful names that belong to Allah),one of which is al-fakur (meaning the All-Thankful).

While the Holy Qur'anic prescriptions and the prophetic sayings played a seminal role in promoting thankfulness to Allah and parents , the social customs and traditions, as well as commitments related to family, relatives and friends also helped to support and disseminate gratitude. The Iranian society has developed a set of shared understandings ,modes of actions that provide overarching principles for Iranian interaction considered appropriate for the individual needs and the desired ends the society sets for its members. This type of cultural grammar includes aspects of relationships between members of the Iranian society related to a system of rights, duties and favors in the form of behavior expressions realized in offering help, or services initiated and exchanged between persons. These kinds of help in turn normally set up obligations: the favored person has the duty to return the favor with something of equal value or preferably of a little greater value. In the case of Ph.D. dissertation writers, there are individuals who either do favors or have the duty to fulfill obligations for the writers. These individuals include, besides others, supervisors, other academics, wife, husband, parents, relatives and friends. To illustrate ,academic supervisors have a duty to supervise the thesis, provide critical feedback, and shape the reported work through their ideas and insights. This is considered by the supervisees as a favor which in turn elicits an obligation from them in the form of thanking and paying gratitude. In other words the supervisors and other academics are entitled to certain duties from their supervisees. Mutual obligations and favors are also demanded of those with kinship ties to the writers ,such as parents, wives, husbands ,brothers and sisters since the Muslim Iranian culture could be termed as 'a kinship culture'(Al-Ali, 2006: 707) Brothers are expected to be supportive morally. Therefore, one can say that there is a kind of 'corporateness' between the family members as they see themselves in relation to others, as members of groups (i.e .extended family), and are expected to sacrifice their own needs for the greater good of the group. Because it is taught that the individual achievement of the favored person is for the benefit of the family members (Rugh, 1985: 278-9).

Actually in Iran, to the best of the researcher's knowledge, there is little research on dissertation and no research on acknowledgements. This study is concerned with the identification of schematic moves and sub-moves (steps) that are specific to acknowledgement text of doctoral dissertation in the field of humanities. After identifying the patterns they were compared to find similarities and differences between generic structure of native and non-native acknowledgement texts. Results of this study can help EFL, ESP and EAP teachers to teach these patterns to students and students in turn can use these patterns in their writing. Syllabus designers also can include them in their writing. Syllabus designers also can include them in their syllabuses of EAP writing.

## RESEARCH QUESTIONS

1. Is there any difference between type and frequency of move structure in doctoral dissertation acknowledgements texts written by Iranian students in Persian and English in sub-disciplines of Humanities?
2. Is there any difference between type and frequency of steps in doctoral dissertation acknowledgements texts written by Iranian students in Persian and English in sub-disciplines of Humanities?
3. Is there any difference between acknowledgements scheme in doctoral dissertation written by Iranian students in Persian and English in sub-disciplines of Humanities?

Based on the above questions the following null hypotheses were constructed:

1. There is no difference between type and frequency of move structure in doctoral dissertation acknowledgement texts written by Iranian students in Persian and English in sub-disciplines of Humanities.
2. There is no difference between type and frequency of steps in doctoral dissertation acknowledgement texts written by Iranian students in Persian and English in sub-disciplines of Humanities.
3. There is no difference between acknowledgement scheme in doctoral dissertation written by Iranian students in Persian and English in sub-disciplines of Humanities.

## METHODOLOGY

### *Corpus construction and procedures*

A total of 100 acknowledgment sections written in Persian by doctoral Persian native speakers and English by doctoral English non-native speakers were selected for the present study. To minimize variations across disciplinary boundaries, the sample was restricted to acknowledgment sections covered humanities (social sciences, literature, geography, history, sociology, religion, English literature, English

Language Teaching, Linguistics, Translation) .Ten acknowledgment sections were analyzed from each of these ten academic disciplines. The length of the texts ranges from 74 to 784 words. The average was 216 words. The sections were written in Persian by Persian native speakers and English by English non-native speakers from Iran, Mashhad .Soft knowledge domains have been focused due to homogeneity of Persian and English Ph.D dissertations .The other reason for the focus on these disciplines is to consider Persian written acknowledgments that rely on localized input and compare it to English written acknowledgments by non-native speakers of English. To control rapid changes within any of the disciplines, the texts were selected from dissertations written over a period of fifteen years (1998 to 2013). Extracts were taken from this set of dissertation sections omitting the writers`names or any element that revealed anything about the identity of the people concerned.

#### ***Theoretical framework and procedures of data analysis***

To identify the genre component options available to Ph.D. acknowledgments writers that are used to articulate the communicative purposes of the dissertation acknowledgment texts and socio-cultural forces that give explanations for these generic resources and the lexico-grammatical devices used to realize these options, Bhatia`s (2004) notion of genre was employed which considers a genre text as a socio-cultural practice. Since no research, as far as I know has been carried out on acknowledgment genre in Persian texts to offer a grounded language identification and description of the acknowledgment genre component options and their lexico-grammatical textualization , Hyland`s (2004) coding scheme was utilized for a corpus of English dissertation acknowledgments written by postgraduate students ,with modifications and additions of certain moves. Hyland`s analysis is based on Swalean (1990) genre moves for article introductions which has been profitably extended by genre analysts to other academic genres .Genre analysis has been approached from different perspectives. Whether approached in terms of the existence and arrangement of obligatory and optional structural elements (Halliday & Hassan 1989: 63-4), or recognizable communicative events characterized by a set of consistent communicative purposes (Swales 1990: 58; Bhatia 1993: 13), or typification of rhetorical actions (Miller, 1984:151; Bazerman,1994:315-16), or regularities of staged, purposive social processes(Martin 1992, p.505), genre theory covers a lot in common ground (Bhatia 2004, p.22).Despite these seemingly different perspectives stimulated by different orientations, genre analysts study genre as a communicative linguistic behavior in a particular setting. It is characterized by identifiable communicative purposes that shape the schematic move options used by writers to construct the genre. Table 2 below provides a description of the modified coding scheme. The additions and modifications of Hyland`s coding scheme include the addition of five moves :` Opening`, `Thanking Allah (God)` ,` Invoking and Blessing`, `Closing` and` Signing off`.

All of the acknowledgements texts were first electronically scanned and converted to computer text files. Each of the texts was then coded for the generic moves by the researcher herself. After discussing and presenting a definition of each move, I asked another trained linguist to code a sample of thirty texts. On a check of inter-rater reliability , the two raters had an agreement rate of 91% in identifying and categorizing the moves on 30 (30%) selected acknowledgements. Quantitative analysis of linguistic features and their frequencies within moves was then performed. The component moves which appeared most frequently in my analysis of post-graduate student acknowledgements are listed in Table 1.

The role of the socio-cultural perspectives that contribute to the construction and interpretation of this discourse genre were also investigated. These perspectives cover a range of features such as beliefs, norms and conventions, which in turn give rise to the unstated behavioral principles (Bhatia 2004: 25) on the part of the members of a particular academic or professional group when they participate in social or academic communicative events .According to Bhatia (2004:20), the emphasis at this level of analysis tended to extend the analysis beyond the textual product to include the broad socio-cultural context to account for the way text is constructed and often interpreted , used, and exploited in specific institutional or academic contexts to achieve particular communicative purposes.

#### **RESULTS AND DISCUSSION**

Genre analysis is used here to find out the component rhetorical moves and the lexico-grammatical devices post-graduate students utilize to construct an acknowledgement text. The analysis of the generic structure of Persian acknowledgements accompanying Ph.D. dissertations has shown eight-move components (see table 1).The texts analyzed demonstrated differences in the number and frequency of moves employed, as well as the type of component moves included. In the corpora analyzed, the moves higher up the list usually made their first appearance before those lower down. There were , however, some exceptions. Move 5,`Thanking for Moral Support, sometimes, occurred before Move 4,`Acknowledging Access to Resources, and Move 6,`Invoking and Blessing`tended to appear immediately after the thanking moves 3,4,5.

*Table 1: Component Moves of Acknowledgements*

Component Moves of Persian Acknowledgements, n=100	No .of Moves	
	Persian	English
1.Opening	25	0
2.Praising and Thanking Allah(God)	70	30
3.Thanking Supervisor(s) and other academics	100	100
4.Acknowledging Access to Resources	62	64
5.Thanking for Moral Support	61	61
6.Invoking and Blessing	48	0
7.Accepting responsibility    (closing)	0	42
8.Dedication    (Closing)	10	20

The individual components of the acknowledgements section genre found in the corpora are presented. The frequency of each component and the order in which these individual components occur are given in Table 1.

#### ***Opening***

The first component of the Persian acknowledgments examined was the `Opening`. It occurred in \_\_\_\_\_ percent of the sample. This component opens with one of the following options as is shown in Table 2:

*Table 2: Distribution of opening options across Corpus*

Opening Option	Frequency in Persian	Frequency in English
Qur`anic verse	8%	0
Prophetic saying	5%	0

Prayers on the Prophet	6%	0
Invocation followed by the formulary	6%	0
Expression <i>wa-baad (and then)</i>		
Total	25%	0

### ***Praising and thanking Allah***

This component occurred in 70 percent of the Persian acknowledgements analyzed. When employed, it generally occupies the first position in comparison to other thanking component options. This component contains expressions of gratitude, and praise to Allah (God) for his favors; one of these bounties is making the completion of the Ph.D. dissertation task possible. The corpus revealed that the praising expressions and gratitude are both prevalent in the corpus of 70 percent of Persian texts while only 30 percent of English majors corpus (written in English) revealed phrases of praising and gratitude to Allah.

*Table 3 : Expressions of Praising and Thanking Allah*

Expression Type	Frequency in Farsi	Freq in English
Praising phrases	35%	5%
Thanking phrases	15%	10%
Praising followed by Thanking phrases	20%	15%
Total	70%	30%

### ***Thanking supervisors and other academics***

The aim of this component is to pay off one's intellectual debts to individuals who have made significant intellectual influence and contributions of various kinds such as originating the idea of the thesis, shaping the reported work through their ideas and insights, or providing critical feedback. Further, it reflects a rich mix of personal, moral, intellectual stimulation provided by intellectual, and conceptual support received from members of the discourse community ( i.e. principle dissertation advisors, doctoral committee members, senior academics, and instructors ). This component registers personal and 'behind the scenes' interactions. It also gives insights into the values and attitudes of the discourse community and the relationship between the individual and the world of academia .Since this component is the only step that has been found in all texts, it can be considered an obligatory constituent.

The corpus showed that the acknowledgers tend to exploit elaborate and deferential patterns of thanks and gratitude expressions especially to their supervisors. They utilize overt forms of thanks expressed mainly through nominalization, or a performative act to realize this component as shown in Table 4.

*Table 4: Patterns Expressing 'Thanking Supervisors and Other Academics'*

Form	occurrences	Frequency
I.nominalization	307	85%
1.Conjoined synonyms other than 'thanks'	92	30%
2.'Thanks'conjoined with other synonyms	215	70%
II.performative verbs	46	15%
Total	353	100%

### ***Acknowledging access to resources***

This component includes thanks and gratitude addressed to participant subjects and those who avail or provide access to data, technical assistance, clerical help (e.g. proofreading, typing , and statistical analysis),financial support ,or facilities that are necessary for the academic study. This step occurred in 62 percent of the acknowledgements analyzed and generally followed component 3.To repay some of the assistance received to accomplish their degree ,dissertation writers tend to use overt expressions of thanks which involve either a bare performative verb 'I thank' without an introductory preface ,which accounted for 40% of all forms or its simple nominalization 'thanks' (45%).

### ***Thanking for moral support***

This category collates expressions of feelings of gratitude for psychological, spiritual, and moral support, encouragement, patience and care received from family members, relatives, friends and colleagues during the period of study. In particular, the data analyzed showed that this category allows the writers to thank parents for their love, supplications and invoking; wife/husband for patience, sacrifice, love and care; children for patience; brothers, sisters and relatives for love and moral support; and friends for help, psychological support and hospitality.

The data revealed that commitment to the social community represented by the extended family ( i.e. father, mother, brothers, and sisters), relatives and friends was evident in 61% of the texts analyzed. Virtually most of the moral support moves employed in the corpus contained at least a word of gratitude to one's parents who were mentioned before other members of family. This high frequency can be explained with reference to religious affiliations as the first thing that Allah enjoins upon man is to show gratitude to Him and to one's parents.

### ***Invoking and blessing***

Another favored strategy is invoking God's (Allah's) favors upon acknowledgees. This act includes requests of Allah's bestowal of divine favor on an addressee to protect and guard him/her from evil thereby bringing him/her happiness. Invoking and blessing are generally fulsome , often even lavish, virtually in this corpus ; they occurred in over half of the acknowledgements analyzed. It is interesting ,however, that this strategy carries explicit interpersonal connotations, similar to patterns of complimenting behavior at speech events, such as phatic conversation (Holmes, 1995; wolfson, 1989 [quoted in Hyland, 2000:53]). However, there are not direct invoking and blessing in the corpus (Farsi & English) but still we can find it in the Opening and Thanking Allah and Supervisors and academics. Neither of these invocations is arbitrary; they are part of their culture reflecting their realm of thought. 'It may seem obvious that words with special culture- specific meanings reflect and pass on not only ways of living characteristic of a given society but also ways of thinking'(Wierzbica, 1997,p.5).

A significant issue related to this strategy is the fact that more than 80 percent of the writers who included this component chose this strategy to supplement the 'Thanking Move', particularly thanking supervisors and academics. Further, this component does not occur only once in each acknowledgement genre. Most often the writers opted for a composite 'Thanking' followed by Invoking and Blessing'; this pattern is repeated several times. That is to say, when an acknowledgee is thanked, this act is often supplemented by invocations.

#### *Closing*

Instead of ending abruptly, about half of the writers (42%) add a sentence or a few to conclude the whole text in order to give it a sense of completeness. This move was present in only English dissertation acknowledgements and was not present on the other Persian corpus, and always followed the Thanking move when it did occur. For the writers who employed it, this move provided a means of publicly making a declaration of their authorial accountability for the dissertation's contents or dedicating the work to an esteemed individual, although the two steps never occurred together.

#### *Accepting responsibility*

By clearly stating their responsibility for possible shortcomings in the data, results, and ideas in a dissertation, writers not only seek to absolve their advisors and collaborators of blame for any deficiencies, they also assert their ownership of the product. This implication is clear in the juxtaposition of assistance and independence often seen in this step:

-I have received much useful advice throughout the writing of my thesis, but all the faults that remain are obstinately my own. (Ling. PhD)  
-Notwithstanding all of the above support for this project, any errors and/or omissions are solely my own. (Elt. PhD)

Accepting responsibility therefore clearly redresses the impression of dispersed responsibility or uncertain authorship which may have been given in the Thanking move and functions to re-establish the student's rights to be regarded as an independent researcher.

#### *Dedicating the thesis*

Only a handful of texts included this step, and perhaps for this reason it stands out as a particularly warm and heartfelt act of thanks unrelated to any rhetorical intent. Here writers borrow a device they have seen in books, although virtually unknown in academic papers, to offer a tribute to people who have made a special contribution to their lives beyond the confines of the research context:

-I would like to dedicate this dissertation especially to my parents for both of them have thought me the meaning of life and its significance.

Here the formal conventions of academic writing and the rhetorical strategies of self-promotion are laid briefly aside and the writer is able to present him or herself in a way which corresponds more closely to a more familiar social identity. In this step we find an attempt to both break free of the restrictions of dissertation discourses and to put the completed research experience into a wider perspective.

### **CONCLUSION**

The preceding snapshot of the component strategies that are employed offers insights about Persian dissertation acknowledgement genre with its discourse structures and the linguistic choices that tend to occur in this genre. In order to understand the rationale governing the rhetorical construction, which in turn reflects the communicative purpose of this genre, I now turn to discuss socio-cultural values and academic constraints that give rise to both the template strategic potential components and the lexical choices available to the writers evidenced in this corpus.

#### *Socio-cultural factors affecting the acknowledgement schematic components*

A discursive look at the generic components, which are ritually drawn upon in writing the acknowledgement texts, displays some of the religious and socio-cultural motivations for the behavioral strategic choices to articulate the communicative purpose of this genre. For way of illustration, twenty-five instances of this genre were initiated with an 'Opening' based on Qur'anic verses or Prophetic sayings. Evidently, although this option does not have a high frequency of occurrence (25%), it is in no means being considered arbitrary. The instances used to express this move seem to reflect the Qur'anic and Prophetic sayings, which focus on the centrality of praise and thankfulness to Allah (God). The centrality of the concept of Allah is fully fledged and reflected in the 'Thanking Allah' component, where seventy percent of the writers present their thankfulness and gratitude to Allah. The examples related to this strategic option show that the writers tend to contemplate Allah's right of praise and gratitude upon them because Allah is thought the source of inspiration, health, patience, perseverance and strength. According to the Qur'anic prescriptions, thanking and praising Allah for his munificence result in increasing the graces of Allah and getting very close to His mercy.

'If you are grateful, I [your Lord] will add more favors unto you; but if you show ingratitude, truly My punishment is terrible indeed.' (Ali 1989:605)

Religious affiliation is further reinforced by the sixth component, Invoking and Blessing'. Calling upon Allah to bless the acknowledgees, the writers usually employ invocations to supplement the thanking components addressed to their supervisors (i.e. Move 3), and to those who were of help in access to data (i.e. Move 4). That is to say, the acknowledgers do not employ thanking and gratitude acts, but these acts are also often supplemented by invocations. Cycles of this pattern including Component 3 or 4 followed by invoking and blessing element reoccur. Such cyclicity could be explained with reference to the cultural belief that 'the word of thanks by itself is not usually a sufficient response to a Farsi compliment and needs to be complemented by additional words' (Nelson et al. 1996, p. 429). This behavior also comes out in the 'Closing' (Move 7), where it is sometimes expressed by a sentence or a stretch of sentences having roots in the Holy Qur'an containing either supplications and/or praises for Allah to bless the writers and to bring them more success. Therefore these strategic components in this paper can be seen as contextualization cues that bring about the impact of religious beliefs and values of the writers.

Acknowledgement texts also furnish indications about the social system of favors and obligations constraining the acknowledgement behavior of the writers. For instance, in the 'Thanking for Moral Support' Move, the writers thank their wives for supporting and serving the daily nurturing of their family while their husbands are being heavily engaged in preparing their theses. In Muslim culture or collectivistic one such as the culture in this study, where in groups take precedence over individual (Triandis 1983), family members see their happiness as resting in the realization of certain corporate purposes: in experiencing a satisfying family, and in exerting efforts to strengthen and coalesce family ties. Likewise, the system of favors and obligations sets up a kind of moral obligation on Iranian Muslim family members who have affective kinship ties to the writers, such as parents, brothers and sisters to support the Ph.D. writers by supplications and invoking, as well as financial support which is returned in the form of thanking and paying gratitude. Thus, one can claim that there is a kind of 'corporateness' between the family members, seeing themselves as members of an in group (i.e. extended family) who are expected to sacrifice their own needs for the greater good of the group. That is because in-group thinks that the individual achievement of the acknowledged person is for the benefit of the group. Similarly, Mursy and Wilson (2001: 138) point out that Iranian Muslim society, 'which basically derives its values from Islam, elevates the group above the individual and values responsibilities and obligations towards the

community'. However, while the Iranian social ideology values corporateness, and sacrifice to fulfill the extended family's goals, a fundamental truth for Westerners is associated with individualism, equal rights and the chances to realize individual goals (Rugh 1985, pp.276-77).

In contrast to Western view, the nature of interaction and social relationships practiced by the graduate students seems to show similarity with non-Western way of viewing interpersonal relations in which politeness functions at the level of society rather than at the level of individuals. For instance, Gu (1990) endorses its normative constraints on each individual' (p.242). Accordingly, individuals behave in conformity with culturally expected norms that are institutionalized by the society. That is to say they place the society's face above their individual desires. As pointed out by Foley (1997), Chinese can be characterized as sociocentric. In such cultures 'the individual and his autonomy are not singled out as the local understanding of person; rather his embeddedness in the social context is the stuff of this definition as a person' (p.266).

If a comparison is drawn between the results obtained from analyzing the generic structure of Farsi and English acknowledgements written by Iranian native speakers and those reported in Hyland's (2004) study of Ph.D. dissertation acknowledgements, one can claim that there are differences as well as similarities. There are general similarities in schematic component moves with respect to the thanking moves (Thanking supervisors, and Thanking for data access, clerical and technical support, and for moral support). Thus, it might be argued that the use of these generic components (i.e. Hyland's model) in the Persian texts may give an impression of the influence of the western practice which might have been imitated by the acknowledgers who either have been taught by instructors having been influenced by the western practice, or having had an idea about acknowledgements written by western authors. Another explanation is that both Farsi and English acknowledgement data share general communicative purpose (i.e. acknowledging credit to anyone who has helped in any way) which is, in turn, articulated by these similar thanking generic moves. Related to this justification is that academic genres, to a certain extent, transcend the territorial constraints of ethno-cultural allegiance (Widdowson 1990) and linguistic borders. Accordingly, it is anticipated that Farsi and English texts develop some similar tendencies to articulate the general communicative purpose of their academic discourse community.

Although both Farsi writers and the non-native speakers of English employed similar thanking schematic moves, Farsi writers' data exhibit cultural specific differences in the use of generic resources in terms of the type of rhetorical component choices, naming practices and organization conventions. With regard to the first point, the Farsi writers tend to use certain components such as 'Opening', 'Thanking Allah', 'Invoking and Blessing', 'Closing' and 'Signing off' which is subcategorized to accepting responsibility and Dedication of thesis that do not surface in the English texts analyzed by Hyland (2004) except for the final steps of dedication and accepting the responsibility. The researcher has found out this subtle difference between Farsi and English written texts; while there are opening and thanking Allah, and invoking in the Farsi texts, the closing stages are missing on the other hand, there is no opening and invoking and only 20% 'thanking Allah' move in the English texts also last stages of closing move are present i.e. the writers accepted their responsibility and dedicated their work to their loved ones. The occurrence of these additional components in Farsi texts reverberates and reinforces the socio-cultural proclivities of the Muslim Iranian writers explained at the beginning of this section. These culture specific-preferred patterns of discourse also reinforce Hyland's (2005:197) view that there is 'considerable variation in the role played by meta discourse in similar genres written in different cultures', as different cultures have different expectations for writing.

As for the second observation, the heading of the Persian acknowledgements has not achieved the same degree of uniformity in terms of naming conventions as it is the case in English. That is because various nomenclatures are sometimes used as titles for the Persian acknowledgement section. To illustrate, the title of this section presents writers with several options, the most frequent of which (70%) is 'Thanks and Appreciation'. Other options are 'a word of thanks' (12%), 'thanks and dedication' (8%), or simply a one word title 'Thanks' (5%). Sometimes, this section is included under the heading of other sections such as the 'Introduction', or mingled with the 'Dedication' section. In other words, the title has not gained a large degree of uniformity in comparison with its English counterpart.

The third point is the observation that the Persian acknowledgements seem to incorporate a number of epistolary conventions of professional letter genre such as the 'Opening', 'Closing', and Signing off as well as 'Thanking for Allah' moves. This was shown in the way twenty-five percent of the Persian acknowledgements are prefaced with the 'Opening', e.g., 'In the name of Allah'. Then Praising for Allah occurred in nearly 70% of the Persian acknowledgments. The 'Closing' and 'Signing off' move was merely evident in 42% of the English instances in the form of accepting the responsibility or Dedication of the thesis. While comparing to Arabic acknowledgements written by Al- Ali (2004), the Closing move was evident in fifty-two percent of the instances that typically close with ritualistic praises and supplications for Allah. Likewise, the 'Signing off' move which is placed at the end of the Arabic texts occurred in 20% of the Arabic acknowledgements. These components reflect the epistolary conventions of Persian professional letters. This tendency suggests that not all of the genre components included in the Persian acknowledgements are an exclusive property of this particular genre since some ingredient components are likely to be found in other well-established genres. Therefore, one may conclude that these lexical, and generic component options seem to be appropriated (Bhatia 2004:87-88) to shape a new generic form.

The generic structure which is the overall organization of the acknowledgement text reveals how each component of the text contributes to the overall communicative function of conveying gratitude and thankfulness. The analysis of the corpus revealed that acknowledgement texts comprise a common rhetorical schematic structure built around an eight staged meaningful basic component moves: Opening > Praising and Thanking Allah > Thanking Supervisors and other Academics > Acknowledging Access to Resources > Thanking for Moral Support > Invoking and Blessing > Closing -accepting responsibility-dedication. However, no single corpus sample neither contained all of these components nor presented them in this order.

The data also exhibit cultural specific differences in the use of generic and lexical resources. It was observed that the Persian writers tend to use certain components such as 'Opening', 'Thanking Allah', 'Invoking and Blessing', components that are absent in the English texts. Another remark is that conventionally accepted generic forms seem to have given way to accommodate newly accepted practices. This is evinced in the tendency that Iranian Muslim writers exploit some generic conventions of another well-established genre, to communicate socially and academically accepted communicative purposes. This study also has shown that the type of components included in most of the acknowledgements analyzed shows a predisposition to resort to the socio-cultural values which can be attributed to the ideology that characterizes most distinguished of Iranian society. At the same time, as already mentioned, some generic practices or writing habits have been borrowed from the West. Sell (1991) believes that 'it is not true to say that people in one culture can never have the faintest idea of what people in other cultures feel' [and that] 'people in different cultures can never feel the same things exactly' (p.14).

This paper examined (1) how the Persian L1 writers express their thanks, (2) the influence of situational and socio-cultural factors on the choice and (3) the lexico-grammatical options available to them. However, much work remains to be done to find out the boundaries

between personal rhetorical choices available to writers, the options related to the socio-cultural constraints, the ideas borrowed from other dissertations, and those due to the general academic conventions that transcend socio-cultural allegiance. We need qualitative research based on personal interviews with the writers of the acknowledgement genre to tease out their consciousness of their rhetorical choices in the process of production of these texts. The research needs also to be extended to other disciplines, such as hard sciences in Persian, and to other languages to compare and contrast how gratitude is expressed. Also, the impact on genre patterns of situational factors such as the author's age, gender, seniority, and publishing experience can be examined. Clearly, we need to examine writers, readers and texts in greater detail to tease out the limits of personal choice and the kinds of effect they can have. The effort is worthwhile for it will help to ensure that students understand the options available to them and the effects of manipulating these options for interactional purposes.

## ABSTRACT

Among other factors that affect translators' mind while producing a text, their spiritual intelligence level might be an influential element. The present study tries to discover whether there is any significant relationship between translators' spiritual intelligence level, and the quality of religious texts translation they produce. The research also investigated the relationship between spiritual intelligence components and quality of translation. To this end, a sample of 42 male and female BA graduated students of English Translation Studies comprised the participants of the study. The participants received a package of four tests: a translation test and two sets of questionnaires were used one to measure the spiritual intelligence level and the other to determine the favorite genre of the subjects for translating. An additional Test of English as a Foreign Language also was applied in order to determine the subjects' English foreign language proficiency level. The research questions were analyzed using Pearson correlation test. The findings of the study revealed that there was no significant relationship between the level of spiritual intelligence of translators and the quality of their translation and between spiritual components only critical existential thinking and transcendental awareness can be positive predictors of the quality of English to Persian translations of religious texts. The analysis also showed that females' spiritual intelligence is significantly higher than average score among males and level of spiritual intelligence cannot be a good predictor to determine the translators' favorite genre.

**KEYWORDS:** Spiritual Intelligence, Quality of translation, TOEFL test

## INTRODUCTION

Human beings have different abilities which have significant roles in their overall performance and behavior. Ignoring the impact of these factors makes the understanding and interpretation of behavior difficult. "Undoubtedly, in the era of communication and dialogue among civilizations, translation as a human behavior occupies a crucial role in transferring different ideas among different nations" (Shangarffam & Abolsaba, 2009, p. 103).

Translation is a phenomenon that has a crucial effect on people's life. It has been regarded as an art, craft, and science by various scholars during the history (Ordudari, 2008). According to Newmark, "translation is rendering the meaning of a text into another language in the way that the author intended the text" (1988, p. 5). But, the problem is that translation is not as easy as it seems. Even in a single language, choosing synonymous words is a difficult task.

According to Edmonds (1998) "When it admits more than one lexicalization, it is often difficult to choose which of these 'synonyms' is the most appropriate for achieving the desired pragmatic goals" (p. 507). In the case of religious texts, the difficulties are expanded. Translating religious texts is a difficult activity for a variety of reasons: firstly, there is a huge chronological gap separating the original text, its culture, language and context, from the target text and audience; secondly, there is the issue of revelation, and the divine nature of the text (Williams & Chesterman, 2002); thirdly, "centuries of veneration have given them [religious texts] a thick overlay of meanings" (Long, 2005, p. 3); finally, although not exhaustively, "the semantic space required in the target language can already be occupied, and the vocabulary and grammatical structures available to convey the message may already be "culturally loaded with indigenous referents" (Long, 2005, p.1).

Generally translation is not a simple process that only requires transforming words from one language into another. As Chen (2007) asserts, "it is unquestionable that the process of translation needs to engage in a great deal of decision-making activities". Levy claims that the process of translation is similar to the process of playing the game of chess (as cited in Venuti, 2000). Considering the process of decision-making in translation as a particularly complex procedure, Willis suggests that the translator should pay his attention on to the factors that lead to choices, rather than on the choices themselves (as cited in Baker, 1997). He further indicates that the final decision depends on a host of factors. Furthermore recent studies (Murphy, 2006) made it obvious that translation has always gone hand in hand with so many factors, thus it should be studied along with other fields, and it is not separated from them. One of the fields that can have a close relationship with translation is psychology. No one can deny the role of memory, language competence, world knowledge, experience, and practice in the success of a translator. The translator has his own feeling about language and his translation. This feeling consists of a 'sixth sense' and also it includes intelligence and sensitivity as well as knowledge (Newmark, 1988). The combination of all these feelings comes into play in the task of translation. "Translation is an activity of intelligence requiring creative problem-solving in novel, textual, social, and cultural conditions", (Robinson, 1997, p. 51). But what *kind* of intelligence does it utilize? Gardner defines intelligence as "the ability to find and solve problems, the ability to respond successfully to a new situation and the capacity to learn from one's past experiences" (1983, p. 21). He has proposed eight intelligences, including linguistic, logical-mathematical, spatial, musical, naturalist, and bodily-kinesthetic (Gardner, 1983, 1993, 1999). Recent decades have also observed broad literature on social and emotional intelligences which describe cognitive abilities of emotional perception on intra- and inter-personal levels (Gardner, 1983; Mayer, 1990). As Gardner (1983) explains, "owing to heredity, early training, or, in all probability, a constant interaction between these factors, some individuals will develop certain intelligences far more than others; but every normal individual should develop each intelligence to some extent, given but a modest opportunity to do so" (p. 278). This means that teachers can now add a new role to their traditional ones: they should activate the less developed types of intelligence in each learner as well as to optimize and draw upon those types that are already active, in order to enhance students' educational opportunities and options (Martins, 2011). Among the intelligences proposed, the concept of *spiritual intelligence* (SI) has remained a forerunner in the past decade (Emmons, 2000 a; Nasel, 2004; Wolman, 2001; Zohar & Marshall, 2000). Vaughan (2002) defined SI as the ability to give meaning which is based on deep understanding and the awareness of existential questions, and the ability to use multiple levels of consciousness in problem solving. Using Gardner's definition of intelligence, Emmons (2000 b) argues that spirituality is a form of intelligence. He claims that spirituality predicts functioning and adaptation as demonstrated by correlations of spirituality with improved health or well-being. As noted above, development of multiple intelligences by Gardner (1983) motivated language educators began to explore the relationship between multiple intelligence (MI) and language learning/teaching, although it has never, to our knowledge, been applied to translator training (Martins, 2011).

The aim of the present study is to investigate the relationship between spiritual intelligence and translation. There are several purposes for this study: first, as the available literature in Iran is low on empirical research on the relationship between translation and spiritual intelligence, the scarcity of research and a need for spirituality in learning and teaching situations necessitates undertaking a study in this field. Second, if the translators' spiritual intelligence can help the translator in perception of the text connotative meaning which is purely associated with the non-literal senses of a word (Yule, 1996) and affects the translation quality, the translators will try to improve this aspect of themselves.

## REVIEW OF THE LITERATURE

### *Multiple Intelligences*

Psychological testing has remained a critical tool that school psychologists use to assist in educational, behavioral and vocational decision-making (Hu & Oakland, 1991). And also the concepts of multiple intelligence and learning style are widely encountered and used today in education, business, arts and other areas of daily life. There is a substantial research on multiple intelligences and learning style in different fields and with different purposes. As suggested by an assumption, combining individual multiple intelligences and learning style in education may help students learn in fields other than those in which they are strong (Silver et al., 1997). Multiple intelligences concept introduced by Gardner (1983). He argues that high scores in mathematics and language tests cannot alone serve as a proof of human intelligence. Intelligence is something beyond the scores made in standard paper-and-pencil tests used to estimate success at schools. In other words, traditional intelligence tests cannot measure the abilities of a chess player, an athlete or a violinist. Gardner (2004) maintains that intelligence incorporates too many abilities not to be explained by a single factor. He describes intelligence as the capacity of an individual to create products that are valued in one or more cultural settings, his/her skill to produce effective and efficient solutions to problems in daily life and also his/her ability to discover new and complex problems demanding solutions (as cited in Saban, 2004). Gardner (1983) first defined seven different types of intelligence and then introduced "naturalistic intelligence" as the eighth type. Regarding human's different types of dominant intelligences, therefore, it seems inevitable that the theory of multiple intelligences will influence curriculum, learning approaches and assessment-evaluation processes. Considering the translator as a learner, Robinson (1997) puts forward that "translation is an intelligent activity involving complex processes of conscious and unconscious learning" (p. 49). He maintains that, "translation is an intelligent activity, requiring creative problem-solving in novel, textual, social, and cultural conditions" (p. 51); but what kind of intelligence does it utilize?. It may seem that translators and interpreters are intelligent *only* linguistically; as if the only intelligence they need on their work as translators are the ability to understand and produce language. It is not. Technical translators need high spatial and logical/mathematical intelligence as well. Interpreters need high bodily-kinesthetic and personal intelligence. Translators of song lyrics need high musical intelligence.

### *Spiritual Intelligence*

Spiritual intelligence (SI) is one of the human abilities that distinct human from the other beings. According to Amram (2009), spiritual intelligence is a kind of ability that causes self-consciousness, self-control, profound understanding of meaning of life, purposefulness, increase in peace, the ability to communicate effectively with others and mental health. Spiritual intelligence does not refer to a specific religious orientation. So in this part, the concentration is on the reviewing of theorists' viewpoints about definitions, dimensions and the studies done to establish a connection between spiritual intelligence and human's some different behaviors. Spiritual intelligence (SI) is one of the human abilities that distinct human from the other beings and it is a difficult term to define. As Crichton asserts that "there are a lot of challenges to define and describe spiritual intelligence: what is it, how it functions, and whether it can be learned or improved; though none of the authors addressed all of these issues" (2008, p. 8). Spiritual intelligence as a new dimension of human intelligence has been presented by Zohar and Marshall and linked the term "SQ" (spiritual quotient) that stands for Spiritual Intelligence. He believes that SQ becomes the fundamental basis of effective usage of EQ and IQ as being argued by people. It is also been denoted by people as the intelligence of the soul. One's IQ comes from the reasonable and logical thinking while EQ derives from the associated habit-bound and pattern awareness emotional thinking. A person's creativeness, understanding, rule-formulating skill and rule breaking thinking reframe and alter our previous thinking that further provides a person the SQ. SQ permits an individual to include a greater, profound and more affluent context to the present just like the whole can be greater than the sum of its parts. There is no such essential connection with organized religion as to the term "*spiritual*" relative to intelligence.

## RESEARCH QUESTIONS

1. Is there any significant relationship between EFL learners' spiritual Intelligence and the quality of their English to Persian translations of religious texts?
2. Is there any significant relationship between components of spiritual intelligence (critical existential thinking, personal meaning production, transcendental awareness, and conscious state expansion) and the quality of EFL learners' English to Persian translations of religious texts?
3. Is there any significant relationship between EFL learners' spiritual Intelligence and their gender?
4. Is there any significant relationship between EFL learners' level of spiritual intelligence and their favorite genre?

## METHODOLOGY

### *Participants of the research*

The target sample of the current study included male and female EFL graduate students of English translation studies living in Dargaz, Iran. The present study relied on a self-selected sample of participants which fell, into the category of opportunity/convenience-sampling in that it relied upon suitable participants in the local to be recruited via correspondence. To remove the effect of EFL level as a variable which might have affected the quality of translation, firstly, participants were homogenized through a sample of a TOEFL test. About 55 graduate students from Dargaz took part in this study, but data from 19 participants were discarded due to EFL proficiency test, reducing the number of sample to 42.

### *Instrumentation*

In order to conduct the study and to investigate the proposed hypotheses, ie, to investigate the variables types of spiritual translation, the researcher used some sets of tests including a rendering and transferring test of translation, and a questionnaire to measure the EFL learners' SI level and also the genre preference of the subjects. An additional TOEFL test was also applied in order to determine the subjects' EFL proficiency level.

#### Procedure

The following steps were taken to accomplish the purpose of the study: First, to ensure the sample's homogeneity, a sample TOEFL test was administered to 55 students among which 42 students whose scores fell within one standard deviation above and below of the mean of the TOEFL test were selected. The participants were all allowed to use any kind of dictionary they desired. First, the translation test was administered to the participants and once each participant had finished the assignment, s/he was given the questionnaires to fill. The time allocated for administering the translation test was 60 minutes and it took 15 minutes to answer the questionnaires. The spiritual intelligence questionnaire had a fixed scoring rubric provided by its designer, and the Khanmohammad and Osanloo's (2009) model was used to rate the translations. To avoid subjectivity as a major problem in scoring the translations, three different raters rated the learners' translations. Therefore, each participant's translation score was the average of the scores given by the three raters.

#### RESULTS AND DISCUSSION

To investigate the first hypothesis, that is, there is no relationship between the spiritual intelligence and the quality of EFL learners' English to Persian translations of religious texts, the Pearson Correlation Coefficient was calculated.

Table 1: Descriptive Statistics of the obtained Scores on Translation Test, and Spiritual intelligence

	Mean	Std. Deviation	N
Translation	73.05	18.407	42
SI	60.74	13.245	42

As it can be seen, table 1 shows the results of variables of religious translation and SI. The mean and standard deviation of religious translation are 73.05 and 18.407 respectively. Also, another variable; the mean and standard deviation of SI are 60.74 and 13.245 respectively. Therefore, it should be noted that the difference between these two variables was not significant. In order to find the difference, the researcher conducted Pearson Correlation Test between these two variables.

Table 2: Pearson Correlation Test between Translation and SI

		Translation	SI
Translation	Pearson Correlation	1	.221
	Sig. (2-tailed)		.160
	N	42	42
SI	Pearson Correlation	.221	1
	Sig. (2-tailed)	.160	
	N	42	42

Table 2 shows the Pearson Correlation Test between religious translation and SI. As the table indicates, the level of significance is .160 and is more than threshold 0.05. Therefore; the present results did not reject the first hypothesis. In fact, the relationship between religious translation and SI are not significant. To address the second hypothesis, there is no significant relationship between critical existential thinking and the quality of EFL learners' English to Persian translations of religious texts, the following analysis was conducted.

Table 3: Descriptive Statistics of the obtained Scores on Translation Test, and CET (Critical Existential Thinking)

	Mean	Std. Deviation	N
Translation	73.05	18.407	42
CET	17.45	4.203	42

As it can be seen, table 3 illustrates the results of variables of religious translation and CET as components of SI. The mean and standard deviation of religious translation are 73.05 and 18.407 respectively. Also, another variable; the mean and standard deviation of CET as component of SI are 17.45 and 4.203 respectively.

Table 4: Pearson Correlation Test between Translation and CET

		translation	CET
Translation	Pearson Correlation	1	.751**
	Sig. (2-tailed)		.000
	N	42	42
CET	Pearson Correlation	.751**	1
	Sig. (2-tailed)	.000	
	N	42	42

\*. Correlation is significant at the 0.01 level (2-tailed).

The above table

illustrates Pearson Correlation Test. As the table indicates, the level of significance is .000 and less than threshold 0.01. Therefore, the relationship between religious translation and CET as components of SI is significant. The correlation between translation and CET are equal to 0.751 and correlation is significant at the 0.01 level (2-tailed). So the results reject the null hypothesis.

Table 5: Descriptive Statistics of the obtained Scores on Translation Test, and PMP (Personal Meaning Production)

	Mean	Std. Deviation	N
Translation	73.05	18.407	42
PMP	14.24	3.818	42

As it can be seen, table 5 illustrates the results of variables of religious translation and PMP as components of SI. The mean and standard deviation of religious translation are 73.05 and 18.407 respectively. Also, another variable; the mean and standard deviation of PMP as component of SI are 14.24 and 3.818 respectively. Therefore, it should be noted that the difference between these two variables was not significant. In order to find the difference, the researcher conducted Pearson Correlation Test between these two variables.

Table 6: Pearson Correlation Test between Translation and PMP

		Translation	PMP
Translation	Pearson Correlation	1	.111
	Sig. (2-tailed)		.483
	N	42	42
PMP	Pearson Correlation	.111	1
	Sig. (2-tailed)	.483	
	N	42	42

As the table shows, the level of significance is more than threshold level of 0.05. Therefore, there are not any relationship between religious translation and PMP. So the obtained results support the null hypothesis, that is, There is no relationship between personal meaning production and the quality of EFL learners' English to Persian translations of religious texts.

Table 7: Descriptive Statistics of the obtained Scores on Translation Test, and TA (Transcendental Awareness)

	Mean	Std. Deviation	N
Translation	73.05	18.407	42
TA	17.10	4.259	42

As it can be seen, table 7 illustrates the results of variables of religious translation and TA as components of SI. The mean and standard deviation of religious translation are 73.05 and 18.407 respectively. Also, another variable; the mean and standard deviation of TA as component of SI are 17.10 and 4.259 respectively. In order to find the difference, the researcher conducted Pearson Correlation Test between these two variables.

Table 8: Pearson Correlation Test between Translation and TA

		Translation	TA
translation	Pearson Correlation	1	.327*
	Sig. (2-tailed)		.035
	N	42	42
TA	Pearson Correlation	.327*	1
	Sig. (2-tailed)	.035	
	N	42	42

\*. Correlation is significant at the 0.05 level (2-tailed).

The above table indicates Pearson Correlation Test between these two variables. As the table shows, the level of significance is .035 and less than 0.05. Therefore, the Pearson coefficient for the relationship between religious translation and TA is .327, and it is positive. This tells us that, as religious translation increases, TA increases. Thus, our hypothesis indicated that "there is no significant relationship between transcendental awareness and the quality of EFL learners' English to Persian translations of religious texts was rejected.

*Table 9: Descriptive Statistics of the obtained Scores on Translation Test, and CSE (Conscious State Expansion)*

translation	73.05	18.407	42
CSE	11.74	3.596	42

Also, in the above table shows the mean and standard deviation of these two variables. The mean of religious translation and CSE are 73.05 and 11.74 respectively.

*Table 10: Pearson Correlation Test between Translation and CSE*

		Translation	CSE
Translation	Pearson Correlation	1	.012
	Sig. (2-tailed)		.940
	N	42	42
CSE	Pearson Correlation	.012	1
	Sig. (2-tailed)	.940	
	N	42	42

Table 10 indicates the Pearson Correlation Test between religious translation and CSE. As the table indicates, the level of significance is .940 and is more than threshold 0.05. Therefore, the relationship between religious translation and CSE are not significant. In fact, the null hypothesis that there is no significant relationship between conscious state expansion and the quality of EFL learners' English to Persian translations of religious texts was not rejected.

#### ***Spiritual intelligence and Gender relationship***

To investigate the second hypothesis, that is, there is significant relationship between EFL learners' spiritual intelligence and their gender, according to their gender, the average score of the participants was calculated. The results are indicated in Table 11.

*Table 11: Descriptive Statistics of SI Scores according to gender*

Gender	N	Maximum Score	Minimum Score	Average
Female	23	82	36	62.45
Male	19	75	27	54.44

In this research, the strongest spiritual intelligence that girls had was 82 and the weakest intelligence score for them was 36. But about the males the strongest spiritual intelligence was 75 and the weakest intelligence score for them was 27. Comparing the average scores of two groups, the level of spiritual intelligence varies in people according to their gender. In this study, females with average score 62.45 have a higher spiritual intelligence than males with 54.44 average score. So the hypothesis is confirmed.

#### ***Spiritual intelligence and favorite genre relationship***

To examine the last hypothesis, that is, there is significant relationship between EFL learners' level of spiritual intelligence and their favorite genre, the participants were divided into two upper and lower groups according to their spiritual intelligence scores; and also their probable favorite genre was assumed through the questionnaire which was explained in details in the previous chapter. The results are indicated in percentage in the Table 12 Comparing two groups, we can see there is no significance different between upper and lower group according to their obtained scores in each genre. Unexpectedly, participants in lower group who enjoyed of lower spiritual intelligence were more interested in religious text translation than the upper group. But the differences were not significant. Thus, the hypothesis that "EFL learners who have high level of spiritual intelligence are intrinsically interested in translations of religious texts", was rejected.

*Table 12: Upper and Lower genre preference*

	Genre		
	Religious	literary	scientific
Upper group	%33.30	%28.5	%38.09
Lower group	%47.6	%19.04	%33.33

## CONCLUSIONS

This study examined the relationship between two sets of scores on a translation production test and a spiritual intelligence questionnaire which were obtained from the same participants. Based on the results of this study, the main null hypothesis was not rejected. In other words, the research provided evidence that there was not any significant relationship between the spiritual intelligence and the quality of English to Persian translations of religious texts. However, further studies may be required on this topic in order to draw more certain conclusions. In addition to the main hypothesis, the next claim that there was no correlation between the quality of English to Persian translations of religious texts and the components of spiritual intelligence, two of them were rejected and two confirmed. In simple terms, in spite of null hypotheses, there was significant relationship between CET (critical existential thinking) and the quality of EFL learners' English to Persian translations of religious texts and also between TA (transcendental awareness) and the quality of EFL learners' English to Persian translations of religious texts. But as predicted, there was no relationship between the other two components of spiritual intelligence, that is, PMP and CES and the quality of religious text translation. Regarding the fact that among all people, no group has experienced more difference than what men and women done (Glick & Rudman, 2008), the third positive hypothesis saying "there is significant relationship between EFL learners' spiritual intelligence and their gender", was confirmed. The results showed that women have a higher level of spiritual intelligence than men. The findings of the study also showed that there is no meaningful relationship between spiritual intelligence and translators' favorite genre. It means that level of spiritual intelligence cannot be a good predictor for translators' favorite genre.

A CORRELATIONAL STUDY OF EFL LEARNERS'  
'AMBIGUITY TOLERANCE' AND 'ACCULTURATION' IN RECEPTIVE SKILLS

## ABSTRACT

Due to the detrimental effects of foreign language ambiguity on multiple areas of language achievement, a large body of research has been devoted to examining the sources of ambiguity intolerance. Yet very few have considered acculturation and proficiency level of learners as causal factors in foreign language Ambiguity Tolerance. This enquiry proposes hypothesized links between foreign language ambiguity tolerance, three components of Schumann's (1978, 1986) acculturation theories (assimilation, preservation, and adaptation), and selected cognitive variable proficiency level as (high, mid, low) in the Iranian English as a foreign language (EFL) context. A set-wise regression analysis revealed the two variables that contributed significantly to the prediction of foreign language ambiguity tolerance: preservation, and English language proficiency. The pedagogical implications of these findings for reducing FL ambiguity intolerance and for improving foreign language learning and acculturation are discussed. An important finding indicates that learners' inclination to resist the TL culture can lead to increased levels of ambiguity intolerance. Hence, strategies need to be devised and implemented to allow learners to develop stronger security about their roots and simultaneously reaching out to global world where multilingual and multicultural societies are the norm.

**KEYWORDS:** Ambiguity tolerance, Schumann's acculturation theory, Acculturation, Receptive skills

## INTRODUCTION

McLaughlin (1987) and Daniels (2000) acknowledge that acculturation theory originated with the ethnographic work of Linton (1960, as cited in Daniels 2000,p.1), who studied the changes Native Americans needed to make in order to become more integrated into mainstream American society. He identifies the notion of the distance separating the two cultural groups and the social and psychological changes which would be necessary for closer interaction to take place. Social distance would be associated with the actual contact which was available between the two cultures, while psychological distance represented the extent to which the learner wanted to become closely adapted to the dominant culture. Perhaps the earliest model toward centrality to learner factors was Schumann's acculturation /pidginization model (1978). Gass and Selinker (2008) assert that the model developed from Schumann's observation of the untutored acquisition of English by Alberto, a 33- year old, working class Costa Rican living in the Boston area. Alberto lived in a Portuguese- speaking neighborhood and worked in a factory staffed by NNSs of English. Due to his limited contact with English speakers, it is not surprising that Alberto was not a very successful language learner. Schumann explained Alberto's limited acquisition of English by pointing to Alberto's social and psychological distance from speakers of the TL.

Reading and listening in a foreign language may be a rather ambiguous process that involves processing unknown linguistic and cultural input, which might eventually cause uncertainty and/or confusion on the part of readers or listeners. Success in such a complex and uncertain process may involve a myriad of factors, one of which could be tolerance of ambiguity that readers exhibit during reading. It is significant to explore this psychological construct since an awareness of how it influences foreign language learners and learning may alter the way teachers plan and execute their lessons, and help learners overcome their psychological barriers. Thus, this study was prompted by the desire to understand tolerance of ambiguity in relation to such factor, proficiency level and its correlation with students' acculturation in their EFL reading and listening comprehension success. Below is presented a brief review of related literature, followed by a description of the research methodology and findings. The findings are then discussed in the light of literature, conclusions are drawn and suggestions are made.

## LITERATURE REVIEW

### *Ambiguity and Tolerance*

Early definitions of ambiguity regarded uncertainty in real life. In such definitions, ambiguity was described as caused by the nature of cues available in the context or stimulus given. McLain (1993), for example, defines ambiguity as not having sufficient information about a context. According to Budner (1962), ambiguous situations can be of three types: new situations, complex situations, and contradictory situations. These are, respectively, where there are not sufficient or non- existent cues, where there are too many cues, and where cues are not easy to distinguish. Norton (1975), further, summarizes causes of ambiguity as 1) multiple meanings, 2) vagueness, incompleteness, or fragmentation, 3) a probability, 4) unstructured, 5) lack of information, 6) inconsistencies and contradictions, and 8) unclear. Kazamina summarizes current definitions and concludes that ambiguity is marked by "novelty, complexity, insolubility and lack of structure" (1999,p. 69).

Related to the concept of ambiguity is *tolerance*. Webster's Encyclopedic Unabridged Dictionary of English language defined tolerance as "a fair and objective attitude toward those whose opinions, practices, race, religion, nationality, etc. differ from one's own; freedom from bigotry." Such a definition of tolerance precludes acceptance of ambiguous situations whereas intolerance may entail considering uncertainties and unclear meanings as potential sources of discomfort and treat (Norton, 1975). Tolerance of ambiguity, then, can be a reflection of our personality (Ely, 1989; Ehrman, 1993; 1994). As such, people with tolerance of ambiguity are likelier to feel comfortable under uncertain conditions (Budner, 1962).

### *Ambiguity Tolerance (AT) and Language Learning*

Ely (1989) defines AT as the acceptance of uncertainties. Such tolerance can be translated into the language learning context as "an ability to deal with ambiguous new stimuli without frustration or without appeals to authority. It allows for indeterminate rather than rigid categorization" (Ellis, 1994: 518). In this sense, students with AT, then, are expected to feel comfortable with learning a new language with its uncertainties and unknown structural and cultural norms to be dealt with. McLain (1993), for example, reports that students who are tolerant of ambiguity are more willing to take risks and open to change (Rubin, 1975; Stern, 1975; Naiman, Frohlich, Stern & Todeso,

1978) and show endurance on tasks and higher levels of achievement (Chapelle, 1983; Naiman, Todeso, and Florich, 1975). Similarly, White (1999) views AT as a reaction to uncertainties whereby ambiguity is accommodated so that it does not impede progress. Our level of AT may also influence the use of certain language learning strategies. Ehrman and Oxford (1990) found that learners with intuitive type of personalities who have relatively higher levels of AT reported that they often guessed from context whereas sensing type of personalities with lower AT reported that they disliked having to guess from context. Further, learners, who are called judgers, reported not using compensation strategies like the sensing type of students because of their discomfort with ambiguity, whereas perceivers who can tolerate uncertainty tended to use of metacognition while perceivers reported that they disliked metacognitive behaviors, reflecting their also illustrated the influence of AT on the use of strategies. The first student who was comfortable with ambiguity did not want to use a dictionary in extensive reading and wanted to carry on without looking up unknown words. However, the second student who was not so tolerant “first figured out the sentence structure, checked the meanings of unknown words, and then translated it into Japanese” (ibid: 89) to minimize any possible ambiguity.

Ehrman (1993; 1999) maintains that tolerance of ambiguity operates at three levels: *intake; tolerance of ambiguity proper; and accommodation*. On the first level, tolerance enables learners to receive linguistic input. Students with tolerance of ambiguity can perceive and accept new information even though it involves many unknown elements. The second level involves being able “to hold contradictory or incomplete information without either rejecting one of the contradictory elements or coming to premature closure on an incomplete schema” (1993, p.331). At this level, the learner has taken new information in and needs to deal with contradictory or incomplete information (e.g. inferring meanings of unknown vocabulary in an article). The last level has been borrowed from constructivist psychology (Piaget, 1967) and involves adopting the self according to new material. That is, this level entails integrating new information with the existing schemata, restructuring the latter

#### ***How tolerant should learners be of ambiguity?***

Ambiguity is an inevitable reality of learning a new language and people do tend to have different levels of ambiguity. As reviewed above, research indicates that AT is related to achievement in language learning. However, concerns have also been expressed regarding over-tolerance. This is because such high levels of tolerance may result in unquestioned acceptance (Ely, 1995; Kazamina, 1999). Ely maintains that the lack of sensitivity to ambiguous linguistic data may cause early pidginization or fossilization in language development. The question then becomes “what level of ambiguity is ideal for success in language learning?” It is generally suggested that a moderate level of tolerance of ambiguity should be beneficial for effective language learning. Ely claims “the ideal case, of course, is that of the learner who is neither inhibited by low tolerance of ambiguity nor oblivious to linguistics subtleties” (ibid: 93). However, Kazamina (1999) purports that this mid-point has not yet been fully defined. To elucidate this mid-point, El-Koumy (2000) illustrated that moderately tolerant students were more successful than both high tolerance students and low tolerance students. His findings are illustrative of what degree of tolerance is suitable for language learning and in all four language skills. Yet, more research is needed to understand the nature and place of AT in the process of foreign language learning.

#### ***The acculturation model***

The acculturation model, developed by Schumann, is based on social and psychological factors. “Acculturation” is defined as the social and psychological taxonomy of factors which are believed to be important in the process of SLA in natural contexts. The major claim of the model is that acculturation, which is a cluster of social-psychological factors, is the major cause of SLA (Schumann, 1978, 1990). Schumann states that any learner can be placed along a continuum ranging from social-psychological distance to social-psychological proximity with the speakers of the target language. The degree of language acquisition, then, would correlate with the degree of the learner’s proximity to the target group. Schuman (1986) claims that acculturation, or the integration of the L2 learner into the target linguistic community is not a direct cause of second language acquisition (SLA), but rather it is the first in a chain of factors which results in natural SLA. Schumann (1986, p.385) proposes that “acculturation as a remote cause brings the learner into contact with TL-speakers and verbal interaction with those speakers as a proximate cause brings about the negotiation of appropriate input which then operates as the immediate cause of language acquisition. According to Schumann (1978), social distance refers to the learner as a member of a social group that is in contact with another social group whose members speak a different language. He enlists various factors that shorten the social distance:

*Social dominance*: If the second-language learning (2LL) group is politically, culturally, technically or economically dominant to or subordinate to the target language (TL) group, social contact between the two groups will tend not to be sufficient for optimal target language acquisition. If they are nearly equal in status, then there will be more contact between the two groups and thus, acquisition of the target language will be enhanced. *Assimilation, preservation, and adaptation*: The best condition for L2 acquisition is obtained when the 2LL group wants to assimilate into the TL group. The second best condition occurs when the 2LL group wants to adapt to the TL culture for intergroup interaction without assimilating to it. The least favorable conditions obtain for acquiring the L2 when the 2LL group wishes to remain separated linguistically and culturally from the TL group. *Enclosure*: The more 2LL group, the more likely the contact with the TL group, the more favorable the conditions will be for L2 acquisition. *Cohesiveness and size, Congruence*: The more similar the culture of the two groups, the more likely there will be social contact and thus language acquisition. *Attitude, Intended length of residence and the psychological factors* affect the psychological distance are: *Language shock* (Learner’s confusion when using L2), *Culture shock* (Learner’s disorientation as a result of culture differences).

#### ***Acculturation: Types, Stages and Kinds of Learning***

Trawinski (2005) cites social and psychological distances determine how much input the learner will be exposed to, and how much input will be converted in to intake. Schumann (1978) believes that the level of language proficiency the learner achieves strictly depend on the degree of acculturation. He distinguishes three functions of language, which may also be considered as the three stages of language development:

- Communicative function (the transmission of referential information only)
- Integrative function (the mark a membership of a particular social group)
- Expressive function (the display of linguistic virtuosity)

The acculturation model developed by Schumann (1978) emphasizes identification with a community as a primary requirement of SLA. According to Schumann, there are two types of acculturation. The first type takes place when the learner is socially integrated with and psychologically opens to the target group. The second type of acculturation has all the characteristics of the first type except for the psychological open-ness of the learner. Brown (1980) postulates the process of acculturation in the target language natural environment consists of four stages:

**Euphoria**-the learners get excited over the newness of the surroundings

**Culture- shock**- emerges as individuals feel the intrusion of more and more culture differences into their own images of self and security

**Cultural stress**- gradual recovery: some problems of acculturation are solved, while others continue for some time. The learner starts to understand the differences in thinking. The learner's problems center around the question of identity, she/he does not perceive herself/himself as belonging to any culture.

**Full-recovery**- adaptation, assimilation or acceptance of the new culture. A new identity developed.

Schumann (1978) also describes the kind of learning which take place in this model. He suggests that the early stages of SLA are characterized by the same processes that are responsible for the formation of pidgin languages. If the social and/or psychological distance is great then acculturation is impeded and the learner does not progress beyond the early stages of language acquisition. As a result his/her target language will stay pidginize. Pidginization is characterized by simplifications and reductions occurring in the learner's inter-language which lead to fossilization when the learner's inter-language system does not progress in the direction of the target language (Gitsaki, 1998).

#### *Evidence Supports the Acculturation Model*

Schumann (1978) provides some supporting evidence from different studies that these variables enhance or inhibit SLA. He also postulates that psychological factors, especially motivation, may have more influence on SLA than social factors (Stauble, 1977). It is interesting to note that according to this model, variables other than acculturation are of minor or moderate importance for SLA. For example, instruction is assumed to have no important role in SLA. In this regard, Schumann (1978, p.368) states: "... Educational institutions are really only free to manipulate teacher, method, and text variables. I believe that these variables are so weak in terms of the total language learning situation that no matter how much we attempt to change them, we will never achieve much more success than we are achieving now". Norton Pierce (1995) highlights the strength of Schumann's model in the socio-cultural contexts of language learning without neglecting the role of individuals in the language learning process. It recognizes, furthermore, the importance that must be placed on regular contact between language learners and speakers of the target language for successful language learning to take place. Moreover, Doughty and Long (2003) postulate that Schumann's model applies to L2 acquisition in the natural settings only. They maintain that, in FL learning the situation is quite different because most social and affective variables lose their importance in conscious learning. Consequently, the Acculturation Model can not be used directly for purposes of working out a methodology for FL instruction. Finally, according to Schumann (1986), acculturation is a dynamic process that takes place over time. A learner's social and psychological distance profile may change during the course of his or her stay in the TL environment.

#### *Acculturation Extended Model (AEM)*

It should be noted that the acculturation model focuses on social and psychological factors and ignore other variables in SLA. That is why some scholar added other variables to account for SLA along with acculturation factor. Ellis (2008) and Larson-Freeman (2007) assert that an elaborated version of Schumann's model was provided by Anderson as cognitive dimension. Anderson built the nativization model on Schumann model in particular by providing a cognitive dimension which Schumann did not consider. According to Ellis (1985) the model consists of two major processes:

**-Nativization:** The process of assimilation of the input. The learner modifies the L2 input to match his/ her internalized knowledge of L1, other languages and the world. This process is visible in the first stage of language acquisition.

**-Denativisation:** The process of accommodation. The learner modifies his/her internalized knowledge to accommodate L2 input. This process is typical for later stages of language acquisition when L2 production is close to target norm.

Teske and Nelson (1974, cited in Navais, et.al.2005) offered the first complete psychological perspective on acculturation. According to these writers, acculturation included changes in material traits, behavior patterns, norms, institutional changes, and importantly, values. However, Teske and Nelson did not go further in their psychological analysis of how members of diverse cultures accommodate to one another. This was left to Berry (et. Al., 1992), who expanded on the view of acculturation to include varieties of adaptation and specifically identified the following four factors: assimilation, integration, rejection, and deculturation. The importance of Berry's model was that it recognized the importance of multicultural societies, minority individuals and groups, and the fact that individuals have a choice in the matter of how far they are willing to go in the acculturation process. Today, there are numerous instances of ethnic groups who have managed to revive their ancestral language and culture (Fishman, 2001). Thus, acculturation was not seen as a strictly unidimensional process of cultural change but as a process forced by intergroup contact with multiple outcome.

#### **PURPOSE OF THE STUDY**

Despite the significant research efforts and advances in exploring factors associated with FL ambiguity tolerance, previous studies have mostly considered the links between FL ambiguity tolerance and socio - demographic variables or personality variables. Less attention has been paid to the role of culture, particularly acculturation, in FL ambiguity tolerance. Furthermore, although acculturation has thus far been shown to be a possible source of ambiguity, how its different aspects operate to affect ambiguity in EFL setting remains unclear. The present research purports to investigate the relationship between three facets of acculturation (assimilation, preservation, and adaptation) and FL ambiguity in the Iranian EFL context. This study aimed to understand how tolerant Iranian learners of English are in the preparatory English classes as well as to explore the relationship between Tolerance of Ambiguity and one major variable: language proficiency. Given that much of the discussion on acculturation focuses on immigrants and most scales developed to measure acculturation center on bilingual immigrant contexts (Anderson et al., 1993; Stephenson, 2000; Tsai, Ying, & Lee, 2000), a questionnaire was designed for this study to probe into the issue. In an attempt to bridge these research gaps and offer insights into multifaceted nature of FL ambiguity tolerance (AT).

#### **RESEARCH QUESTIONS**

- 1) How tolerant are Iranian university level EFL learners of ambiguity?
- 2) Does tolerance of ambiguity increase as level of English proficiency develops?
- 3) What are the relationships between learners' FL ambiguity tolerance, acculturation, and selected socio-demographic variable?

#### **METHODOLOGY**

##### *Participants*

The participants included 188 undergraduate students participating in conversation classes at Safir Language Institute in Mashhad, Iran. Of the whole participants, the majority was females while there were fewer male students (106-56% vs. 67-36%). Fifteen students did not report their gender. The students had a mean age of 19.67 (SD= 1.51), representing a very close age band. They generally had an intermediate level of English proficiency (108-57%), followed by pre-intermediate (48-26%), and advanced (27-14%) students. A big proportion of students perceived themselves as average readers and listeners (115-61%) while 34 students (18%) reported that they thought they were good at reading and listening in English. An important proportion of students (19%) thought they were not good at receptive skills in English. The participants were selected based on a local Teacher-made placement test.

### Instruments

The Participants were invited to complete a paper-based questionnaire which consisted of three parts: (a) the Foreign Language Classroom Ambiguity Tolerance Scale (FLCATS) ; (b) the EFL Student Acculturation Questionnaire (ESAQ) ;and (c) the Background Questionnaire. The FLCATS (Ely, 1995) with some demographic questions. Although there are other scales for measuring AT available in the literature (e.g. Budner, 1962; Norton, 1975) , to the best of our knowledge , FLCATS is the only published scale especially designed for measuring ambiguity tolerance in language learning. The (ESAQ) was developed to assess learners' levels of acculturation in various domains (cultural values, social interactions, and life choices).The background questionnaire elicited information on participants' gender , proficiency level in reading and listening skills. Each instrument was first translated into Farsi and checked through back-translation to ensure that alteration in meaning of the items had not occurred. They were pilot- tested prior to the formal study.

*The Foreign Language Classroom Ambiguity Tolerance Scale:* The version of FLCATS used in this study has 12 items with a four point likert scale. The items aim to measure students' agreement level with statements depicting intolerance of ambiguity in given situations. This version of FLATS was previously reported to have high internal consistency (Kazamina , 2000) and was employed in this study with the consent of Professor Christopher M.Ely. In its original version the FLTAS was used with anchors being at 4 (strongly Agree), 3(Agree), 2 (Disagree), and 1 (Strongly Disagree). In this current study, however, to avoid any bias and not to make students take a forced decision between a negative or positive choice ( Dornyei,2001), Ely's FLTAS was modified to have a five point Likert scale, inserting a new anchor 3( not sure).Moreover, the scale, originally written in English, was translated into Farsi. Back translation measures were taken and no significant semantic shift was detected by two expert readers. The Cronbach's alpha internal consistency reliability for Farsi version of the FLTAS with the five point Likert scale was found to be .75.

*The EFL Student Acculturation Questionnaire:* The ESAQ was developed following the criteria for inventory development (Dornyei, 2003; Gilham, 2000) to assess learners' acculturation levels in an EFL context. The initial items were developed based on theoretical frameworks of acculturation (Schumann,1978, 1986). Prior to the pilot test, three experts in educational psychology and EFL pedagogy were asked to scrutinize item clarity, redundancy, and reliability. The preliminary version of the questionnaire was piloted among 100 students in the same institute and their comments were incorporated accordingly to refine the questionnaire. The final version included 21 items on 5-point Likert scales in which 5 indicated *strongly agree* and 1 indicated *strongly disagree*. Evaluated with an exploratory factor analysis (principal axis extraction with direct oblimin rotation), the questionnaire revealed a three- factor solution which optimized parsimony and interpretability. Appendix A contains all the variables and items that have been submitted to correlation and regression analysis. The three factors included in this instrument were as follows:

- 1) Assimilation measuring an adoption of cultural norms, values, and lifestyles of the TL group
- 2) Preservation assessing the attributes that one maintains one's own cultural values while at the same time rejecting those of the TL group
- 3) Adaptation measuring an adjustment to the TL group's cultural norms and at the same time keeping their own cultural values

## RESULTS AND DISCUSSION

### *How tolerant/ intolerant are Iranian EFL learners of ambiguity at tertiary level?*

To identify the level of ambiguity tolerance of the students, descriptive statistics were utilized. To avoid any misunderstandings, the readers are reminded that the items in the FLCATS sought respondents' reactions to statements describing intolerance of ambiguity in some language learning contexts. Disagreement with an item, then, is conversely a sign of tolerance. Therefore, while interpreting how tolerant students are, a mean of 3.00, which was also the anchor for *not sure* , can be used as the border line of tolerance/ intolerance. Values above this border line will indicate lower levels of tolerance while those below will suggest more tolerance depending on their distance to the mean score of 3.00. Table 1 presents students' mean scores from the FLCATS.

Table 1: Ambiguity Tolerance scores from the SLTAS

	N	Mean	Sd
Total Ambiguity Tolerance Score	175	3.69	.47
When I'm reading something in English, I feel impatient when I don't totally understand the meaning.	186	3.85	.99
It bothers me that I don't understand every thing the teacher says in English.			
When I write English compositions, I don't like it when I can't express my ideas exactly.	188	4.40	.84
It is frustrating that sometimes I don't understand completely some English grammar.	186	4.28	.92
I don't like the feeling that my English pronunciation is not quite correct.			
I don't enjoy reading something in English that takes a while to figure out completely.	186	4.14	1.05
It bothers me that even though I study English grammar some of it is hard to use in speaking and writing.			
When I'm writing in English, I don't like the fact that I can't say exactly what I want.	185	4.11	.96
It bothers me when the teacher uses an English word I don't know.	188	3.82	1.23
When I'm speaking in English, I feel uncomfortable if I can't communicate my idea clearly.			
I don't like the fact that sometimes I can't find English words that mean the same as some words in my own language.	186	4.05	1.06
One thing I don't like about reading in English is having to guess what the meaning is.			
	186	4.35	.80
	187	3.42	1.36
	186	4.30	.85
	188	3.88	1.13
	188	2.99	1.33

The participants reported a level of tolerance of ambiguity that is a little above the mid- point (mean= 3.69). This gives support to Oxford (1999) who claimed that with its uncertainties language learning can be quite an ambiguous and stressful experience. The level of tolerance identified here shows that the participants in this study, on average, will not exhibit high tolerance/ intolerance of ambiguity, neither accepting without questioning nor being hampered by incomplete linguistic information. However, an item-by-item analysis of the scale reveals a mean range between 4.35 and 2.99, which indicates that the total score of 3.69 should not lead to stereotyping as people may have different levels of tolerance of ambiguity: low, moderate, or high tolerance (El-Koumy, 2000; Ely, 1995; Ehrman, 1999).

To explore whether participants could be placed in the suggested three ambiguity groups, a further K- means cluster analysis on SPSS was performed. The results can be seen in Table 2.

*Table 2: The results of grouping*

Ambiguity Cluster	N	% OF TOTAL N	MEAN	SD	Minimum	Maximum
High (H)	18	10.3%	2.7176	.3761	1.75	3.08
Moderate (M)	74	42.3%	3.5000	.1655	3.17	3.75
Low (L)	83	47.4%	4.0773	.2019	3.83	4.58
Total	175	100.0%	3.6933	.4788	1.75	4.58

A further analysis of variance (ANOVA) between these three groups confirmed that these clusters of students were distinct from one another ( $p < .000$ ) in terms of AT. The differences can be seen in

*Table 3: Differences between three AT clusters*

	Sum of squares	Df	Mean Square	F	Sig	Direction of Differences
Between Groups	32.141	2	16.070	356.706	.000	H>L P<.000
Within Groups	7.749	172	4.505E-02			M>L P<.000
Total	39.889	174				H>M P<.000

Descriptive statistics, coupled with cluster analysis and analysis of variance, point to three different groups of students according to their tolerance of ambiguity. An important proportion of students ( $f = 83$ ; 47.4%) had very high levels of intolerance (mean=4.07), while a similar proportion ( $f = 18$ ; 10.30%) reported they can tolerate ambiguity to a great extent (mean=2.71). This means that, expectedly, there are variations among language learners and they will not always tolerate ambiguity unanimously.

#### ***Does tolerance of ambiguity improve as proficiency improves?***

A slight improvement has been detected in tolerance of ambiguity as the level of English proficiency increases. Table 4 shows the mean values for tolerance of ambiguity for each proficiency level.

*Table 4: The findings from analysis of variance*

Proficiency Level	Tolerance of Ambiguity (Mean)	N	SD
Elementary (E)	3.6913	44	4894
Pre-intermediate(P)	3.7475	101	4814
Intermediate(I)	3.4647	26	4070
Total	3.6901	171	4806

*Table 5: Effects of proficiency level on tolerance of ambiguity*

	Sum of squares	df	Mean square	F	Sig	Direction of differences
Between Groups	1.654	2	.827	3.693	.027	E<P P<.511
Within Groups	37.614	168	.224			I>P P<.055
Total	39.268	170				I<E P<.007

The only significant difference was observed between pre-intermediate and advanced students in favor of the latter ( $p < .007$ ). Although there was also a considerable difference between the intermediate and advanced learners, this difference was slightly outside the significance level ( $p < .055$ ). This finding shows that as students improve their language proficiency, their level of tolerance also improves. This is to be expected as students becoming more equipped may feel safer in dealing with new information. After all, with their advanced level of language proficiency, the participants must have mastered both an important proportion of grammatical structures and very valuable advanced vocabulary to be able to read and listen without looking up unknown words (Nation, 1990).

#### ***What are the relationship between ambiguity tolerance, acculturation and socio-demographic variable?***

Normality of the questionnaire data was first checked using the Shapiro-Wilk test (Shapiro & Wilk, 1965). The results indicated that the distribution of the FLCATS scores were normal. Justifying the use of Pearson product-moment correlations and a multiple regression approach, no violations regarding the linearity were identified. To examine the relationships between FL ambiguity tolerance, EFL student acculturation (i.e. assimilation, preservation, and adaptation), and selected socio-demographic variable, Pearson product-moment correlations were used (see Table 1). One acculturation –related variable, preservation, was found to be the largest correlate of FL ambiguity intolerance, explaining 6.25% (i.e.  $.252^2 = 6.25\%$ ) of the variance. Ambiguity tolerance was also found to correlate significantly with the following variable: proficiency level (pre-intermediate, intermediate, advanced), in reading and listening comprehension.

Table 6 : Pearson of correlations of ambiguity tolerance with selected variable

Independent variable	FLCATS (r)
<b>EFL Student Acculturation</b>	
Assimilation	.09
Preservation	.25*
Adaption	.13
<b>Selected socio-demographic variable</b>	
Proficiency level	
High	-.19*
Mid	
low	

\*p &lt;.05

Table 6 presents the unstandardized regression coefficients and intercept, the standard error of the unstandardized coefficients, the standardized regression coefficients, the semi-partial correlations, and the squared multiple correlation coefficient (R<sup>2</sup>) of the model which maximum proportion of variance was explained. The analysis of set-wise regression revealed that preservation, proficiency level, (the higher would have more tolerance of ambiguity) reading/listening ability of FL learners contributed significantly, to the prediction of their ambiguity tolerance. The semi-partial correlation coefficients (Table 6) suggested preservation was the best predictor of FL ambiguity intolerance, accounting for 23.8% of the variance followed by proficiency level of the learners which explained 18% of the variance respectively.

Table 7: Selected multiple regression model for predicting FL ambiguity tolerance

Independent variable	Regression Coefficient	Standard Error	t value	Standardized regression co.	Semi-partial coefficients
Intercept	1.859	.304	6.114		
Preservation	.083	.042	1.989*	.205	.181
English proficiency	-.64	.040	-1.590	-.148	.145

An important result of this study is the confirmation of the speculation that preservation in Schumman's acculturation theory (1978,1986) was found to be a significant predictor of FL ambiguity. This finding suggests that ambiguity intolerant EFL students were likely to have disposition to resist the TL culture so that their cultural identity would remain intact. In other words, increased cultural preservation can result in reduced contact with the TL group and greater social distance, which exacerbated FL ambiguity.

There are positive correlations between proficiency level of the learners and tolerance of ambiguity. Consistent with previous findings (Baily, Daley, 2000; MacIntyre, Noels,1997), higher proficiency is the predictor of ambiguity tolerant EFL learners . The other studies showed females rather than males are more intolerant of ambiguity as well.

## CONCLUSION

This study aimed to explore the nature of ambiguity tolerance in reading and listening in a foreign language among tertiary level learners of English and its relationship with acculturation. It determines likely relationship between tolerance of ambiguity and cognitive variable , proficiency level. The findings of this study allow the authors to draw some conclusions. Firstly, the tertiary EFL learners participating in this study reported having a moderate level of ambiguity intolerance in language learning. Cluster analysis confirmed that the majority of the learners have either a high or moderate level of intolerance while only a small number of them have low intolerance. Therefore, it can be said that learners in an EFL context are generally less tolerant of ambiguity. The findings also suggested that there is a significant difference between ambiguity tolerance and learners' language proficiency levels, indicating that the higher the proficiency level, the more tolerant learners become in foreign language learning. One factor that may have impacted this result is that, as learners develop their linguistic knowledge, the need to control every detail in language learning becomes less important, thus resulting in higher tolerance of ambiguity.

The implications of this study are two- fold: pedagogical and further research. Firstly, students were found to have low tolerance of ambiguity. Such levels of intolerance can simply interfere with the learning process. As active agents in this learning process, teachers, then, have responsibilities to assist learners in their efforts to succeed in language learning. They should be prepared to set an agenda and share it with their students to help them increase their awareness of classroom procedures as well as the content to be learnt. As suggested by the literature, when learners are informed about classroom procedures, they feel more comfortable, self-confident and motivated in the language classroom (Dornyei,2005; Williams & Buerden,1997), which may in turn help lower intolerance of ambiguity. Secondly, as this study also indicated, pre-intermediate and intermediate learners tend to be less tolerant of ambiguity. Therefore, it could be more conducive to learning if teachers adopt a teaching approach, especially with such lower proficiency level students, that includes more insight into negative affective factors influencing language learning and acculturation.

An important finding indicates that learners' inclination to resist the TL culture can lead to increased levels of ambiguity intolerance. Hence strategies need to be devised and implemented to allow learners to develop stronger security about their roots and simultaneously reaching out to global world where multilingual and multicultural societies are the norm.

As for implications for further research, we need to note that this study is not without limitations. Firstly, the study did not employ a standard measure of reading/listening comprehension. Neither did it measure the students' proficiency level through standardized placement test. Finally, this study focused on a small number of university level Iranian EFL learners from one educational context. Therefore, it would be fruitful to further explore the relationship between all these variables employing more standardized measures and larger samples.

#### ABSTRACT

The paper critically analyzes the Semantic Translation from the popular comic The Adventure of Tintin 'The secret of the Unicorn'. Related to translation, culture manifests in two ways. First, the concept or reference of the vocabulary items is somehow specific for the given culture. Second, the concept or reference is actually general but expressed in a way specific to the source language culture. In practice, however, it is suggested that a translator should take into account the purpose of the translation in translating the culturally-bound words or expressions. One of the translation method which is focused on the cultural context is Semantic translation.

This research also describes the practical possibility of loyalty in Semantic translation. Since loyalty as a major translation criterion has been understood in many ways, the present writer feels that it is essential to investigate the subject in order to find the variation of the lexical in the cultural context that is loyal to the source language by using a translation comic The adventure of Tintin 'The Secret of Unicorn' as a case study. The research found that it is possible to find the equivalent of lexical in cultural context that is loyal to the sense and message of the source language.

**KEYWORDS:** The Semantic Translation, The Loyalty Concept, French and English languages, The Translation Comic

#### INTRODUCTION

In the field of visual story, such as comic, the translation allows us to understand the content of the story and also to recognize the writer and their idea. Thanks to the translator, there are many kinds of visual story books are produced in the different languages, so it can be accessed to the reader in whole world. Newmark (1988: 15) has said: "The translator's job isn't limited on transferring the linguistic system of language but they also have to be able to create the appropriate language and acceptable usage to represent the story through the sentence in order to express their idea." It means that they have to be competence on predicting the right word and term which are equivalent to the target language and sending a message from the source text to the target language.

The comic translation is more complicated than the other translation in the others genres, because it doesn't only need the competence of linguistic but also the competence of transferring the culture. The comic book which is translated to the others languages, for example from French to English, is not only transferring the linguistic system but also different culture and the idea of the author to the reader from the source language to the target language. In the process of translation, the competences of translator are important. For consideration, a good translator must not only understand the source language and the target language but also have a skill to understand the situation and the context of the story from the source language and translating that to the target language appropriately. The translators do their job by using the concept, the method and the technique of translation to transfer the sense of source text to the reader of the target language in order to produce the good translation.

The translator might be loyal on translating the source language to the target language by using the equivalence and the correspondence procedure to transfer the sense from the source language to the target language.

There are so many of comics which are translated in English. One of the translation comics which is quite popular in the world is The adventure of Tintin . The series of The adventure of Tintin are distributed in whole world and translated into many languages, including English. As we know, the original language used of the comic The adventure of Tintin is French. It was created by the Belgian cartoonist Georges Prosper Rémi who is known with the name Hergé. There are 23 complete series of The adventure of Tintin. Thanks to the translator, because of their translation, we know very well all the series of The adventure of Tintin and of course we can recognize very well the characters of the casts in this comic, and it is described excellently by the result of their translation.

According to that subject, the present writer proposes the title for the thesis research as 'The Loyalty Concept of Semantic Translation in French – English Translation comic The Adventure of Tintin 'The Secret of Unicorn'.

#### LITERATURE REVIEW

##### *The Loyalty Concept*

The loyalty is an important concept in the translation. It determines the trust of the message from the source language to the target language. It is a principal in whereas the translator who is loyalty to the message of the source language to the target language and culture, to the material and the style of the source text, and also loyal to the sense of the source language. They make the equivalent or correspondence translation to the text of the source language for the readers of the target language.

Kalawole and Salawu (2008) proposed that loyalty in translation is passing of the message from one language into another by producing the same affect in the other language, (in sense and in form), in a way that the reader of the translation would react exactly as the reader of the original text.

Tende in Guidère (2008 : 84) recommended the necessity of a good knowledge of both languages (source language and target language) and a distinction between the sense and the word for the translator to produces a target text which is loyal to the source language. Then, the translators use the loyalty concept in the translation to the literature books by translating the source text according to the message of the author and the sense from the source text.

According to Lederer (1994 : 51 -124) the concepts of Loyalty in translation are the translation is loyal to the author's message, the sense of the translation is equivalence to the source language, the translation has the cultural transfer from the source language to the target language. In the other side, Guidère (2008 : 83-85)

proposed that the loyalty concept is the translation which is loyal to the structure of the source text and correspondence to the source text.

The responsibility that translators have toward their partners is what I call 'loyalty'. The loyalty principle was first introduced into Skopostheorie in 1989 (Nord 1989, cf. Nord 1997: 123 ff.) in order to account for the culture-specificity of translation concepts, setting an ethical limitation on the otherwise unlimited range of possible skopoi for the translation of one particular source text.

#### ***The semantic translation***

The translator tries to translate the words by using the prediction of the cultural context that resemble to the oriented culture on the equivalent sense to the target language. Newmark (1988 : 46) proposed that the semantic translation may translate less important cultural words by culturally neutral third or functional terms but not by cultural equivalents - *une nonne repassant un corporal* may become 'a nun ironing a corporal cloth' - and it may make other small concessions to the readership.

The semantic translation is a way to write more pliable and refer more to the rule of the target language, comparing to the faithful translation. In the other hand, this method more concerns to the esthetic and expressive way on translation. For example :

Source language : Il est **un rat de bibliothèque**. (Hoed, 1993 : 18)

Target language : He is **a worm book**. (Hoed, 1993 : 18)

Halliday in Halliday and Hasan (1985: 5) states that there was the theory of context before the theory of text. In other words, context precedes text. Context here means context of situation and culture (Halliday and Hasan, 1985: 7). This context is necessary for adequate understanding of the text, which becomes the first requirement for translating. Thus, translating without understanding text is non-sense, and understanding text without understanding its culture is impossible.

Before that, the definition of culture should be understood by all translators before their created the translation products. From Koentjaraningrat (1996: 80-81) and Hoijer (1967: 106) the culture are (a) culture seen as a totality of knowledge and model for perceiving things, (b) immediate connection between culture and behavior and events, and (c) culture's dependence on norms. It should be noted also that some other definitions claim that both knowledge and material things are parts of culture.

So, the relation between language and culture are proposed by Snell-Hornby (1988: 40) who said that the connection between language and culture was first formally formulated by Wilhelm Von Humboldt. For this German philosopher, language was something dynamic: it was an activity (energia) rather than a static inventory of items as the product of activity (ergon). At the same time language is an expression of culture and individuality of the speakers, who perceive the world through language. Related to Good idea on culture as the totality of knowledge, this present idea may see language as the knowledge representation in the mind.

Nida and Taber explained on "*closest natural equivalent*", however, we can infer that cultural consideration is considered. They maintain that the equivalent sought after in every effort of translating is the one that is so close that the meaning/message can be transferred well.

In this study, in a large part, the basic conceptualizations of loyalty concept in translation are taken from Kalawole and Salawu (2008), Tende, Lederer (1994), Guidère (2008), Skopostheorie (1989). And there are also some theory of semantic translation from Newmark (Newmark (1988), and the theory of Halliday (1985) and Snell-Hornby (1988) about the language and culture.

#### **RESEARCH QUESTIONS**

The present study is undertaken to examine The Loyalty Concept of Lexical used in Semantic Translation From French – English Translation Comic The Adventure of Tintin 'The Secret of the Unicorn. The present study therefore, seeks to answer the following questions:

1. How to determine the loyal concept of lexical used in Semantic translation ?
2. Is it possible to find the equivalent lexical which is loyal in Semantic translation?

#### **METHODOLOGY**

This research is conducted based on the qualitative method. Alwasilah (2002) said that a qualitative method can be used to uncover and to understand what is behind any phenomenon. The descriptive method is employed to define, classify, analyze and describe the available data. Djajasudarma (1993) proposed that the descriptive method aims to describe factual and explain the character, situation, language phenomena in order to gain a systematic, factual and accurate data".

The process of data collecting can be described as follows :

- Reading the comic
- Conducting close reading strategy on the comic by reading thoroughly and repeatedly
- Collecting textual evidence by taking on the type of data
- Making data presentation and categories the data
- Conducting textual analysis the collected data descriptively
- Drawing conclusion

In this study, the collections of Semantic translation are taken from the translation comic 'The Adventure of Tintin' in French and English version. It was created by the Belgian cartoonist Georges Prosper Rémi who is known with the name Hergé. There are 23 complete series of The adventure of Tintin.

#### **RESULT AND DISCUSSION**

**French : *Vingt....ça me coûte plus cher* (p.1)**  
**English : *Seven.....but I'm robbin myself* (p.131)**

Based on the statement "*the culture is about both knowledge and material things*", Value of currency are included of the material thing and automatically it is a part of the culture. In this kind of translation, the translator tried to change the value of currency from Franc to Pound in

order to be acceptable in the target language. The loyalty concept can be seen in the sense and the message which is sent from the source language to the target language, just like what Lederer said about the sense and message indicates the loyalty concept in translation. ‘**Vingt**’ that must be translated ‘Twenty’ in word-to-word translation, is translated “**Seven**” in pound currency as a result of the loyalty of cultural context in Semantic translation .

In Pragmatic, the way of people talk in certain situation is the cultural context because there is a part of behavior. ‘*ça me coûte plus cher*’ is the way of talk in the bargain situation and a part of cultural context. It must be translated ‘*I give you a cheaper price*’ in word – to – word translation. But in the other hand, in English language, the sentence usually use in the bargain situation and as a behavior of the English people is ‘*but I’m robbin myself*’ and It is a part of the cultural context. In the loyal concept, according to Lederer and Guidère, the sentences send the same sense, and message that can be accepted by the readers from the target language as the loyalty concept in the cultural context.

**French :** *Police Secrète ! Police secrète !* ....Vous direz ça au commissariat ! (p. 3)

**English :** *Special Branch ! Special Branch !* .....You can tell that to the inspector ! (p. 133)

According to Newmark, in Semantic translation, the terminology is a part of the cultural context, and every language has their terminology word which different from one language to another language but send the same sense and message. ‘**Police Secrète**’ that must be translated as the *secret police* in word-for-word translation, is attached by the cultural context in terminology of English language and translated as **Special Branch**. It is loyal because based on Tende’s explanation that the most important thing in translation is the acceptable message in the target language and that must be adapted with their culture. ‘**Police Secrète**’ and **Special Branch** send the same sense and message which is attached by their own culture.

**French :** Il est vraiment *très beau*. (p. 3)

**English :** It really is *a beauty* (p. 133)

The loyalty concept, according to Guidère, is also included the syntactic aspect in the translation. This kind of translation is attached by the syntactic process when *très beau* which is identic with the beauty in masculine thing, is translated only with *a beauty* which is identical with the feminine thing. It happened because in French is known the classification of masculine and feminine noun as a result of the norms in the structural use in each language, and norms is a part of culture. So, this translation shows the loyalty concept in semantic translation because it does not change any sense and message of the word although both languages brought their own cultural context in field of structural.

**French :** *Saperlipopette* (p. 6)

**English :** *Great Snakes* (p. 136)

*Saperlipopette* is a term or cursing word in French, it expresses for the shocking situation. The translator transferred it into English with *Great Snakes* which is known as the expression of the negative situation. It is the match translation product when the reader from both languages also can predict the shocking situation from the both cursing word. The cursing word is a kind of behavior and it is a part of the cultural context, it is loyal because it send the same sense and message from the source language to the target language.

**French :** *Mon dieu !* que vous est – il arrive ? (p.10)

**English :** *Good heaven !* Whatever’s happened ? (p.140)

*Mon dieu* and *Good heaven* are the positive word in the shocking or surprising situation. Even though *Mon dieu* is usually translated as *My god* in English but according the cultural context *Good heaven* would be more acceptable for the reader in the target language, because according to Tende’s explanation that the most important thing in translation is the acceptable message in the target language and that must be adapted with their culture. *Good heaven* must be more acceptable in certain cultural context of behavior. Somehow, *Good heaven* does not change any sense or message of the source language.

**French :** *Sapristi !*...On me l’a de nouveau vole ! (p. 10)

**English :** *Goodness gracious !* I’ve been robbed again (p. 140)

Although *Sapristi* has the negative expression of the situation and *Goodness gracious* is more positive, but according to the cultural context, this translation is possible and acceptable for the reader because it consider the cultural context (behavior) from the target language. Based on Lederer and Guidère, this translation is loyal because it does not change any sense which considers the cultural context of the target language and the message of the source language.

**French :** *Nom d’une pipe !* C’est cet individu qui nous a croisés dans l’escalier, hier soir, en venant chez vous!.....il me souviens : il m’a bousculé !.... (p. 10)

**English :** *Great Scotland yard !* .....That man we met last night on the stairs on our way here!.....I remember now : he bumped into me!..... (p.140)

*Nom d’une pipe* and *Great Scotland yard* are the cursing phrases which represent the negative expression. It is a kind of behavior from the people in the target language in using that sentence in certain situation. it is acceptable because it does not change the sense and the message from the source language although in the word – for – word translation, the source language wasn’t translated correctly, but behavior on using the sentence can be acceptable in semantic translation theory which is emphasized in the cultural context. However, that translation is loyal in their cultural context in Semantic translation.

## CONCLUSION AND SUGGESTION

The analysis constitutes on important aspect of practical semantic translation. The assessment of the translation the comic The Adventure of Tintin ‘The secret of Unicorn’ in this study is based on target language and target culture-oriented translation theories which are usually called as the semantic translation. Particularly, this analysis used the interpretative theory which is focused on ‘the sense’ rather than ‘the word’. This paper attempted to trace the problems of semantic translation in the cultural context. The present writer discovered that emphasis has shifted from the form of the Source text to the responses of the receptor; therefore, the response of the receptor to the translated message now plays an important role in determining the loyalty concept in translation. This implies that the loyalty concept in

translation must then be explained as the degree to which the average reader reacts to the translated message just as the receptor reacts to the original text. This translation is successful by approaching the two ideals needed in semantic translation such as loyal to the sense and the message of the source language.

Finally, it can be concluded that theoretically a text which is embedded in its culture is both possible to translate into other languages. The degree of its closeness to its source culture and the extent to which the meaning of its source text to be retained is very much determined by the purpose of the translation. To close, it is suggested that in the translator considered the procedures explained above to translate culturally-bound words or expressions.

#### ***Limitations of the study***

The limitation of study is important to give the frame of the study in order to be focus on certain case that needs to be found. The limitations of this study are :

1. To describe the determination of the loyalty concept in semantic translation
2. To identify the possibility of the loyalty concept in semantic translation

**ABSTRACT**

The present study is an attempt to investigate the comparative effect of teaching metacognitive strategies and cooperative learning on the reading comprehension of Iranian intermediate English as Foreign Language (EFL) learners. To fulfill the purpose of this study, a group of 90 male and female intermediate learners of Aryanpour School of Culture & Education in Tehran, Iran took a piloted sample Preliminary English Test (PET) as a proficiency test and 64 of them were selected as homogenous learners and were divided into two experimental groups. One experimental group received metacognitive strategies based on Chamot & O'Malley's "Cognitive Academic Language Learning Approach (CALLA)" (1994), and the other one cooperative learning based on "Cooperative Learning" Model by Novak, (1991). To make sure that the students were not significantly different in terms of their reading comprehension ability, they were given a piloted reading comprehension pretest. Both groups were instructed by the same teacher (one of the researchers) using the same material -American Headway. At the end of the training, 18 sessions, a piloted post-test of reading comprehension was administered to both groups. The analysis of the test scores using *t*-test revealed that the experimental group which received metacognitive strategy training did statistically better in their post-test, which means that an increase in students' performance in reading comprehension due to the effect of teaching metacognitive strategies was occurred. The implication is that metacognitive strategy training can be included in regular English reading courses. This result may help EFL teachers to bear in mind the beneficial of teaching strategies especially when dealing with reading comprehension.

**KEYWORDS:** Cooperative Learning, EFL Learners, Metacognitive Strategies, Reading Comprehension,

**INTRODUCTION**

One of the most necessary and vital skills that a person has to acquire in his/her life is reading. This is understandable as reading has always been connected with knowledge, maturation of thoughts, advancement, modernization and so forth. Nearly every aspect of life involves reading. Reading is a receptive skill, similar to listening, during which readers decode the message of the writer and try to recreate it anew (Rashtchi & Keyvanfar, 2010). In fact, reading can be seen as a dialogue between the reader and the text or between the reader and the author. According to Chastain (1988),

*Reading is a process involving the activation of relevant knowledge and related language skills to accomplish an exchange of information from one person to another. Reading requires that the reader focus attention on the reading materials and integrate previously acquired knowledge and skills to comprehend what someone else has written. (p. 216)*

It is a complex cognitive process of decoding symbols in order to construct or derive meaning (reading comprehension). Reading is seen as an extremely complex activity involving a combination of perceptual, linguistic and cognitive abilities (Brumfit, 1980).

Effective reading is not something that every individual learns to do (Nunan, 1999). Learning to reading is difficult especially for those reading in a second or foreign language because it is an essential skill to acquire knowledge and exchange information (Chien, 2000; Dlugosz, 2000; Huang, 2005; Salinger, 2003). However, most English instructors still focus on correcting the learners' grammar or increasing their vocabulary (Chi, 1997; Griffiths, 2008; Tsao, 2004). To improve learners' reading abilities, effective strategies and assistant tools should be carefully considered (Cassata-Widera, 2008; Lin, 2008; Zittle, Johari, & Eastmond, 2005). Successful readers use a flexible repertoire of strategies and cues to comprehend texts and to solve problems with unfamiliar structure and vocabulary which is quite difficult for second language learners to achieve. But the instructors seldom teach learners how to use learning strategies effectively to improve their reading comprehension; consequently, learners cannot master this language skill effectively (Berkowitz, 1986; Carnine and Carnine, 2004; Chi, 1997; Griffiths, 2008; Rivard & Yore, 1992; Tsao, 2004).

Strategies are specific actions, behaviors, steps, or techniques that students (often intentionally) use to improve their progress in developing L2 skills (Oxford, 2002). These strategies can facilitate the internalization, storage, retrieval, or use of the new language. They are tools for the self-directed involvement necessary for developing language skills (Oxford, 1990).

Among these strategies, metacognitive strategies are considered as the most essential ones in developing learners' skills (Anderson, 1991). Metacognitive strategies are related to how we think and learn (Ashman & Conway, 1993). The aim of these strategies is to teach the learners how to set objectives, how to be effective and independent. It was emphasized by O'Malley, Chamot, Stewner-Manzanares, Russo, and Kupper (1985) that learners without metacognitive approaches have no direction or ability to monitor their progress, accomplishments, and future learning directions. On the other hand, learners who have developed their metacognitive awareness are likely to become more self-regulating and autonomous language learners (Hauck, 2005). According to Paris and Jacobs (1984), "metacognitive strategies help students to focus attention in an understanding of the content, to connect past knowledge with new information and to code them in their memories" (p. 2083-2093). These strategies also involve readers' deliberate mental behaviors for directing and controlling their cognitive strategy processing needed for successful performance (Phakiti, 2003).

The current understanding of reading strategies has been shaped significantly by research on what expert readers do (e.g., Bazerman, 1985; Pressley & Afflerbach, 1995). Through metacognitive strategies, a reader allocates significant attention to controlling, monitoring, and evaluating the reading process (Pressley, 2000; Pressley, Brown, El-Dinary & Afflerbach, 1995). Regarding the above-mentioned discussions it seems that the metacognitive strategies are considered as essential elements in learning reading comprehension.

Another possible solution to increase the learners' ability in reading comprehension skill is creating an environment in which the learners will have opportunities for their participation. In this regard many ways have been proposed, one of them is cooperative learning (CL).

Cooperative Learning with its roots in ancient tribal customs has traditionally been a part of educational practice. Its effectiveness has been documented through hundreds of research studies (Johnson & Johnson, 1986; Kagan, 1986; Slavin, 1988).

As Barros, Rodriguez-Artacho, and Verdejo (1998) state, "Cooperative Learning is originally based on the social constructivist view of learning and as a major teaching/learning strategy, aims to make instruction more relevant and students more responsible" (p. 45). Cooperative Learning refers to instructional method that students work together in small groups to accomplish shared learning goals. It is a successful teaching strategy in which small teams, each with students of different levels of ability, use a variety of learning activities to improve their understanding of a subject (Bramlett, 1994). Dohron (2002) describes cooperative learning as the use of small groups for instructional purposes that require students to work together for their own and each other's learning. Dohron (as cited in Zuheer, 2008) adds,

*In order for cooperative learning groups to be cooperative in nature, the students in the groups must believe that all the group members are equally important to the success of the group. They must be able to use the appropriate interpersonal and small-group skills that are needed to work cooperatively. (p.45)*

Each member of a team is responsible not only for learning what is taught but also for helping teammates learn. In this process, students are assigned to groups of two to five members by the instructor for the purpose of achieving academic and social tasks (Johnson, Johnson, & Smith, 1998).

By now, it is not perhaps redundant to say that through "cooperative learning" and "metacognitive" strategies, the teacher can involve most of the students in the use of language, and teach them how to use their thinking strategies for better understanding of the text. But to find out how cooperative learning and metacognitive strategies work as improving elements for better reading comprehension, this study is conducted to see whether or not cooperative learning and metacognitive strategies have significant effect on reading comprehension of EFL learners.

## REVIEW OF THE LITERATURE

### *Metacognitive Strategies*

Metacognitive strategies "are higher order executive skills that may entail planning for, monitoring or evaluating the success of a learning activity" (O'Malley and Chamot, 1990, p. 44). In simple terms, metacognition is thinking about thinking. Its scholarly description comes from cognitive psychology that approaches metacognition as one's knowledge concerning one's own cognitive processes and products or anything related to them. Active monitoring, consequent regulation and orchestration of these processes to achieve a goal also seem to be the necessary components of metacognition (Flavell, as cited in Goh, 2008). In link with this definition, metacognitive development can be described as conscious development in one's metacognitive abilities, such as the move to greater knowledge, awareness and control of one's learning, selecting strategies, monitoring the progress of learning, correcting errors, analyzing the effectiveness of learning strategies, and changing learning behaviors and strategies when necessary (Ridley, Schutz, Glanz, & Weinstein, 1992).

O'Malley, Chamot, Stewner-Mazanares, Russo, and Kupper (as cited in Vianty, 2007) stated that "metacognitive strategies involve thinking about the learning process, planning for learning, monitoring of comprehension or production while it is taking place, and self-evaluation of learning after the language activity is completed" (p. 506). Metacognitive strategies also involved readers' deliberate mental behaviors for directing and controlling their cognitive strategy processing for successful performance (Phakiti, 2003).

Among native English speakers learning foreign languages, Purpura (1999) found that metacognitive strategies had a significant, positive, direct effect on cognitive strategy use, providing clear evidence that metacognitive strategy use has an executive function over cognitive strategy use in task completion. Studies of EFL learners in various countries (e.g., in South Africa, Dreyer & Oxford, 1996; in Turkey, Oxford, Judd, & Giesen, 1998) uncovered evidence that metacognitive strategies are often strong predictors of L2 proficiency.

### *Cooperative learning*

Cooperative learning is one strategy for group instruction which is under the learner-centered approach. Slavin (1995) describes cooperative learning as an instructional program in which students work in small groups to help one another master academic content (Slavin, 1995). Cooperative learning involves students working together in pairs or groups. They are a team whose players must work together in order to achieve goals successfully (Brown, 1994). In addition, cooperative learning is a within-class grouping of students who learn to work together on specific tasks or projects in such a way that all students in the group benefit from the interactive experience (Kessler, 1992). As Johnson (2005) puts it, cooperation is not assigning a job to a group of students where one student does all the work and the others put their names on the paper. It is not having students sit side by side at the same table to talk with each other as they do their individual assignments as well. It is not having students do a task individually with instructions that the ones who finish first are to help the slower students. On the contrary, cooperative learning is a teaching strategy in which small teams, each with students of different levels of ability, use a variety of learning activities to improve their understanding of a subject. Each member of a team is responsible not only for learning what is taught but also for helping teammates learn, thus creating an atmosphere of achievement. Students work through the assignment until all group members successfully understand and complete it.

Cooperative learning has been found to be both an effective instructional method (Slavin, 1996) and a successful way to enhance social and academic development among children (Deen, Bailey, & Parker, 2001; Johnson & Johnson, 2003; Slavin, 2000). The end product of cooperative learning is collaboration and joint ownership. Also, researchers have found that students not only feel more engaged but also perceive that their learning task is more important when working in a small group than during large-group instruction (Peterson & Miller, 2004). The most important goal of cooperative learning is to provide students with the knowledge, concept, skills, and understanding they need to become happy and contributing members of the society (Slavin, 2001).

Cooperative Learning focuses on achievement and is goal oriented. In Cooperative Learning, each individual goal oriented efforts contribute to others' goal attainment. Cooperative goal structures create a situation in which the only way group members can attain their own personal goal is if the group is successful. Therefore, to meet their personal goals, group members must help their teammates to do whatever helps the group to succeed or to encourage their teammates to give in their best efforts.

#### **Reading Skill**

Reading is considered as one of the most important skills which despite lots of research and due to its complicated nature sounds impossible to be described in a single comprehensive definition. According to Grabe (1991), simple definitions typically misinterpret complex cognitive processes such as reading. Aebersold and Field (1997) also note that, "The act of reading is neither completely understood nor easily described. In the most general terms we may say that reading involves the reader, the text, and the interaction between reader and text" (P. 5). They further state that reading is what happens when people look at a text and assign meaning to the written symbols in the text.

Chastain (1988) mentioned that as it is true for other skills, reading is a process involving the activation of relevant knowledge and related language skills to exchange information from person to person. He believes that reading is a receptive process in that the reader is receiving a message from a writer. Reading also is known as a decoding process, since language is regarded as a code and the reader must figure out the meaning of the message. In Goodman's view (1967), "Reading is a psychological guessing game in which the reader constructs, as best as he can, a message which has been encoded by a writer as a graphic display" (P. 135). He further states that reading is an ongoing process in which the reader selects the most productive language cues from the text to help him predict what comes next. Celce-Murcia (2001) maintains that, "reading as an interactive, socio-cognitive process involves a text, a reader, and a social context within which the activity of reading takes place" (P. 154).

#### **RESEARCH QUESTION**

To fulfill the purpose of this study, the following research question was posed:

Is there any significant difference between the impact of metacognitive strategies and cooperative learning on EFL learners' reading comprehension?

#### **METHODOLOGY**

##### **Participants**

To fulfill the objective of this study, 64 male and female intermediate EFL learners with the age range of 18-60 studying in Aryanpour School of Culture & Education in Tehran, Iran participated in this study. These participants were non-randomly selected and homogenized through a piloted Preliminary English Test (PET) among 90 learners. The participants whose scores are one standard deviation above and one standard deviation below the mean were selected. Then, the homogenized participants were randomly divided into two experimental groups, each containing 32 participants. One experimental group treated with metacognitive strategies and the other one with cooperative learning.

It is worth mentioning that a group of 30 students with almost similar characteristics to the target sample participated in the pilot study of proficiency test (PET) and reading pre & post-tests. Also, both researchers assessed writing & speaking sections of the PET based on the specific rating scales.

##### **Instrumentation**

To fulfill the purpose of the study the following instruments were used:

##### **Preliminary English Test (PET)**

The researchers used a sample of PET for homogenizing the participants in terms of their general language proficiency at the beginning of the study which covers the four main language skills: reading (35 items), writing (7 items), listening (25 items), and speaking. The PET test used in the study was a sample of the Preliminary English Test (PET) adopted from "Objective PET" by Louise Hashemi and Barbara Thomas (2010), Cambridge University Press. The allotted time for this test was an hour and thirty minutes. The Cronbach's Alpha was employed for this purpose and an acceptable reliability of .83 was obtained.

##### **Writing Rating Scale of PET**

The rating scale used to rate the writing section of PET was the one provided by Cambridge under the name of *General Mark Schemes for Writing*. The rating was done on the basis of the criteria stated in the rating scale including the rating scale of 0-5.

##### **Speaking Rating Scale of PET**

The rating scale used to rate the oral proficiency of the subjects was the predetermined official Cambridge General Mark Schemes for speaking. The rating was done on the basis of the criteria stated in the rating scale including the range of scores from 0 to 5.

##### **Pretest and Post-test of Reading**

The tests were adopted from "Objective PET" by Louise Hashemi and Barbara Thomas (2010), Cambridge University Press. The learners were given a pretest to make sure they are not significantly different in terms of their reading comprehension ability before employing treatment. And they were given a post-test at the end of the study to see which group did better. Both tests had 35 items done in 40 minutes each.

##### **Material**

All the subjects in this research study received instruction based on "New Headway Second Edition" by John and Liz Soars (2009), Oxford University Press.

##### **Procedure**

To achieve the purpose of the study and to address the research question, the following procedures were followed. 90 male and female students with age range of 18-60 were randomly selected from intermediate level classes at Aryanpour School of Culture & Education in Tehran. Prior to the treatment, a sample PET test was piloted among a group of 30 students with almost similar characteristics of the representative sample. Then the three characteristics of individual items (Item Facility, Item Discrimination, and Choice Distribution) were calculated and two malfunctioning items were discarded from the test battery. The Cronbach Alpha formula was employed for calculating the reliability of the tests' scores gained by the participants. The writing part was rated according to the rating scale provided by Cambridge for PET by the researchers. First, the rating scale was shared between them and then in order to make sure that both had the same understanding of it, a few papers were rated by both. Since it was shown that there was consistency between the papers they rated, the researchers moved to the actual practice. Later on, the inter-rater reliability was calculated on the basis of the ratings done by both

researchers for the pilot test of PET. Since there was an acceptable consistency between the two raters, the researchers went through the same procedure for the main participants.

An already piloted PET was given to 90 intermediate level students of Aryanpour School of Culture & Education who were selected randomly. The reading and listening parts were scored objectively, each question received 1 point. For the writing part, the first sub-part includes 5 items and each received 1 point and for the two other sub-parts which required students to write paragraphs the scoring was based on the analytic scale for rating writing tasks of PET by researchers. Also, the speaking part of PET was rated according to the rating scale provided by Cambridge General Mark Schemes for speaking following the same procedure for correcting writings. Based on the obtained results, 64 students whose score fall between one standard deviation above and below the mean were selected as the participants of the study. The 64 participants were randomly divided into two groups, each group with 32 participants; one experimental group which received teaching the metacognitive strategies and another experimental group which followed the cooperative learning strategy. To make sure that the students were not significantly different in terms of their reading comprehension (the dependent variable of the study) they were given a piloted reading comprehension pretest. All the participants were taught using the same material and they received the same amount of instruction. All classes comprising the two groups were instructed by the same teacher (one of the researchers). The course consisted of 18 sessions, two hours each, spanning over a period of approximately six weeks.

#### *The Metacognitive group*

In this experimental group the students received instructions for metacognitive strategies. Chamot & O'Malley's "Cognitive Academic Language Learning Approach (CALLA)" (1994), was chosen to apply for strategy training. The sequence of instruction in the CALLA approach is a five phase recursive cycle for preparation, presentation, practicing, evaluating, and applying learning strategies.

The descriptions of the above-mentioned stages are as follows:

*Preparation:* In this phase, the teacher explained the importance of the metacognitive strategies and one or more metecognitive strategies were explained in each session. The learners in this phase used the strategies to plan and create their ideas. For example, they were given a limited time to create ideas on the topic to talk with the class.

*Presentation:* The teacher talked about the characteristics, usefulness and the application of the strategies explicitly and made clear through some related examples. Then the learners used the strategies to organize their own created ideas and used them more related and effectively to the topic.

*Practicing:* In this phase the learners had the opportunity of practicing the learning strategies with an authentic learning task.

*Evaluating:* There were some activities used in this phase for evaluation, such as self- questioning, debriefing discussions after using the strategies. Learners shared their ideas with the teacher one by one and got hints from her, or they shared it with the class and had a whole class discussion.

*Applying learning strategies:* In this final phase the learners were encouraged to:

- 1) Use the strategies they find more useful;
- 2) Apply these strategies to new contexts; &
- 3) Devise their own individual combinations and interpretations of metacognitive learning strategies.

#### *The Cooperative Group*

In the second experimental group which received cooperative learning, considering the number of the learners (32) they were grouped into eight groups of four. One important point was that competitiveness was de-emphasized and the group work was encouraged. In these groups the teacher focused on the four main steps of cooperative learning by Novak (1991) in every session of the reading tasks. The learners were aware of the steps which were: planning, Acting, Observing and Reflecting.

The descriptions of the above-mentioned stages are as follows:

*Planning:* After grouping the learners, the teacher and students started a discussion based on the topic of the reading passage and students gave their own ideas. Then, they discussed the topic in groups.

*Acting:* The learners read the text in a given time, and then start to restate what they read and compared it with their first discussion. In this step, the learners also helped each other with any difficulty and tried to facilitate one another's understanding.

*Observing:* The teacher changed the group members and asked them to discuss what they read, with new group members, while doing her own observation.

*Reflecting:* The teacher evaluated the procedure according to the learners' group evaluation and feedback.

## **RESULTS AND DISCUSSION**

### ***Descriptive Statistics of the PET Proficiency Test Piloting***

Prior to the administration, the PET test, reading comprehension pretest, and reading comprehension post-test were piloted with 30 learners of almost the same characteristics to make sure that the tests could be used confidently for screening.

The PET consisted of 67 items including three sections of reading (35 items), writing (7 items), and listening (25 items) and also another section for speaking. The test was administered to a group of 30 intermediate-level EFL learners at the Aryanpour School of Culture & Education bearing almost the same characteristics as the target sample. All items went through an item analysis procedure and two items were discarded due to their malfunctioning characteristics.

Following the piloting of the test, the mean and standard deviation of the raw scores and the reliability were calculated. The mean and the standard deviation of this administration were found to be 70.20 and 7.46 respectively.

Also, Cronbach's Alpha was employed for calculating the reliability and an acceptable reliability of .83 was obtained. After deletion of the 2 malfunctioning items, the reliability of the test shifted to .87.

There were two writing tasks in the test rated by the two researchers using the predetermined PET rating scale. The rating scale used in this study was the official Cambridge General Mark Schemes for Writing. The rating was done on the basis of the criteria stated in the rating scale including the range of scores from 0 to 5.

In order to calculate the inter-rater reliability between the two researchers, the Pearson correlation coefficient was used. The results showed that there was a significant correlation (.85) between the two raters in the piloting of Writing Part 2 and (.79) in the piloting of Writing Part 3.

The speaking part of the proficiency test (piloting) was also rated by researchers using the predetermined PET rating scale. The rating scale used for this aim was the official Cambridge General Mark Schemes for speaking. The rating was done on the basis of the criteria stated in the rating scale including the range of scores from 0 to 5.

The Pearson correlation coefficient was also used in order to calculate the inter-rater reliability. The results showed that there was a significant correlation (.76) between the two raters/researchers.

#### **Descriptive Statistics of the PET Proficiency Test Administration**

After the procedure of piloting the PET test, it became an instrument to homogenize the students for this study. On the whole, 90 students participated in the test administration. After the administration of the test, descriptive statistics were conducted just as was done in the piloting phase. Table 1 shows these statistics with the mean of 80.12 and the standard deviation of 8.23.

*Table 1: Descriptive Statistics of the PET Administration*

	N	Minimum	Maximum	Mean	Std. Deviation
VAR00005	90	58.00	91.00	80.1211	8.2384
Valid N (listwise)	90				

The reliability of the PET in this actual administration for homogenization of the subjects was calculated too (Table 2). An index of .91 reassured the researchers of the reliability of this test.

*Table 2: Reliability of the PET Administration*

Cronbach's Alpha	N of Items
.91	65

From among the 90 students who took the test, 64 students' scores who fell between one standard deviation below and above the mean were selected to participate in this study. The 64 participants were randomly divided into two experimental groups -Metacognitive (32 participants) & Cooperative (32 participants).

#### **Descriptive Statistics of Reading comprehension Pretest Piloting**

Before starting the treatment, a "Reading Comprehension Pretest" was administered by the researchers to know the students' reading comprehension ability before the treatment. The test was thus piloted with 30 students prior to its real administration and the descriptive statistics and reliability were calculated (Tables 3 and 4 respectively).

*Table 3: Descriptive Statistics of Reading comprehension Pretest Piloting*

	N	Range	Minimum	Maximum	Mean	Std. Deviation	Variance	Skewness	
	Statistic	Statistic	Statistic	Statistic	Statistic	Statistic	Statistic	Statistic	Std. Error
VAR00001	30	1.00	11.00	12.00	11.940	4.6692	21.756	-.183	.427
Valid N (listwise)	30								

*Table 4: Reliability of the Reading Comprehension Pretest Piloting*

Cronbach's Alpha	N of Items
.819	35

#### **Descriptive Statistics of the Reading Comprehension Post-test Piloting**

The researchers administered a parallel form of the Reading Comprehension pretest as post-test among the experimental and control groups once the treatment was completed in order to compare the post-test of both groups to see whether there was any improvement for each group in comparison to their previous stage. The Reading Comprehension Post-test was thus piloted with 30 students prior to its real administration and the descriptive statistics and reliability were calculated (Tables 5 and 6).

*Table 5: Descriptive Statistics of the Reading Comprehension Post-test Piloting*

	N	Range	Minimum	Maximum	Mean	Std. Deviation	Variance	Skewness	
	Statistic	Statistic	Statistic	Statistic	Statistic	Statistic	Statistic	Statistic	Std. Error
VAR00004	30	5.00	10.00	15.00	10.5600	3.20955	10.2455	-.059	.427
Valid N (listwise)	30								

Table 6: Reliability of the Reading Comprehension Post-test Piloting

Cronbach's Alpha	N of Items
.833	35

It should be mentioned that, after calculating item facility, item discrimination and choice distribution no malfunctioning item was observed in pretest and post-test of reading comprehension.

#### Checking the Normality

The present data were measured on an interval scale, and none of the subjects' perform dependently on the tests. The assumption of normality is also met. As displayed in Table 7 the values of skewness and kurtosis are within the ranges of  $\pm 2$ .

Table 7: Normality Assumptions

Group		N	Skewness		Kurtosis	
		Statistic	Statistic	Std. Error	Statistic	Std. Error
Meta-Cognitive	PET	32	-.193	.414	.755	.809
	Pretest	32	.218	.414	-.808	.809
	Post-test	32	-1.032	.414	-.213	.809
Cooperative	PET	32	-.196	.414	.262	.809
	Pretest	32	-.301	.414	-1.114	.809
	Post-test	32	-.642	.414	.002	.809

The assumption of homogeneity of variances will be discussed after reporting the results of the independent *t*-test.

#### Descriptive Statistics of the Pretest of Reading Comprehension by Groups

An independent *t*-test was run to compare the meta-cognitive and cooperative groups' mean scores on the pretest of reading comprehension in order to prove that the two groups enjoyed the same level of reading ability prior to the main study. As displayed in Table 8 the mean scores for meta-cognitive and cooperative groups on the pretest of reading comprehension are 22.13 and 22.63 respectively.

Table 8: Descriptive Statistics of Pretest of Reading Comprehension by Groups

Group	N	Mean	Std. Deviation	Std. Error Mean
Meta-Cognitive	32	22.13	5.428	.960
Cooperative	32	22.63	5.154	.911

The results of the independent *t*-test ( $t(62) = 1.88, P = .064 > .05, r = .23$  it represents a weak to moderate effect size) indicate that there was not any significant difference between meta-cognitive and cooperative groups on the pretest of reading comprehension test (Table 9). Thus it can be concluded that the two groups enjoyed the same level of reading ability prior to the main study.

Table 9: Independent *t*-test of the Means of Pretest of Reading Comprehension by Groups

	Levene's Test for Equality of Variances		<i>t</i> -test for Equality of Means						
	F	Sig.	T	Df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
								Lower	Upper
Equal variances assumed	.033	.855	1.889	62	.064	2.500	1.323	-.145	5.145
Equal variances not assumed			1.889	61.834	.064	2.500	1.323	-.145	5.145

It should be noted that the assumption of homogeneity of variances is met (Levene's  $F = .033, P = .855 > .05$ ). That is why the first row of Table 9, i.e. "Equal variances assumed" was reported.

An independent *t*-test is run to compare the meta-cognitive and cooperative groups' mean scores on the post-test of reading comprehension in order to probe their effect on the reading ability of the students. As displayed in Table 10 the mean scores for meta-cognitive and cooperative groups on the post-test of reading comprehension are 31.53 and 28.19 respectively.

Table 10: Descriptive Statistics of Post-test of Reading Comprehension by Groups

Group	N	Mean	Std. Deviation	Std. Error Mean
Meta-Cognitive	32	31.53	4.016	.710
Cooperative	32	28.19	3.237	.572

The results of the independent *t*-test ( $t(62) = 3.667, P = .001 < .05, r = .42$  it represents an almost large effect size) indicate that there is a significant difference between meta-cognitive and cooperative groups on the post-test of reading comprehension test (Table 11). The experimental group which received metacognitive strategy training did statistically better in their post-test, which means that an increase in students' performance in reading comprehension due to the effect of teaching metacognitive strategies was occurred.

Table 11: Independent *t*-test of the Means of Post-test of Reading Comprehension by Groups

	Levene's Test for Equality of Variances		<i>t</i> -test for Equality of Means						
	F	Sig.	T	Df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
								Lower	Upper
Equal variances assumed	2.046	.158	3.667	62	.001	3.344	.912	1.521	5.167
Equal variances not assumed			3.667	59.327	.001	3.344	.912	1.519	5.168

It should be noted that the assumption of homogeneity of variances is met (Levene's  $F = 2.04$ ,  $P = .158 > .05$ ). That is why the first row of Table 11, i.e. "Equal variances assumed" is reported.

### Empirical Validity

The Pearson correlations between the PET and pretest & post-test of reading comprehension are employed as the empirical validity indices of the latter two tests. The statistically significant correlation between the pretest ( $r(62) = .51$ ,  $P = .000 < .05$ ) and post-test ( $r(62) = .34$ ,  $P = .005 < .05$ ) with the PET test indicate that the pretest and post-test of reading comprehension enjoy empirical validity (Table 12).

Table 12: Empirical Validity

		PET
Pretest	Pearson Correlation	.511**
	Sig. (2-tailed)	.000
	N	64
Posttest	Pearson Correlation	.347**
	Sig. (2-tailed)	.005
	N	64

\*\* Correlation is significant at the 0.01 level (2-tailed).

### CONCLUSION

The analysis of the scores using the independent sample *t*-test showed that the mean score of the metacognitive and cooperative groups on the post-test of reading comprehension were 31.53 and 28.19 respectively. Also, the analysis of the test scores using *t*-test revealed that the experimental group which received metacognitive strategy training did statistically better in their post-test, which means that an increase in students' performance in reading comprehension due to the effect of teaching metacognitive strategies was occurred. To conclude, it seems that using metacognitive strategies make the learners have better understanding of the reading text. Also, learning these strategies help students to find out what they want or what they need to know. Oxford (1990), also says that learners who are more aware of strategies and more advanced seem to use the strategies better. This again shows the importance of improving the students' metacognitive strategies in teaching and learning. Studies proving the effectiveness of strategy training are likely to convince English teachers, teacher trainers, course book writers and curriculum designers to be more aware of the benefits of strategy training and include these strategies in their lessons, course books and curricula.

As reported in Dhiab-Henia's study (2003), a traditional approach to reading comprehension fails to equip students with highly developed and positive strategies required for comprehending the text they read. The teachers should help students to become efficient readers and enhance their reading ability. Gradually, the students need to be moved from dependency on the teacher to more independent readers. This independence can be achieved by assisting them in being efficient in the use of certain strategies. As suggested by Salataci & Akyel (2002), strategy instruction has a positive effect on students' reading strategy use and reading comprehension in English. In this regard, Dhiab-Henia (2003) has provided quantitative and qualitative evidence about the efficiency of metacognitive strategy training on the way that university students function in their reading. According to Zhang (2001), if researchers could ascertain EFL readers' metacognitive strategic knowledge, it would help teachers make a more informed choice in teaching second language or foreign language reading.

At the end, it is worth mentioning that like any study, this research faced some limitations, which has to be taken into consideration while attempting to generalize its findings. The number of the male and female participants was not the same so, the researcher was provided with the unequal number of male and female participants. There was no determined age range of participants and the classes were filled with any adults ages 18 up to 60. Therefore, the findings of the study may not be generalizable to other age groups.

### Suggestions for Further Research

The following are suggested for further studies:

1. Lysynchuk, Pressley, d'Ailly, Smith, and Cake (1989), however, noted that one of the major problems in intervention research studies of reading comprehension strategy instruction was an exclusion of the examination of long-term effects of strategy instruction. Unfortunately, the current study also did not examine long-term effects (the intervention in this study occurred in approximately 7 weeks). Thus, further research should examine long-term effects of metacognitive and cooperative strategies on students' reading comprehension performance.

2. According to National Reading Panel (2000), vocabulary is critical to reading comprehension. In this study, however, vocabulary performance was not included as a dependent measure. Future research examining effects of metacognitive strategies on vocabulary of students is recommended.
3. It is suggested that in future research a large size of subject be included in the research. The more subjects will result in greater reliability and validity.

## THE EFFECT OF RECEIVING ELECTRONIC FEEDBACK AND THE EFFECT OF GENDER ON FOREIGN LANGUAGE WRITING PERFORMANCE

Maryam Koolivand

Maryamkoolivand43@yahoo.com

Hasan Iravani

iravanitefl@gmail.com

Azad University Iran, Bandar Abbas

### ABSTRACT

The current study tries to suggest the findings obtained in a research project investigating whether development in writing performance has resulted from applying electronic feedback (email) in writing class. This study attempts to examine the difference between electronic writing modes and old-fashioned writing styles. The project has forty participants studying English in Karoon Language Institute of Tooyserkan, Iran who were chosen through the present intact classes and attended two different EFL writing courses; a computerized classroom and a traditional one. Then the results and findings were investigated. The major finding demonstrated that e-mail users made enhancement in their writing achievement. Another finding suggests that female users (in the electronically oriented group) showed a greater improvement on their writing performance than male users.

**KEYWORDS:** E-mail, English Language, Feedback, Writing

### INTRODUCTION

Nowadays computers and technology ingrained in different parts of our life. By the advent of IT, communication becomes easier and distance between people become closer. It makes this chance for people to communicate to each other in different parts of the world at a same time. One of the most common forms of technology is Internet and e-mail which pervade our daily life and because of they have been replaced for all means of traditional communication they have had a distinctive place in every part of life. Soon afterwards www started to be utilized in education especially in learning context. Their importance as a tool for developing learning cannot be regarded (Vargas, 2010). They have made foreign language materials easy to access and use and help learners experience the target language. They suggest numerous benefits in educational domain, such as greater levels of participation (Gonzalez-Bueno, 1998 as cited in Shang, 2007), more motivation and interest (Skinner & Austin, 1999 as cited in Shang, 2007), reducing anxiety (Kupelian, 2001 as cited in Shang, 2007), becoming familiar with the aspects of syntax and semantic knowledge (Chen, 2008), more language functions (Wang, 1998 as cited in Shang, 2007), etc. By considering these beneficial aspects and growing understanding of its potentials there is an emphasis of various application of this novel technology in more practical aspect of teaching and learning situations.

With these descriptions, it is expected that research's results provide a path for teachers to benefit from the hypothesis; e-feedback can be seen as a supplement in better teaching and learning writing foreign language.

### Rationale

As the topic of this project suggests the study aims to investigate the efficiency of using electronic feedback on the promotion of language writing performance with regard to the gender of learners. According to the research questions, it attempts to see the effect of computer work in writing skill. That is to say, it tries to report if it is economical and cost effective for teachers, students and institutes to employ computers at school. In other word, it tries to show if some positive outcomes in writing skill have been made by means of email transmission. In so doing, it is going to explore whether males e-mail users make a significant difference in their achievement in writing English as a foreign language. For these purposes, following hypotheses are presented:

N<sub>01</sub>: There is no significant difference between e-mail users vs. traditional group in their achievement in writing English as a foreign language.

N<sub>02</sub>: There is no significant difference between male and female email users in their achievement in writing English as a foreign language.

### LITERATURE REVIEW

#### *Research on E-mail in the Teaching of ESL Writing*

Various studies have looked at the role of multimedia feedback in electronic class. And most of these studies make support teaching and learning grammar and writing skill via email. For instance Sullivan and Pratt (1996) have established from their research that over fifteen weeks students in the computer-assisted classroom showed a significant gain in writing due to the networked computers. Students in the C.A classroom demonstrated not only more interest in discussions, and, subsequently, more practice writing English.

In 2000, Gonzalez-Bueno and Perez (as cited in Kupelian, 2001) have investigated the effect of using e-mail on writing dialogue journals on learners of Spanish as an L2. Results demonstrated that students who used e-mail for their dialogue journals out-performed those who used pencil and paper in the amount of language generated.

Similarly, Al-Jarf (2001) conducted a study in which 113 ESL female freshmen students in their writing course in Saudi Arabia were exposed in two different writing instructions: traditional in-class writing instruction in control group and a combination of traditional and online (web-based) writing instruction. Results revealed that the experimental group made more gains as a result of web-based instruction. So, Web-based instruction seemed to be an important factor in enhancing the writing quality of ESL students. Therefore, it can be suggested that the use of web-based instruction as a supplement to traditional in-class writing instruction was significantly more effective than using traditional writing instruction alone.

Similar findings were generated in Liao's study (2002) as cited in (A Razak & Asmawi, 2004) when she established an e-mail key pals project with her students in Sophomore EFL Writing at National Chung Hing University (NCHU). Her findings indicated that e-mailing improved EFL learners' writing abilities as it provided practice in reading and writing using the target language to express ideas and opinions to real audience.

A related study was performed by Chuo (2007) to investigate the effects of the WebQuest Writing Instruction (WQWI) program on Taiwanese EFL learners' writing performance. The results indicated that students in the WQWI class improved their writing performance significantly more than those in the traditional classroom writing class. The findings suggested that integrating web resources into EFL writing instruction was effective for enhancing students' writing performance and provided a positive learning experience. The findings of this research also support those of Shang (2007) who carried out a research on email application with 40 non-traditional EFL students in an intermediate reading class at a university in Taiwan. Results demonstrate that the nature of email application promotes written accuracy and sentence complexity. The findings and suggestions emerging from the mentioned studies are in line with results of other studies like, Li (2000) as cited in Shang (2007) who examined the linguistic characteristics of 132 emails of ESL students in tasks that differed in terms of purpose, audience interaction, and task structure. Statistical results showed that in email tasks involving audience interaction, students tended to produce syntactically and lexically more complex texts.

Recently, Bridge and Appleyard (2008) tried to make comparison between electronic and paper-based assignment submission and feedback. 47 radiotherapy physics students submitted assignments and received feedback via features within the Virtual Learning Environment Blackboard. Results indicated that 93% of students preferred having their feedback available online rather than printed and handed to them. Overall, students preferred online assignment management to postal or physical hand-in.

## **METHODOLOGY**

### ***Participants***

In this research 40, 20 males and 20 females Iranian English language learners in Karoon Language Institute of Tooyserkan, Iran participated. Students were from 16 to 18 years- of -age at an intermediate English level. The students were chosen through intact groups and were divided into four groups, two groups as the control groups and the two others as the experimental groups and their homogeneity was confirmed by Nelson Test. Four groups took a pre-test (first writing) and a post-test (last writing) English language writing skill. Then the experimental groups received the treatment (writing and receiving feedback electronically). The two other control groups had their traditional writing class (paper-based correction of errors).

### ***Instrumentation and Materials***

The first instrument was Nelson English Language Test developed by WS Fowler and Norman Coe and was published 1976, which was used to determine the homogeneity of the learners. The book consisted of three different levels of tests from elementary to advance. It is necessary to mention that researcher chose intermediate level which involved 40 tests which contained 50 items (it is included in appendix) and students had to choose the correct answer from four choices. In the current study, for calculating reliability of the test the researcher used Kuder-Richardson Formula 21 (K-R21), and reliability of .73 was achieved for the Nelson pre-test that is considered appropriate for the research purpose. It is worth mentioning that due to the fact that Nelson Test is a standardized test of proficiency, and the index of reliability includes .73, consequently, its validity was assumed to be satisfactory (see Appendix A).

And the other instrument which was used in the study was four students' papers, their pre and post writing, which the students were expected to write during the project. And the last instrument was Yahoo Mail. It was the main instrument which was used in this project. It was able to provide feedback for students about their mistakes such as spelling, capitalization, subject-verb agreement and punctuation,...and the correct forms were suggested, so the learners had the opportunity to benefit from these suggestions.

### ***Procedure***

As mentioned before, this study has four groups, two groups as the control groups and the two others as the experimental groups, as a result it includes one male control group, one male experimental group, one female control group and one female experimental group and their close homogeneity was confirmed by Nelson Test. They attended in two different classes, control groups in traditional class and experimental groups in electronic one. Then process methodology was employed in both classes. Control groups received traditional classroom instruction and met in a traditional environment the entire time and they are expected to write compositions and received researcher's feedback on their papers. Meanwhile, the learners of experimental groups met in the electronic classes in which included writing their compositions in Yahoo Mail and sending them to their teacher's mail and receiving feedback electronically. The e-class lessons which were used in the experimental setting directed students in carrying out their assignments by guiding them in completing their writing assignments on the computer. The only difference between the four classes was the students' use of networked computers in two classes. Each class was expected to write four compositions which they were scored based on IELTS Writing band descriptors which its table and its components are included in the appendix (see Appendix B).

### ***Variables and Data Analysis***

The researcher has employed a quasi-experimental design which was performed with one independent variable (method of teaching: computerized or traditional setting) investigated through application of email. In the present research, the following statistical steps were taken.

First, statistical procedures were used to check the homogeneity level of learners. Secondly, the main cause of promotion of writing ability in this research was determined. Therefore, a t-test was used to observe the effectiveness of e-instruction in experimental groups.

Thirdly, a t-test was used to test any significant differences in the promotion of writing skill as a result of applying email between email users and non-users.

At the end, another sample of t-test was run too, to explore any significant difference between male users and female users in their writing achievement with regard to their gender.

## **RESULTS AND DISCUSSION**

The first statistical test was Mann-Whitney test which is used to compare the difference between the means. In this case, the researcher used it to ensure that the difference between the two groups regarding their writing skill was not significant. The results indicated that the level of significance of the obtained index of sig. (.397) does not exceed .05. In other words, the probability level in this test was less than .05 ( $p < .05$ ). Hence, the difference between the mean scores of the two groups on pretest was found to be non significant and both the groups were found to be almost equal before intervention.

As we mentioned before, the experimental group received treatment. So, to measure the effectiveness of e-instruction on their writing performance, another Mann-Whitney test was run as a t-test to compare the results of the students in experimental and control groups on the post-test.

The results revealed that the difference between the groups is meaningfully significant at .000 level which is well above the conventional level of .05. The probability level in this test was higher than .05 and the significant level which was assumed by the researcher was ( $p > .05$ ). Therefore, there is a significant difference between the two groups in favor of experimental group. In so doing, the students who received e-assignments had a better performance compared to those in the second group who participated in traditional context.

The next statistical test, Wilcoxon Test, deals with the comparison of the results of the students in experimental and control groups on their pre-test and post-test. Two pairs of t-test were used to investigating significant differences between pre-test and post-test of control and experimental groups.

Results showed that experimental group was significantly better on the post-test compared to the pre-test. Because t-value was .021,  $p < .05$ , it means the outcomes of learners' final writing was higher than in their pre-test, which is an indication of the effect of email on improving students' knowledge.

However, a sample of t-test in control group demonstrated same results too. The estimated-t showed improvement in the students' performance from the pre-test to post-test too. It means that the feedback provided by computer and the one which provided by the instructor had a similar effect on their final writing achievement.

And the last one is related to the comparison of the male and female subjects in the experimental group on their post-test. To meet this aim, a Mann-Whitney Test as t-test was run to explore the difference between writing performance post-test scores in the male and female users. In this case, the level of significance (.000) indicates that the difference between the means is absolutely significant. In other word, the scores of the female users revealed that female users performed better than male users did. It helps the researcher to conclude that female users outperformed male users quite significantly on the post-test in the experimental group.

### **Discussion**

Research Question 1, "Is there any significant differences between e-mail users vs. traditional group in their achievement in writing English as a foreign language?"

The results obtained through the application of Mann-Whitney test as a t-test revealed that significant differences between mail-users and paper-pen users were found. It was suggested that the students exposed to e-instruction were better performers. In other word, applying e-mail had a stronger positive effect on students' writing skill than traditional style. This improvement was brought about by the corrective nature of the email activity that provides a room for some common writing rules such as spelling, punctuation, and capitalization in which some grammatical mistakes are addressed by underlining and the students are provided with some choices that help learners to polish their written document with the suggested replacements and make a grammatical accurate written language. Thus it is evident that e-mail is a writing tool that can help students to write English effectively.

Also, in the next phase the null hypothesis: "There is no significant difference between e-mail users vs. traditional group to their achievement in writing English as a foreign language" was tested too. Two pairs of t-tests were used to investigate significant differences between pre-test and post-test of control and experimental groups. Results suggested enhancement in the students' performance in both groups from the pre-test to post-test. It can be said that both paper-pen method and computer method are effective to different degrees. Although results showed that both methods (paper-based and computer-based) were effective in improving writing skill but, the effect for the computer-based group is greater proving that teaching writing through electronic medium can lead to higher achievement in writing skill. Therefore, the null hypothesis is rejected.

With regard to the second research question: "Is there is any significant difference between male and female email users in their achievement in writing English as a foreign language.", the results outlined in previous pages already indicated the rejection of the second null hypothesis because significant differences were observed between the male and female experimental groups in favor of the female group. In other words, writing composition of the female experimental group was better in comparison with the males. The scores on the e-assignments revealed that females in the e-setting performed better than what males in the similar condition did. It can be concluded that the treatment in the female experimental group has been more effective than the male one. In these two classes, the girls showed perseverance and interest when they were going through the treatment. They also made fewer mistakes than the boys did. On the contrary, the boys were less motivated and did not notice to what they were writing. They made many mistakes and did not pay attention to the underlined words or phrases. As a result, female users made a great difference on the level of writing skill at the end of the course. Therefore, the hypothesis is strongly rejected.

### **CONCLUDING REMARKS**

In sum, the analysis conducted here revealed that the electronic medium could bring some positive changes in the outcome of learners' final writings and enhance grammatical written accuracy. This is because email generates a room for correcting some common grammatical problems therefore, students who are afraid of making mistakes can benefit from the immediate feedback which offers new opportunity for students to make their writing more organized through self-correction in a non-threatening atmosphere which leads to be independent of teacher. It may be due to computer can be a very important source of providing input which is authentic which facilitates learning. It is interesting to note that as students paid more attention to grammatical accuracy, they tended to decrease the number of mistakes. Therefore, it is evident which supports our claim that using e-mail as a technique in writing classes for EFL students improve their English writing.

The findings of this research also support those of Carter and Nunan (2002 cited in Ghalami Nobar and Ahangari, 2012) who had suggested that the repetitive nature of input through internet assists learners in understanding linguistics cues. Therefore, learners can easily engage in language practice and real learning context.

The findings having emerged from this study are in line with several studies such as Shaver's (1986), and Allen and Thompson's study (1995) as cited in (Al-Jarf, 2001) who found that using a computer assisted collaborative writing by L1 elementary, middle, high school and college students increased the quantity of writing instruction and the amount of student writing more than those using traditional instruction. Also, in Al-Jarf's study (2001) Web-based instruction seemed to be an important factor in enhancing the writing quality of ESL students. It helped enhance their writing ability (achievement) and resulted in a significant improvement in their posttest (achievement test) scores.

These findings support those of Cooper and Selfe (1990; Spitzer's, 1989 cited in Sullivan & Pratt, 1996) which had noted the advantages of using networked computers for writing. Therefore, it can be suggested that the use of web-based instruction as a supplement to traditional in-class writing instruction was significantly more effective than using traditional writing instruction alone.

Although the findings in this research have provided answers to research questions but, in order to raise generalizability of the results following list of recommendations is suggested for further study:

- This study was performed to explore the effect of computer-based feedback on EFL writing performance. Further research can be suggested to investigate the usefulness of e-feedback on other skills such as speaking, reading, listening, and so on.
- This study has been performed on a group of intermediate language learners. Although it worked for them, we cannot make sure that it will work for all language learners. Thus, it can be a good idea to carry out same research for other levels and larger groups of students or in higher education such as college or university.
- Since this study examines only implementation of email into EFL writing instruction, one area that does seem worthy of investigation is exploring the effect of incorporating other aspects of web technologies such as synchronous discussion among students in the class, or collaborative projects with other groups of students besides email in curriculum to enhance learning.

## Appendix

### Choose the correct answer. Only one answer is correct.

Last June my brother...1.....a car. He had had an old scooter before, but it....2.... several times during the spring. "What you want is a second-hand Mini," I suggested. "If you give me the money," he said, ".....3....one tomorrow." "I can't give you the money," I replied, "but what about Aunt Myra. She must have enough. We...4....her since Christmas but she always hints that we...5..... go and see her more often."

We told our parents where we were going. They weren't very happy about it and asked us not to go. So...6.....But later that same day something strange.....7..... A doctor.....8..... us that Aunt Myra.....9.....into hospital for operation.".....10.....go and see her at the same time," said my mother. "You two go today, but don't mention the money."

When we...11....., Aunt Myra.....12....."I'm not seriously ill," she said, "but the doctor insists that.....13.....to drive my car. You can have it if you promise.....14..... me to the seaside now and again." We agreed, and now we quite enjoy our monthly trips to the coast with Aunt Myra.

- 1) A. wanted to buy
- B. wanted buying
- C. liked to buy
- D. liked buying
- 2) A. was breaking down
- B. was breaking up

- 8) A. rang for telling
- B. rang to tell
- C. rung for telling
- D. rung to tell
- 9) A. had gone
- B. had been

- C. had broken down
- D. had broken up
- 3) A. I get
- B. I'm getting
- C. I'm going to get
- D. I'll get
- 4) A. are not seeing
- B. haven't seen
- C. didn't see
- D. don't see
- 5) A. should
- B. shall
- C. would
- D. will
- 6) A. that we haven't
- B. that we didn't
- C. we haven't
- D. we didn't
- 7) A. occurred
- B. took the place
- C. passed
- D. was there

- C. has gone
- D. has been
- 10) A. We may not all
- B. We can't all
- C. All we can't
- D. All we may not
- 11) A. have come there
- B. were arriving
- C. got there
- D. came to there
- 12) A. was seeming quite happily
- B. was seeming quite happy
- C. seemed quite happily
- D. seemed quite happy
- 13) A. I'm meeting so old
- B. I'm getting too old
- C. I get so old
- D. I get too old
- 14) A. taking
- B. bringing
- C. to take
- D. to bring

**Choose the correct answer. Only one answer is correct.**

- 15. Can this camera..... good photos?  
A. make                      B. to make                      C. take                      D. to take
- 16. Who was the first person.....today?  
A. spoke to you                      B. you spoke to                      C. you spoke                      D. whom you spoke
- 17. I can't find the book.....  
A. nowhere                      B. everywhere                      C. anywhere                      D. somewhere
- 18. There was a house at.....  
A. the mountain foot                      B. the foot of the mountain  
C. the feet of the mountain                      D. the mountain's foot
- 19. A person who talks to ..... is not necessary mad.  
A. himself                      B. oneself                      C. yourself                      D. itself
- 20. I'll be 13 tomorrow,.....?  
A. am I                      B. aren't I                      C. won't I                      D. will I
- 21. Did you hear.....Julie said?  
A. what                      B. that                      C. that what                      D. which
- 22. Spanish people usually speak ..... than English people.  
A. quicklier                      B. more quicklier                      C. more quickly                      D. more quicker
- 23. That old lady can't stop me.....he tennis match on my radio.  
A. to listen                      B. listening                      C. listen to                      D. listening to
- 24. I haven't got a chair.....  
A. to sit                      B. for to sit on                      C. to sit on                      D. for sitting
- 25.....at the moment, I'll go the shops.  
A. For it doesn't rain                      B. As it doesn't rain  
C. For it isn't raining                      D. As it isn't raining
- 26. Bill drinks..... whisky.  
A. any                      B. none                      C. too many                      D. so much
- 27.....are very intelligent.  
A. Both of them                      B. Both them                      C. Both they                      D. The both
- 28. In a shop.....customers.  
A. it is important pleasing                      B. it is important to please  
C. there is important pleasing                      D. there is important to please
- 29. Don't leave your shoes on the table.  
A. Put off them!                      B. Take them off!  
C. Pick them off!                      D. Pick up them!
- 30. ....in my class likes a teacher.  
A. All persons                      B. All pupils                      C. Everyone                      D. All people
- 31. We expected about 20 girls but there were..... people there.  
A. another                      B. others                      C. some                      D. more
- 32. Your bicycle shouldn't be in the house!  
A. Take it out!                      B. Get out it!                      C. Put it off!                      D. Take away it!
- 33. What time does the bus.....Bradford?  
A. go away to                      B. go away for                      C. leave to                      D. leave for
- 34. She.....be Canadian because she's got a British passport.  
A. can't                      B. isn't able to                      C. mustn't                      D. doesn't need
- 35. "Our daughter.....", they said.  
A. was born since three years                      B. is born for three years ago  
C. was born three years ago                      D. has been born since three years ago
- 36. When..... English?  
A. has he begun to study                      B. has he begun study  
C. did he begin to study                      D. did he begin study

37. Do you want some cheese? No,.....  
A. I've some still                      B. I still have much  
C. I don't want                         D. I've still got some
38. Brenda likes going to the theater and .....  
A. so do I                      B. so go I                      C. so I like                      D. so I am
39. .... from London to Edinburgh!  
A. How long there is                      B. What a long way it is  
C. What distance is there                      D. How long is
40. He's a good guitarist, but he plays the piano.....  
A. quick well                      B. too hardly                      C. very good                      D. much better
41. When you go to the shops, bring me.....  
A. fruit tin                      B. a fruits tin                      C. a tin of fruit                      D. a tin of fruit
42. Molly doesn't eat fish.  
A. So doesn't John.                      B. Neither does John.  
C. John doesn't too                      D. John doesn't that either
43. The airport is five miles.....  
A. away from here                      B. from here away  
C. far from here                      D. far away from here
44. Please ask .....and see me.  
A. to Bill to come                      B. Bill to come                      C. to Bill come                      D. Bill come
45. She always buys.....my birthday.  
A. anything nice to                      B. anything nice for  
C. something awful to                      D. something awful for
46. Aren't they friends.....?  
A. of yours                      B. of you                      C. to yours                      D. to you
47. She hardly ever eats.....potatoes.  
A. or bread or                      B. bread or  
C. neither bread or                      D. neither bread nor
48. This is the record we.....  
A. like so much                      B. are liking so much  
Like it much                      D. like it much are liking it much
49. She's going to buy.....new trousers.  
A. some pair of                      B. some                      C. a couple of                      D. this
50. Is she going to school? No, .....  
A. she doesn't                      B. she's cycling                      C. she gets by bus                      D. to the shops

## IELTS Task 2 Writing band descriptors (public version)

Band	Task Response	Coherence and Cohesion	Lexical Resource	Grammatical Range and Accuracy
9	<ul style="list-style-type: none"> <li>fully addresses all parts of the task</li> <li>presents a fully developed position in answer to the question with relevant, fully extended and well-supported ideas</li> </ul>	<ul style="list-style-type: none"> <li>uses cohesion in such a way that it attracts no attention</li> <li>skillfully manages paragraphing</li> </ul>	<ul style="list-style-type: none"> <li>uses a wide range of vocabulary with very natural and sophisticated control of lexical features; rare minor errors occur only as 'slips'</li> </ul>	<ul style="list-style-type: none"> <li>uses a wide range of structures with full flexibility and accuracy; rare minor errors occur only as 'slips'</li> </ul>
8	<ul style="list-style-type: none"> <li>sufficiently addresses all parts of the task</li> <li>presents a well-developed response to the question with relevant, extended and supported ideas</li> </ul>	<ul style="list-style-type: none"> <li>sequences information and ideas logically</li> <li>manages all aspects of cohesion well</li> <li>uses paragraphing sufficiently and appropriately</li> </ul>	<ul style="list-style-type: none"> <li>uses a wide range of vocabulary fluently and flexibly to convey precise meanings</li> <li>skillfully uses uncommon lexical items but there may be occasional inaccuracies in word choice and collocation</li> <li>produces rare errors in spelling and/or word formation</li> </ul>	<ul style="list-style-type: none"> <li>uses a wide range of structures</li> <li>the majority of sentences are error-free</li> <li>makes only very occasional errors or inaccuracies</li> </ul>

## AIMS AND SCOPE

The international journal of language learning and applied linguistics world performs as a platform for the new scholars to share their insights with other scholars in the form of original papers.

The international journal of language learning and applied linguistics world is a double-blind peer-reviewed international journal dedicated to promoting scholarly exchange among teachers and researchers in the field of language teaching and applied linguistics. Papers submitted to the journal will immediately be sent to two related reviewers who are responsible to provide feedback on the content and the language use.

The journal is published monthly in online and print versions. The scope of the journal includes, but not limited to, the following fields:

*Theory and practice in English*  
*Language teaching & learning*  
*Teaching English as a second or foreign language*  
*Applied linguistics*  
*Discourse studies*  
*Syllabus design*  
*Language learning problems*  
*Computer assisted language learning*  
*English for specific purpose*  
*English for academic purpose*  
*Language teaching & testing*  
*Translation studies*

## ABSTRACT

This paper examines motivation in the light of its affective roles in learning of English language as a second language. It acknowledges the lack of motivation for both the students and the teachers of English but emphasizes the fact that the assumed need of English language by the learners will to a large extent affect the attainment level of ESL learners. There is an attempt to unravel the implication of different kinds of motivation on language learning with special attention to the kinds of motivation used by the learners of English as a second language in Nigeria and how learners can maximise this for an improved proficiency in it.

**KEYWORDS:** motivation, language learning, second language, acquisition, first language

## INTRODUCTION

There is no doubt that a child whose mental and physical capabilities lie within the normal range will grow up to acquire a language and most of the time need arises for the learning of more language(s). Motivation in language learning can be the drive that compels one to learn or study a language. In other words, motivation is the factor that spurs learners of language to learn a particular language.

There are two major types of motivation: Extrinsic motivation and intrinsic motivation. The extrinsic motivation operates when learners learn as a factor external to them while intrinsic motivation comes into play when a language is learnt because of factors internal to the learner. From psychological perspective, motivation is regarded as the internal drive directing behavior towards some end (Firth, 1997). Also Huitt (2001) submits that motivation is an internal state or condition that serves to activate or energise behavior and give it direction. From both definitions, it is obvious that in psychology, though external factors are acknowledged, motivation is approached through internal factors. The internal condition is highly emphasized.

In Nigeria, the importance of English Language cannot be over emphasized based on the roles it performs especially in the educational sector. No wonder, Bamgbose (1971) says that English Language is most noticeable in the field of education and Bamisaye (1995a) acknowledges its status as the Nigeria's most important language, thereby describing it as a 'legal alien'.

The second language is a language that is learnt after the first language has been acquired. There is no gain saying that the learning of English Language by students in Nigeria has become as indispensable as the air that one breathes since the success and survival of a student in school will, to a large extent, depend on his knowledge of English. At this juncture, it is pertinent to emphasize that a second language (L2) is not always learnt. There could be instances of second

language acquisition, in which case a child is exposed to two languages at an early age, thereby acquiring the two languages simultaneously.

In Nigeria, most children learn English language as a second language at school. In this case, the teachers serve as the role model. No wonder, Bamisaye (1995a) aptly points to the fact that the learners as well as the teachers of English language face a lot of problems in learning/teaching endeavours in Nigeria. The issue of motivation constitutes one of the major problems associated with language learning which, according to this paper, will be approached by examining the kinds of motivation for learning the language. This is the goal of students learning the language.

## **MOTIVATION IN LANGUAGE LEARNING**

Adegbite (2003) asserts that motivation is the desire or determination to learn a language. In learning any language, there is a goal that is set to be achieved. The goal will motivate individual learners or students of language in the process of learning and eventual attainment in the language. Therefore, one can say that motivation in language learning refers to the orientation and attitude of a learner towards target language learning and the community of the language. It is with due consideration of this factor that motivation in language learning can be classified into Instrumental and Integrative motivation (Gardener & Lambert 1972; Munkaila & Haruna, 2001).

Learners of a language are said to have been instrumentally motivated when the orientation is based on an interest to learn a language for utilitarian purpose i.e., to transact a business, in order to succeed in an examination etc. The instrumental motivation is recognized by Ariyo (2004b) as extrinsic motivation, which he describes as learning of a language as a sort of utilitarian adventure.

Integration motivation, on the other hand, refers to when learners are oriented to learn about the culture of the language community and cultivate a sense of belongingness toward the community. In such a case, learners will be willing to adapt the behaviour. Ariyo (2004b) asserts that language learning correlates with intrinsic motivation positively if the aim is to identify with the culture of native speakers of the language. Therefore, integrative motivation encompasses not only the language but the culture associated with the language.

## **THE IMPLICATION OF INSTRUMENTAL MOTIVATION**

Pride and Holmes (1974) submit that motivation is instrumental in form, if the purpose of language study reflects the more utilitarian value of linguistic achievement such as getting ahead in one's occupation, securing a job and the likes, if this definition is taken 'carte blanche,' then instrumental motivation is premised on the notion of learning a language for specific purpose[s].

Instrumentally motivated learners focus on areas of need. Since the learning of a target language is directed towards certain goals, efforts and energy invested in learning decrease once those goals are achieved or when the learners assumed they have learnt enough to achieve the goals. It

is a pertinent observation that different languages reflect different cultural practices. The culture of a particular language environment differs from another. Therefore, learners that are instrumentally motivated have little knowledge about the culture of the community of the target language.

Another distinct factor is the use of the second language. Learners are not likely to use the target language outside the context for which the language is learnt. Even in schools, learners are basically pre-occupied with sailing through tests and examinations, which in most cases, are basically theoretical in approach. Once, they can successfully achieve that, they are no more interested in putting the language into use outside the school environment.

Learners that are instrumentally motivated have little knowledge about the lexico-grammatical system, meaning system and sound system of the language. Suffice to say that the knowledge of a learner at each level of the grammar of the language will also depend on the goals. A student that does not intend to study English in any tertiary institution might not pay adequate attention to the sound system of the English language.

Instrumentally motivated learners can hardly attain near native – like proficiency, let alone native – like proficiency in the target language as long as the orientation remains the same. The fact remains that they do not even desire to be.

## **THE IMPLICATION OF INTEGRATIVE MOTIVATION**

Pride and Holmes (1972) staunchly argue that a language may be learnt as a means of being accepted in another cultural group because of dissatisfaction experienced in one's culture. Also the interest to learn another culture might just be the same as the learner's own culture. It is along this reasoning that Ariyo (2004b) asserts that language learning correlates with intrinsic motivation positively if the aim is to identify with the culture of the native speakers of the language. The point being emphasized here is that learning about the culture of the target language is the crux of the matter in integrative motivation.

Learners are encouraged to speak the target language in both formal and informal environments. No doubt, there will also be certain needs, but the focus is not only on immediate needs, but a continuous learning of culture until they become 'linguistic members' of the language community. Learners are exposed to wide stylistic variations of the target language coupled with a deep knowledge of the verbal behavior. Also, the learners will cover extensively the phonology, morphology, semantics and syntactic systems of the target language. No wonder, Adetuyibi and Osundahunsi (1984b:140) agree that this type of motivation (integrative) will stimulate learners to think creatively and to express their thoughts intelligibly.

Integratively motivated learners are emotionally attached to the culture of the target language, therefore, they possess a sense of belonging to the language community of the target language. There will be more successful learning when a target language is learnt in order to be part of those that speak the language. This leads to better learning and the learners could attain near proficiency in the target language.

In an ESL situation, the learners of English have acquired a language (first language) and in most instances, an ESL learner is a linguistic adult. It becomes obvious that English will be the second sequential language. In apt reference to the submission of Ariyo (2004a), there exists different purpose for teaching English in Nigeria. As a matter of fact, teaching or learning of the language, since it is an L2 is goal oriented. No wonder, Adegbite (2003) stresses the fact that motivation is an affective element in language acquisition.

According to the provision stipulated in the National Policy on Education (1981):

*Government will see to it that the medium of instruction in the primary school is initially the mother tongue or the language of immediate community and at a later stage, English.*

From the quoted of the National Policy on Education, there is the provision for the use of both indigenous language and English language as media of instruction in early and later primary school respectively. The use of English by ESL learners is most noticeable in the formal setting; therefore the learning environment is restricted. These cannot but have grave consequences on the attainment level of learners of English.

Adegbite (2003) opines that in Nigeria, English is learnt mainly through formal instruction in the classroom. He reiterates further that this context for learning English in a second language environment contrasts in certain respects from the context whereby second language learning takes place in English as a mother tongue environment. This observation captures the linguistic environment of learners of English as a language in Nigeria.

Davies (2006) acknowledges the fact that second language learners could possess communicative competence in the target language but he aptly excludes areas such as accentual speed and judgment of grammatically. Despite this, it is pertinent to say that communicative competence is not one of the major goals in Nigeria. The concern of Nigerian learners is to achieve the functional purpose for which English language is meant to serve and the success of such purposes.

The functional purposes of English in Nigeria include: Language of Administration and Government; Mass media; Education; Science and Technology; Religion; Business and Commerce; Law and Politics; International relations (Ariyo,2004a).These functions of English are utilitarian in purpose, therefore, it seems quite unnecessary for second language learners to pursue native speakers competence in the language.

The L2 learners are not exposed to models that are native speakers. Most L2 learners are taught by teachers who also learnt the language as L2. In essence, they do not have access to language resources from the natives. The ESL environment is not conducive for the learning process; an attempt to use English as a native speaker might be socially unacceptable expect for a few elite parents that encourage their children to be simultaneous bilinguals whereby they learn and use English both at home and school.

The mastery of the language of instruction determines the performances of learners in their academic pursuit. Therefore, the level of academic attainment will also go a long way to influence the level of proficiency in the language. No wonder, Ariyo (2004b) submits that people of high academic attainment are better in English language proficiency.

Adegbite (2003) opines that most Nigerian learners of English have instrument reasons for learning the language, which show through their low level achievement in it. He further observes that the impersonal and distant communicative role, which English plays in the lives of individuals and the society as a whole, keeps the standard of the language low. The question that readily comes to the mind is, how can the attainment level of ESL learners' proficiency be increased despite the fact they are instrumentally motivate?

Learners need a change in approach to orientation. Though, the fact remains that the learning of English is a sort of utilitarian adventure, learners should approach the learning with a positive attitude and they should not set a limit or target for themselves.

In linguistic, the native speaker serves as a resource and also a standard setter (Davies, 1991). The focus or goal of ESL learners is not to be sacrificed on the altar of attaining native speaker proficiency since this will lead to loss of identity but ESL learners should accept the native speakers' use of the English language. In this case, a learner will not be perceived as a 'linguistic bastard' if he sounds 'too English' especially in the academic or school setting.

Students are usually tested based on the Standard English and not necessarily as expected from ESL students. An instance is the test of Oral English, which a candidate is expected to have mastered correct pronunciation of sounds since there is no different Phonology of English for ESL learners.

The fact that integrative motivation leads to better learning does not make an ideal option for learners of English as a second language because it results in loss of cultural identity. Even, Adegbite (2003) rightly observes that children that are encouraged to learn English without recourse to their mother tongue end up failing to achieve mastery of either language.

Despite the main premise of this work which has been strongly articulated afore time, Native speakers also need to encourage ESL learners as rightly observed by Kubota (2001) thus:

There is the need for Native Speakers to develop positive attitude towards other speakers of English...They should develop skills to complement them

This submission is very far removed from the fact that ESL is inferior to NE, since the possibility of cross cultural communication cannot be ruled out, hence, through complementary cross cultural communication; both ESL learners and speakers will not suffer cultural loss.

## CONCLUSION

There is no doubt; motivation is an affective factor in language learning. Both teachers and learners are to approach the learning and teaching of ESL with positive attitudes stressing that good English should be used intelligibly with the right words, grammar, pronunciation and meaning. That is, the ability to discern 'what to say', 'how to say it', 'to whom to say it' and 'in

what context'. By this, a speaker knows the appropriate words to use in appropriate manner to the right person in the right situation which fall within the research objectives of linguists interested in pragmatics.

I acknowledge that the points in this paper are by no means exhaustive they could go a long way in assisting teachers and learners of ESL. Therefore, the fact that the various purposes for learning of ESL, have been accomplished should not discourage continuous learning, since there would also be room for improvement, which will improve the attainment level of such learners in English.

## ABSTRACT

The present study aimed to investigate the effect of form-focused vs. meaning-focused instruction on the development of reading comprehension among Iranian elementary EFL learners in a content-based context. Therefore, SAMA junior high school (related to Islamic Azad University) in Mashhad, was chosen as the research site. A general language proficiency test of Nelson (book1, Elementary 050A) was used to measure their general language ability. Also, standard KET reading comprehension test was implemented to examine the participants' reading comprehension development level. Participants were divided into: form-focused instruction (FFI) group, meaning-focused instruction (MFI) group, and a control group. The numbers of students were 30, 28 and 28 respectively. The FFI group performed activities such as underlining structures in texts. The MFI group was assigned activities such as pair/group discussion, while the control group did not receive meaning/form-focused instruction. The data were analyzed via SPSS software to compare the means of the groups involved. The results ascertained that form and meaning-focused groups significantly outperformed the control group. It also disclosed that form-focused group performed better than meaning-focused group on KET reading comprehension test unexpectedly. As a conclusion, it might be generalized that both form-focused and meaning-focused methods of teaching can promote the reading comprehension of EFL learners in a content-based context.

**KEYWORDS:** Reading comprehension, Focus on forms, Focus on form, Form-focused instruction, meaning-focused instruction, content based instruction.

## INTRODUCTION

There is a discussion among many scholars about the effective type of instruction. Some (Krashen, 1994) believe that exposure to input is enough for learners to acquire the language while the others (Long, 1991; Doughty & Williams, 1998; Norris & Ortega, 2000) refer to the effectiveness of attention to form. According to Doughty and Williams (1998), pedagogical interventions embedded in communicative activities can be effective in overcoming classroom limitations on second language acquisition (SLA). Therefore, form-focused instruction and meaning-focused instruction were two types of instruction which have been used for investigating on this issue (the effective type of instruction) in this study.

One of the major skills in second language acquisition is reading comprehension. Reading is the cornerstone of a learner's success in school and consequently through his/her life since it is one of the basic life skills the lack of which affects the students' academic growth (Anderson, Heibert, Scott & Wilkinson, 1985). According to Grabe (1995), in all students' academic careers, students must learn to make the transition from learning to read to reading to learn other information. There is little discussion in most reading development discussions on how this transition to academic learning from reading can be made. Therefore, some questions have been raised on the relationship between reading instruction and content-Based Instruction (CBI) and the role of CBI in reading instruction. It is worth to know that CBI provides a natural framework for incorporating text-structure awareness and formal knowledge of language structure and also demonstrating how language serves useful functions for communicating. CBI is useful for language skills development in many L2 contexts (also Mohan, 1990; Crandall, 1993). Thus, because of the advantages of CBI, the background context of this study was content-based instruction.

Teachers can measure their students understanding level through different ways one of which is reading comprehension. Because reading with comprehension is the basis of all content areas, it is essential that a variety of needs relating to reading comprehension to be met. Furthermore, many researchers (Fotos & Hinkel, 2007; Nassaji, 2007) studied the effectiveness of two types of instruction (Focus on form and focus on meaning) on different areas in learning second language context specially their effect on productive skills (speaking and writing), but here in this study the researcher was interested in investigating receptive skills such as reading comprehension and wanted to know whether these types of instructions could affect reading comprehension or not. The main purpose of this study is the assessment of students' reading comprehension through form/meaning-focused instruction in order to figure out which type will lead to better results.

In this study, the teacher can motivate the learners positively; giving the students of each group the chance to participate in the form/meaning-focused activities (depending on the experimental group they are assigned to), giving them a fresh opportunity to work in small groups with their classmates on language activities which will give them a strong sense of motivation and accomplishment. Therefore; the students are self-motivated and take an active role in their own learning process. It also provides language teachers with information about different activities which is needed in each experimental group. Language teachers might be encouraged to examine different activities during their teaching process of different skills.

Fortunately, studies have contributed to the field of SLA and applied linguistic in general. This is achieved through searching more on a subject which has not been fully expounded in previous studies on reading comprehension development. This study tries to look at reading comprehension development from a new viewpoint. Therefore, in the present study, the researcher has been interested in investigating the effects of two various types of instruction (form-focused and meaning-focused instruction) that may affect the development of reading comprehension indirectly. Consequently, the implementation of this study tries to answer the following research questions:

1. Does implementing focus on form in the context of content-based instruction have any significant effect on reading comprehension development among the Iranian guidance school students?
2. Will meaning-focused tasks through content-based instruction lead to development of reading comprehension skill of the Iranian guidance school students?

## REVIEW OF LITERATURE

Some L2 scholars believe in the role of implicit instruction more than explicit language learning (e.g., Krashen, 1994; Long, 1996), but empirical studies show that explicit attention to form in communicative contexts is more effective (Spada, 1997; Norris & Ortega, 2000; Roy Lyster, 2004). Focus on form instruction is a kind of instruction that may hold up the important factors of communicative approach such as student-centeredness and authentic communication, and, on the other hand, maintains the value of the occasional study of some L2 grammatical forms (Long, 1991; Alex Poole, 2005).

Long (1991) and Long and Robinson (1998) believed that focus on form instruction is different from instructions which are aimed at teaching grammatical forms, rather than using language for communication. This type of instruction, which they call focus on forms instruction, focuses on the grammatical forms that the teacher can transmit to his/her students so it is teacher-centered, but focus on form instruction is learner-centered due to its aim of responding to the learners' perceived needs in a spontaneous manner.

Both focus on forms and focus on meaning instruction are valuable and complement each other, but focus on form instruction keeps a balance between these two by calling on the teachers and the students to attend to form when it is needed in a communicative class (Long, 1991, Long & Robinson, 1998, Poole, 2005). Ellis (2001) claimed that form focus instruction is any type of planned or unplanned instructional activity which leads learners to pay attention to form.

Spada (1997, p. 73) asserted, "FFI will mean any pedagogical effort which is used to draw learners' attention to language form either implicitly or explicitly. This can include the direct teaching of grammar language through grammatical rules or reaction to learners' errors". According to Ellis, Basturkmen and Loewen (2002), there are three kinds of basic approaches in form-based instruction. Table 1 shows the syllabus, primary focus and distribution of them. As the table shows, the focus on forms has intensive distribution and structural syllabus and its primary focus is on form. The planned focus on form has task based syllabus an intensive distribution and its primary focus is on meaning, in contrast, the incidental focus on form has task based syllabus but extensive distribution and its primary focus is on meaning.

*Table 1: Types of form-based instruction*

Type	Syllabus	Primary focus	Distribution
1. Focus on forms	Structural	Form	Intensive
2. Planned focus-on-form	Tasked-based	Meaning	Intensive
3. Incidental focus-on-form	Tasked-based	Meaning	Extensive

Source: Ellis et al. (2002, p.420)

According to Long and Doughty (2009), fluent reading comprehension requires some processing sub skills and linguistic knowledge bases in order to allow the reader to comprehend texts to the level required. Researches on L2 syntax and discourse knowledge have shown that there are strong relations between these two language knowledge bases and reading comprehension. Researches on Dutch students have shown that grammatical knowledge is a powerful predictor of reading comprehension abilities of students. Studies of Schoonen, Hultijn and Bossers (1998), Van Gelderen et al. (2004) and also both Alderson (2000) and Enright, Bridgeman, Cline, Eignor, Lee, and Powers (2002) (in reading assessment research) have shown the same result that is syntactic knowledge is strongly related to reading comprehension.

Content-Based Instruction (CBI) has been defined as teaching content or information in the second language being learned without direct effort for teaching the language itself (Krahnke, 1987). There are several general subjects that are used in CBI: mathematics, science, and social studies. Crandall (1995) cited that Kessler and Quinn (n.d.) introduced Science Learning and Second Language Acquisition as an example of CBI that is the lesson gives new science concepts to learners through the text and enables them to acquire the language skills in a way that while they interact with the new input, they can develop their language skills too.

Also to support the positive side of CBI, Crandall (1995) cited that according to Penfield and Ornstein-Garlicia's (1981) suggestion, teachers may use the learners' first language to introduce and discuss new scientific concepts, depending on the class situation. The effectiveness of teaching science through CBI is revealed in bilingual as well as monolingual English environments. English can be developed along with learning science (pp. 71-72).

Scholars stated that for a child to comprehend an author's written message it requires him/her to be able to analyze and sort through multiple layers of text meaning. The layers are broken down into four separate processes: First, in order to comprehend a written passage properly, a learner must be able to decode the words on the page (Wagner & Tannenbaum, 2007). Second, he/she needs to hold the information in working memory for long enough time in order to process the information more extensively (Gathercole & Alloway, 2008). Third, the learner must have sufficient vocabulary, grammar and syntactical skills so that he/she can organize and interpret the text efficiently (Paul, 2006; Wallach, 2008). Fourth, learners need to access higher order thinking

skills in order to process the text and go beyond the surface layer of it and infer possible meaning (Wolf, 2008).

Furthermore, there are several studies in which researchers have experimentally attempted to increase attention to form within an overall focus on meaning. For example, Hulstijn (1989) measured the effect of exposing learners to target texts and giving them activities which require focus either on meaning or on form. He found that meaning group scored better than formal group and even showed no disadvantage on form-oriented activities (also Doughty, 1991). Similarly, Spada and Lightbown (1993, p.218) decided to compare a purely communicative control group with another communicative group but with focus on form added to it. However, they declared that it was the unplanned “context embedded focus on form” that occurred unexpectedly in their control group (by the “wayward” teacher) that caused comparison subjects to outperform the experimental group.

Finally, since there is not enough research in the educational context in reading comprehension, this study tries to analyze English teaching and learning in the context of education in Iran from practical perspectives, through ‘focus on form’ and ‘focus on meaning’ theories so, it wants to disclose whether form-focused instruction or meaning-focused instruction has any effect on the development of reading comprehension among elementary learners in a CBI setting.

## **METHODOLOGY**

### ***Participants and Setting***

For the purpose of this study, SAMA guidance school (related to Islamic Azad University) in Mashhad, Ghasem-abad was chosen as the research site. All the students in this school participated in content classes such as science, math and computer. They were at elementary level, however, they were more competent than their peers in other schools due to their content classes and extra English classes they had in SAMA institute.

Among 100 students, 86 students were qualified for the research due to the result of Nelson test. Their age ranged from 13-14. They were divided into three groups of 28, 28, and 30 participants. Two groups were chosen as the experimental groups and the other as the control group. Therefore, 86 students were taught under three different conditions: each class was randomly assigned to one condition: the form-focused instruction group (N=30), the meaning-focused instruction group (N=28), and the control group (N=28).

### ***Instrumentation***

First, Nelson English language test, series 050A, developed by Fowler and Coe (1976) was used to determine the learners’ level of proficiency and homogenize the students in terms of English language proficiency. It consisted of two sections: structure and vocabulary in the form of multiple choice questions. There were, 50 items and the time allotted was about 40 up to 45 minutes. The Nelson test is a standard test, however, in order to test the reliability of the test in this study for these students in Iran, a Kuder-Richardson was calculated to determine the degree of internal consistency. The analysis was done considering the data from the whole participants taking part in the study. The value gained through the analysis is 0.602 which is considered at an acceptable level of reliability.

Second, a reading comprehension test from Cambridge Key English Test (2008) (KET) was administered as both pre-test and post-test. It consisted of four reading comprehensions each with seven multiple questions.

### ***Design***

The design of this study is quasi-experimental design, since it was impossible for the researcher to set learners randomly to these three classes. The subjects in this study were somehow intact, but the researcher administered two tests: 1) Nelson English language test, series 050A, developed by Fowler and Coe (1976) as homogeneity test and selected 28, 28, and 30 participants in each group. 2) A reading comprehension test from Cambridge Key English Test (2008, KET) as a pre-test in order to make sure that they are at the same level of language proficiency. KET was used to compare the data from pretest and post-test in order to see which treatment is efficient. After that the researcher divided the students into two experimental and one control groups. Experimental groups received treatment, while the control group did not. After the treatment, the participants were asked to take the reading comprehension test, again as a post-test. The results were compared with the subjects' grades which were obtained previously in pre-tests. Therefore, the design of this study would be intact group pretest-posttest design.

### ***Procedure***

The researcher went to SAMA school and talked about this study with the guidance school principal. After accepting the request, she introduced the researcher to her colleagues and let her start the study. This study was conducted in the second semester of 1390-91 in SAMA guidance school in three groups. First, the Nelson English language test was administered. The test takers were 100 female students. Only 86 students passed the test. The rational for administrating this test is to determine the subjects with nearly the same proficiency level. The passing mark was 30 out of 50. Those who scored 30 – 35 have been considered to have the same level of proficiency for this study. After the test administration, the subjects who acquired the acceptable score were chosen to contribute to the investigation in each group. Then, two groups were randomly considered as experimental groups and one as control group. After that the researcher used another test (KET reading comprehension tests) as a pretest in order to find out students' ability level of reading comprehension before doing the treatment. Next, the appropriate form and meaning-focused instructions were implemented as a treatment for each experimental group. Treatment was implemented in two months for about 16 sessions. At the end of term, the two experimental groups along with the one control group were given KET reading comprehension tests again as the post test.

In FFI group, it was tried to involve the learners more with form and grammatical points. It is important to mention that because the subjects of the study were school students they used their own books (their content books: Science in English) like other groups in this research. At first, the teacher introduced the topic by asking direct or indirect questions and showing related pictures for motivating learners and activating their background knowledge. Then, the students were asked to read a text form their course book (Science by Poursafar & YousefiNamin, 2010) paragraph by paragraph. Students had no dictionary for unknown words. However, when students wanted to ask the meaning of a word, the teacher would provide the necessary meaning of the word. When reading was completed, she addressed the questions or comments of the students.

After completing the text, the students did some activities after the teacher's modeling the steps of the activities. In this activity, each pair of students read the text again and tried to underline the structures that they saw. Students had 5 to 10 minutes for this activity depending on the length of the text. After that the teacher asked some volunteers to come to the board and discuss or even teach the points they knew about the forms other students could ask their related problems on that structure. Moreover, they had some home activities. The teacher divided them in some groups and assigned some tasks to each member. They had to find a text, of course related to their own lesson in school which is science, from internet or short story books. Then they read it, underlined the form structures and made questions and answered them.

The next step was checking and reviewing their individual tasks with their friends and then delivered their work to the teacher. Another activity which they had to do was a kind of short class research. In this activity, each group chose one topic from their book and they read at least two related texts about it. Then, they tried to write a short paragraph about whatever they understood from their studies with their own sentences and also they had to care about the form and structure of their sentences. The researcher's aim in assigning these different activities was just motivating the students and keeping them fresh. Besides the different activities, the researcher had a short list of grammatical points which most of the subjects had problem with, and tried to focus on those points more than others in the activities. She made this list through analyzing the results of the Nelson test.

In the second experimental group, MFI, the first part of this treatment is similar to the form-focused instruction group that is the teacher had a kind of warm up by talking about the topic in order to awaken students' background knowledge. Then, the students were asked to read a text paragraph by paragraph and state the main idea of each paragraph. The teacher answered the students' questions or comments about words' meaning. Upon the completion of the text, students had pair or group discussion tasks. The teacher gave discussion topics based on the texts of students' course book (Appendix). First, students worked in pairs, and discussed the topic. Then the entire groups discussed the topics in class with each other while the teacher managed and observed the discussion. They had some home activities, too. The teacher divided them in some groups and assigned some tasks to each member. They had to find a text, which is related to their own lesson, from internet or short story books. Then, they have to read it at home and discuss about the main idea of their text in class. Also, for motivating the students they sometimes have short class research activity like the form-focused group but, in this group students give lecture about the texts which they had read (the teacher did not ask them to be careful about the structures during their lecture).

Within the control group, the teacher talked about the topic in order to activate student's background knowledge. Then the students read the text paragraph by paragraph, and after which the teacher provided learners with the new words and paraphrased the text. Learners' homework included a text which was summarized and paraphrased by the students, and the text's questions were answered. The teacher was the authority and the only source of knowledge, and students were passive recipients of knowledge presented to them.

Finally, on the last session in all three groups, the KET reading comprehension test was administered as the post-test of the students' achievement in reading comprehension.

In order to sort and display data in a meaningful way, the researcher went through different statistical procedures. The Kolmogorov-smirnov normality test beside the one way ANOVA (or equivalent tests such as Welch if needed) and scheffe post hoc test were used in three groups of form-focused instruction, meaning-focused instruction and control groups in pretest, posttest and language proficiency tests.

After checking the normality of data by Kolmogorov-Smirnov test for all data in KET reading comprehension test (Table 2), in order to ensure the homogeneity of groups at the beginning of the research, one-way ANOVA (or equivalent tests such as Welch if needed) was used.

Table 2: Results of Kolmogorov-Smirnov test for KET

Group	Variable	N	Kolmogorov-Smirnov Z	p-value
Control	Pre	28	.970	.303
	Post	28	1.011	.259
Form	Pre	30	.759	.612
	Post	30	1.146	.145
Meaning	Pre	28	.692	.725
	Post	28	.492	.969

To ensure the homogeneity of groups with respect to reading comprehension, one-way ANOVA was used. As Table 3 shows there is no significant difference ( $F=1.312$ ,  $P=.275 > 0.05$ ) among three groups with respect to reading comprehension. The results show P-Value equals .098 which is more than  $\alpha = 0.05$ .

Table 3: Results of one-way ANOVA for pretest

	Sum of Squares	Df	Mean Square	F	P-value
Between Groups	15.120	2	7.560	1.312	.275
Within Groups	478.229	83	5.762		
Total	493.349	85			

After two months (about sixteen sessions) of treatment, the KET reading comprehension test was administered again in control and experimental groups. In order to find out each group's reading comprehension development, the three groups were presented with the same reading comprehension test as pretest. Since equality of variance which is one of the ANOVA defaults is

not established (the Levene test was used to ensure the constancy of variances), it is better to use ANOVA equivalent tests such as WELCH, Brown-Forsythe. Table 4 shows there is a significant difference among three groups according to the treatment that they have received. Results show that Welch and Brown-Forsythe tests' P-Value are 0.002 and 0.007 respectively, which are less than is  $\alpha = 0.05$ . The null hypothesis can be rejected with 95 percent. This means that there is a significant difference between scores in experimental and control groups.

*Table 4: Results of WELCH, Brown-Forsythe for Posttest*

	Statistic <sup>a</sup>	df1	df2	Sig.
Welch	7.145	2	52.029	.002
Brown-Forsythe	5.260	2	71.910	.007
a. Asymptotically F distributed.				

The highest rank in the experimental group is the form group which got 11.13 and the other experimental group (meaning group) that obtained 10.85 is ranked as second. The control group (9.10) is ranked as third.

*Table 5: Results of Scheffe post hoc test for posttest*

Group	N	Subset for alpha = 0.05	
		1	2
Control	28	9.1071	
Meaning	28		10.8571
Form	30		11.1333
Sig.		1.000	.921
Means for groups in homogeneous subsets are displayed.			
a. Uses Harmonic Mean Sample Size = 28.636.			
b. The group sizes are unequal. The harmonic mean of the group sizes is used. Type I error levels are not guaranteed.			

As Table 5 shows, there is a significant difference in form and control groups. Also there is no significant difference in form and meaning groups. Therefore, it can be said that students' reading comprehension development in form focused group is much better than control group while there is not a very significant difference in the reading comprehension development of students in form focused group and meaning-focused group.

## CONCLUSION

The whole findings of this study can be clarified in light of research null hypotheses:

1. Attention to form in content based classroom has no impact on the development of Iranians' guidance school students' reading comprehension,
2. Meaning-focused tasks through content based instruction will not lead to the development of reading comprehension.

In order to test the null hypotheses, three groups of 28, 28, 30 students were selected through applying a Nelson English Language Test (Book1, elementary learners) from among 100 EFL learners. Next, learners received different treatment base on the research aims. Finally, the students' score in reading comprehension tests (KET) were compared through different statistical analyses.

The result of the first null hypothesis was rejected surprisingly, showing the fact that learners achieved higher reading comprehension development in form-focused instruction group. Although, it was expected that focus on form will not impact on the development of reading comprehension. The second null hypothesis was rejected, too. But, statistical results show that meaning-focused instruction have less impact on reading comprehension development than the form-focused instruction. In fact, there is not very much significant difference between these two groups.

These findings also indicated that form-focused activities (such as underlining structures) can familiarize learners with grammatically correct and meaningful sentences while meaning-focused activities (such as discussion) help learners to be fluent even with ungrammatical meaningful sentences. So, when they (subjects in meaning-focused group) were encountered the correct forms in text, they were unfamiliar with those forms. The form and meaning activities were implemented generally and the students did not aware of the aim of those activities which were reading comprehension development.

Implementation of procedures that help learners process comprehensible input while at the same time giving them opportunities for language awareness, has been one of the greatest challenges for EFL teachers. In other words, effective language teaching needs input processing and acquisition, which is combined with focus on form (Bourke, 2008). Language awareness has to do with the raising of learners' awareness of features of the target language. Therefore, the teacher's role is not the "all knowing one", but he/she is a facilitator of learning.

Another point is that the teacher should realize the importance of pair/group work for learners' language learning in general. Pair/group work gives students a strong sense of motivation and accomplishment. Students can help each other to perform the activities which they do not handle by themselves. In this study, participants in both experimental groups were involved in pair/group work and tried to handle their problems in understanding meaning of texts and also their linguistic difficulties with the help of their peers and their teacher.

Seba's case study in 2008 confirms the role of focus on form in group work for enhancing reading comprehension. Moreover, Shak (2006) referred in her article that learners find their own linguistic shortcomings and develop strategies for solving them during working with a partner. This process which includes cognitive comparison tends to raise learners' awareness of certain grammatical structures. Therefore, this study also tried to use the positive points of the previous researches' results in its experimental groups by putting participants in several groups and assigning different activities proper to each experimental group. Also, the role of the teacher was the mediator and the facilitator.

Finally, familiarity with the activity procedures is an important point in accurate accomplishment of the activity. Therefore, teacher's modeling of the activity is useful at the first sessions of instruction. Moreover, it is critical to provide students with feedback because students tend to remember their incorrect solutions. Consequently, the teacher as a facilitator of learning process needs to be available during activities and attends to the accuracy of the final product.

Some important limitations to this study which should be noted: First, this study was conducted in the context of Mashhad SAMA junior high school which is a CBI context; therefore, more investigation could be carried out in order to see whether similar results will be obtained in other settings. Moreover, randomizing the subjects was not possible because these classes already existed at schools. Therefore, subjects were intact and a quasi-experimental design was implemented. Then, the female students were the only participants in the study, therefore, the factor of sex was not cleared up that is it is not obvious whether utilizing form-focused and meaning-focused instruction would be more beneficial for a particular sex or not.

## **APPENDIX**

### **Discussion Topics**

Students talked about the following topics:

1. Talk about plants. How do plants grow from seeds?
2. Talk about different kinds of animals. How do some animals without backbones live?
3. Discuss about the properties of matter. What makes up matter?
4. Talk about the galaxy. What do you know about sun, moon, and planets? Discuss about the earth moves.

5. Talk about whatever you know about your body. The importance of bones and muscles for your body.
6. Discuss about your body health needs. How can you stay healthy? What causes disease?
7. Talk about energy. What do you know about different kinds of energy? Discuss about different energy changes in your body and in nature.
8. Talk about the universe. How do scientists learn from space?

## CORPORA USE IN THE TEACHING OF ENGLISH WRITING

Xuezheng Ji Lijuan Wei

*School of Foreign Languages, University of Jinan, China*

*Email: [sfl\\_jixz@ujn.edu.cn](mailto:sfl_jixz@ujn.edu.cn)*

### ABSTRACT

This study mainly focuses on how to use corpora to help students develop their English writing skills. The rapid growth of technology has made it more easily available for teachers and students to have access to online corpora. However, the use of corpora in the English writing classroom is still a practice many teachers are not very familiar with. Hence, the paper makes a summary of the characteristics of the main popular British and America Corpora. Then it demonstrates online corpora are useful resources to aid students in two aspects ---words choice, sentence-level errors correction. The results indicate that Corpus-Assisted instruction is one of the positive and effective ways in teaching English writing, as well as to minimize the teacher's workload.

**KEYWORDS:** English, Corpora, Writing skills, Word choice, Errors correction

### INTRODUCTION

In [linguistics](#), a corpus (plural *corpora*) or text corpus is a large and structured set of texts (now usually electronically stored and processed). They are used to do statistical analysis and [hypothesis testing](#), checking occurrences or validating linguistic rules on a specific universe.

McEnery (2006), define a corpus in modern linguistics as “a collection of sampled texts, written or spoken, in machine-readable form which may be annotated with various forms of linguistic information” (p. 4). That is to say, a corpus is a compilation of natural texts stored into a computer that contains interpretative linguistic information that is useful for the analysis of a language. According to Cook (2003), through the systematic analysis of corpora, it is possible to observe the different patterns and regularities of language use.

[Jabbour \(2001\)](#) points out that “a corpus approach befits teaching second language reading and writing, since both activities are text oriented and make use of words and word combinations, or lexical patterns, within the confines of discourse” (p. 294). In other words, a corpus approach provides meaningful input into the language side of L2 writing instruction, while important rhetorical concerns and issues may be in the teaching and learning of writing in another language, the language domain—syntax, punctuation, style, vocabulary development, etc.—also commands attention. L2 writers, particularly below the advanced level of proficiency, are also language learners eager to develop greater knowledge and command of the linguistic resources necessary for effective writing. A corpus is now seen as a primary contributor of these resources because, as [Tao \(2001\)](#) observes, of its “potential to make explicit the more common patterns of language use” (p. 116).

Corpus-based activity has also been considered beneficial to L2 writing by offering learners a rich experience of real language ([Thurstun J. & C.N Candlin, 1998](#)). Corpora, which are, as noted earlier, databases of authentic language uses culled from multiple sources, provide learners with large quantities of real-life target language discourse. Exposure to these examples of genuine language use can enrich learners' understanding of specific uses of target words in a wide variety of contexts and expand their English knowledge. Students' encounters with these multiple samples of discourse combinations should then contribute to growth as L2 writers.

This paper will mainly focus on how to use corpora to help students develop their English writing skills. In details, the paper will demonstrate online corpora are useful resources to aid students in two aspects---words choice, sentence-level errors correction. It proves to be that Corpus-Assisted instruction is one of the positive and effective ways to develop students' English writing skills, as well as to minimize the teacher's workload.

## **THE REALITY OF EVER-INCREASING TEACHER'S WORKLOADS**

Gene Fowler, American journalist and biographer said: "Writing is easy. All you do is to sit staring at a blank sheet of paper until drops of blood form on your forehead." Writing can be a slow, painful process even in our mother tongue, but when it is in a second language the problems (and the pain) are magnified. Given the amount of conscious effort involved in the writing process, learners in English for Speakers of Other Languages (ESOL) classrooms understandably expect feedback on their work and may feel discouraged if it is not provided ([Hedge 1988](#)).

The difficulty for the teacher, however, is in balancing the needs of individual students for meaningful feedback with the unfortunate reality of ever-increasing workloads. In our universities, for example, it is not uncommon for teachers to have at least 3 English classes, with 70 or so students per class. This means around 121 essays to mark for each assignment every other week, especially CET-4 is approaching, this number can easily double or triple.

## **THE MAIN CHARACTERISTICS OF ONLINE CORPORA**

In response to the needs and difficulties of writing, Here, the paper strongly recommend the teachers and students who teach and learn English writing the four popular free-online corpora—two America English and two British English Corpora. They are believed to be beneficial in English writing.

### ***The Corpus of Contemporary American English (COCA)***

The Corpus of Contemporary American English (COCA) (<http://corpus.byu.edu/coca>) is the largest freely-available corpus of English. The corpus contains more than [425 million words](#) of text and is equally divided among spoken, fiction, popular magazines, newspapers, and academic texts. It includes [20 million words each year from 1990-2011](#) and the corpus is also updated once or twice a year (the most recent texts are from March 2011). Because of its design, it is perhaps the only corpus of English that is suitable for looking at [current, ongoing changes](#) in the language.

The interface allows you to search for [exact words or phrases](#), [wildcards](#), [lemmas](#), [part of speech](#), or [any combinations of these](#). You can [search for surrounding](#) words (collocates), within a ten-word window (e.g. all nouns somewhere near *faint*, all adjectives near *woman*, or all verbs near *feelings*), which often gives you good insight into the meaning and use of a word. The corpus also allows you to easily [limit searches by frequency and compare the frequency](#) of words, phrases, and grammatical constructions, in at least two main ways:

By genre: comparisons between spoken, fiction, popular magazines, newspapers, and academic, or even between sub-genres (or domains), such as movie scripts, sports magazines, newspaper editorial, or scientific journals.

Over time: compare different years from 1990 to the present time. You can also easily carry out semantically-based queries of the corpus. For example, you can contrast and [compare](#) the collocation of [two related words](#) (little/small, democrats/republicans, men/women), to determine the difference in meaning or use between these words. You can find the frequency and distribution of [synonyms](#) for nearly 60,000 words and also compare their frequency in different genres, and also use these word lists as part of other queries. Finally, you can easily create your own lists, of semantically-related words, and then use them directly as part of the query.

### ***Word and Phrase Information***

WORD AND PHRASE. INFO (<http://www.wordandphrase.info>). This site allows you to see detailed information on the top 60,000 words (lemmas) of English, based on data from the [Corpus of Contemporary American English \(COCA\)](#).

WORDS: You can see the overall frequency for each word, as well as the frequency of words in different kinds of English -- spoken, fiction, magazines, newspapers, and academic writing. For each word you can also find the 20-30 most frequent collocates (nearby words) and see 200 or more concordance lines (words in context). You can also see a list of synonyms and (from WordNet) words with more specific and more general meanings, and in all of these cases you can click to see the entries for those related words as well.

TEXT: You can enter any text that you would like in the form at the left -- for example, a paper that you've written, or a newspaper article that you've copied from another website. After inputting the text, you can then see useful information about words and phrases in that text. First, it will highlight all of the medium and lower-frequency words in your text and create lists of these words that you can use offline. This frequency data can help language learners focus on new words, and it can allow you to see "what the text is about" (i.e. text-specific words). You can also have it show you the "academic" words in your text.

Second, you can click through the words in the text to see a detailed "word sketch" of any of the words -- showing their definition, and detailed information for the word from COCA -- collocates (which provide meaning into the meaning and usage of the word), re-sortable concordance lines, and the frequency of the word (overall, and by genre). Finally, you can do powerful searches on selected phrases in your text, to show related phrases in COCA. In this way, this resource is like a "collocational thesaurus" to see what related phrases are most likely in different styles of English.

For example, if you click on the words *potent argument* in the text that you enter, it will suggest alternate ways to express this (e.g. *powerful* or *convincing argument*), and it will show you the frequency of those phrases in COCA -- overall, and by genre. This will help you use "just the right phrase", based on a huge collection of native English texts.

### ***The British National Corpus (BNC)***

The British National Corpus (<http://www.natcorp.ox.ac.uk/>) provides a representative sample of contemporary English, as experienced by a British speaker- though the issue of representativeness is a very thorny one. BNC is a 100 million word collection of samples of written and spoken language from a wide range of sources, designed to represent a wide cross-section of British English from the later part of the 20th century, both spoken and written. The latest edition is the *BNC XML Edition*, released in 2007.

Written part: The written part of the BNC (90%) includes, for example, extracts from regional and national newspapers, specialist periodicals and journals for all ages and interests, academic books and popular fiction, published and unpublished letters and memoranda, school and university essays, among many other kinds of text.

Spoken part: The spoken part (10%) consists of orthographic transcriptions of unscripted informal conversations (recorded by volunteers selected from different age, region and social classes in a demographically balanced way) and spoken language collected in different contexts, ranging from formal business or government meetings to radio shows and phone-ins.

### ***The Bank of English (BoE)***

The Bank of English (<http://www.collins.co.uk>) is another well-known British corpus, has sub-corpora of informal speech, various newspapers, books and magazines, BBC World Service broadcasts, and spoken and written data from the USA and Australia.

## **USING CORPORA TO DEVELOP STUDENTS' ENGLISH WRITING SKILLS**

### ***Proper Word Choice***

Language can be used as a means to control people and influence what they think and do (Bourdieu, 1991; Fairclough, 1995). The choice of words, sentence structure, register, or discourse structure can radically alter people's perceptions toward a method, a belief, or an ideology. Strong word choice is characterized not so much by an exceptional vocabulary chosen to impress the reader, but more by the skill to use everyday words well.

Here's a problem in students' writing like "负责" in the sentence "我负责学生会", they always confuse by the words and phrase such as run, manage, be in charge of, be responsible for. Based on the evidence from corpora, students would be well advised to stay clear of the word "*run*" and the phrase *in charge of*, both of which would seem to be associated with power (e.g., *run the show*, *in charge of the country*). In addition, the data show that "*run*" frequently occurs with nouns which describe non-human entities and may give the feeling to the native-speaker audience that their new masters regard them as automatons who simply have to be told what to do. Meanwhile, the verb "*manage*" or a phrase such as "*responsible for*" which do not seem to carry the same connotation of power and are more frequently associated with people. Given the corpus evidence, the students finally use the utterances such as *I am responsible for Student Union* or *I manage the Student Union* and to avoid phrases like *I am in charge of Student Union* or *I run the Student Union*.

Another example is that a student who wants to use the word “*inquire*” in an essay might be confused about which words best “collocate,” or link, with that word. By connecting to a corpus database and then typing in the word “*inquire*,” also known as a keyword because it activates a search procedure and something called a “concordance program,” the student would eventually see a long list of actual uses of the word with different collocations. These uses occur in the form of portions of sentences, with the keyword positioned in the middle of them. The purpose of the concordance program is to produce such a list. Each example of the keyword in use is a concordance, and the concordancing program provides a series of concordances, as reflected in the following samples for the keyword “*inquire*”:

They will then be able to offer advice and first hand experience when parents *inquire about* good local schools.

When he started to *inquire about* my life, I deflected the conversation by saying that I had sold one of the famille rose vases.

They were both widows, so there was no husband's welfare to *inquire about*.

There is, however, no general duty actively to *inquire about* contracts between others.

The American military government resented the presence of UNTCOK since it was bound to *inquire into* many features of the political scene,

They *inquire into* the consequences of historical events.

Occasionally special committees were set up to *inquire into* particularly important or topical questions.

The Royal Government had decided to recommend the appointment of a Royal Commission to *inquire into* the possible limitation or modification of the death penalty. We first acknowledge the person and only *inquire into* facts later if necessary.

If you search <http://www.wordandphrase.info/analyzeText.asp>, some samples for the same word can be shown as the following:

1	MAG	... is looking for a new shirt to buy a new or sweatshirt and	inquire	about	a	shirt	oat . Same time next year ? Around
2	SPOK	says he 's already contacted the city 's budget department to	inquire	about	a	payback	for a search that included more
3	FIC	, laughing now , too , and so I do n't	inquire	about	a	special	number , or if we should carry bu
4	MAG	Ruben S. Ojeda , Pasadena (626/564-2688) // You should	inquire	about	a	tile	's durability . Every ceramic tile can t
5	ACAD	was sent to a national sample of 360 school psychologists to	inquire	about	about	current	accountability practices . Pot
6	SPOK	I accompanied her to university of Chicago emergency room to	inquire	about	admittance	on	to inquire about getting som
7	NEWS	at the narrow mobile home 30 miles north of Detroit to	inquire	about	an	inquiries	" sexually suggestive " note f
8	MAG	of on-site baby-sitting services ? You may also want to	inquire	about	available	activities	In and around your lodg
9	MAG	by the Grief Recovery Institute . Call your local hospital and	inquire	about	bereavement	programs	. Check your local newspaper for

The information above is known collectively by the more technical term, “concordance output.” Students can study this output, or information, closely and see how a keyword operates in context with closely related words. They can also obtain a second key type of output known as “collocate output.” Collocate output indicates how often (within the larger corpus) a keyword is collocated, or linked, with specific surrounding words. Students will encounter additional statistical information about the frequency of this collocation. With this information at hand, students can then compose their own sentences using the keyword with increased knowledge of how to link the word with appropriate collocates.

### ***Sentence- level Correction***

Teachers face difficult decisions on how to best utilize limited time and resources both inside and outside the classroom to correct students’ essays. A greater focus on accuracy is likely to reduce the amount of actual writing practice students get and affect their fluency, while less attention to mistakes may deprive them of the tailored feedback they need to develop their interlanguage. In addition, practical realities can often outweigh any pedagogical considerations, with teachers simply too busy to provide more individual feedback even when they believe it would be beneficial.

One effective way to encourage students to focus more on error correction, while at the same time providing them with the support they need, is to train them in methods to query online corpora. Here is an example to demonstrate how to use online corpora to improve student’s drifts, let us look at some student writing errors:

- A. ‘Since then, the food price started to soar... ’
- B. ‘...the boy’s confidence changed greatly ’
- C. ‘... Her parents died for a car accident’

Ask students to work in pairs, try to decide what the problems are with each of these sentences.

Analysis:

In (A), a search using the keywords *since+then* in COBUILD (or COCA and WordandPhrase.Info) gives the following example sentences (known as concordance lines) from the corpus: Episcopal church services has increased by 23 *since* then. [p] What difference would it make if Constitutional Committee in 1991 and have *since* then served on panels dealing with a wideas a grade A8 administrator in May 1993 and *since* then have worked in Directorate-General 1Aoldest members. They were elected in 1920 and *since* then their relationship has been a close18 months ago after a bloody military coup. *Since* then thousands of Haitian refugees have been

From these examples, we can see that “*since then*” is typically used with the present perfect tense in native speakers’ texts (have + past participle) and we can conclude that (i) should be rewritten as ‘Since then, the food price has started to soar ... ’

In (B), a search for *confidence+changed* in COBUILD (or COCA and WordandPhrase.Info) produces the following: Lookup Error: No matches.

This means that there are no examples of this pattern in the whole COBUILD corpus, which is made up of 56 million words! We can therefore conclude that this is not a natural expression. So how would a native speaker write this idea? A search using the keyword “*confidence*” produces the following example concordance lines:

Gary seems to grow in *confidence* the more he plays.  
I was tearful all the time and I lost my *confidence*.  
I couldn't sleep and I suffered from lost and bewildered. How can I regain my *confidence*?  
I should be reaching and I have got my *confidence* back.  
He felt that the market reached its lowest point in the first half of last year and that a number of signs now pointed to returning *confidence*.  
Only the person to whom the duty of *confidence* is owed will be allowed to sue; in other words, an outsider who is adversely affected by trading in shares to which the information relates, will again have no remedy.  
It would not have the *confidence* of the people, so it would never work.

From these examples, we can see that there are many ways to describe how confidence changes in English, depending on whether it increases or decreases.

In (C), a search using the keywords “*car accident*” in the BNC produces the following example concordance lines: CN3 815 To take one example, a man was killed in a car accident. CEK 1948 Her husband dies in a car accident alongside another woman and driven by grief and jealousy, she investigates his secret life and becomes G15 2972 For many years, Marek wrote, he had believed his mother when she said his father had been killed in a car accident. HH0 2263 In fact I cause a car accident by obstructing someone's driveway. HWL 7 I covered the mouthpiece and said: ‘Salome's been involved in a car accident.

We can see from these examples that ‘was killed in ...’ (passive construction) or ‘somebody died in ...’ are more appropriate structures to use.

To sum up, such an approach allows students to learn how to revise their drafts. This experience is both meaningful and valuable. In the course, students go beyond the language they learn in the classroom and in their books, what's more, have a better understanding and enrich knowledge of the use of English language.

## CONCLUSION

In this study, we explored both British and America Corpora provide significant and authentic resources for English teaching and learning. Teachers can develop instructional materials and activities involving a corpus-based orientation; students can make a proper choice of words in English writing and revise their drafts within Corpora. In the course, students go beyond the language they learn in the classroom and in their books, what's more, have a better understanding and enrich knowledge of the use of English language. So, it's one of the best ways to improve student's English writing skills; as well as minimize the teachers' workload. However, corpora may sound reasonable in theory, applying it to the classroom is challenging, because the information it provides appears to be so chaotic. For this reason, it is the teacher's responsibility to harness a corpus by filtering the data for the students. Personally, I support having students conduct their own analyses. This paper, of course, is only the tip of the iceberg. The further studies on how to use Corpora to develop students' English writing skills are expected more and need both educators and researchers corporate effort.

### ABSTRACT

This empirical study was carried out to observe classroom dynamics in terms of the quantity of use of L1 in two third grader high school intact classes in Andimeshk, Iran. The aim of the study was to investigate both students and teachers' perceptions and attitudes toward the use of Farsi (L1) in English (L2) classes. After analyzing the data gathered using classroom observations and interviews, it was concluded that an excessive use of Persian (L1) could have a demotivating effect on the students. The outcomes of this study were in line with other similar studies carried out in different contexts. One of these studies of which this research is a replication was conducted by Mahmoudi (2011). This study also showed that the over use of L1 in L2 classes might lead to students' dissatisfaction.

**Key Words:** L1 (Persian), L2 (English), Attitudes.

### INTRODUCTION

Throughout the history of language teaching in general and English language teaching in particular, the role of the students' native language and its influence on the L2 learning has been the focus of many linguists, researchers and teachers. Since the time when classical languages including Greek and Latin were taught to many learners there has been a general assumption that the only job of the students was to translate either from Latin and Greek to their L1 or vice versa. Then when audio-lingualism was in its heyday, the use of learners' L1 was supposed to be totally banned. The reason was the assumption that there might be negative influence coming from L1 to L2 learning. The use of the students' native language in foreign language classes has always been a matter of "to be or not to be". This is a very controversial area as different theories of second

language acquisition propose different hypotheses about the value of L1 use in L2 classes. Some theories have advocated a monolingual approach because they believe that the processes of L2 and L1 learning are identical. They believe that maximum exposure to L2 and least exposure to L1 are of crucial importance may obstruct L2 learning process (Krashen, 1981; Cook, 2001). Yet, some language experts and educationalists have argued against the complete elimination of L1 from L2 classes (Nation, 2003; Larsen-Freeman, 2001) and have reiterated that a judicious and well-planned use of L1 can give positive results. As it was mentioned at the beginning of this introduction, the role of the native language has had a rocky history during the course of second language acquisition research. This subfield of SLA has come to be known as language transfer. It has always been assumed that, in a second language learning situation, learners rely extensively on their native language.

Lado, in his early and influential book, *Linguistics Across Culture* (1957: 2), states this clearly:

Individuals tend to transfer the forms and meanings, and the distribution of forms and meanings of their native language and culture to the foreign language and culture – both productively when attempting to speak the language and to act in the culture, and receptively when attempting to grasp and understand the language and the culture as practiced natively.

Lado's work and much of the work of that time was based on the need to produce pedagogically relevant materials. To produce these native language –based materials, it was necessary to do a contrastive analysis of the native language and target language (Gass & Selinker, 2008). This entailed making detailed comparisons to find similarities and differences between L1 and L2.

In this study, the point which requires special attention is the attitudes and perceptions of teachers and pupils as the key players of L2 classes towards using L1. Teachers' and students' attitudes on the use of L1 in L2 classes have been sought in different countries and contexts of English language teaching. Schweers (1999) conducted a research on the use of Spanish as the students' L1 in English classes at the University of Puerto Rico to see how frequently the teachers used L1 in their English classes. He reported that almost all students supported the use of Spanish in English classes. The students believed that using L1 in English classes could lead to better understanding of texts and this made students feel more comfortable, less tense and less lost. The researchers added that using L1 led to positive attitudes toward learning English and also it encourages them to learn more English. In the same line, Kim Anh (2010) studied the attitudes of Vietnamese university teachers towards using Vietnamese (L1) in teaching English. A questionnaire and a semi-structured interview were used to collect the data. The findings of the study indicated that judicious use of L1 is found to be necessary in some situations in teaching English. In this research, almost all the participants supported the use of L1 in their classes. They stated that L1 was part of their teaching method and could play a positive role in their classroom. Such a view is in line with that of Atkinson (1987) who sees L1 as a classroom resource.

Tang (2002) conducted a similar study in the Chinese context. The data was collected through interviews and classroom observations. The results were to a large extent similar to those of Schweers' (1999) research in the context of Puerto – Rico, but Tang's research added two more reasons for using L1 in L2 classrooms including: effectiveness and being less time consuming. The study revealed that the use of L1 in L2 classes not only doesn't hinder L2 learning but also it helps teaching and learning.

The use of Persian in teaching English in Iran has also been under Scrutiny. Nazary (2008) for instance, elicited the attitudes of Tehran University students towards the use of Persian in English classes. Based on the results obtained from this study, the author concluded that Iranian university students in an unmistakable divergence from the previous studies were reluctant to use Farsi in their L2 (English) classes. This divergence prompted another study conducted by Mahmoudi (2011). The study was carried out to observe classroom dynamics in terms of the quantity of use of Persian on two pre-university Iranian classes. The aim of the study was to seek both the students and the teachers' perceptions and attitudes towards the use of Persian in English classes. The findings of the study showed that an excessive use of Persian could have a de – motivating effect on students.

## **RESEARCH QUESTION**

The aim of this empirical study is to address the following research question:

- What are third grader high school teachers and students' attitudes towards the use of Persian (L1) in English (L2) classrooms?

## **METHODOLOGY**

### ***Participants***

In order to obtain the necessary data for the study two third grader intact high school English classes were selected. There were 25 students in class A and 28 students were in class B. All participants in both classes (A & B) were male. The teaching methodology employed in the two classes will be described in the observation section given below. The age range of the students in both classes was 16–18. The classes were taught by two teachers, holding MA degrees in TEFL. The last but not the least point to put here is that both these schools from which these classes were selected were private schools located at affluent and privileged parts of the city. The study was carried out in Khozestan, Iran.

### ***Instruments***

Two instruments were employed to collect the data. They were: observation and interview conducted by the researcher. Both classes were observed to reflect the quantity of Persian (L1) and English (L2) use. In order to provide the researcher with an in-depth understanding of the interviewees' perceptions, attitudes and feelings semi-structured interviews were employed. Both the teachers and the students were interviewed in Persian. Each interview lasted about 10 to 15 minutes.

### ***Procedures***

It lasted a period of 70 days (10 weeks) to collect the required data for the study. That is to say, during this period, every week both classes were observed by the researcher for about 30 to 40 minutes each session. The researcher took note on what happened in both classes on the part of

the teachers and the students. Based on their mid-term scores, 4 students from each class as high achieving and low achieving students were interviewed. The reason why the students were selected from the extreme points was to see whether they held different or similar attitudes towards the use of Persian and English in their classes. The two teachers were also interviewed to have their attitudes towards the use or no use of L1 (Farsi) in their English (L2) classes.

## **FINDINGS**

The instruments used in this study were observations and semi-structured interviews. Here the main points observed in classes A and B are briefly highlighted.

### ***Class A observation***

Throughout the course of observation of class A, the observer could see that the major part of class time was given to focus on grammar exercises, translation of texts, sentences and giving Persian equivalents for all the words and expressions in each lesson. In teaching reading the teacher read the text aloud line by line and translated every sentence and word in the text. After covering the whole text this way, the teacher using Persian explained any and every grammatical point to the class, and the students were supposed to take notes in their L1. The teacher also did his best to translate each sentence into the students' L1. For instance, he occasionally wrote a sentence on the board and encouraged a collective translation of each sentence into Persian.

Class A was nearly observed for about 280 minutes during a ten session program. It was observed that about 70% was purely Persian and the remaining 30% was given to reading over the text, or reading out grammar exercises by the students and teacher. A few words were read aloud by the teacher to show where the stress pattern was. Although the teacher was the only voice in the classroom, he did not have the necessary control over the class. For example, many students were either busy doing assignment for other subjects or they were very noisy. Generally it seemed that the majority of the pupils were not very interested in participating in class activities. Many were bored and tired. That is a general lack of motivation and interest was felt in the class.

### ***Class B observation***

In terms of the method of teaching which assigned the teacher and students' behavior in the classroom, this class was different from class A. For example, in teaching reading there was an activation session during which the teacher asked a few general relevant questions to activate the students' background knowledge so there might be better comprehension by them. Then the students were supposed to read the paragraphs of the text one by one. After each paragraph two or three questions relevant to the content of the paragraph were asked so the students' comprehension could be checked for. In case there were any new words in the text the teacher did not provide the students with Persian equivalents for the words. But he informed students of the clues they could use to guess the meaning of the words. He also employed other techniques including giving synonyms, antonyms, examples and the like so the students might get the meaning.

In teaching grammar, the instructor put the grammatical topic of the lesson on the board and gave examples in L2 to show how this structure or grammar point is used. He also asked students to refer to the paragraphs of the passage to underline or specify the sentences constructed based on the grammar point just introduced. It seemed that the teacher was going to focus the students'

attention to the new structures given in the text thereby they could perceive how these structures are actually used in a real context.

The major part of the class time was given to English (L2) to do most of the activities in class. Of course, where necessary a short time explanation in students L1 (Persian) was given by the teacher. Most likely, this teacher chose his way of teaching based on his student's English background in English. That is, most of the students in class B have attended private language institutes. This probably helped both the teacher and the students to be more at ease when English was used in their classes.

### ***Interviews***

In order to be better informed of the attitudes and perceptions of teachers and students in both classes one-to-one interviews were conducted with the two teachers and four students in each class. The interview was based on the following questions.

- 1) How much of class time do you speak Persian in your English classes and why do you think teachers should or should not speak Persian in their English classes?

#### ***Teacher A:***

One main reason to use Persian in my English classes is that I'm always concerned about my students' proficiency in English and I'm afraid they may not understand me. In addition, the use of L1 (Persian) in teaching L2 (English) has been a norm in our English classes and learners expect to be taught the same way. Parents are also concerned about using English by teachers. Because they think that using L2 will have a detrimental effect on the students comprehension of the lesson's which in turn adversely affects their final exams. The teacher himself is not the only one to decide how much Persian to use in teaching English. There are always beyond the class forces regarding this issue. To sum everything up, it is highly that teacher A and his student were not so comfortable to use English in their class because of variables which were not easy to be controlled by the teacher.

#### ***Teacher B:***

As far as my students can follow me, I try my best to use English (L2) in my English classes. But this does not mean that I don't use Persian while I'm teaching English. I sometimes use L1 in my classes when it is necessary as I think in certain cases using L1 will help me provide a non-threatening environment which is of crucial importance for my English students.... I believe that the way English is taught in Iran will lead us nowhere as our products, our students, have not shown to be very successful in oral communication in English. Of course I'm not here to say that the use of Persian should be banned in our classes, but I'm against the improper over use of L1. It should be used properly.....

- 2) How often do you think teachers should use Persian in their English classes?

#### ***Teacher A:***

I think the use of L1 is more beneficial in teaching English in our current educational system because the purpose of teaching English in our country is not oral communication.... See the English textbooks. They speak for themselves! I believe the use of L2 depends on the level and background of the students. The needs of the students should also be accounted for. That is to

say, most of our students think of English as a credit course to pass not as a course which may open a window on a new world. Under the current circumstances of English teaching in Iran I believe using L1 is an effective way of teaching L2. You know the students and their families' satisfaction directly influences the teachers' promotion and other fringe benefits of teachers.

***Teacher B:***

A false belief about teaching English is that, English teachers should by no means employ their student L1 in teaching English to their students. But L1 is inevitably used in both learning and teaching English. However, overusing L1 is not the only way to teach L2 (English). One occasion in which the use of L1 may be of high benefit is when communication in English (L2) fails to happen. In addition, I believe we should not be led by the students and their families' emotions and feelings not to use L2 in our classes.... I think we teachers should be duty – bound and we should try our best to follow the correct principles, because professional issues including theoretically supported methodology of teaching should be dealt with accordingly.

In addition to the teachers of classes A and B two high achieving and two low achieving students were interviewed to see how they think of the use or no use of L1 (Farsi) in teaching L2 (English) by their teachers. The researcher did his best to elicit the students' responses for the following questions.

- 1) Should teachers use L1 in teaching English classes?
- 2) If not, why should teachers not use L1 in teaching English (L2)?
- 3) If yes, in what situations should teachers employ L1?

***The high achieving student (class A):***

As we participate in our English class, we should always think of the purpose for which we study English. I believe that is communication.... If we attend our English classes to seek that purpose we should hear and speak English to learn it. I think our teacher should speak English in the classroom because this is the only place where we can learn English and practice English. But unfortunately I sometimes think we have two Persian literature teachers as both our Persian literature teacher and our English teacher teach the same way (they both speak Farsi). And this demotivates me to come to our English class not because of the teachers' personality but because of his overuse of Farsi in teaching English. We hear a little English but a lot of Persian. It's very boring to be in an English class where you really learn no English....

***The low – achieving student (class A):***

Our English teacher speaks Persian most of the time. He translates everything into Farsi. He explains grammar in Persian. We memorize many words and grammar rules. But we cannot use them to speak or write in English. Sometime the class gets very monotonous and boring. We ask our teacher to speak English but he doesn't do it. Definitely we are deprived of the chance of using English even in our English class because of overusing Persian.... Our teacher doesn't want us talk, think or discuss in English. We don't know why we should call such a boring class as English class.

***The high – achieving student (class B):***

I believe that to learn English in order to communicate with English speaking people we have to listen, speak and discuss in English. Luckily, we have a very active class because our teacher speaks English. His way of speaking is very encouraging. We understand him because he speaks very clearly. He uses very easy words when he speaks. When there is a feeling of non–

understanding our teacher recognizes it. Therefore, he occasionally uses Persian so we may not get confused. Our teacher always encourages us to participate in class activities. For example, he asks us to express ourselves in English. He sometimes uses audio and visual aids in the class to add more fun to classroom activities. Our previous teacher was the only voice in the classroom. We heard little if any English from him and we did not speak English. I like both my English teacher and my English class because now I feel English ....

***The low – achieving student (class B):***

When our English teacher speaks English we enjoy our time although we do not understand everything. I think using Persian in English class is very helpful when we cannot understand difficult words and grammar. I believe using Persian is helpful for weaker students who have not had a chance to attend private institutes.... Though my English is not good, I feel our new teacher has managed to make us feel more motivated and interested to learn English. We need to hear English and speak English any way to learn it... . Although one students' view is not easily conclusive , that is to say , one cannot easily generalize an idea expressed by one student to all the other students , it can , however , be a clue for the researcher to see how the students may perceive the use or nonuse of English in their classes

## **DISCUSSION**

Inspired by the rise of Communicative Language Teaching (CLT), some experts in the field of language learning and teaching have rejected any use of L1 in L2 learning classes (Atkinson, 1987) while others have advocated the use of L1 as an efficient way to make it easy for the students to understand L2 (Nation, 2005). According to Larsen–Freeman (2012) judicious use of the students' native language is permitted in CLT classes. She further believes that, where ever possible, the target language should be used not only during communicative activities, but also for explaining the activities to the students or in assigning homework. The students learn from these classroom management exchanges, too, and they realize that the target language is a vehicle for communication, not just an object to be studied.

In the same line many experts believe that one main area of concern should be the attitudes and motivation of students to learn and use L2. Depending on the learner's attitudes, learning a second language can be a source of enrichment or a source of resentment. According to Light Bown (2003) if the speaker's only reason for learning the second language is external pressure, internal motivation may be minimal and general attitudes towards learning may be negative. Based on the above mentioned reasons and many studies done in the field, learners' perception, motivation and attitudes towards L2 have been found to be of crucial importance in mastering it. The main aims of this empirical study were to observe the two classes in terms of the quantity of use of L1 as well as to reflect the attitudes and perceptions of the students and teachers towards using Persian (L1) in English (L2) classes. As stated above, the two classes were observed. In class A the teacher mainly used Farsi to do almost anything in the class.

That is to say, the class was dominated by grammar – translation method. In class B however, great attempt was done on the part of the teacher to use English and involve students in group

work activities. The teacher in class B also did use audio – visual aids so the students could be exposed to English more.

In class A the purpose of language learning was found to be reading and translation. The class was then a Grammar Translation Method (GTM) oriented one.

In terms of varieties of activities the two classes were observed to be very different. In class A there was a monotonous and fixed pattern. Most activities were in the fixed framework of translating from either L1 into L2 or vice versa. A great deal of class time was allocated to grammar explanation in Persian. The students were also asked to answer after reading questions and memorize English words together with their Persian equivalents. As the researcher observed the classroom for 10 weeks, it was found that the students did not enjoy their class time. They were very passive and bored. That is to say, the class was not lively. The passivity of the students in class A, as Dornyei (2001; 73–74) believes, could be attributed “first and for most” to the monotony of language tasks. He warns that “both teachers and students can easily turn into the familiar routines. The routines, then, can easily turn into a monotonous ‘daily grind’, with the class losing its edge. Monotony is intensively related to variety.

In class B on the other hand a variety of activities, exercises and tasks were given to the students to do. Group work, pair work, audio visual aids, combining reading with speaking activities in English were used by the teacher so he might better involve every student into the classroom dynamics.

Indeed, in class B the teacher was aware of the importance of employing various types of activities so that the monotony of the class atmosphere may lessen.

Using such a kind of diverse language tasks and activities, as Dornyei (2001) puts it, could guarantee the breaking of learning monotony and making teaching – learning an enjoyable experience to both teachers and their pupils.

In order to better delve into the students attitudes and perceptions about the use of L1 (Persian) in their L2 (English) class interviewing with teachers and students was another source of data. Teacher A was greatly in favor of using Persian in his class because he believed in the context of Iranian schools, the syllabus designed and the content of the books are not very suitable for teaching and learning English communicatively. He also claimed that in terms of their proficiency the Iranian students are not homogeneous. He mentioned the lack of enough time and the likes and disliked of the students’ parents related to the method that teachers apply in their classes. However such a stance is rejected by Larsen – Freeman (2012) who believes that L1 should be used only judiciously.

As another source of data two students from each class were also interviewed. These students were high achiever and low achievers in both classes. That is from each class a high and a low achieving student was interviewed. After they were interviewed both high and low achieving students in class A and B had rather similar attitudes towards using Persian in their English classes. All four students were in favor of using more L2 in their English classes. Of course, this is in sharp contrast with Butzkam (2003; 36) who believes “with growing proficiency in the foreign language, the use of native language becomes largely redundant and the foreign language will stand on its own two feet”. The findings of this study are not also in line with another study conducted by other researchers including AL–Nofaie (2010) and Brooks Levis, (2009). They both claimed that in their context L2 learners are in favor of using L1 in L2 classes.

The findings of the present study are yet in line with another two studies carried out by Mahmoudi (2011) and Nazary (2008). In the first study a group of pre – university students were observed and interviewed to see what their perception and attitudes towards the use of L1 in teaching L2 were. The study came to the conclusion that L2 domination in L2 classes is supported. The present study is, of course, a replication of the study done by Mahmoudi but in a different context and on different subjects. The second study was carried out by Nazary. The participants were a group of Tehran University students. They were found to be reluctant to use L1 (Persian) in L2 (English) classes on the grounds that any minutes of using L1 will diminish a minute of their exposure to L2.

## CONCLUSION

The findings of this study are in line with the previous studies done in the Iranian context. The study shows that the third grader high school students like pre–university students in Mahmoudi's study (2011) and university students in that of Nazary were supportive of L2 domination in their English classes and they were reluctant of excessive use of Persian (L1) in the context of Iranian schools. However, the results of this study are by no means prescriptive, because as Ellis (2008; 801) points out, the use of L1 in L2 classes depends on the instructional contexts. Another important point for conclusion is that there is a relationship between teachers' attitudes and their classroom practice. This goes along with Richards (1982) viewpoint that teachers' classroom practices could be viewed as reflections of their beliefs and perceptions about the nature of language and how language is learnt. As it is evident from the findings of this study then we can sum everything up that although a teacher like teacher A in this study blames other external factors that might have a detrimental effect on his effectiveness, teacher B teaching under more or less the same conditions indicated that a teacher can effectively and efficiently take benefit from the least to the best of the advantage. We teachers should not be waiting for an ideal class to come. Our effectiveness is when we can make a change in our students' perception and attitudes towards English which can be to their benefit.

### ABSTRACT

Implicit knowledge, also known as tacit knowledge or intuitive knowledge may manifest itself in one's behaviour or judgments about grammaticality, but it cannot be articulated. Explicit knowledge on the other hand can be verbalized and explicated. For example, native speakers of English intuitively know the regularities in the use of a definite, indefinite or zero article, but are generally unable to describe the principles. This article contrasts implicit knowledge with explicit knowledge and explains the difficulties in implicit and explicit learning. Finally, it will present the pedagogical implementation of explicit and implicit grammar teaching and learning in an integrated approach namely Ex-implicit Grammar Teaching Approach in the classroom context.

**KEY WORDS:** Implicit knowledge/ learning/ teaching, Explicit knowledge/ learning/ teaching, SLA, pedagogical implementation, Ex-implicit Grammar Teaching Approach

### INTRODUCTION

Bialystok (1994) claimed that explicit knowledge can be learnt at any age. However, there are age-related constraints for L2 learners before they develop their own abilities to learn a second language. As Krashen (1982) argued, the use of explicit knowledge may enable L2 learners capable of learning only those rules that are formally and functionally simple.

The author believes that we cannot separate those two types of knowledge, namely implicit and explicit knowledge, because implicit knowledge is formed in a learner's memory and will be transferred to explicit knowledge when the teacher activates the learner's memory by interaction and feedback and use all this activated information as input for the target task. Paradis (1994) asserted that the difficulties associated with learning need to be examined separately in relation to the type of knowledge (implicit/explicit). On the other hand, Ellis (2006) suggests that when investigating learning difficulty in the construct of implicit knowledge, it may require tapping into what a learner intuitively feels to be target-like. Further aspects involving random and time

pressured or automatic processing of stored linguistic knowledge are also essential but would require elaborate research techniques. In contrast, investigating learning difficulties in the context of explicit knowledge may be easier since the focus and concern generally relate to task performance in controlled environments. Other concerns may include motivational techniques and response elicitations that can be done free of any time pressure.

This article consists of six main sections; the introduction is presented in section one, the literature review comes in section two, the discussion is presented in section three, the pedagogical implementations will be presented in section four, while conclusion will be presented in section five, and finally, the references is in section six. In the following, literature review will be presented.

## LITERATURE REVIEW

Vygotsky's discussion (1887) in Wells (1994, p.1) pointed out that scientific concepts in contrast with spontaneous concepts have four features: Generally; systematic organization, conscious awareness, and voluntary spontaneous concepts are developed inductively and unconsciously: where they are hard to be reasoned with, while scientific concepts are developed deductively and purposely. He adds that the scientific concepts provide the framework and the systematic meaning to a new presented item and it usually takes place in school learning.

In the same line, Lantolf (2008, p. 42) in Ellis (2008) pointed out that the implicit knowledge is acquired without learner's awareness of its existence as the acquisition of the mother language, while explicit learning is totally opposite, it is acquired intentionally.

In this field, an issue arose seeking to identify the nature relationship between these two knowledge: Lantolf (2008, p 43) and Ellis (2005, p. 144) mentioned that three independent positions are suggested in the way that implicit and explicit knowledge relate to each other: The first position is: *the non-interface position* where the two types of knowledge do not relate to each other and it describes the implicit knowledge as the bridge to spontaneous performance. The second position is: *the strong interface position* where the explicit knowledge can be implicit knowledge through continuous practice. The third position is: *the weak interface position* where the ability of transformation from implicit knowledge to explicit knowledge is through drawing the learner's attention:

Lantolf (2008, p. 42) made a comparison between the three positions recognized by Ellis (2005), to the Vygotsky theory, he concludes that the implicit knowledge tends to take the same spontaneous knowledge path, while explicit knowledge is not quite the same with scientific knowledge, this is because the explicit knowledge do not necessarily be systematic and correct and generalization of particular behavior as the scientific knowledge do.

The aim of this article is to draw on insights from the applied linguistic literature and Second Language theories (SLA) to develop the practical approach of teaching writing which is called Innovated Writing Process (IWP) approach suggested by Mourssi (2012d). The IWP aims at improving Second/Foreign Learners of English level of writing as well as speaking, see Appendix A, where the teacher can integrate the skill of writing with speaking. He/she can change the teaching method according to the mistakes or points of weakness of his/her learners; this highlights the role of error analysis leading to metalinguistic feedback which can be achieved following a Communicative Grammar Language Teaching Approach (CGLTA) where the teacher interacts freely with learners. This allows for his/her learners to participate in the task,

and to raise a high degree of awareness on the learners' part. This will lead learners to be able to interact, negotiate and discuss, which, in turn, results in preparing them to revise and redraft and improve their writing as well as speaking in a suitable educational and interactional environment (Mourssi, 2012b). This, in turn, will lead us to the importance of the pedagogical implementation of explicit and implicit grammar teaching and learning in an integrated approach namely Ex-implicit Grammar Language Teaching Approach in the classroom context. First, the difficulties in implicit and explicit learning will be presented in the following part.

### ***Difficulties in Implicit and Explicit Knowledge/Learning***

According to Ellis (200, p. 431), the distinction between implicit and explicit knowledge of L2 learners can shed light on the reason why some grammatical structures are more difficult to learn than others. To substantiate, Ellis (2005) conducted an experiment using 17 grammatical structures and traced the learning difficulties in each of these structures by applying both explicit and implicit forms of knowledge. Findings show that structured items identified as easy within the context of implicit knowledge were, on the other hand, described as difficult in the constructs of explicit knowledge. With its inverse relational structure, there was no correlation between the ranks of orders concerning the difficulty experienced with the 17 grammatical structures. A regression analysis demonstrated that both types of knowledge (explicit and implicit) can predict general proficiency.

In explaining the difficulties most L2 learners confront, Ellis (2006, p. 432) hypothesized that some features are naturally easier or more difficult to learn than others due perhaps to the manner the human mind manages its intrinsic properties. Therefore, learning difficulties are still a universal phenomenon; L2 learners of all nationalities confront the same type of ease and difficulty over the same features and structures. One empirical study that supports Ellis' (2006) hypothesis draws on the theory of "natural order" (Dulay & Burt, 1973; Krashen, 1977) in relation to second language acquisition. Ellis (2006) suggested the need to differentiate between implicit and explicit knowledge forms present in an L2 learner based on the seven principal dimensions tabulated below:

*Table 1: Ellis' Seven Principal Dimensions (2006, p. 433)*

<b><i>Dimension</i></b>	<b><i>Implicit knowledge</i></b>	<b><i>Explicit knowledge</i></b>
<i>1 – Awareness</i>	<i>It involves unconscious awareness</i>	<i>It entails conscious awareness</i>
<i>2 – type of knowledge</i>	<i>It is procedural knowledge</i>	<i>It is declarative knowledge</i>
<i>3 – Systematicity and certainty of L2 knowledge</i>	<i>It is highly systematic when established in a learner's inter language (Tarone 1988)</i>	<i>It is imprecise, inaccurate and inconsistent (Sorace 1985)</i>
<i>4 – Accessibility of knowledge</i>	<i>It allows automatic processing</i>	<i>It requires more controlled processing (Preston 2002)</i>
<i>5 – Use of L2 knowledge varies according to the specific conditions under which learners are asked to perform tasks</i>	<i>Learners access their implicit knowledge when they are pressured to perform the same task rapidly, so their speech is less accurate</i>	<i>When learners have plenty of time to plan production on-line, their speech becomes more accurate because they access their explicit knowledge (Yuan and Ellis (2003)</i>
<i>6 – Self report</i>	<i>It is not verbalisable</i>	<i>It is verbalisable</i>
<i>7 – Learnability</i>	<i>It is not learnable at any age</i>	<i>It is learnable at any age</i>

***Implicit Knowledge in Contrast with Explicit Knowledge***

One way of distinguishing explicit knowledge from implicit knowledge is by determining whether the learner is aware or unaware of the underlying regularities and knowing the extent whether a learner can or cannot verbalise these regularities. Hulstijn (2006, p. 130) provides good definitions of the difference between: Explicit/Implicit knowledge, Explicit/Implicit teaching, and Explicit/Implicit learning. The author believes that Second/Foreign Learners of English may have a good amount of explicit knowledge and are conscious of the rules of using English grammar. However, with random grammar generation, they have not internalized this form of explicit knowledge. Implicit learning is generally described as non-conscious learning. In contrast, explicit learning is conscious learning. To illustrate, a table of comparison is provided below:

Table 2: *Explicit and Implicit Learning*

<b><i>Explicit learning</i></b>	<b><i>Implicit learning</i></b>
<i>* It involves conscious operations such as hypothesis formation and testing</i>	<i>* It does not have or does not involve conscious operations. It is unconscious.</i>
<i>* The learner is aware of what has been learned</i>	<i>* Learner is learning without being aware of what has been learned.</i>
<i>* It is concerned with learning language items (e.g. vocabulary) by means of overt strategies such as: memorization techniques, direct grammar explanations, analyzing mistakes, and knowing the difference between L1 and L2.</i>	<i>* It refers to learning primarily by means of unconscious exposure to input.</i>
<i>* Explicit teaching: information about a language is given to the learners directly by the teacher or text book.</i>	<i>* Implicit teaching: information about the language is given to the learners indirectly by teacher or text book.</i>

With regard to implicit and explicit learning, Hulstijn (2006, p. 131) mentioned that explicit and implicit learning are the two for which the least consensus exists. He explained that explicit learning is input processing with conscious intention to find out whether the input information contains regularities to work out the concepts and rules with which these regularities can be captured. He added that implicit learning is input processing without such an intention, it takes place unconsciously. He noted that learning is defined with reference to the nature of the knowledge learned, in other words, explicit and implicit learning is the learning of explicit and implicit knowledge. The discussion will be presented in the following section.

**DISCUSSION**

Relating to how to implement these findings in the Ex-implicit Grammar Teaching Approach suggested in the Innovated Writing Process approach (Mourssi, 2102d, see Appendix A for details) the researcher believes that teachers can use the learner's implicit knowledge in the first stages of writing process. It can be used in brainstorming and giving ideas related to the target topic in general and to the target linguistic item in particular. Then, students can draw up their first draft, revising, and (re)drafting their writing after receiving explicit grammar teaching for the linguistic items which could not be understood implicitly. Receiving both implicit and explicit grammar teaching in an integrated approach, namely Ex-implicit grammar teaching approach, they can concentrate more on the forms, having enough time to rewrite, asking their peers or teacher in performing the task properly without feeling shy or hesitating to ask for help in front of their classmates. Achieving these stages in an organized manner might help Second/Foreign Language Learners participate effectively in writing tasks. This, in turn, will lead to actual

improvements in their internalized grammatical system and, in turn, result in improving their speaking as well as their writing.

Hulstijn (2006, p. 129) is convinced that there are good theoretical and educational reasons to involve implicit and explicit learning in Second Language Acquisition (SLA) research. By comparing some differential factors between L1 and L2, Hulstijn (2006, p. 129) was able to ascertain that success in the acquisition of an L1 is the result of full mastery of and ample exposure to the language since childhood. L2 learners, on the other hand, require a comprehensive range of both theoretical and practical inputs. Thus, L1 leans toward universal and natural forms of acquisition whereas L2 acquisition is dependent upon variables and differentials. There are scholars working in different disciplines who have argued that L1 acquisition relies on the processes of implicit learning whereas the acquisition of L2 relies on both implicit and explicit learning (Krashen, 1981; Bley, Vroman, 1991; Dekeyser, 2003; Ellis, 2004 and 2005).

To achieve success in SLA which is similar to some extent to success in first language acquisition, it is generally considered then that one needs to increase and provide learners of L2 with comprehensive input theoretically and practically. With regard to writing, in other words, wherever learners commit errors or mistakes, the teacher has to analyze and explain the nature of these mistakes in his interaction (metalinguistic feedback, Mourssi, 2012b), where all of these gaps will be taken as comprehensive input or will be used as intake for the writing task. We can consider all what is presented explicitly to the learners as input to be formed in the learners' memory and form their implicit knowledge. This knowledge can be activated later when learners expose to similar linguistic items stored in their memory. There are many factors which form the input received by learners, among them is the method of teaching, degree of awareness, motivation to write, speak and participate in the writing activity, in addition to the amount of learners' exposure to L2.

Ellis (2006, p. 434) examined the learning difficulty of certain grammatical structures in the context of implicit knowledge and identified several variables that make grammatical features either easy or difficult, and these were: frequency, saliency, functional value, regularity and processability. Ellis (2004) surmised that L2 learning in the context of explicit knowledge consists of analytical and meta-linguistic knowledge forms, whereby the meta-linguistic constitutes conscious representations of linguistic structures that can be verbalized on demand, whereas analytical knowledge consists of lexis for labelling linguistic structures.

Hulstijn (2006, p. 130) assumed that curriculum planners, material designers, teachers, and learners all have some vested interest in knowing which linguistic domains L2 learning might best benefit from in either implicit or explicit learning modes. To comment on Hulstijn's point of view related to implicit and explicit learning, first of all, I think that his point of view depends on previous findings of Ellis related to the same area.

According to the researcher's point of view, he thinks both types of implicit and explicit memories have to be used in the target linguistic item, where the teacher should draw on both categories of memories in teaching the target linguistic item. The learners' degree of awareness

and the role of the teacher to motivate learners to verbalize their knowledge and interpret it as they write, revise and redraft are crucial. Moreover, teachers and learners often have to decide when and where they use their implicit knowledge in the different stages in writing activity, requiring them to have a sufficient amount of lexical and grammatical items and knowledge of the difference between forming target-like sentences in the L1 and the L2. In the following, pedagogical implementations of ex-implicit grammar teaching will be presented.

## **PEDAGOGICAL IMPLEMENTATIONS**

Lantolf (2008, p. 44) in Ellis, (2008) associates proceduralization with explicit knowledge, he mentions that the possibility of explicit knowledge to be transformed to implicit knowledge or automatized with conscious control looks like when an individual learns how to shift gears in driving a car. He followed the same image which was made by Leantief (1981) in illustrating the significant distinction between spontaneous and scientific knowledge.

Based on the language learners' level and the individual differences, and the important role of interaction in acquiring second language grammatical rules, I think that Ex-implicit Grammar Teaching Approach and implementing IWP approach in writing might help second language learners acquiring both simple and complex rules related to forming target-like sentences in L2.

Ellis (2002) preferred the instruction to be in explicit knowledge but the domain aim should be on building the implicit knowledge. This means that explicit acquired knowledge is proceduralized to be an implicit knowledge as the weak interface position believes. He mentions that this could be done through engaging students in communication activities. This view was supported by Lantolf (2008, p. 44) who recommended to enhance the acquisition of implicit knowledge, the explicit knowledge should be associated with engaging students with communicative activities, explicit grammar is appropriate and more sufficient to be used because in this way learners will be motivated for analyzing rules for themselves. All what is mentioned support my contribution to knowledge, which comes in presenting the pedagogical implementation of explicit, and implicit grammar teaching and learning in an integrated approach namely Ex-implicit Grammar Teaching Approach in the classroom context in order to improve students' written accuracy and fluency as well. An integrated type of feedback which gathers between implicit and explicit feedback, namely Ex-implicit feedback, will be presented in the following part

### ***Ex-implicit feedback***

Explicit and implicit feedback are the two types of corrective feedback, Ellis (2008, p. 339) stated that implicit feedback is no obvious indicator that an error has been committed, but explicit feedback indicated an error has been committed. Explicit feedback takes several forms based on the source of problem indicated. Ellis, (2008, p. 339) ensured that a number of studies have investigated the effects of implicit and explicit feedback on SLA. He added that both types of corrective feedback are effective in promoting acquisition of the grammatical structures.

For example, Carroll and Swain, (1993); Nagata, (1993); Carroll, (2001), Rosa and Leow, (2004), demonstrated that explicit feedback was more effective than implicit feedback. Similarly, Ellis, Loewn, and Elam's (2006) study of the effects of recasts and metalinguistic feedback on the acquisition of English past tense *-ed* also found that explicit type of feedback is more effective than implicit feedback. On the contrary, Leeman (2003) found that implicit feedback is more effective than explicit feedback. In my point of view, I think that it is difficult to form a conclusion regarding which type is more effective, but I think it is better to gather between both

types in the classroom context and form Ex-implicit feedback, where explicit feedback can be more effective with low level language learners, while implicit feedback can be more effective with higher level language learners. In addition, recasts feedback which represents the implicit type of corrective feedback can vary enormously and explicit feedback also can be varied depending on whether it only indicates an error had been committed in order to provide correction, or it includes metalinguistic information.

To implement and follow a certain type corrective of feedback whether it is implicit or explicit or integrating both in a form of Ex-implicit, there are two very important factors which have to be taken in consideration, they are: the nature of the target structure-simple or complex – and the level of language learners, having in consideration the individual differences. In my point of view, I think following explicit feedback is more effective with simple rules with beginner learners of English, and following ex-implicit feedback is more effective with complex rules with higher level of learners.

Some studies support my conclusions: (Dekeyser, 1995; Robinson, 1996; Ayoun, 2001), proved that implicit instruction is more effective than explicit instruction, while Scott (1989) and deGraff (1997) proved that explicit instruction is more effective for learning complex structures.

In a study based on one structure was related to regular simple past tense carried out by Ellis (2008), he concluded that typical learner errors in the simple past –*ed* involve either omission or miss formation only. Ellis (2008) concluded that the most effective feedback in promoting acquisition of –*ed* simple past is the metalinguistic feedback. On the contrary, Doughty, and Varela (1998); Han (2002, p. 357) didn't find a positive effect for recasts on the acquisition of grammar. In the case of both Doughty and Varela and Han, the recast treatment was provided over several weeks and the recasts were repeated at the same error. This the recasts became salient to the learners, and it was extremely brief-consisting of a single word. As a result, the recasts will have only limited effect on any grammatical structure.

In general, because Second/Foreign Language Learners are usually older when they start acquiring a second language they are more developed cognitively than First Language Learners. This comes with an exception which would be the compound bilingual, who learn the second language at the same time as the first language. This point was supported by: Marinova-Tedd, Barshal, and Snow, (2000), who mentioned that old learners appear to have distinct advantages in several areas: they tend to learn more quickly than first language learners, they have greater knowledge of the world in general than first language learners, they can control over the input they receive related to L2 than first language learners, they have the ability to learn and apply rules which an aid in facilitating the acquisition process, they already have a first language from which they can transfer strategies and linguistic knowledge.

Some researcher do not support the author's idea here: Richard-Amato (2003) pointed out that being older may not always be advantages us in learning a second language; Long (1990) mentions it seems that older learners have some maturational constraints affecting the language acquisition process; MacIntyre and Charos (1996) mentioned that old learners may find themselves afraid to make errors; Newmarks, (1983) commented that old learners may have poor

attitudes and lack motivation, depending on their feelings and their condition in learning L2; Schachter, (1974) and Kleinmann, (1977) added old learner may avoid using certain structures altogether because they are not part of their first language repertoire.

## CONCLUSION

Based on what is mentioned above, it can be concluded that we can integrate both types into what is termed in the current article as Ex-implicit Grammar Teaching/learning where implicit teaching/learning may be effective with high level language learners while explicit teaching/learning may be effective with low level language learners. Since any language has both simple and complex rules, ex-implicit teaching/learning may be effective with both, having in consideration the level of the language learners and the individual differences.

## ABSTRACT

This study was an attempt to explore the possible relationships among university students' self-efficacy in General English (GE) course and their achievement in this course. Moreover, the differences in GE course achievement among university students of Humanities, Sciences, and Engineering were examined. Furthermore, it checked the relationship between GE achievement among such students and their level of anxiety. Also, the differences among anxiety mean scores of students of humanities, sciences, and engineering were explored. The results of the study indicated that first there is a significantly positive relationship between the university students' self-efficacy and their achievement in GE course. Second, there is a negative correlation between GE university students' self-efficacy and their level of anxiety. In other words, university students of humanities suffered more than other university students. Third, there are significant differences in GE course achievement among the three groups. Fourth, there are significant differences in self-efficacy among the three groups of university students. Fifth, the differences in anxiety among the three groups of students were significant. In addition, the results of teachers' interviews were also in agreement with those of the questionnaires. The results of this study can invite the attention of GE course teachers to the fact that encouraging their students to find ways to enhance their self-efficacy and manage their anxiety can be highly useful for them to achieve higher scores in GE course.

**KEY WORDS:** Self-efficacy, Anxiety, general English, Humanities, Engineering, Sciences, achievement.

## INTRODUCTION

Few studies have paid adequate attention to the relationship between psycho-affective factors and anxiety. The studies cover a wide range of issues such as the relationship between gender and anxiety, self-perception and anxiety (Kitano, 2001), the effect of gender, nationality, and first language experience on classroom anxiety (Machida, 2001), apprehension of negative evaluation and higher level of anxiety (Kitano, 2001), the relationship between affective factors and anxiety links with language proficiency (MacIntyre & Charos, 1996; Gardner et al, 1977; Yamashiro & Mclaghlin, 2001; Yashima, 2002), and risk-taking, motivation, as predictors of language achievement and anxiety. Due to the importance of the role of psycho-affective factors which influence language anxiety and consequently the EFL learners' performance, it appears important

to examine the effect of such factors like self-efficacy on anxiety level and achievement of foreign language learners. The available literature on psycho-affective variables indicates the scarcity of research concerning the effect of self-efficacy on GE learners' anxiety and achievement. This motivated the researcher to focus his concentration on examining the effect of GE university students' self-efficacy on their anxiety and achievement.

Self-efficacy is closely related to the concept of motivation (Jarvis, 2005; Dörnyei, 2005). In other words, the higher the more self-efficacious the students are, the higher their level of motivation is. In addition, a number of research conducted in EFL literature have confirmed the pivotal role of motivation on foreign language learning success. Thus, exploring the foreign language learning process in light of self-efficacy is a useful research avenue which can be very beneficial as a focus of EFL studies.

Furthermore, the lack of adequate research on GE university students is clear. University students in Iran just study English as a foreign language in a three credit course. It is obvious that this course cannot provide university students with much exposure to English. Therefore, investigating the level of psychological factors such as self-efficacy and anxiety to get a better understanding of the current psychology of GE university students can initiate conducting much more practical research in this neglected realm.

Self-efficacy practice has caught the attention of EFL/ESL researchers since 1990s (Gimenez, 1999). However, the need to carry out research on self-efficacy focusing on GE students at the level of university is strongly felt. Another important variable in university GE studies is anxiety whose significance was established in a load of research. Bearing in mind the importance of these two variables, this study focuses on the relationships among GE university students' self-efficacy, their anxiety, and achievement.

## **REVIEW OF LITERATURE**

### ***Self-efficacy***

Researchers have explored the utility of Bandura's (1997) theory of self-efficacy in a wide range of settings for understanding behavior for over 20 years. Self-efficacy is essentially an individual's belief in his or her ability to perform a specific task or behavior. Bandura (1997) emphasized that self-efficacy is not a general quality possessed by individuals, but rather specific beliefs an individual may have around particular tasks or behaviors. For example, an individual with higher social self-efficacy is said to have greater confidence in his or her ability to interact with others socially.

In other words, Bandura (1997) has defined self-efficacy as "beliefs in one's capabilities to organize and execute courses of action required to produce given attainments" (p. 3). To put it other way, self-efficacy is referred to the judgments of what individuals are able to do with whatever skills they possess rather than the judgments of the skills themselves. Research studies show that self-efficacy is a flexible concept (Klassen, 2004). Therefore, it is useful to explore the self-efficacy sources and the factors that contribute to the concept of self-efficacy.

In addition, because individuals with levels of self-efficacy incline to set themselves more ambitions and goals, to do their best and be more persistent while encountering problems (Bandura, 1995; Schwarzer & Fuchs, 1996) they prefer to have more mastery experiences. Besides, since the relationship between self-efficacy and behavior is reciprocal, such individuals' self-efficacy will stay at high level or even increase.

In contrast, individuals with lower levels of self-efficacy tend to set less goals and ambitions, allocate less effort and surrender easier when facing difficulties. As a result, they will have less frequent mastery experiences and their chances of failure may rise as well. As a consequence, due to their attribution style, their level of self-efficacy will drop. Therefore, as maintained by Bandura (1995), "disbelief in one's capabilities creates its own behavioral validation" (p. 4). As Bandura (1997) dubbed, there are four significant sources of self-efficacy: Mastery or enactive experience, vicarious experience, social persuasion, and physiological or emotional state.

Mastery or enactive experience refers to the past experience of success or failure. "Successes raise efficacy appraisals; repeated failures lower them, especially if the failures occur early in the course of events and do not reflect lack of effort or adverse external circumstances" (Bandura, 1986, p. 399). A strong sense of efficacy is likely to be developed through repeated successes. To put it in another way, if an individuals have already performed a certain behavior well, then they are likely to have stronger self-efficacy beliefs with regards to that behavior. Bandura (1997) posited that performance accomplishment, or *enactive mastery*, is the most influential source for self-efficacy beliefs.

Social persuasion is the third primary informational source for self-efficacy beliefs. If others give individuals reinforcement for a behavior, then they are likely to have higher self-efficacy for that behavior. Self-appraisals of competence are partly based on the opinions of significant others who presumably possess evaluative power (Bandura, 1997). People who are persuaded verbally that they possess the abilities to accomplish a given task are more likely to persist longer when confronted with difficulties and develop a sense of self-efficacy. Raising unrealistic beliefs of a person's self-efficacy coupled with failure when performing the task, however, will only discredit the persuader and further undermine the person's perceived self-efficacy. Therefore, encouragement is a powerful tool for increasing self-efficacy beliefs in others

### ***Research on self-efficacy***

Bandura's (1997) theory of self-efficacy has proven especially useful for researchers in the field of counseling psychology. Specifically, research in the areas of vocational and academic behavior has been productive over the past 20 years. As the body of literature related directly and indirectly to self-efficacy theory is so vast, the following review will focus primarily on the literature directly relevant to the field of counseling psychology, namely vocational and academic behavior. The application of self-efficacy theory to vocational behavior and career counseling primarily originated with the research of Hackett and Betz (1981). Hackett and Betz addressed that women were significantly underrepresented in many managerial and professional occupations (e.g., lawyer, physician, engineer, professor). The model proposed by Hackett and Betz, based on Bandura's (1977) self-efficacy theory, was created for better understanding the influences of women's socialization on their career development patterns. The argument is made that self-efficacy beliefs are significant for determining whether more women will begin choosing nontraditional careers for females.

More recently, Peggy Hsieh and Schallert (2008) tried to consider the interrelationship of the two constructs of self-efficacy and attribution theory and also their influence on language learners' achievement. They focused their study on 500 undergraduates in French, German, and Spanish. In their regression analysis of the EFL learners' achievement; they found self-efficacy as the strongest predictor of their achievement. More interesting, they noticed that internalizers, learners who attribute their failure to internal factors, such as lack of effort, had higher levels of self-efficacy than externalizers, those who attribute their failure to the external factors, such as luck.

Roberts and Dyer (2005) examined the effect of web-based online teaching of vocabulary on EFL learners' self-efficacy, motivation, and critical thinking. They maintained that individualized online activities may contribute more to students' achievement than the traditional face-to-face class. They presented the web based lecture in the form of text-based Power Point presentation. They found that the effect of such online activities significantly influenced their self-efficacy, motivation, and critical thinking. Also, they recommended that EFL teachers take advantage of online course to boost their learners' self-efficacy which in turn improves their motivation. Furthermore, they discovered that online courses can orient learners to positive attitudes towards learning English.

Goaker (2005) explored the effect of peer teacher training programs on the self-efficacy and instructional skills of TEFL teachers. He compared the difference in self-efficacy mean scores of two groups of teachers, one experimental, and the other control. The student teachers were selected from English language teaching Department of European University of Lefke, North Cyprus doing their Teaching Practicum course (EDU 420) as part of a B.A. Teacher education program. The findings of this study indicated that those student teachers trained through peer teacher training showed higher orientations of self-efficacy and instructional skills than those with such program. Thus, the findings implied that peer coaching training programs

Adams (2004) explored the effect of peer model performance in the seminar course of postgraduate students on their self-efficacy in this course. Prior to the study he maintained that such task for international postgraduate is daunting, and the literature both in Australia and abroad confirms their lack of self-efficacy in this course. This paper presents findings He observed a seminar performance of a peer to that of a senior academic to check the level of self-efficacy of the students at an Australian university. Participants responded to a 19-item questionnaire which measured self-efficacy for four areas of seminar presentation: speech, display, content, and presenter presence. The findings demonstrated that the use of a peer model performance was more effective pedagogical for improving students' self-efficacy in this course.

Also, within the realm of research self-efficacy Unrau and Beck (2004) examined research self-efficacy of two groups of university students: 75 speech language pathology students and 60 Social Work students. There were interested in investigating whether such students' research self-efficacy might change under the influence of research and practice courses. They found that taking part in both courses improved these students' research self-efficacy. In other words, whenever courses in these two majors are accompanied by applied research leaning and opportunities to practice them out of class, they can augment students' research self-efficacy.

Talking about teacher self-efficacy, PekkanliEgel (2009) examined the effect of English EFL pre-service teachers' reflection on their teaching efficacy. To do so, they assessed 67 undergraduates' self-efficacy beliefs at one of the Turkish faculties of education. He found that feedback plays a pivotal role in teachers' reflection which, in turn, improves their self-efficacy. Thus, providing more feedback for themselves, EFL teachers can improve their mastery experience, leading to higher levels of self-efficacy.

Saka and Surmeli (2010) explored the relationship between pre-service teachers and their communication skills. They found a positive and high correlation between the two variables. In other words, the more self-efficacious the teachers were, the more skillful they were in their communication.

Wong (2005) explored the relationship between graduate ESL students' self-efficacy and their language learning strategies. The participants were also pre-service language teachers from a teachers' college in Malaysia. He discovered six categories of language learning strategies from the participants' responses. His findings demonstrated that there was a positive and high significant relationship between the two variables. In line with the above findings, the findings of the interviews showed that high self-efficacy pre-service ESL teachers expressed more frequent use of language learning strategies than those with lower levels of self-efficacy.

More recently, Graham (2011) analyzed the effect of listening strategies on EFL learners' self-efficacy and sense of control in listening comprehension. His findings showed that listening strategies can positively influence EFL learners' self-efficacy. In turn, this boosted self-efficacy can contribute to higher level of achievement.

### ***Anxiety***

Many researchers have tried to identify the construct of anxiety, a significant individual difference in language learning, for many years. Within different fields of study such as psychology, anthropology, and education new insights and perspectives on the concept of anxiety have been explored. Most of the findings in the nineteenth century relate anxiety to a sense of threat and fear to individuals' psychological state while interacting with the environment (Freud, 1920).

In later decades, anxiety was considered a state of apprehension or an ambiguous sense of fear which is indirectly associated with an object (Scovel, 1978). Later, Rholes, Riskind, and Neville (1985) asserted that anxiety might have rooted in an expected physical peril which is accompanied by depression. In other words, anxiety occurs when a loss is anticipated. However, Spielberg (1976) had made a distinction between fear and anxiety. Fear appears due to a "real objective danger in the environment" (p. 6).

Two major classifications of anxiety have been discussed in the literature; the first one is a dichotomous distinction between 'debilitative' and 'facilitative' anxiety and the second one a trichotomy of anxiety into 'trait', 'state', and 'situation specific'. Facilitative anxiety is a encouraging and positive derive that can best be defined as enthusiasm before a challenging task. On the other hand, debilitative anxiety involves feeling of fear that hinders the process of learning (Matsuda & Gobel, 2003). The earlier research studies conducted on anxiety indicated that different levels of both facilitative and debilitative anxiety might be present in the same individuals at the same time. For example, Albert and Haber (1960) pointed out that "an individual might possess a large amount of both a anxieties, or of one but not the other, or of none of either" (p. 213). Scovel (1978) also asserted that the two kinds of anxiety may function

together because both “work in tandem, serving simultaneously to motivate and to warn, as the individual gropes to learn an ever changing sequence of new facts in the environment” (p. 139).

Moreover, some researchers such as Kuhl and Bechmann (1985) have distinguished between static and dynamic anxiety. Static anxiety refers to 'ruminating about the causes and feelings' (Ford, 1992, 113) and the dynamic one refers to taking real action in order to tackle a problem or lessen feelings of apprehension.

Trait anxiety has been described as the probability of individuals becoming anxious in any situation (Spielberger, 1983) or “a constant condition without a time limitation” (Levitt, 1980, p.11). In other words, this tendency to become anxious is a permanent personality trait. On the other hand, state anxiety is a transitory emotional condition, which is activated by the nervous system, such as the stress felt before taking a test (Kim, 2001). Moreover, Spielberg (1966, p. 12) had defined state anxiety as a “transitory state or condition of the organism that varies in intensity and fluctuates over time”.

Situation specific anxiety refers to the anxiety consistently felt in a specific situation. In other words, as McIntyre and Gardner (1991) maintained, it can be regarded as the trait anxiety limited to a specific situation. They also maintained that the situation specific attitude towards anxiety “offers more to the understanding of anxiety because the respondents are queried about various aspects of the situation” (p. 91). Oh (1990) presumed that foreign language anxiety is a “situation specific anxiety that students experience in the classroom which is characterized by self-centered thoughts, feelings of inadequacy, fear of failure, and emotional reactions in the language classroom” (p.56).

Also, Von Worde (2003) described some examples of internal, physical, and functional manifestations of anxiety in foreign language students. He illustrated the internal and functional reactions to language anxiety in the statement of one the participant of his study: “I just completely blank out and everything is like a jumble in my head” (p. 5). Some other students “reacted by losing patience or becoming angry” and some also they had to “look ahead in the book” (p.5). The physical responses were reported to be headaches, shaking, food tapping, clammy hands, and pounding heart.

### ***Research on language learning anxiety***

The role of anxiety in language learning was not put much emphasis because previous studies usually generated contradictory results and were hard to interpret (Chastain, 1975; Scovel, 1978). Gardner and MacIntyre (1993) believe that using general measures of anxiety is the reason to generate contradictory results. Based on the situation-specific perspective, recent studies have focused on anxiety which is specific to language situations. After examining the concept of language anxiety empirically, researchers find language anxiety is distinct from any other type of anxiety and is not merely a composite of other anxieties (Horwitz, Horwitz, & Cope, 1986; MacIntyre & Gardner, 1991).

In order to identify and measure foreign language anxiety, Horwitz, Horwitz, and Cope (1986) developed the Foreign Language Classroom Anxiety Scale (FLCAS), in which 33 question items

ask respondents to respond to situations specific to foreign language learning anxiety and reflect the three components of foreign language anxiety: communication apprehension, test anxiety, and fear of negative evaluation (Ganschow & Sparks, 1996). For example, they ask questions about students' anxiety in situations like speaking in front of the language class, taking exams in language course, and perceiving other students' evaluation of them. Due to the scale's success on construct validation and reliability, FLCAS has been widely adopted by many researchers to explore learners' foreign language anxiety (Aida, 1994; Chang, 1999; Ganschow et al., 1994; Ganschow & Sparks, 1996; Liao, 1999).

According to Horwitz (2001), when researchers interested in the field of anxiety tried to use FLCAS findings with regard to anxiety and language achievement turned to be uniform. Thus, anxiety was regarded to have a pivotal role on EFL learners' success. Using FLCAS researchers have found a consistent negative correlation between the two variables.

Recent studies into the nature of the relationship between anxiety and reading performance show that higher levels of anxiety influence the reading process in several ways (Sellers, 2000). First, high levels of anxiety may direct 'attentional capacity' away from the reading process. Second, anxiety can slow down the application of such reading processes as letter and word recognition. Third, anxiety can influence the learner's decision-making process, for example, deciding on meaning or on what strategy to use. Reading anxiety has also been studied.

By using the Language Reading Anxiety Scale: a five-point, 20-item Likert scale questionnaire specifically developed to measure reading anxiety), Saito et al., (1999) explored links between general FL anxiety and FL reading anxiety among learners of French, Japanese, and Russian. They found that FL reading anxiety is related but distinguishable from general FL anxiety.

Similarly, Matsuda and Gobel (2001) conducted a study concerning English majors in a Japanese university and found no statistically significant relationship between the foreign language classroom anxiety (FLCAS) and the foreign language reading anxiety (FLRAS) as a whole. However, by conducting factor analyses they found that some subcomponents of the two scales were closely related.

MacIntyre et al. (1998) cite several studies (Cle'ment et al. 1977; 1980; 1994; MacIntyre et al. 1997) that mark close relationship between foreign language anxiety and self-evaluation, and they consider the plausibility of considering the two variables as a single construct: self-confidence. Furthermore, factor analyses in Cheng et al. (1999) and Matsuda and Gobel (2001) highlight the important role of "self-confidence" in identifying components of foreign language anxiety.

Also, Cheng et al. (1999) found a significant relationship between "Low Self-confidence in Speaking English" and "Low Self-confidence in Writing English." Likewise, Matsuda and Gobel (2001) observed a strong link between "Low Self-confidence in Speaking English" and "Reading Confidence/Enjoyment." Supporting these findings, Gardner et al. (1997) report high correlations and consistency for the measures of Language Anxiety, Self-confidence, and Can Do ratings of proficiency.

In other words, confident learners claim low anxiety and feel that they have the ability to perform well, while less confident learners suffer from higher anxiety and feel that they lack the ability to do well. The Can Do ratings mentioned above are learners' perceptions of their own abilities, and

it has been observed that learners often overestimate or underestimate their proficiency (Gardner et al. 1977; MacIntyre et al. 1997; Spezzini & Oxford, 1998). Research also points to the relationship between foreign language anxiety and learners' actual proficiency and performance, although findings to date have yielded somewhat inconsistent results.

As a great deal of research indicates a negative relationship between anxiety and proficiency (e.g., Aida, 1994; Bailey, 1983; MacIntyre & Gardner, 1991; Phillips, 1992), the effects of facilitative anxiety have also been reported (e.g., Bailey, 1983; MacIntyre & Gardner, 1994; Tobias, 1986; Brown, et al., 2001). In turn, the causal issue remains controversial. While Cle'ment (1980) reports that self-confidence leads to achievement, Gardner et al. (1997) based on their causal modeling that yielded a statistically significant path from achievement to self-confidence—suggest that proficiency leads to self-confidence. Yashima (2002), however, tested the Gardner theory in a Japanese EFL setting and reported that the path from L2 proficiency to self-confidence was not significant.

In a closely related investigation, Ghonsooly (2003) examined reading anxiety produced as a result of practice TOEFL and IELTS tests and found that testees had greater anxiety with the reading section of IELTS than the one in the TOEFL. For these testees, vocabulary was the most anxiety provoking element compared to the length and structural complexity.

Saito *et al.* (1999, p. 203) examined reading anxiety and found that it is influenced by two factors: a) unfamiliar scripts, b) unfamiliar cultural material. The first factor deals with sound-symbol correspondence; thus, the weaker such a correspondence is, the more anxiety the reader experiences. L2 Readers experience this kind of anxiety when they try to decode the text but fail to make it comprehensible. To date, most of the studies done clearly reflect the debilitating aspect of anxiety in L2 reading research leaving us stranded with the critical question of how to reduce the negative effects of high anxiety.

With regard to the factors moderating the effect of anxiety on language achievement such as age and gender several research has been conducted. Some researchers considered age an important moderating factor within the relationship between anxiety and language learning achievement. Onwuegbuzie (1999) found a positive and significant correlation between anxiety and age. He used multiple regression analysis to analyze the collected data. To put it another way, older language learners experience higher levels of anxiety than the younger ones.

Talking about the moderating effect of gender, many researchers have reached consistent results about such effect within the interrelationship of anxiety and language learning achievement (Chang, 1997; Daly, Kreiser, & Rogharr, 1994; Felson & Trudeau, 1991). Most of them assert that female language learners experience higher levels of anxiety than the male ones. Padila, Cervantes, Maldonado, and Garcia (1988) reported that female language learners were more likely to be under the influence of language anxiety than the male ones.

Elkhafaifi (2005) discovered that male and female language learners' level of anxiety depends on the type of anxiety they experience. For example, female Arabic language learners showed

significant higher levels of general language anxiety than the male ones. However, no statistically significant difference was observed with regard to gender in Arabic listening anxiety.

To the best of the researchers' knowledge, there has been no research on university students' self-efficacy and anxiety in the domain of GE studies. Only few studies have been conducted in the field of general education; however, they are only available through paid membership. Unfortunately, due to the restriction in the country the researchers could not access these articles. The dearth of research on GE university students' achievement with regard to their self-efficacy and anxiety is a good justification for the present effort which is trying to investigate such constructs.

## RESEARCH QUESTIONS

This study seeks answers to these questions:

1. Is there any significant relationship between GE university students' Self-efficacy and their GE achievement?
2. Is there any significant relationship between GE university students' Self-efficacy and their anxiety?
3. Are there any significant differences in GE achievement of GE university students of Humanities, Sciences, and Engineering?
4. Are there any significant differences in self-efficacy of GE university students of Humanities, Sciences, and Engineering?
5. Are there any significant differences in anxiety of GE university students of Humanities, Sciences, and Engineering?

## METHODOLOGY

### *Participants*

270 university students at the faculties of Engineering, Sciences, and Humanities at Shahid Beheshti University and Tehran University participated in this study. 90 students who were attending their General English Course at each of these three faculties were selected through stratified random sampling. It should also be noted that their participation was quite voluntary. The participants ranged between 19 and 24. They were both male and female.

### *Instruments*

#### *EFL learners' self-efficacy Instrument*

For the purposes of this study, the Persian version of Self-efficacy scale developed by Ghonsooly and Elahi (2010) was used to measure the participants' self-efficacy. This scale contains 11 five-point Likert-type items which produce a possible range of scores from 11 to 55 with higher scores reflecting higher levels of self-efficacy and lower scores reflecting lower levels of self-efficacy. Cronbach's alpha of the questionnaire is 0.82 which indicates a high reliability. The participants' Grade Point Averages (GPA) of their General English Course exams also served as the instrument to measure their General English achievement.

*Foreign Language Reading Anxiety Scale*

The other instrument used in this study was the Foreign Language Reading Anxiety Scale (FLRAS) which was developed by Saito et al. (1999). It consists of 20 five-point Likert scale ranging from “strongly agree” to “strongly disagree”. Students' self-reports of anxiety is elicited by this scale over various dimensions of reading, their target language reading perceptions, and their perceptions of the difficulty level of reading in their own language compared with the target language (Saito et al. 1999, p. 204)

*Interview*

An *unstructured* interview with 10 students of each group was conducted about the amount of time and effort they spent on GE homework and tasks. Their attitudes towards GE course, their attempts and efforts to gain higher scores in this course were also examined. Each interview took about half an hour. Unstructured format was used in this study because as Dörnyei (2007) words:

It allows maximum flexibility to follow the interview in unpredictable directions, with minimal only interference from the research agenda. The intention is to create a relaxed atmosphere in which the respondent may reveal more than he/she would in informal contexts, with the interviewer assuming a listening role.....This kind of interview is most appropriate when a study focuses on the deep meaning of particular phenomena (p. 136).

***Data collection***

Before distributing the questionnaires, the participants were informed briefly about the purposes of the study and the possible implications their results may have for GE teachers and university students. They were told that all the collected information would be kept confidential. They answered the two questionnaires in about 30 minutes. Ten days after the final exam of GE courses, the participants' GPA of all their GE exams during the semester was provided by their teachers.

***Data analysis***

The collected data were put into SPSS software to be analyzed. The Pearson product moment formula was used to answer the first and the second questions. One Way Analysis of Variance (ANOVA) was used to answer the third, fourth, and fifth questions of the study.

**RESULTS**

The first research question deals with the possibility of any significant relationship between GE university students' self-efficacy and their GE achievement. The statistical technique of Pearson-product moment Correlation was used to investigate this research question. Table 1 summarizes the correlation coefficient between the two variables.

Table 1: The Relationship between GE university students' self-efficacy and their GE achievement

		SE	GEA
SE	Pearson Correlation	1	.751*
	Sig. (2-tailed)		.000
	N		136
GEA	Pearson Correlation	.751*	1
	Sig. (2-tailed)	.002	
	N	90	

Note: *SE*= Self-efficacy, *GEA*= General English Achievement

As seen, the correlation coefficient for the two variables in question turned out to be 0.75 which is significant at  $P < 0.05$ . This correlation is moderately high and positive. Therefore, it can be concluded that the higher GE university students' self-efficacy is, the better achievers they are. Thus, the first null hypothesis was rejected at 0.05 level of significance ( $r = 0.75$ ,  $p < 0.05$ ).

The second research question seeks to establish whether there is any relationship between GE university students' self-efficacy and their anxiety. Pearson-product moment Correlation was used in order to investigate this relationship. Table 2 summarizes the correlation coefficient between the two variables.

Table 2: The relationship between GE university students' self-efficacy and their anxiety

		SE	Anxiety
SE	Pearson Correlation	1	-.729*
	Sig. (2-tailed)		.002
	N		136
Anxiety	Pearson Correlation	-.729*	1
	Sig. (2-tailed)	.002	
	N	90	

As shown in the table above, the correlation coefficient was calculated to be -0.72, which is significant at  $P < 0.05$ . This correlation is moderately high and negative. Therefore, it can be concluded that the higher GE university students' self-efficacy is, the less their anxiety is. Thus, the second null hypothesis was rejected at 0.05 level of significance ( $r = 0.729$ ,  $p < 0.05$ ).

The third question regards the significance of the possible differences between the achievement of university students of Humanities, Sciences, and Engineering in GE. The following table shows the mean scores of the two groups.

Table 3: Mean Achievement Scores of the three groups of university students

Students	N	Mean	Std. Deviation	Std. Error Mean
Humanities	90	12.75	2.49	.29
Sciences	90	14.63	1.56	.28
Engineering	90	16.27	1.48	.25

As seen in table 3 the achievement mean scores of the three groups of students are different. University students of engineering have the highest mean score, 16, and 27. The university students of Humanities have the lowest mean scores, 12, 75. Finally, university students of sciences have the middle mean score of achievement among the three groups, 14, 63. Table 4 demonstrates whether such differences in mean scores are significant or not.

Table 4: Determining the Significance of the Differences in Achievement Scores

GE	Sum of Squares	Df	Mean Square	F	Sig.
Between Groups	216.50	2	108.25	68.93	.000
Within Groups	370.63	267	1.57		
Total	587.14	269			

The above table demonstrates that the differences among the three mean scores is significant. However, the analysis of variance indicates just the difference among the three groups, but in order to find out which pairs were significantly different, the Scheffe test was run.

Table 5: A comparison of GE mean scores of the three groups of university students

Scheffe

Fields	N	Subset for alpha = 0.05		
		1	2	3
Humanities	90	12.75		
Science	90		14.64	
Engineering	90			16.27
Sig.		1.000	1.000	1.000

Means for groups in homogeneous subsets are displayed.

Table 5 demonstrates that the difference in mean scores among the three groups is significant at  $p < 0.05$  and students of Engineering have obtained higher scores in self-efficacy than students of Sciences and Humanities.

The fourth research question deals with the possible significance of differences among the three university groups' self-efficacy. Table 6 shows the self-efficacy mean scores of the three groups.

Table 6: Mean SE Scores of the three groups of university students

Students	N	Mean	Std. Deviation	Std. Error Mean
Humanities	90	18.61	2.49	.29
Sciences	90	29.96	1.56	.28
Engineering	90	39.61	1.48	.25

As shown, the mean score of Engineering students is 39.61, that of Sciences students is 29.96, and that of Humanities students is 18.61. Table 7 demonstrates that the difference in mean scores among the three groups is significant at  $p < 0.05$  and students of Engineering have obtained higher scores in self-efficacy than students of Sciences and Humanities.

Table 7: Determining the Significance of the Differences in Self-efficacy Scores

SE	Sum of Squares	Df	Mean Square	F	Sig.
Between Groups	71429.884	2	35714.942	21.895	.000
Within Groups	384956.86	267	1631.173		
Total	456386.74	269			

As indicated, the differences among the three mean scores of self-efficacy in the three groups are significantly different. The next table, Scheffe test, demonstrates which pairs of groups are significantly different in self-efficacy.

Table 8: A comparison of the self-efficacy mean score of the three groups of university students.

Fields	N	Subset for alpha = 0.05		
		1	2	3
Humanities	90	18.61		
Sciences	90		29.96	
Engineering	90			39.61
Sig.		1.000	1.000	1.000

Means for groups in homogeneous subsets are displayed.

Table 9 indicates that the difference in self-efficacy mean scores among the three groups is significant among all the pairs. In other words, university students of engineering are significantly more self-efficacious than the other university students and university students of humanities are the least self-efficacious students.

Table 9: Multiple Comparisons of the three pairs

(I) Fields	(J) Fields	Mean Difference (I-J)	Std. Error	Sig.	95% Confidence Interval	
					Lower Bound	Upper Bound
Science	Humanities	5.350*	6.406	.706	-10.43	21.13
	Engineering	-33.650*	6.406	.000	-49.43	-17.87
Humanities	Science	-5.350*	6.406	.706	-21.13	10.43
	Engineering	-39.000*	6.386	.000	-54.73	-23.27
Engineering	Science	33.650*	6.406	.000	17.87	49.43
	Humanities	39.000*	6.386	.000	23.27	54.73

\*. The mean difference is significant at the 0.05 level.

The fifth research question deals with the possible significance of difference among the three university groups' level of anxiety in GE course. Table 9 shows the anxiety mean scores of the three groups.

Table 10: Mean anxiety mean scores of the three groups of university students

Students	N	Mean	Std. Deviation	Std. Error Mean
Humanities	90	72.25	1.22	.32
Sciences	90	59.14	1.17	.29
Engineering	90	44.81	1.61	.38

As shown, the mean score of Engineering students is 44.81, that of Sciences students is 59.14, and that of Humanities students is 72.25. Table 11 demonstrates that the difference in mean scores among the three groups is significant at  $p < 0.05$  and students of Engineering have obtained lower scores in anxiety than students of Sciences and Humanities.

Table 11: Determining the Significance of the Differences in Anxiety Scores

Anxiety	Sum of Squares	Df	Mean Square	F	Sig.
Between Groups	61241.724	2	35714.942	21.895	.000
Within Groups	26516.389	267	1631.173		
Total	374172.581	269			

As indicated, the differences among the three mean scores of anxiety in the three groups are significantly different. The next table, Scheffe test, demonstrates which pairs of groups are significantly different in self-efficacy.

Table 12: A comparison the anxiety mean score of the three groups of university students.

Fields	N	Subset for alpha = 0.05		
		1	2	3
Humanities	90	72.25		
Sciences	90		59.14	
Engineering	90			44.81
Sig.		1.000	1.000	1.000

Means for groups in homogeneous subsets are displayed.

Table 13 indicates that the difference in anxiety mean scores among the three groups is significant among all the pairs. In other words, university students of engineering are significantly less anxious than the other university students and university students of humanities are the most anxious students.

Table 13: Multiple Comparisons of the three pairs

(I) Fields	(J) Fields	Mean Difference (I-J)	Std. Error	Sig.	95% Confidence Interval	
					Lower Bound	Upper Bound
Science	Humanities	4.740*	5.102	.407	-8.83	18.75
	Engineering	-22.320*	5.221	.000	-45.55	-17.87
Humanities	Science	-4.740*	5.102	.407	-18.75	8.83
	Engineering	-28.000*	5.221	.000	-48.28	-19.66
Engineering	Science	22.320*	5.102	.000	17.87	45.55
	Humanities	28.000*	5.221	.000	19.66	48.28

\*. The mean difference is significant at the 0.05 level.

### Interview Results

The results of the interviews corroborated those of the questionnaires. Most Engineering students believed that they were capable of good communication and reading ability in English. They maintained that through regular exercise they have reached a better level of English. 8 out of 10 believed that besides being advantageous for their future career, learning English gives them a sense of pleasure and prestige, so they felt they should make all their efforts to accomplish in GE course. For example, an engineering student said "I have high motivation to learn English. I try very hard to have good grades and gain a sufficient level of competence in English." In general, more than seven of Engineering students asserted that their previous experiences, especially at

the institutes, were beneficial to their success in GE course. In addition, they mentioned that their teachers have played a pivotal role in their positive attitude towards GE course. Eight of them pointed out that they want to have higher speaking and reading abilities like their teachers. Some of their teachers were good models for them. Talking about anxiety, more than eight interviewed engineering students did not have any major problems in handling their stress in GE course. One said "When you have good attitude towards English, you try very hard to tackle possible problems". More than six emphasized that their high motivation can contribute to coping with the anxiety in GE course.

Also, interviews with students of Sciences indicated that more than half of them were keen on learning English. For instance, one of them said "My teachers' encouragements have provided me positive attitudes towards English." Another one said "Spending more time with my classmates while doing English helped me to succeed in GE course." Furthermore, more than six of them took advantage of their teachers' advice to deal with the sources of anxiety in GE course. One said "Unfamiliar words, difficult pronunciation, and finding the main ideas of the passage paragraphs are among the anxiety makers; however, by following my teacher's tips I can tackle them."

In spite of the fact that both GE students of Engineering and Sciences revealed high levels of self-efficacy in GE, university students of Humanities showed the opposite. Seven out of ten were not highly motivated to learn English. They believe that their negative attitude towards English roots in their previous bitter experiences especially at high school. Three of them explained that even teachers treat them differently from other university students. One said "our teacher frequently compared our performance in GE with the other university students, especially engineering students." On the side of anxiety, almost all of the interviewed students expressed their high levels of anxiety with GE. One said "What I suffer most in GE course is my high level of anxiety; I think my low abilities in this course are really embarrassing, especially when I do not understand the unfamiliar words and phrases.

## **DISCUSSION**

The findings of this study are in agreement with those previously mentioned in the review of literature. For example, MackIntyre and Gardenr (1955), and Trylong (1987) found a negative relationship between students' anxiety and their self-ratings of language proficiency. Moreover, Kitano (2001) indicated that there is a negative relationship between Japanese university students' language anxiety and their self-perception. As to second research questions involving the relationship between self-efficacy and foreign language reading anxiety, a significant negative relationship was observed between the two variables. High self-efficacious participants experienced lower anxiety than low self-efficacious participants. As Bernhardt (1997) maintains the result may be interpreted by the fact that high self-efficacious participants feel really confident because of the experiences they have gained in solving problems and the approaches they have developed based on those problem solving experiences. This corroborated what was observed in the interviews. For instance, having good attitude towards English, university students of engineering and sciences expressed lower anxiety compared with the other university

students. They benefited from their teachers' advice to manipulate their anxiety arising from not knowing unfamiliar words or phrases. This indicates that they have taken advantage of useful vicarious experiences in their GE course which in turn has led to lower levels of anxiety. On the other hand, university students of humanities suffered from higher levels of anxiety compared to other university students. Their mastery experiences were full of anxiety. Teachers somehow labeled them as "those with low ability".

However, it is interesting that Cubukcu (2008) found no significant relationship between language anxiety and self-efficacy, contrary to the findings of the present study. Furthermore, he reported no difference between high self-efficacious learners and low self-efficacious in language anxiety. Nevertheless, he pointed out that this contrast might occur due to the Turkish educational setting, the learners' lack of ability, or their sense of embarrassment to express their opinions directly in public. In addition, the response to the first research question in this study showed a positive relationship between GE university students' self-efficacy and their achievement in this course. High self-efficacious learners also performed better than low self-efficacious learners in GE achievement. Such findings are in agreement with those of Wigfield (1994, cited in Pintrich and Schunk, 1996) and Chen (2007, cited in Rahimi & Abedini, 2009)). Wigfield considered self-efficacy a good predictor of school students' achievement. Besides, Chen (2007) found a significant relationship between EFL learners' listening achievement and their self-efficacy. Chen's (2007) findings and those of the current study both indicate that EFL learners' self-efficacy is a significant factor in the achievement of higher scores in English language skills such as listening or reading comprehension. Furthermore, these findings can be interpreted in the light of the possible link between self-efficacy and use of language learning strategies; that is, high self-efficacious learners might use more suitable language learning strategies than those with lower levels of self-efficacy. Such postulate can be supported by the research conducted by Siew and Wing (2005), and also Magogwe and Oliver (2007). They all emphasized the relationship between EFL learners' self-efficacy and use of language learning strategies.

## CONCLUSION

Self-efficacy in GE refers to individuals' perceptions of their abilities of success in this course, mainly reading comprehension activities. Individuals with high levels of self-efficacy perceive themselves of carrying out GE course activities. However, those with lower levels of self-efficacy consider themselves incapable of standing chances of success in GE. The researcher tried to see if this factor has a bearing on GE university students' anxiety and achievement.

As another part of the study, the significance of any difference between the self-efficacy of university students of engineering, sciences, and humanities, was also investigated. The results showed a significant difference in GE achievement between the three groups of students. Students of engineering turned out to be better language achievers, excelling students of sciences and humanities.

This study also explored the significance of any possible relationship between GE course and anxiety. Such correlation appeared to be highly negative,  $-.72$ . Following statistical analysis demonstrated that the difference among the three pairs of university students was significant, with the student of humanities suffering from the highest level of anxiety compared with the other pairs.

Figure 1

Common statistical procedures such as one-way analysis of variance indicated that the difference in anxiety mean scores among these groups was significant.

Figure 2

Every useful study opens new directions for further study. University GE self-efficacy and anxiety are both important subjects that require more in-depth studies. Research in these areas can be continued in the following directions:

1. Replicating this study with a larger number of participants could yield more credible results.
2. Investigating the relationship between self-efficacy in GE course and learner related factors such as motivation can be useful.
3. Investigating the relationship between teacher's LOC and teacher burnout can be a very useful area of research.
4. Also, investigating the relationship between teacher's reflection and teacher burnout can yield interesting results.
5. Replicating this study within a qualitative framework can provide more insights into the variables of this research.
6. Finally, giving this study a gender perspective can be worthwhile.

## Appendix A

### FLRAS Questionnaire (English)

*Directions: Statements 1 through 20 refer to how you feel about reading English. For each statement, please indicate whether you (1) strongly agree, (2) agree, (3) neither agree nor disagree, (4), disagree, or (5) strongly disagree by marking the appropriate choice. Please give your first reaction to each statement and mark an answer for every statement.*

NOTE: SA=strongly agree, A=agree, N=neither agree or disagree, D=disagree, SD=strongly disagree

1. I get upset when I am not sure whether I understand what I am reading in English.  
SA      A      N      D      SD
2. When reading English. I often understand the words but still cannot quite understand what the author is saying.  
SA      A      N      D      SD
3. When I am reading English. I get so confused I cannot remember what I am reading.  
SA      A      N      D      SD
4. I feel intimidated whenever I see a whole page of English in front of me.  
SA      A      N      D      SD\
5. I am nervous when I am reading a passage in English when I am not familiar with the topic.  
SA      A      N      D      SD
6. I get upset whenever I encounter unknown grammar when reading English.  
SA      A      N      D      SD
7. It bothers me to encounter words I cannot pronounce while reading English.  
SA      A      N      D      SD
8. I usually end up translating word by word when I am reading English.  
SA      A      N      D      SD
9. By the time you get past the funny letters and symbols in English, It's hard to remember what you're reading about.  
SA      A      N      D      SD
10. I am worried about all the new symbols you have to learn in order to read English.  
SA      A      N      D      SD
11. I enjoy reading English.  
SA      A      N      D      SD
12. I feel confident when I am reading in English.  
SA      A      N      D      SD
13. Once you get used to it, reading English is not so difficult.  
SA      A      N      D      SD
14. The hardest part of learning English is learning to read  
SA      A      N      D      SD
15. I would be happy just to learn to speak English rather than having to learn to read as well.  
SA      A      N      D      SD
16. I don't mind to reading to myself, but I feel very uncomfortable when I have to read English aloud.  
SA      A      N      D      SD
17. I am satisfied with the level of reading ability in English that I have achieved so far.

- SA      A      N      D      SD
17. English culture and ideas seem very foreign to me.
- SA      A      N      D      SD
18. You have to know so much about English history and culture in order to read English.
- SA      A      N      D      SD
19. I find it hard to comprehend an English text which contains unfamiliar cultural material.
- SA      A      N      D      SD
20. I find it hard to comprehend an English text which contains unfamiliar cultural material.
- SA      A      N      D      SD

### Appendix B

EFL learners' self-efficacy scale in Reading Comprehension (English)

Name:      Age:      Gender:      Semester:

- 1) I have the ability to focus all my concentration on the content of the text I am reading.
- SA      A      N      D      SD
- 2) I believe that my reading comprehension proficiency improves every day.
- SA      A      N      D      SD
- 3) I am capable of improving my reading comprehension skill.
- SA      A      N      D      SD
- 4) Reading L2 texts is stressful.
- SA      A      N      D      SD
- 5) My reading comprehension teacher believes that I am proficient.
- SA      A      N      D      SD
- 6) I enjoy practicing reading L2 texts with a proficient friend.
- SA      A      N      D      SD
- 7) I believe that by more practice of reading L2 texts, I can improve the course grades.
- SA      A      N      D      SD
- 8) In my reading class, I am always volunteer to answer the questions the teacher asks.
- SA      A      N      D      SD
- 9) I am among the best students in my reading class.
- SA      A      N      D      SD
- 10) Although my world knowledge is good, I have problems in reading comprehension.
- SA      A      N      D      SD
- 11) I don't mind getting high scores in my reading course.
- SA      A      N      D      SD

## THE INFLUENCE OF EFL STUDENTS' SELF-ESTEEM ON THEIR SPEAKING SKILLS

### ABSTRACT

This study aims at investigating the relationship between the EFL intermediate students self – esteem and their speaking skills. Accordingly, two groups of university students were selected as the low and high self – esteem participants. This was done by their responses given to a questionnaire developed by Lui et al. (2005) to measure self – esteem. After selecting the participants, the researcher utilized a standard oral proficiency test based on the scales provided by Farhadi et al. (1995), measuring five sub skills of vocabulary, structure, pronunciation, fluency and comprehensibility to evaluate the speaking ability of the participants at the end of the study. By analyzing the data were gathered from the participants. That is to say the high self-esteem students were found to be more inclined to involve themselves in the conversations and other spoken activities on the classroom including the oral production of stories in English. It was found that there is a statistically significant correlation between the students self – esteem and their verbal performance.

**KEY WORDS:** self – esteem, speaking ability

## INTRODUCTION

The affective domain is difficult to describe scientifically. A large number of variables are implied in considering the emotional side of human behavior in the second language learning process. Based on Brown (2007, p. 153), affect refers to emotion or feeling. The affective domain is the emotional side of human behavior, and it may be juxtaposed to the cognitive side. Brown further claims that the development of affective states or feelings involves a variety of personality factors, feelings both about ourselves and about others with whom we come in contact. Understanding how students feel, respond, believe and value is an exceedingly important aspect of a theory of second language acquisition.

Self- Esteem, as one important factor of human affective domain, has been found to play an extremely important role in Second Language Acquisition (SLA). In this line, Brown (2007, p. 154) proposes that no successful cognitive or affective activity can be carried out without some degree of self – esteem, self – confidence and self – efficacy – belief in your own capabilities to successfully perform that activity. Many definitions have been given for self-esteem. But the following is the most well accepted definition given by Coppersmith (1967, pp. 4-5):

By self – esteem, we refer to the evaluation which individuals make and customarily maintain with regard to themselves; it expresses an attitude of approval or disapproval, and indicates the extent to which individuals believe themselves to be capable, significant, successful and worthy. In short self – esteem is a personal judgment of worthiness that is expressed in attitudes that individuals hold toward themselves. It is a subjective experience which the individual conveys to others by verbal reports and other overt expressive behavior.

As it is indicated in the literature, different terms such as ‘Self-concept’, ‘Self-esteem’ and ‘self-confidence’ are often used interchangeably and inconsistently because they may refer to different ideas about how people think about themselves (Stern, 1995).

Some researchers view self-concept and self-efficacy as the same construct. But others view them as two different constructs (Bong & Clark, 1999; Choi, 2005). Huitt (2004) distinguished the two terms ‘self-concept’ and ‘self-esteem’ by stating that ‘self-concept’ is the cognitive aspect of self, but ‘self-esteem’ is the affective aspect of self, which refers to one’s feelings of self-worth. Self-confidence is not always what we think it is.

Some experts (e.g. Miyagawa, 2010) distinguish between self-confidence on one side and self-esteem on the other. Self-confidence is about what we can do by virtue of our efforts or what we are good and bad at. Self-confidence grows along with the quality of the effort. Self-esteem is more fundamental and is about the feeling of being worth something just because we are who we are, and not because we have done something.

Nativists believe that any normal child can learn a first language because of the availability of what Chomsky (1959) refers to as the Universal Grammar (UG). However, when it comes to learning of a foreign language, especially at the later stages, there are factors which can either inhibit or enhance the process of learning. These factors can be cognitive, affective, biological and socio-cultural variables (Stern, 1983). Academic self-esteem positively affects school performance. Whatever the case, it is almost certain that there is a significant relationship between self-esteem and achievement in second language acquisition.

Throughout the history of language learning and teaching, many other studies have been conducted to see the effects of self-esteem on EFL/ESL students' performance, Adelaide Heyde (1979) studied the effects of the three levels of self-esteem, i.e., global situational and task self-esteem on the performance of an oral production task by American college students learning French as a foreign language. She came to the conclusion that all three levels of self-esteem correlate positively with performance on oral production measure, with the highest correlation occurring between task self-esteem and performance on oral production measures. Concerning the relationship between self-esteem and achievement in second language acquisition, the results of a study by Hayati and Ostadian (2008) revealed that students listening comprehension was significantly influenced by their self-esteem, supporting earlier studies in this area.

## **RESEARCH QUESTION**

The aim of this study was to answer the following question:

Is there a significant relationship between self-esteem and speaking skills of intermediate Iranian EFL students?

## **METHODOLOGY**

### ***Participants***

The participants of this study were 38 undergraduate EFL students studying towards a B.A degree in teaching English as a foreign language at Azad University of Dezful, Iran. These participants were about to sit for the final exam of their required course of oral production of stories, which is normally offered in the third semester of their B.A program. There were 18 male and 30 female students selected from population of 129 students by the results obtained from their responses given to the self-esteem questioner developed by Lui et al. (2005) as a measure of self-esteem.

### ***Instruments***

First an Oral Proficiency Test (OPT) was administered to determine the proficiency level of the students. The OPT was administered by two university EFL professors to check for the homogeneity of the spoken proficiency level of the participants. This was done to insure that all the students participating in the research were at roughly the same level of spoken proficiency. A speaking scale developed by Farhadi, Jafarpour and Birjandi (1995) was used by the interviewers and the researcher, who was also the instructor teaching the course of oral production of short stories, to the participants at Dezful University. This scale was utilized by the interviewers and the researcher to measure the students' speaking ability in terms of the following components:

1. Accent
2. Structure
3. Vocabulary

4. Fluency
5. Comprehension

Scores were given on a 6 point scale ranging from the least appropriate (1) to the most (6). Comprehension as intended by Farhadi et al. was interpreted to mean the extent to which the subjects could comprehend what was said by the speaker. In order to measure the participants' self-esteem, the researcher provided a questionnaire taken from Marsh and Herbert (2007) containing 20 items.

### ***Procedure***

Right from the beginning of the course, the self-esteem questionnaire was distributed among a group of 129 students to select the required participants of the research. The participants were required to fill the questionnaires out. The questionnaires then were collected for the purpose of analysis. The aim of the researcher was to group the participants into two groups, including those who were found to be the students having a high degree of self-esteem and those who indicated a low degree of self-esteem. That is, the questionnaire was distributed among a population of 129 EFL students taking the same course (Oral Production of stories). From among these students, 18 were selected as the ones having the highest degree of self-esteem (HSe) and 20 others as the lowest self-esteem (LSe). This was done after ranging the students' responses to the items in the questionnaire. That is to say, the researcher ranged the students' scores obtained from the self-esteem questionnaire to determine the highest and the lowest students in terms of their level of self-esteem. Having been selected as the participants of the study, these students were interviewed at the end of the term by two interviewers who were both EFL university professors. As it was mentioned before, a speaking scale developed by Farhadi, Jafarpoor and Birjandi (1995) was used by both the interviewers and the instructors to make their judgment about the students' oral proficiency as reliable as possible. The scale used by the teacher and the researcher both as the raters of the students spoken performance made it essential to give careful attention to the following points suggested by Farhady et.al. (1995) in order to make the scoring as reliable as possible.

1. Each interview must be carefully structured.
2. The number of raters will not be less than 20 for each case.
3. The candidates should be put at ease in order to make the results both more valid and reliable.
4. Each interview will be recorded for scoring and future reference.
5. Scoring will be discrete rather than holistic.

In order to determine if there was a significant relationship between the students obtained scores on the final exam in the form of the structured interviews and the subjects' self-esteem determined by the self – esteem questionnaire, the researcher calculated the correlation coefficient of the scores obtained on the speaking test and the scores resulted from the self – esteem questionnaire.

## **RESULTS**

In order to see if there is a significant relationship between the performance of the students on the OPT and their academic self – esteem, the researcher run a t - test won the results obtained by the high self – esteem students on the OPT and that of the low self – esteem subjects on the same test. The following table provides the results obtained from the t – test.

Tables one and two: one sample t – test results on the OPT

One-Sample Statistics

	N	Mean	Std. Deviation	Std. Error Mean
OPTLSeA=Oral Proficiency Test Low Self -esteem A	20	7.5000	3.59092	.80296
OPTLSeB=Oral Proficiency Test High Self -esteem B	20	15.9000	2.22190	.49683

One-Sample Test

	Test Value = 0					
					95% Confidence Interval of the Difference	
	T	df	Sig. (2-tailed)	Mean Difference	Lower	Upper
OPTLSeA=Oral Proficiency Test Low Self -esteem A	9.340	19	.000	7.50000	5.8194	9.1806
OPTLSeB=Oral Proficiency Test High Self -esteem B	32.003	19	.000	15.90000	14.8601	16.9399

Based on the results given in table one, the mean and the standard deviation of the scores obtained from the Oral Proficiency Test (OPT) given to the low self- esteem students were 7.50 and 3.59. The mean and the standard deviation for the high self – esteem group on the same test (OPT) were 15.90 and 2.22 respectively. At the 95% confidence interval of difference one can conclude that as P is less than 5% ( $P < 5$ )  $p=0$ , the difference between the means obtained from the t – test is statically different. That is to say, the means of the OPT given to the low and high self – esteem students were 7.50 and 15.90 respectively. There is a difference value of 8.40 of the mean of the two groups on the same test. Based on the data provided in tables one and two, it can be concluded that it is highly likely that the students’ self – esteem influences their oral performance in the form of spoken English.

To see if there is a significant correlation between the participants’ self – esteem and their oral production in their English classes Pearson correlation statistics was also run on the results obtained from their responses to the items in the questionnaire distributed among them and their scores obtained from the OPT. Based on the results represented in the following tables , one can come to the conclusion that there is a high correlation between the participants self – esteem and their performance on the OPT. Put it another way, the correlation is significant at the %5 level. One can compare the results given in the following two tables to come to the same conclusion provided above.

*Tables three and four: Correlations between the students' self-esteem and their oral performance (speaking)***Correlations**

<b>Correlations</b>		LSeA=Low Self - esteem	OPTLSeA=Oral Proficiency Test Low Self -esteem A
LSeA=Low Self –esteem	Pearson Correlation	1	-.192
	Sig. (2-tailed)		.417
	N	20	20
OPTLSeA=Oral Proficiency Test Low Self -esteem A	Pearson Correlation	-.192	1
	Sig. (2-tailed)	.417	
	N	20	20

<b>Correlations</b>		HSeB=High Self -esteem	OPTLSeB=Oral Proficiency Test High Self -esteem B
HSeB=High Self - esteem	Pearson Correlation	1	-.497*
	Sig. (2-tailed)		.026
	N	20	20
OPTLSeB=Oral Proficiency Test High Self -esteem B	Pearson Correlation	-.497*	1
	Sig. (2-tailed)	.026	
	N	20	20

\*. Correlation is significant at the 0.05 level (2-tailed).

These findings are in part in line with the findings of Niki Maleki and Mohammadi (2009). They found that the more successful learners regarding the oral communication had higher self – esteem than less successful ones in performing oral communication tasks. To sum up concerning the main question raised in this study one can be safe to conclude that there is a significant relationship between self – esteem and spoken fluency and classroom oral participation.

**CONCLUSIONS AND SUGGESTIONS**

This study aimed at investigating the relationship between self – esteem and oral (speaking) skill of the intermediate EFL students. For this purpose, two groups of intermediate EFL Persian students were selected as the participants of the study. There were twenty students in low self-esteem group and 18 in high self – esteem group.

Their level of self– esteem was determined based on their responses given to a self – esteem scale questionnaire developed by Liu et al. (2005). Based on the results obtained from the participants' responses to the self – esteem questionnaire and their performance on an standard oral proficiency test, it was concluded that there was a high correlation between the participants self – esteem and their oral performance. Based on the findings of this study and many other studies

conducted on this issue, foreign – language teachers should consider academic self – esteem as a powerful motivating force that can optimize language learning processes and more importantly consider enhancing student self –esteem as one of the primary goals of language education. However, the researchers do not claim the results obtained from this study are absolutely conclusive. Put it another way, as people come to learn a new language in a foreign context, not only their self-esteem may influence their performance in general and their spoken performance in particular but also many other factors including their motivation, attitudes towards the language they are going to learn, the context in which they are going to master the new language are extremely influential in this regard. So the story of second language acquisition is interestingly comparable to the story of the elephant which was supposed to be described by a group of people in a dark room. And they all came to different descriptions of the whole body because they just touched parts of the body. The same story still is the case for SLA.

### *Appendix*

The self – esteem questionnaire used in the study

1. I can follow the lessons easily.
2. I day-dream a lot in class.
3. I am able to help my classmates in their schoolwork.
4. I often do my homework without thinking.
5. If I work hard, I think I can go to the Polytechnic or University.
6. I pay attention to the teachers during lessons.
7. Most of my classmates are smarter than I am.
8. I study hard for my tests.
9. My teachers feel that I am poor in my work.
10. I am usually interested in my schoolwork.
11. I often forget what I have learnt.
12. I am willing to do my best to pass all the subjects.
13. I get frightened when I am asked a question by the teachers.
14. I often fell like quitting school.
15. I am good in most of my school subjects.
16. I am always waiting for the lessons to end.
17. I always do poorly in tests.
18. I do not give up easily when I am faced with a difficult question in my schoolwork.
19. I am able to do better than my friends in most subjects.
20. I am not willing to put in more effort in my schoolwork.

## INVESTIGATING ENGLISH LANGUAGE TEACHERS' JOB SATISFACTION IN PAKISTAN

### ABSTRACT

This study attempts at examining the factors that influence English Language Teachers' job satisfaction in Pakistan. The factors like job security, workplace flexibility and fairness, handsome salary and reward, job autonomy and conducive behavior of leadership increase the job satisfaction whereas the absence of job security, job autonomy, handsome salary and reward, workplace flexibility and fairness and conducive behavior of leadership brings dissatisfaction among the teachers. The study is quantitative in nature. 500 questionnaires were distributed to collect data from English language teachers irrespective of age, gender, experience, level and sector. On the basis of the findings, some recommendations regarding job satisfaction of English Language Teachers are given at the end of this study.

**KEYWORDS:** job security, workplace flexibility and fairness, handsome salary and reward, job autonomy and conducive behavior of leadership

## INTRODUCTION

Job satisfaction is a factor that plays a significant role in improving English Language Teachers' performance. Locke, (1976) defines the job satisfaction as a positive and pleasing emotional state from the appraisal of one's job or experience. The very definition suggests that the employees' attitude towards their jobs is formed by their behaviors, beliefs and feelings. According to Galup, Klein and Jiang (2008), successful organizations ensure their employees' job satisfaction realizing the fact that poor job satisfaction can cripple an organization. Kalleberg (1977) suggests that job satisfaction includes two components. These are intrinsic (referring to the work itself) and extrinsic (representing the facets of the job external to the task itself) job satisfaction. Lashbrook (1997) is of the view that leadership style plays an important role in influencing the employees' job satisfaction.

Bogler (2001) demonstrates that the different leadership styles engender different working environments and directly influence employees' job satisfaction. Emery and Barker (2007) state that transformational leaders motivate and encourage their followers to take on more responsibility which increases employees' sense of accomplishment and job satisfaction. Castaneda and Nahavandi (1991) indicate that the employees are more satisfied with both relational and task-oriented behaviors exhibiting simultaneously by their heads. Spector (1997) refers to job satisfaction in terms of how people feel about their jobs and different aspects of their jobs. Ellickson and Logsdon (2002) support this view by defining job satisfaction as the extent to which employees like their work. Schermerhorn (1993) defines job satisfaction as an affective or emotional response towards various aspects of an employee's work. Reilly (1991) defines job satisfaction as the feeling that a worker has about his job or a general attitude towards work or a job and it is influenced by the perception of one's job.

Wanous and Lawler (1972) state that job satisfaction is the sum of job facet satisfaction across all facets of a job. Abraham Maslow (1954) suggested that human needs from a five-level hierarchy ranging from physiological needs, safety, belongingness and love, esteem to self-actualization. Based on Maslow's theory, job satisfaction has been approached by some researchers from the perspective of need fulfillment (Kuhlen, 1963; Worf, 1970; Conrad et al., 1985).

Herzberg's Two Factor Theory encompasses factors that cause satisfaction and dissatisfaction among employees. According to this theory, quality of work, pay, physical working conditions and job security are the factors associated with dissatisfaction of the employees. He uses the term 'motivators' for the factors like opportunities for promotion and personal growth, recognition, responsibility and achievement that increase the job satisfaction of the employees. (Greenberg & Baron, 2003: p. 153). There is another theory named Value Theory. This theory is about the job reward. According to this theory, the key to employees' job satisfaction is to minimize discrepancy between employees' desires and job rewards (Greenberg & Baron, 2003: p. 153-154). Better human resource management practices also play a vital role in enhancing the employees' job satisfaction (Bloom & Van Reenen, 2007; Petrescu & Simmons, 2008).

This study investigates the factors that influence English Language Teachers' job satisfaction in Pakistan and the specific objectives of the study are as under:

- To explore the reality of working conditions in educational organizations.

- To point out the workplace problems faced by English Language Teachers.
- To find out the factors that increase job satisfaction among English Language Teachers.

## **LITERATURE REVIEW**

Leadership directly influences the performance of employees. If the leadership is conducive for employees, the employees' performance will be improved. Leadership is a way to influence the groups' behavior and direct them towards achieving the defined goals (Robbins, 2003, P314). There have been discussions about leadership and leaders since man started working in group. Leader can be defined as a person who has managerial authority and who can influence others. Leadership is simply what the leader does. Leaders should have the qualities like drive, desire to lead, honesty and integrity, self-confidence, intelligence, job-relevant knowledge and extraversion. Leaders influence the behavior, feelings and performance of their subordinates. Performance of subordinates is improved if they are positively influenced by their leaders. Researches have been made to explore the leadership styles to find the most effective one for both the quality and quantity of work. The autocratic style, the democratic style and laissez-faire style and their impact on employees' performance have been deeply researched. In autocratic leadership, work methods are dictated to the employees not involving them in decision making process.

In laissez-faire leadership, the leaders let the group make decisions and complete the work in whatever way it saw fit. In democratic leadership style, the employees are involved in decision making. It is concluded that democratic style is the most effective to make employees' performance better. Recently, the researches are being made to investigate the influences of transactional and transformational leadership on employees' performance. Burns (1978) opines that transactional and transformational leadership styles are more prominent among leadership styles. Transactional leaders give rewards and punishments to encourage performance, making the leader/ worker relationship essentially an economic transaction. (Bass, 1985). Transactional Leaders work with their team members exchanging rewards with them and being responsive to their immediate interests. Transformational leaders are active leaders that have four distinguishing qualities: charisma, inspiration, intellectual stimulation and individualized consideration (Bass, 1985; Conger, 1999).

Charisma is the extent of pride, faith and respect leaders encourage their workers to have in themselves, their leaders and their organizations. Inspiration is the ability to motivate followers through communication of high expectations. Intellectual stimulation is the frequency with which leaders encourage employees to be innovative in their problem solutions. Finally, individualized consideration is the degree of personal attention and encouragement of self-development a leader imparts to the employees (Bass, 1985; Bass, 1990). Conducive leadership style create eagerness

among employees to achieve the goals with sincerity and it also brings satisfaction among employees (Aydin & Ceylan, 2009). Lee and Ho, (1989) are of the view that the employees are more satisfied if they are involved in decision making by the leadership. Tanke (1990) states that unpleasant behavior of the leader creates dissatisfaction among the employees and even the employees may leave the organization. Markow and Klenke (2005) and Milliman et al. (2003) point out that the pleasant behavior of the leadership can enhance the efficiency and job satisfaction of the employee.

The term job autonomy refers to the state of the self-governing of the people (Smith, 1993). Job autonomy is one the important factors that enhances the employees' job satisfaction (Dawson, 1987). Job autonomy is one of the key factors that play a vital role for the job satisfaction of the employees (Nguyen et al, 2003) Person's job is more than some obvious activities. The factors like the nature of work, supervision, present pay and promotion opportunities bring satisfaction among employees (Robbins, 2003: pp. 78-79). Hackman (1990) is of the view that intrinsic as well as extrinsic rewards play an important role for employees' satisfaction. James Brown (2007) defines the fairness as equal treatment in which all the employees receive the same benefits rendering the same services like other employees in the organization. Lepper and Green (1978) state that the employees experience greater satisfaction in the situations where the probability of making endogenous attributions is higher than the probability of making exogenous attributions. Lawler and Porter (1967) opine that the performance of the employees will be increased if they get proper reward of their efforts. They further state that if the employees' rewards are inequitable to their co-workers, it will result dissatisfaction.

Adams (1963) expresses that the employees are dissatisfied if the rewards will not match their efforts. Podsakoff (1982) gives his view that employees are more satisfied when they receive just rewards after their performances. Hackman (1976) demonstrates that the employees perform better with satisfaction if they will be favored. Herman (1973) is of the view that the economic conditions affect job satisfaction-performance relationship. Miller (1982) explains that job security and higher pay are important factors that bring job satisfaction. Furnham (1992) categorizes the factors that can have impact on job satisfaction into three categories: organizational policies and procedures, working conditions at workplace and personal issues of employees. Robbins (1998) gives his opinion that flexible work situations and supportive work environments bring satisfaction among employees and increase their performance.

## **THE IMPORTANCE OF THE STUDY**

The present study aimed at discovering the factors that influence English Language Teachers' job satisfaction in Pakistan. The findings of the study and its recommendations will be placed in front of decision makers in the educational sector to be taken into consideration. This study will be helpful for the heads of the educational institutes to increase the job satisfaction of their employees.

## HYPOTHESES OF THE STUDY

This study will test the following hypotheses.

- H.1. Job security increases the job satisfaction.
- H. 2. Job autonomy also enhances the job satisfaction.
- H. 3. Workplace flexibility and fairness bring job satisfaction.
- H. 4. Handsome salary and reward are the factors that maximize the job satisfaction level.
- H. 5. Conducive and positive behavior of leadership ensures job satisfaction.

## METHODOLOGY

The population of this study was 500 in-service English language teachers irrespective of gender, level, age, experience and sector. Teachers of English were selected for collecting data because English is taught as a compulsory subject and the teachers of English are involved in almost all the programs. The study was quantitative in nature. Data were collected through questionnaire using random sampling method. The questionnaire used a five point Likert scale. Five variables: job security, workplace flexibility and fairness, handsome salary and reward, job autonomy and conducive behavior of leadership were addressed in this study. There were twenty items in questionnaire and four questions on each variable were to be answered by each respondent. Keeping in mind the research ethics, the questionnaire was given for filling to those who showed their willingness. 398 out of 500 (79.60%) questionnaires were received. 8 questionnaires were incomplete enough not to be interpreted. The responses of remaining 390 questionnaires have been interpreted through charts.

## RESULTS AND DISCUSSIONS

### CHART

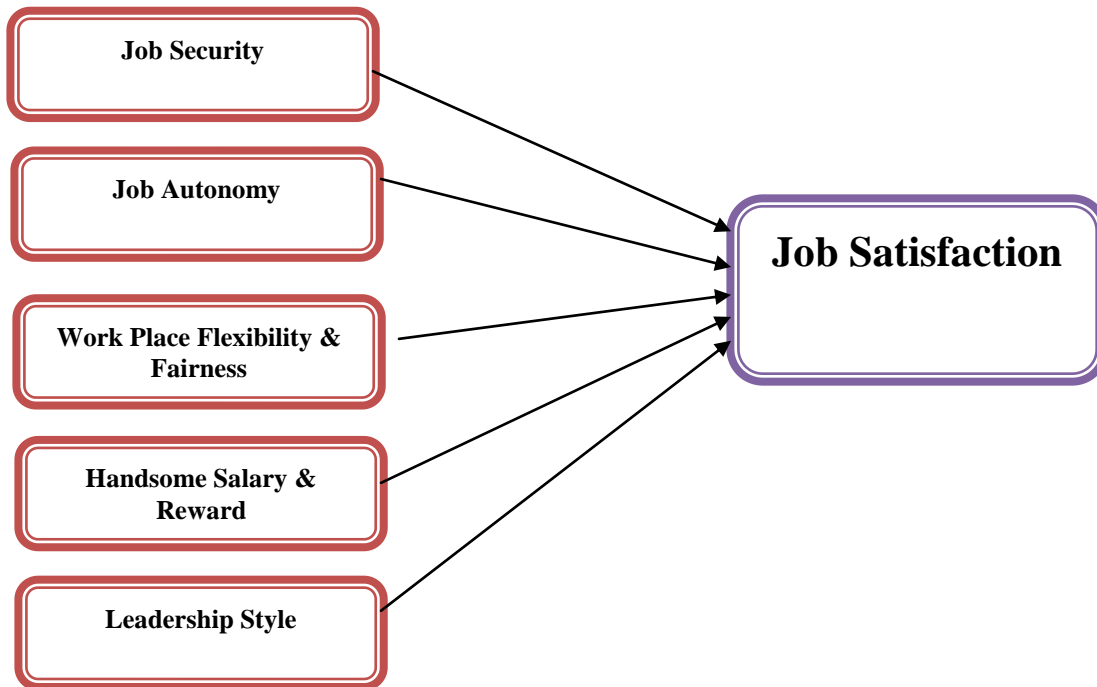

Chart 1 given above shows the responses of 390 respondents on the questions about the factors that influence the job satisfaction of English language teachers. 371 respondents out of 390 agreed that Job Security is factor that influences job satisfaction. As far as Job Autonomy is concerned, 351 out of 390 respondents considered it an important factor that influences job satisfaction. Leadership Style has been taken as an important factor that affects job satisfaction by 371 out of 390 respondents. Handsome Salary and Reward are the factors that affect job satisfaction, this is supported by 390 out of 390 respondents. All 390 respondents agreed that Workplace Flexibility and Fairness are the factors that influence job satisfaction. All variables are given below according to the response of the respondents.

<u>Variables</u>	<u>Response &amp; Percentage</u>
Job Security (J.S)	(Agreed by 371 out of 390 respondents & 95%)
Job Autonomy (J.A)	(Agreed by 351 out of 390 respondents & 90%)
Leadership Style (L.S)	(Agreed by 371 out of 390 respondents & 95%)
Handsome Salary and Reward (H.S.A.R)	(Agreed by all 390 respondents & 100%)
Workplace Flexibility and Fairness (W.F.A.F)	(Agreed by all 390 respondents & 100%)

See the figure below for the quick understanding of the factors that influence job satisfaction of English language teachers.

**Figure**

- H.1. Job security increases the job satisfaction.
- H. 2. Job autonomy also enhances the job satisfaction.
- H. 3. Workplace flexibility and fairness bring job satisfaction.
- H. 4. Handsome salary and reward are the factors that maximize the job satisfaction level.
- H. 5. Conducive and positive behavior of leadership ensures job satisfaction.

Hypotheses (1-5) are about the factors that influence job satisfaction were taken by the researchers before starting this study. Hypotheses need no longer discussion here. Data interpreted above clearly proves these hypotheses.

## **CONCLUSIONS, RECOMMENDATIONS AND LIMITATIONS**

The problem of this study was to investigate the factors that influence English Language Teachers' job satisfaction in Pakistan. The limitations of the study are as under:

- 100 % accuracy cannot be assured because the survey is subjected to the biased and prejudiced responses of the respondents.
- This research was carried out in a short span of time and the researchers could not widen the study.
- The study can be generalized to the limited population.

The findings support that the factors like job security, work place flexibility and fairness, handsome salary and reward, job autonomy and conducive behavior of leadership increase the job satisfaction whereas the absence of job security, job autonomy, handsome salary and reward, workplace flexibility and fairness and conducive behavior of leadership brings dissatisfaction among the teachers. On the basis of findings, here are some recommendations as under:

- Educational organizations should ensure the workplace flexibility and fairness so that they may decrease the employees' turnover.
- Educational organizations should discourage the favoritism to increase job satisfaction level among the employees to provide them peace of mind and relaxation so that they may work with innovation and enthusiasm.
- Absenteeism, tardiness and health sets backs due to stress can be reduced if the employees meet job security and job autonomy.
- Salaries of the employees should be increased to that level where they feel comfortable to fulfill their needs easily. In this way, their working efficiency can be increased
- Government of Pakistan should take some immediate measures to formulate some laws ensuring the job security of the employees working in private sector educational organizations.

In short, if the above stated recommendations are taken into the consideration by the decision makers of the education sector, the employees' job satisfaction level will be increased to that level where they will perform enthusiastically putting their best efforts.

### ABSTRACT

Translation, particularly news translation, is an essential means of communication in information exchange era. Its quality influences international relationships and leads to offer readers either accurate or wrong information. Accordingly, it is essential to evaluate the quality of translated news texts. It is also important that the task of translation quality assessment be carried out with consideration of text function and its context. In this study, it is attempted to evaluate the quality of news translations in one of the major news sources of Iran media, namely ISNA news agency through the application of objectified discourse-based TQA model of Farahzad (1992). By applying this model to the corpus of the selected texts used in the present study, the researchers rated 10 news texts translation for 5 criteria of appropriateness, accuracy, naturalness, cohesion and style.

### INTRODUCTION

News as a major part of today's communications plays a considerable role in the exchange of information. This information exchange would be of value if it is proper and accurate. While there is not a united language for all people worldwide, there is no remedy of translation.

According to Hatim and Mason (1997, Cited in Khajeh and Khanmohammad, 2006), translation is an act of communication that is permanently dealing with at least two different languages along with a broad network of elements including cultural, historical, political and ideological differences. In order to establish a proper communication and offer a tangible and meaningful translation, one needs to transfer the original utterances to his/her audiences thoroughly. It is possible when the translator is aware of source text (ST) and target text (TT) structure, text function in both ST and TT context, and culture-specific elements and the characteristics of the audiences. In other words, translation should be meaningful, accurate, and functional for its context.

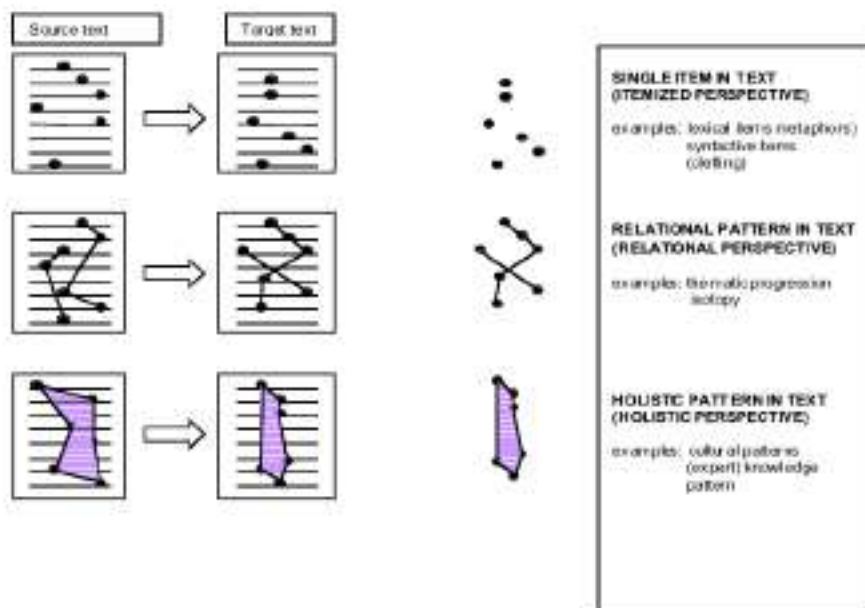

In this study, the researchers evaluated the quality of news translation in Iranian Students News Agency applying TQA model of Farahzad (1992), in which 5 criteria of appropriateness, accuracy, naturalness, cohesion and style were introduced as quality indexes.

## THEORETICAL BACKGROUND

### *Different Perspectives to a Text*

Arbogast (2001) explains that each text can be seen from different perspectives. In an *Itemized Perspective*, individual problems in a text such as metaphors, cohesive devices and ambiguities are investigated. These items are usually of local essence and should be treated as culture-bound matters. The translator often resorts to compensation strategies in such cases. The *Relational Pattern Perspective* describes patterns that can be identified and traced subsequently in the whole text. He/She should find such patterns and find an alternative for the whole pattern. With a *Holistic Pattern Perspective*, the translator deals with holistic patterns which are functional entities in a text. These holistic patterns have not an identifiable starting point like relational patterns. The whole pattern is made up of elements that are *functionally related to each other*. Coherence, cultural and general or specific knowledge patterns are some examples of such patterns (Figure1).

FIGURE 1

### ***Functionalist view of translation evaluation***

In the functional approach, translation is not simply a text reproduction and the function of a text is its use in a situation in which it is applied. The functionalists believe that each and every text gains its function just in its context. Hence, without considering the particular context of a text, the translator is not allowed to provide a correct and functional translation

According to *Christina Schaffner* (1998), the criteria for evaluation of translation quality will be different depending on the purpose of the assessment and on the theoretical framework which the evaluator applies and in assessing the quality of the translation. The TT is compared to the ST to find out whether the TT is an “accurate, correct, precise, faithful, or a true reproduction of the ST” (pp. 1). This comparison, based on Newmark (1991), involves both quantitative and qualitative aspects, or in other words, it investigates the status of accuracy referentially and pragmatically.

Translation evaluation in functional approaches, according to Lauscher (2000), is determined by factors related to the target culture rather than the source text. Translation is seen as a process of text production on the basis of a source text, and the target text is considered as a text in its own right. In the process of functional translation quality assessment, the evaluator compares SL and TL structures and pragmatic parameters in ST and TT. The evaluator then determines to what extent these parameters matched in ST and TT. In functional view of translation, the proper translation is pragmatically adequate or functionally appropriate. The functionalist approaches to translation also propose the function and the purpose of the TT as the most essential criterion of all translation and translation quality assessment. From a functionalist approach, the quality of a translation depends on the text user and the way in which s/he considers it as appropriate and corresponding to its purpose and the specific context.

As House (1997: cited in Baker, 1998) proposes, ST and TT are likely to be functionally adequate or equivalent when their functions in their respective contexts are alike so the degree of matches and mismatches between textual profile and the function of ST and TT is the scale of adequacy and quality of a translation. From House (2001) point of view, the translator should take into account the “interconnectedness of context and text” because the language and the real world are interdependent (p. p. 247).

### ***Farahzad’s TQA model***

Farahzad (1990) introduced her first model for TQA in an essay which was offered in Denmark conference, entitled: “translating and interpreting training”. This model which is basically designed for educational settings, as Tajvidi (2005) states, provides one of the most applicable models for TQA. In her model, she suggests criteria of appropriateness, accuracy, naturalness, cohesion and style for scoring a long text and considers two ways for it.

In the holistic version of this model, the evaluator reads the translation once and considers 20 percent of the total score for each index. On the other way, or objectified version, the target text is read twice, once for checking accuracy and appropriateness, and then for cohesion and style. Objectified version is somehow time-consuming but more precise and reliable. In this way, sentence or clause is the unit of translation. In order to score cohesion and style, the elements of cohesion (e.g. transitional, appropriate use of pronouns, linkages, etc.) and style of discourse (e.g. choice of words, grammatical structures, etc.), are evaluated in the whole text. According to what

Farahzad (2012) said in an interview with the researchers, translation of journalistic texts should be scored based on an objectified version of her model and rater should read each text twice.

## **RESEARCH QUESTIONS**

The aim of this study was to answer the following research questions:

1. To what extent is news translation accurate and appropriate in Iranian Students News Agency, according to TQA model of Farahzad?
2. Regarding Farahzad's model, what is the most problematic translation quality index in news translation in ISNA?
3. How much is the News translations cohesive in ISNA news agency?

The researchers will answer all the questions by using scores which are made based on Farahzad's TQA criteria, namely, appropriateness, accuracy, naturalness, cohesion, and style.

## **METHODOLOGY**

In this study, 10 in-brief news texts were taken incidentally from among 50 short news items. Each item consisted of up to 25 sentences. The researchers concentrates on in-brief news items because too long items may cause some distracters like fatigue both for the translator and the raters during the process of translating and scoring.

### ***Participants***

A group of 10 translators rendered 10 English texts into Persian. All of the translators were M.A students in translation studies who had been homogenized through precise written examinations (semi-TOEFL) and interviews which were taken by ISNA international editorial board.

The researchers read each translated text twice. At first, the researchers divided each source text into its units of translation, compared ST and TT pairs and scored appropriateness, accuracy, and naturalness for each unit of translation. Then, she read the translation as a whole text and scored it for cohesion and style.

### ***Design***

In the scope of the present study, the process of rating consisted of two phases. In the first phase, the researchers divided each source text into its units of translation. The unit of translation, based on what Farahzad (2012), asserted in an interview with the researchers, could be word, compound, or phrase. Generally each verb takes a score. If a sentence is consisted of a main clause and subordinate clause(s), the main clause receives one score and each sub-clause another score; no matter how many sentences/clauses were in its translation.

Then the researchers compared TT and ST pairs and scored each unit for accuracy, appropriateness, and naturalness. Afterward, in the second phase of rating, she read each translation as a whole text and scored the translation for cohesion and style. Finally, 10 score-sheets for 10 translations were collected and analyzed in order to find the lowest quality index in news translation in ISNA.

In the next step, the researchers calculated the percentage for appropriateness, accuracy, naturalness, cohesion, and style in order to be more tangible and based on the same scale. In this way, the comparison of translations scores became easier and more tangible. Finally, the researchers compared the scores of different quality index to find out what quality index was the most problematic one for translators in news translation in ISNA.

It is necessary to mention that the process of scoring the translated texts was checked step by step through the supervision of Farahzad. The researchers referred to Farahzad in different phases of the scoring process in order to assure the correctness of the process.

## RESULTS

The corpus consists of 10 sets of total scores each of which was sum of 3 scores, namely, appropriateness, accuracy, and naturalness; two other criteria, cohesion and style, were scored separately as holistic measures. (Separate scores have been given for all 5 criteria additionally). Because the number of translation units for each source-text item (and the resulted total score for each translated text) was different, thus the quality index percentages in their respective text were calculated.

At last, the researchers compared scores of each criterion (appropriateness, accuracy, cohesion and style, and naturalness) in order to find out which criteria raised difficulty more in translation of news texts in ISNA.

Following are instances of the translation evaluation of 10 news translated texts which is based on the quintuple translation quality index of Farahzad (1992) TQA model. In the first round of rating, three quality scales of appropriateness, accuracy, and naturalness were scored. In the second phase, the rater read each text as a whole and gave a score for style and cohesion:

Source text No.1:

1.Afghan President Hamid Karzai would pay an important visit to Pakistan next week
رییس جمهور افغانستان هفته آینده سفری مهم به پاکستان خواهد داشت
2.to talk Islamabad on board over peace talks with Afghan Taliban as well as US troops drawdown plans
تا با اسلام آباد بر سر مذاکرات صلح با طالبان و طرح خروج نظامیان آمریکا از افغانستان گفتگو کند.
3.Sources said on Monday
ترجمه نشده است.
4.Well-place diplomatic sources told this scribe that
به گزارش ایسنا به نقل از روزنامه نیشن، منابع خبری دیپلماتیک اظهار داشتند که
5.President Karzai would visit Pakistan from June 10
حامد کرزای رییس جمهور افغانستان 20 خرداد به پاکستان سفر خواهد کرد
6.and the leadership of the two countries would also take stock of the state of bilateral relations, peace and stability in the region and the proposed Indo-Afghan defense pact.
و رهبران دو کشور به ارزیابی روابط دوجانبه، صلح و ثبات در منطقه و پیشنهاد پیمان دفاعی هند و افغانستان خواهد پرداخت.
7.In a related development, the visiting deputy foreign minister of Afghanistan Jawed Ludin is finalizing with his Pakistani counterpart the agenda of talks of the Afghan president with Pakistani leadership.
در همین راستا جاوید لودین، معاون وزیر امور خارجه افغانستان با همتای پاکستانی خود در حال نهایی سازی دستورکار مذاکرات رییس جمهور افغانستان با رهبران پاکستانی است.
8.Mr. Ludin,...met Minister of State for foreign affairs Hina Rabbani Khar
وی ...با حنا ربانی خوار، وزیر امور خارجه ی این کشور دیدار کرد
9.who is on a two-day official visit to Pakistan,
در سفر دو روزه خود به پاکستان،..
10.and discussed host of issues of bilateral interest.
و طیفی از مسائل مربوط به منافع دوجانبه را مورد بحث قرار داد.
11.Hina Rabani Khar ... emphasized further consolidation the relations between Pakistan and Afghanistan.
حنا ربانی خوار... بر تحکیم هرچه بیشتر روابط میان پاکستان و افغانستان تاکید ورزید.
12.Embedded: while talking to the Afghan dignity
در مذاکرات با این مقام پاکستانی
13.She expressed her satisfaction over the current state of bilateral relations,
وی نسبت به وضعیت کنونی روابط دوجانبه...، اظهار رضایت کرد.
14.(Adjective clause) which had under gone tremendous change under the present democratic regime
که در حکومت دموکراتیک کنونی دستخوش تغییرات عظیمی گردید،

TABLE 1

Tr. Unit	Appropriateness	Accuracy	Naturalness	Total score
1	1	1	1	3
2	1	1	1	3
3	0	0	0	0
4	1	0.5	1	2.5
5	1	1	1	3
6	1	1	1	3
7	1	1	1	3
8	1	1	1	3
9	0.5	1	1	2.5
10	1	1	1	3
11	1	1	1	3
12	0	0	-	0
13	1	1	1	3
14	1	1	1	3
Sum	11.5	10.5	12	35

As it is shown in table 1, the translator did not render any Persian translation for sentence No. 3, so the rater considered 0 score for all indexes. In an interview with the researchers, Farahzad (2012) also confirmed that in cases for which the translator did not offer a translation all criteria would take 0 score.

In sentence 4 the translator did not offer the precise translation for “well-placed” and the rater, gave half of the score for accuracy.

In sentence No.9 it seemed to the rater that diction of the text could be more accurate if the expression of "ملاقات" substituted "دیدار", because the first expression was used just in a meeting with individuals. Therefore, it seemed that the meaning was not caught and rendered completely.

Note: according to the commissioner hints and some news translation formats, the expression of "به گزارش خبرگزاری ایسنا به نقل از..." should be added in order to quote the original news source.

Furthermore, in sentence No.12, “Afghan dignity” was translated as "مقام پاکستانی" which is absolutely wrong and distorts the meaning. Such mistakes are not ignorable at all in news

agencies environment. It is obvious that the translator knows well the meaning of the words but false translation was produced because of carelessness.

### *Status of Quality Indexes in the Corpus of the Study:*

5 proposed criteria of translation quality were investigated in 10 English news texts in the previous section. The status of each index of quality in whole corpus of the study is wrapped up in table No.11 to indicate the relative status of the criteria.

The scores of style and cohesion were considered out of 10% of the total number of translation units in their respective texts.

TABLE 2

Text No.	Appropriateness	Accuracy	Naturalness	Style	Cohesion
1	11.5	10.5	12	1.3	1.3
2	13	13	12	1.5	1.5
3	5.5	5	9	1.7	1.6
4	17	15	17	1.8	1.7
5	15.5	14	14	1.5	1.4
6	9	5	10	2.05	2.1
7	11.5	12	12	1.2	1.2
8	15.5	16	16	2.3	2
9	18	20.5	18	2.5	2.4
10	11.5	11	11	0.9	1.1
Total score	126	120	129	16.85	16.3

### *Quality Index Averages*

In Table 3, the percentage score is calculated for all the scores. In this manner the comparison of results is more convenient.

TABLE 3

Text No.	Appropriateness	Accuracy	Naturalness	Style	Cohesion
1	82.14	75	85.71	92.85	92.85
2	81.25	81.25	75	93.75	93.75
3	32.35	29.41	52.94	100	94.11
4	85	75	85	90	85

6	42.85	23.8	47.61	97.61	100
7	88.46	92.3	92.3	92.3	92.3
8	67.39	69.56	69.56	100	86.95
9	69.23	80.76	69.23	96.15	92.3
10	95.83	91.66	91.66	75	91.66
Overall mean	74.13	70.62	75.65	93.61	90.55

**Quality Index Scores Percentages**

FIGURE 2

**Status of Quality Indexes for Each Text**

As it is clear, table No.3 indicates that among three criteria of appropriateness, accuracy, and naturalness the best and the worst scores respectively belong to naturalness and accuracy. Two last columns of the table show the status of style and cohesion scores for each text. The maximum score for style belongs to text no. 3 and no.8 and minimum score for style is for text no.10 which acquired just 75% of the optimum score (1.2 for text No.10). Text 6 gained 100% of score for cohesion while text No.4 with 85% enjoyed the worst cohesive translation. The status of quality indexes in each text was depicted in the Figure 2.

Table No.4 shows that what quality index gained the maximum score in each text. In the last row of the table further indicates that how many times quality index have acquired maximum score. According to the table, it is known that the index of naturalness has relatively better status in comparison with appropriateness and accuracy. The pie chart made this information more tangible (Figure 3).

## CONCLUSION

Having applied the TQA model of Farahzad (1992), the researchers, in answer to the first question, found out that in the corpus of the present study, Persian translations of English in-brief News texts could score 74.13%, 70.62%, and 75.65% of the maximum possible scores respectively for quality indexes of appropriateness, accuracy, and naturalness.

According to the results and figures which were provided, it seems that the quality of accuracy is the lowest measure among others. Findings of the study indicate that quality scores for index of cohesion ranged between 85 to 100 percent of the maximum score possible. This variation range implies that almost every translation in the corpus of the present study was cohesive. This means that cohesion elements like lexical and grammatical cohesion, cohesive ties, and referential elements (such as pronouns) were distributed all over the translations well.

From all quality indexes, style and cohesion had better status in comparison with others. In the scope of this study, the quality index of style got 93.61% of possible scores. With the exception of text No.10 which showed a diversion, almost every translation scored more than 92% of the score for style. Cohesion as another yardstick for quality assessment was of pretty satisfactory status and acquired 90.55% of the total score. On the other extreme, lowest scores were given to accuracy and roughly 70% of the maximum scores were gained on average. Two indexes of naturalness and appropriateness had fairly similar positions in scoring by gaining 75.66% and 74.13%.

Regarding the importance of preserving the precise meaning in translation particularly in translation of news, the researchers emphasize the significance of appropriateness and accuracy as two priorities in translation. The results of the study show that the status of these quality indexes unfortunately acquired the lowest scores. Although all the translators had professional capacities, they did not transform and transfer the exact meaning of the original. Sometimes the translation got the score for appropriateness but lost all or part of the accuracy score. It is possibly because of lack of command on target grammar and writing skills and can be a subject to further research.

Based on the findings of the present study, it is implied that in almost all of the translations, elements of form, that include terminology, text construction, and cohesive devices took into consideration. Relevant text format and style of the news items were followed in almost all texts to high extent. This helps the feasibility of translation fluency and integration which can improve the quality of naturalness as well. The quality index of naturalness was of better position in comparison with appropriateness and accuracy somehow because of good status of style consideration and application of cohesion elements. On the other hand, not satisfactory status of appropriateness and accuracy scores influenced the quality of naturalness and thwarted the positive effect of good translation format and text cohesion to some extent.

At the end, it seems necessary to mention that as it is the case with almost any study done in the area of applied linguistics and translation issues, this research does not intend to come to an absolute conclusion based on its findings. Put it another way, it is still necessary to carry out further studies to better verify the influence of the other factors not mentioned and focused on in this study on the quality of the translated news texts in other sources of media rather than the Iranian media, namely ISNA news agency through the application of objectified discourse-based TQA model of Farahzad (1992).

### **ABSTRACT**

A reader may experience manifold feelings while going through a text. It is not only the subject that the author has discussed in the text but also its sound presentation that leaves an immutable impression on the mind of the reader. Literature provides manifold opportunities to readers to acquire the ability to encounter several situations in their life time. The paper accentuates the need for teaching literature in educational institutions in a conscious manner. It is potential to illuminate the readers' private world and teach the grandeur of a language. A committed reader will have a chance to update his/her knowledge besides correcting his/her language impairments through meticulous reading of literature. The research proves that through the study of literature, learners of a language unconsciously acquaint themselves with language rules, which they feel elusive to learn independently.

### **INTRODUCTION**

Language teaching has acquired vital significance during the last two decades in education institutions. An observation of how language is taught in the present scenario reveals that the pedagogues of English prefer to have such a syllabus as to help the learners hone their language skills. Since the development of skills has become the primary aim of the instructors, it cannot be denied altogether that there is a gradual diminution of focus on literature in learning centers. The actual problem lies in the situation where the instructors and learners as well seem to have been convinced that the study of literature is a mammoth task, which is in many ways not useful in improving the basic language skills. When students proceed with the notion that the purpose of language learning is to acquire ability to express themselves effectively, they are loath to accept any text that would present the nebulous imagination of the author, which they feel, is beyond their comprehension. There should be integrated approach to the teaching of language and

literature and it is high time to believe that the absolute indifference to literature would leave language teaching null and void.

## LITERARY BASED READING MATERIAL

For the teachers especially those who are working in the areas where the regional language outclasses the second language, imparting sound education in a second language is an arduous task. An effective model and a well-founded curriculum is therefore necessary to fulfill this purpose. The newly issued *National English Syllabus Standard* (Department of Education, P.R.C, 2003) for compulsory education clearly states that “English learning is not only a process for students to master English knowledge and skill and improve their practical language use... but also a process for teachers to train their will, mould their temper, enrich their life, develop their individual character and abilities and sharpen humanist qualities.” A systematic and disciplined approach is indispensable in teaching-learning process and the drafting of this recipe is wholly dependent on the discretion of the one who should aim at the optimum results it would produce for the pleasure of the two potential parties (the teacher and the learner) involved in the task. To achieve this goal, the text has to be an assemblage of a variety items which would include introspection and reflection on the part of both the pedagogue and learner.

The world's orientation towards science, technology and industrial development is now questioning the purpose of having a class for the study of literature in education centers. Votaries of science argue with magisterial voice that the study of Chaucer and Dryden is less useful to the students compared to the study of the task that would teach them how to develop the skill of telephonic conversation. In such predicament, English is treated just as a tool for communication. It no more enjoys the magnitude of being a discipline in humanities and as a result its role in literature has fallen into decline. In accordance with the changing opinions regarding English language, the current curriculum accentuates the need for linguistic skills and therefore the learning centers are welcoming the skill-oriented syllabus rather than literature-oriented one.

The learner develops a wide range of analysis of the written work when the text is conducive to contemplation and consequently he/she accepts the text as his/her best instructor that would help him/her in many ways to strengthen his/her language and literary competence. Improving critical thinking should be the first priority objective of education. The kind of education the individuals receive during their stay in institutions is reflected through their behavior. Their actions are totally dependent on their analysis and thinking. In a broad sense, it means that any individual who is expelled from the world of literature is seldom blessed with an opportunity to mutate himself/herself as a complete man. Therefore, the learners need to study the kind of syllabus that is useful to them in two ways: one in improving their language skills and other in molding their character through critical thinking. Since it is the study of the past, reflection of culture, revival of history, enlightenment of spirit and delineation of philosophy, it is capable of building firm character among the readers. Emerson (1837) says in his speech, “Our anniversary is one of hope, and, perhaps, not enough of labor. We do not meet for games of strength or skill, for the recitation of histories, tragedies and odes, like the ancient Greeks; for the parliaments of love and poesy, like the troubadours; nor for the advancement of science, like our contemporaries in the British and European capitals. Thus far, our holiday has been simply a friendly sign of the survival of the love of letters amongst a people too busy to give to letters any more. Who can doubt that poetry will revive and lead in a new age as the star in the constellation Harp, which

now flames in our Zenith, astronomes announce, shall one day will be the polar-star for a thousand years?"

He emphasises the need for renaissance and production of great literature. Without literature there is neither national development nor individual progress. It is necessary that the teachers who possess profound knowledge and deftness in communication and good awareness of culture, history and philosophy are needed in this mission.

## **LANGUAGE TEACHING THROUGH LITERATURE**

Povey (1967:42) claims that the study of literature can extend the students' knowledge of vocabulary and syntax. It should be designed in such a way that the instructor can prepare various tasks to involve the students in language learning. Learners need to obtain an opportunity to study the stylistic features of the text and learn the extensive use of words in their creative writing.

A.G. Gardiner's 'ON SAYING PLEASE' shown below provides empirical evidence that literature is a fount for language study.

*Having searched my pockets in vain for stray coppers, and having found I was utterly penniless, I told the conductor with as honest a face as I could assume that I couldn't pay fare and must go back for money." "Oh, you need not get off that's all right," said he. "All right," said I, "but I haven't a copper on me." "Oh, I'll book you through," he replied. "Where'd ye want to go?" and he handled his bundle of tickets with the air of a man who was prepared to give me a ticket for anywhere from Bank to Hong Kong. I said it was very kind of him, and told him where I wanted to go and as he gave the ticket, I said, "But where shall I send the fare?" "Oh, you'll see me some day all right," he said cheerfully, as he turned to go. And then, luckily my fingers, still wandering the corners of my pockets, lighted on a shilling, and the account was squared. But that fact did not lessen the glow of pleasure which so good natured an action had given me.*

## **TEACHER'S ACTIVITY**

The teacher can use this text for developing various skills of students. The following are the tasks the instructor can prepare:

- **COMPREHENSION** ( Asking pre-reading, while-reading and post-reading questions)
- **GRAMMAR** (Reported Speech, clause-definition and types, question formation, conjunctions and prepositions)
- **VOCABULARY** (Suffixes, prefixes, formation of negative words with prefixes and suffixes, one-word substitutes, phrasal verbs)

The teacher should provide examples from the passage. This will help students to learn through reading. Grammar learning that would seem an onerous burden, when taught independently, would enchant the learners when they learn through context in the literary text and it offers them

lasting thrilling experience when they apply their knowledge. A careful study of any literary text, which is simple and delightful, would help students to use words wisely in speech and writing.

Learning does not mean students' listening to the elucidation of any theory to record it on their mind and then to regurgitate it. If learning is defined as memory and retention of information, attentive listening is the only measure to attain this goal. No doubt, learning of this kind would be useful to fetch percentage but it is apparently too weak to aid the individuals in crucial moments like decision making, problem solving, solution discovery and self-evaluation. Any amount of learning is impossible without learner's participation in the activity of learning. A learner is to be made a focal point in learning programme by making his/her mind busy in thinking and action. Asking questions and evaluating answers in conscious manner would promote an access to critical thinking in learners.

The following comprehension questions can be asked to test the understanding ability of students:

What does the author of the text intend to focus on? (Tick the right answer)

- a. Duty-mindedness
- b. Deceitfulness
- c. Sweet-tempered attitude
- d. All the above

- 'As honest a face as I could assume'-Illustrate the meaning of the clause.
- What do you understand the character of good-natured people like? (Tick the right one)
  - a. Cheerful b. gloomy
- Do you want to be like the conductor? Why? (Write your answer in not more than three sentences)

Have you ever encountered a man like the conductor in the passage in your life? If so, present your experience with him/her in black and white.

The students may be encouraged to disclose the situations when they felt offended because of the impoliteness of certain persons in their life. Such activities will keep the classroom lively and they are also useful in generating humanistic qualities in them.

Sowden (1987:28) suggests that literature can be used in the teaching of language 'by the linguistic manipulation of literary texts chosen for their real literary worth, but with an eye to their suitability for such manipulation'. He goes on to list examples of manipulation exercises that include cloze, vocabulary recognition and development, grammar reinforcement and extension, sentence building and pronunciation practice. These, he claims, 'will challenge the student, ensuring he gets completely involved in the language and style of the text, so increasing his familiarity with the language and improving the facility and accuracy with which he uses it' (1987:32).

## LANGUAGE LEARNING THROUGH POETRY

On interacting with teachers and students of several Engineering Colleges in the state of Andhra Pradesh in India, the researcher discovered that according to the majority of teachers and

students, poetry is something that comprises nebulous thoughts, unfathomable ideas, implied meanings, and vague illustrations. It has all intricacies and; no doubt, its hidden grandeur on several occasions may question the rationality of a reader and ultimately s/he may end up in absolute confusion. It is true that poetry does not proffer as much satisfaction to a teacher as prose does. According to Lackward, "Often language art teachers report feeling uncomfortable teaching poetry, either because they are not sure how to teach it effectively (owing to lack of pedagogical role models), or because they find it elusive themselves." Not having any specific strategy or method that can be attributed to poetry teaching is the possible reason that the learner and the pedagogue can adduce for the absence of any orientation towards its teaching. Hanauer (2001:320) suggests that poetry can be used in the second-language classroom to focus attention on formal language structures, 'a task that can enhance linguistic and cultural knowledge of the target language'. Tomlinson (1986:41) suggests that poetry 'can break down the barriers and involve learners in thinking, feeling and interacting in ways which are conducive to language acquisition'.

The research concludes that poetry teaching would be effective when students are encouraged to appreciate the qualities of a given poem. It suggests multiple ways to orientate the attention of students towards poetry and delineates methods to improve the communicative ability

The teacher can create a situation and encourage the students to compose a small poem. Students will start thinking and struggle to find suitable words to make appropriate expression. They are encouraged by their own success. The teacher can give pre-reading and post-reading activities to improve the students understanding. Gradually students acquire skill to reduce, expand, analyze, or discuss the original text. Tomscha (1987:17) recommends teacher re-writing a poem in the learners' native language; students then translate it back into English and compare their translation with the original. Ambatchew (1997) suggests that literature can be demystified through students attempting to write their own poems. Lima (1999) lists post-reading activities that include writing the unwritten parts of a text, expansion and/or reduction of the original, as well changing the point of view and genre. Wales (1990) sees rewriting as a creative way to promote engagement with the text and discussion about style. Skills developed in this way may later be put to good use in a stylistic approach to literary study (Carter, 1986; Lazar ,1993:28).

Such student-centered syllabus that orientates the students towards the active involvement is an indispensable aid to them in the learning process. Making students to prepare such texts is another useful technique in this process. Students who are intimidated at the thought of literature begin to realize how it would facilitate the enormity of the task and be useful to them in achieving their goals.

The poem is suitable to prepare many tasks based on grammar, vocabulary. Activities which are useful to students based on text interpretation, debate would generate thinking ability in students. The teacher has to make use of this and benefit the students.

## LANGUAGE MASTRY TO UNDERSTAND PROFOUND LITERATURE

Saunders says:

Until there is considerable language mastery and until there is considerable experience of current literature, reflecting current, even local, issues and concerns, there is little sense in compelling students to grapple with books about remote events, written in a highly complex and antiquated style (for example, Dickens, George Eliot and Thomas Hardy). Until language mastery is achieved, the teaching of literature should occupy a secondary place, and books should to a large extent be prescribed for their usefulness in achieving that mastery. They should help reinforce the process of learning the language as a current medium of expression.

Examine the following, which is an exact contrast.

The old fable covers a doctrine ever new and sublime; that there is One Man, — present to all particular men only partially, or through one faculty; and that you must take the whole society to find the whole man. Man is not a farmer, or a professor, or an engineer, but he is all. Man is priest, and scholar, and statesman, and producer, and soldier. In the divided or social state, these functions are parceled out to individuals, each of whom aims to do his stint of the joint work, whilst each other performs his. The fable implies, that the individual, to possess himself, must sometimes return from his own labor to embrace all the other laborers. But unfortunately, this original unit, this fountain of power, has been so distributed to multitudes, has been so minutely subdivided and peddled out, that it is spilled into drops, and cannot be gathered. The state of society is one in which the members have suffered amputation from the trunk, and strut about so many walking monsters, — a good finger, a neck, a stomach, an elbow, but never a man.

(An extract from the speech of Ralf Waldo Emerson delivered on 30th August 1837)

Students who intend to learn language cannot enjoy a passage like this. Moreover, they feel they are mentally strained to understand the depth of philosophy in the text. Literature of such quality can be introduced at matured level of students; after they have acquired the complete knowledge of philosophy so that they can derive pleasure from reading such texts; otherwise, they only confirm that literature is something so potential to baffle the readers with its complicated features. The pedagogue also fails to prepare any interesting tasks based on this for the benefit of the students.

## COMMUNICATIVE COMPETENCE

Although for many people language is just the development of communicative skills, it is necessary to admit that literature, in other words a sound and impressive expression of thought, will function admirably in helping students to refine their expressions in day-to-day actions. How this activity is done is in the hands of the instructor. If s/he can use literary text deftly, it will produce multiple benefits and students realize that it is not meant just for classroom discourse but is handy in many ways. Literary text is a fount of hidden language skills and while going through it students will enjoy a departure for activities to promote communication in and outside the classroom. Thus Collie and Slater (1987:10) describe their overall aim in integrating language and literature as 'to let the student derive the benefits of communicative and other activities for language improvement within the context of suitable works of literature. By studying literature, students not only develop an insight into linguistic forms but also acquire the knowledge of cultural values and conventions of different ages embedded in language. According to Stern (1991:330), the link between culture and language seems to be obvious and intimate, and literature is seen as the ideal vehicle for explaining it to learners. Other language-based activities

can also deepen the students' understanding of the literary text. Whiteson (1996), for example, mentions, among other activities, critical or descriptive writing about the text, group discussion, prediction, role-play and dramatization.

## CONCLUSION

Study of literature provides an access to learning of grammar and vocabulary. With its most appealing features, literature is capable of orientating the students towards learning the best and most effective language. Since it is a storehouse of various events and incidents, it creates stimuli in learners to interact with the text and peers to strengthen their communicative competence. It provides authentic exposure to English and bolsters confidence in students that they are able to create untold and unseen texts as it sets itself as a model for ideal learning. It enlightens the readers and promotes introspective thinking which results in their change of characters.

### ABSTRACT

This study aimed at investigating the extent to which Iranian pre-university students undertaking two different activities, predicting from topic and outlining, guess the meaning of unfamiliar words from the reading context. Also, it was an attempt to compare the effect of these two pre-reading activities on the students' ability in guessing unfamiliar words. Among the 70 Iranian pre-university students who volunteered for this study, 49 were selected based on their performance on the Oxford Solution Proficiency Test. They were assigned randomly into two experimental groups: Outline Group and Predict Group. Each group received 8-sessions of treatment. Each session, they were required to read a text from the students' textbook including some unknown lexical items which were bolded and numbered in order to be guessed by the participants. The results highlighted the low rate of guessing accuracy by the students in both groups. Furthermore, the findings revealed that there is not statistically significant difference between the two experimental groups in terms of ability in guessing unfamiliar words from the reading context.

**KEYWORDS:** Guessing word meaning, pre-reading activity

### INTRODUCTION AND LITERATURE

Guessing word meaning or lexical guessing is to make "informed guesses as to the meaning of a word in light of all available linguistic cues in combinations with the learner's general knowledge of the world, her awareness of context and her relevant linguistic knowledge" (Haastrup, 1991, p. 40, as cited in Soria, 2001). Guessing the meaning of unfamiliar words in a target material extends knowledge of vocabulary (Shokouhi & Askari, 2010; Hamada & Park, 2011) and to guess correctly, readers must be familiar with 95-98% of tokens in a reading text (Nation & Meara, 2002). Liu and Nation (1985) take the view that deriving the meaning of unknown words from context is a good strategy for handling words of low frequency in a passage. For them, the

teacher should not allocate a substantial amount of time to teach these words, as they do not occur frequently, so the best way to deal with them is to encourage learners to make use of the available clues in the context in order to decipher their meanings.

Conversely, Swan (2008) does not consider word-meaning guessing from context as a strategy for learning vocabulary, but a compensatory strategy. According to Clark and Nation (1980), the skill of guessing meaning from context enables the learners to save time and to read without interruption and dictionary use. For them, developing this skill results in developing the reading skill.

Research indicates that a larger amount of background knowledge results in long-term retention (Kintsch, 1998; Ellis, 2001; Robinson, 2003). Prior knowledge of the topic is important for reading that activates background knowledge and helps with guessing the meanings of unknown words (Soria, 2001; Tumolo, 2007). Pulido (2008) also argues that familiarity with the topic leads to more accuracy of word meaning inferences. He further compares the topic which is more familiar to less familiar one, that appropriate background knowledge causes students pay more attention to what they are reading. As far as Rivers (1981) is concerned, knowledge of text topic and context is a prerequisite for reading practice. He points out that familiarity with semantic area assists learners in guessing the meaning of unfamiliar lexical items.

Several studies have been carried out that investigated the relationship between pre-reading activities and lexical guessing. Exploring the impact of discussions prior to reading on lexical inferencing ability and English language proficiency, Samadi (2012) studied the Iranian university freshman students taking their general English course. The findings of her study revealed that discussions prior to reading lead to relative development in learners' word-meaning inferencing and general language proficiency.

Studying on high school junior students, Rouhi and Asghari (2011) investigated whether familiarity with a text topic has effect on word guessing from the text and the text comprehension, whether employing pre-reading activities, pre-questioning and previewing, improve word guessing and getting meaning from a text of familiar topic, and whether employing pre-reading activities, pre-questioning and previewing, improve word guessing and getting meaning from a text of unfamiliar topic. They assigned the students into four groups: the first group with a familiar topic and without pre-reading activities (G1), the second group with a familiar topic and with pre-reading activities (G2), the third group without a familiar topic and with pre-reading activities (G3), the forth group without a familiar topic and without pre-reading activities (G4). The findings showed that G1 and G2 outperformed G3 and G4, that is, the performance of groups with a familiar topic was better than the groups with an unfamiliar one whether with pre-reading activities or without those. Put it simply, the implementation of pre-questioning and previewing does not promote guessing word meaning and reading comprehension. Therefore, they concluded that the important factor which has a role in lexical inferencing and understanding a reading text is topic familiarity, not provision of pre-questioning and previewing.

Studying the Farsi-speaking EFL learners and native speakers of English, Paribakht and Wesche (2006) compared lexical guessing in L1 and L2. The findings revealed that L1 English readers, who were at high intermediate and advanced level, guessed 89.3 percent of unfamiliar words in the text correctly and L1 Farsi readers guessed 79.0 percent of unfamiliar words in the text

written in Farsi correctly and only 11 percent of those words in the text written in English, while these L1 Farsi readers guessed meanings for 79.0 percent of English lexical items.

As far as the research concerning the effect of pre-reading activities on word guessing is thin, more research is needed to clarify suitable pre-reading activities which improve inference accuracy. Consequently, the primary objective of this study was to investigate the extent to which the Iranian pre-university students undertaking two different activities, predicting from topic and outlining, guess the meaning of unfamiliar words from the reading context. Also, it was an attempt to explore whether there is statistically significant difference between these two groups in ability in guessing unfamiliar words.

Based on the above-mentioned literature, this study addressed the following research questions:

1. To what extent do the Iranian pre-university students undertaking two different pre-reading activities, predicting from topic and outlining, guess the meaning of unfamiliar words from the reading context?
2. Is there any significant difference between the effects of the two activities on the Iranian pre-university students' ability in guessing unfamiliar words from the reading context?

## **METHODOLOGY**

### ***Participants***

70 pre-university female students with an average age of 17 volunteered for the study. Out of the initial 70 students, only 49 students selected based on their level of proficiency, namely elementary, were randomly classified into two experimental groups for the study.

### ***Instruments and materials***

The following instruments and materials were used in the study:

#### ***English placement test***

A standard proficiency test, namely Oxford Solution Proficiency Test by Linda Edwards (Oxford University Press 2007), was administered to volunteers of the study to select homogeneous subjects for this study. The test consisted of 50 multiple choice questions which assess students' knowledge of key grammar and vocabulary from elementary to intermediate levels. It also includes a reading text with 10 graded comprehension questions. Finally, there was a writing task that assesses students' ability to produce the language.

#### ***Test of novelty***

Since the unknown words were needed for the study, a search was made for those words which the participants did not know. Hence, a checklist of 130 lexical items was designed and copies of it were distributed among the students. They were supposed to write the mother tongue equivalent for the words they knew. The unknown words were recognized as being 129 on the part of students.

### *Reading texts*

The readings were from the students' textbook, i.e. *Learning to Read: English for Pre-University*. The texts covered a variety of topics such as speech, exercise, earthquakes, space, and IT. The book consisted of eight lessons, each with a reading text, that is, eight texts were used for this study.

### *The guessing test*

In each of the reading texts mentioned in the previous section, 9-15 unknown lexical items were bolded and numbered in order to be guessed by the participants.

### *Procedures*

Prior to the main study, a pilot study was conducted to indicate the time which had to be allocated for the sessions and also to find out about the possible problems that might occur during the study.

To determine the subjects' level of proficiency at the beginning of study and to ensure the homogeneity of the participants of the study, a standardized language proficiency test was administered to the total of volunteers. 49 selected students were randomly classified into two experimental groups for the study.

The whole experiment lasted more than three weeks, 10 sessions. Each session, the students in Group A (Outline Group) were given a handout of the outline of the assigned text and were asked to read it carefully. They were given 3 minutes to read the outline and make sense of it. After reading the outline, the students had to read the reading passage individually to guess the meanings of the selected bold and numbered unknown words.

Before approaching the reading passages, the students in Group B (Predict Group) were given the topic of assigned text (written on the board). They were asked to predict the content of the text, that is, what they may encounter in the text and write it in their first language on a piece of paper. The reason was that the students were not able to write in English. Similar to the first group they were given 3 minutes to complete the pre-reading activity. After writing their prediction, first, the students in this group were asked to read the whole text, then to guess the meanings of unknown lexical items.

### *Data Analysis*

To answer the first research question, the correct answers and the total guesses of the two groups were counted and their percentages were calculated. To answer the second question, data was analyzed running descriptive and inferential statistics. Descriptive statistics included the means, standard deviations, and standard error mean obtained from the scores of participants in both experimental groups for their correct guesses on eight lexical guessing tests from eight reading texts. Furthermore, a t-test tested the null hypothesis at .05 levels of significance in order to investigate if there was any significant difference between the scores of the two experimental groups.

## **RESULTS**

Tables 1 and 2 below show the findings regarding guessing attempts of the subjects and their guessing accuracy. As displayed in Table 1, even though the students in Outline Group guessed

the meanings of almost 62 percent of the unknown words, only 16 percent of their guesses were correct. Also, it shows that although students in the Predict Group guessed the meanings of almost 63 percent of the new words, only 18 percent of their guesses were correct. Based on these results, it could be concluded that there was low rate of correct guessing by the students in both groups.

*Table 1: Percentage of total and correct guessing by the two groups*

Group	Total guessing	Correct guessing
Outline Group	62.68	16.49
Predict Group	63.82	18.09

As Table 2 shows, the mean score for the two groups was almost the same, that is, Outline Group had a mean score of 1.77 and Predict Group a mean score of 1.94.

*Table 2: Descriptive statistics for two groups guessing gain*

Group	N	Mean	Std. Deviation	Std. Error Mean
Outline Group	22	1.7727	.49346	.10521
Predict Group	27	1.9444	.65260	.12559

Prior to the independent *t*-test to answer the second research question, a normality test was run to compare the mean scores of the two groups on the guessing tests in order to probe the difference between the effects of the two pre-reading activities. The results are displayed in Table 3 below.

*Table 3: The normality test*

	N	Skewedness	Kurtosis	K-S	Sig. (2-tailed)
Outline Group	22	0.219	-0.203	0.095	0.15
Predict Group	27	0.378	-0.979	0.159	0.077

As displayed in Table 3, since P-values of the two groups are greater than .01, the data did not show any marked deviations from normal distribution and enjoyed normal distribution; therefore the independent t-test was administered. Results are displayed in Table 4 below.

Table 4: Results of independent-samples t-test

	Levene's Test for Equality of Variances		t-test for Equality of Means						
	F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
								Lower	Upper
Equal variances assumed	.523	.473	-.418	47	.678	-.30303	.72453	-1.76060	1.15454
Equal variances not assumed			-.410	40.863	.684	-.30303	.73842	-1.79445	1.18839

As shown in Table 4, the assumption of homogeneity of variances was met (*Levene's*  $F = .52$ ,  $P = .47 > .05$ ). The results of the independent t-test ( $t(47) = -1.019$ ,  $P > .05$ ) indicated that there was not any significant difference between the two groups' mean scores on the guessing tests. Put it simply, although the overall guessing grade of students in Predict Group was higher than Outline Group, this difference was not significant. That is to say, the null hypothesis was confirmed at .05 level of significance.

## DISCUSSION, CONCLUSION, AND SUGGESTIONS

This study aimed at investigating the extent to which the EFL students undertaking two different activities guess the meaning of unfamiliar words from the reading context. Also, it was an attempt to explore whether there is statistically significant difference between predicting from the two activities in ability in guessing unfamiliar words from the reading context.

Analysis of the results concerning the first research question highlighted the low rate of guessing accuracy by the students in both groups. This is in line with Paribakht and Wesche's (2006) study who found that Farsi speakers could guess correctly the meanings of only 11 percent of unknown words in the text written in English, while they guessed the meanings of 79 percent of the target words. However, their study shows lower level of correct guessing probably because of lack of pre-reading activities. Paribakht and Wesche's justification for low success rate of L2 inferencing is "insufficient L2 proficiency, lack of relevant content schemata, and less effective L2 inferencing procedures" (p.127). The reason for low rate of correct guessing in the current study is probably due to the reason. That is, the students' low level of proficiency. Furthermore, some previous studies (i.e., Alavi & Kaivanpanah, 2009; Shen & Wu, 2009; Tavakoli & Hayati, 2011; Riazi & Babaei, 2008) indicate that the level of language proficiency plays a significant role in lexical inferencing.

The participants of the current study did not have sufficient vocabulary and grammar knowledge necessary to understand the text around the unknown lexical items so that they could not decipher their meaning. This was clear from the fact that they appealed to the teacher or considered other students for help. This result confirmed Ranjbar's subjects' performance who (2012) proved that grammatical knowledge plays a significant role in word-meaning guessing.

During reading the texts, there were a large number of words, in addition to the unknown words, which were translated by the students, that is, the Farsi equivalent of those words had been written above or beneath them. This could be an indication of the students' attempt in order to get as close as possible to the meaning of the unknown words. These cases were observed by Soria (2001) as well who studied the advanced and intermediate learners.

For a number of the new words, some of the participants initially guessed the meanings, but they crossed them out. It is probably because of their low degree of risk-taking. As Istifçi (2009) found that intermediate level learners possessed higher inference accuracy in comparison to low-intermediate level learners probably because of learner's level of language proficiency or the extent to which they tend to take risks.

Analysis of the results concerning the second research question revealed that the two experimental groups performed the same on guessing tests. The findings suggest that there is not statistically significant difference between predicting from topic and outlining in ability to guess unfamiliar words on the part of Iranian pre-university students. Therefore, it can safely be concluded that the effect of outlining and predicting from topic on word-meaning inferencing is either the same or they do not have any significant effect at all. Although, based on the literature on pre-reading activities, which indicates that reading comprehension of students increase with introducing these activities, the first conclusion seems to be more acceptable. It should be mentioned that there was no control group in the study to compare its results with the results of the two experimental groups. This point is admitted as one of the limitations of the study that can be subject of further studies. Besides, this study was concerned with predicting from topic and outlining, the same research can be carried out to investigate the effect of other pre-reading activities in guessing ability of EFL learners. Also, another study can be conducted with both sexes to examine whether different results will be obtained. Besides, the same research can be conducted at different language proficiency levels or with participants in other age ranges.

This research faced a number of limitations which have to be taken into consideration while attempting to generalize its findings. One limitation is that the participants in the study were only female students. Furthermore, the sample size was low. If the sample size was larger, the researcher could also have had another group as control group in the study to compare its results with the results of the two experimental groups. Besides, students were at elementary level of language proficiency and at the specific range of age.

## IMPLICATIONS

The results of this research study provide information to language teachers about the implement of both outlining the text by the teacher and predicting from the text topic on the parts of the EFL learners. It may give teachers the insight that incorporating these activities into the classes may not help elementary students much to decipher the meaning of unfamiliar lexical items. On the other hand, lexical inferencing may not be so useful strategy for learners at this level. If the teachers want to apply lexical inferencing strategy, they should make students aware of the importance of lexical inferencing in both L2 reading comprehension and vocabulary learning. Teachers should teach students effective L2 inferencing procedures to infer correct word meaning, especially checking their guesses to be sure that they are correct. Also, teachers should be sure that students' word knowledge is at established level for most of the words in an assigned text to guess word meaning correctly. Besides, teachers should make them aware of different sources of information which they may have to assist them to derive word meaning.

Second, syllabus designers and material developers can also benefit from the results of this study. They should not include material and syllabus lexical inferencing for the students at elementary level. Again if syllabus designers and material developers do so, they should include material and syllabus information about the importance of lexical inferencing in both L2 reading comprehension and vocabulary learning. Also, they should include material and syllabus effective L2 inferencing procedures to infer correct word meaning.

## ABSTRACT

The present study was conducted to compare the effect of Cooperating with peers as indirect vocabulary learning strategy on reading comprehension skill. To fulfill the purpose of the study, a language proficiency test was administrated to one hundred male and female university students who studied in a course other than English as their major in Omidiyeh Islamic Azad University, Khuzestan, Iran. Ultimately, sixty intermediate students were selected and assigned into two experimental (A) and control (B) group. The first group was taught vocabulary through Cooperating with peers as indirect vocabulary learning strategy for developing their vocabulary storage in reading comprehension and group (B) was assigned as control group. After ten sessions of treatment, the two groups were given a post-test of an achievement vocabulary test. Data analysis was conducted through t-test statistics. It demonstrated that the experimental group (A) who utilized Cooperating with peers vocabulary learning strategy outperformed the control group (B) who was the control group in terms of the mean and standard deviation gained in the post- test ( $p < .05$ ). *t*- Test analysis revealed that there was a significant difference between the two groups learning vocabulary at intermediate level. In other words, Cooperating with peers strategy at intermediate level can lead to higher achievement of vocabulary storage in reading comprehension of intermediate level of Iranian EFL undergraduate students.

**KEYWORDS:** Vocabulary Learning Strategy, Indirect vocabulary learning Strategies, Reading Comprehension, Cooperating with peers strategy

Vocabulary learning is an essential element in language learning that affects all portions of learners' academic life, and also having good command on vocabulary has a direct relationship with comprehension, the more our vocabulary knowledge increase the more our comprehension will be, also students who have problem with vocabulary acquisition are placed under an additional burden, especially, when required to read texts that are filled with technical words (Flynt & Brozo, 2008). Unfortunately, many students have a lower retention rate for vocabulary words, and need specific strategies to help them increase their overall vocabulary (Flynt & Brozo, 2008).

Vocabulary learning strategy is a subcategory of language learning strategies (which in turn are a subcategory of learning strategies in general). (Oxford, 1990: 8), vocabulary learning strategy organizes knowledge about what learners do to find out the meaning of new words, retain them in their memory for a long time, recall them when needed in comprehension, and also apply them in language production (Catalan 2003, cited in: Ruutemets, 2005).

Language learning strategies have received specific attention in the researches that were done by Chamot (1987), Cohen (1998), Oxford (1990), and Schmitt (1997). According to Schmitt (1997), vocabulary learning strategies are even the focal of observation in second language learning and teaching with the increasing nature of vocabulary acquisition and its emphasis on large exposure to the language. Language learning strategy application is the focus of attention in second or foreign language acquisition. Research on language teaching and learning strategy use has revealed that learners, on the one hand, tend to employ learning strategies in vocabulary learning more than in any other skills of language learning activities and, on the other hand, general language learning strategies may be used in vocabulary learning (O'Malley et al., 1985). According to Jo Moir and Paul Nation (2008), in the previous days it was widely assumed that vocabulary teaching is not important matter as it can happen by itself; thus, the teaching of vocabulary was not favorite (Nation, 1990). Stern (1975) and Rubin (1975) were probably among the first researchers who brought up the idea of successful language learners. The idea can probably help us with both understanding more about the nature of language learning and also to facilitate the language learning process for others. With regard to this, most of the research in the area of language learning strategies has focused on the identification, description, and classification of useful vocabulary learning strategies.

Vocabulary learning strategy is a very effective in language proficiency development because it constitutes the basis for learners' ability in other skills, such as speaking, reading, listening and writing. Griffiths (2006) points out that recently the importance of teaching vocabulary has been acknowledged. The result and effect of the correct use of vocabulary learning and teaching strategies is vocabulary retention and following of that vocabulary knowledge, which is a key element in language learning since 'words are the building blocks of language and without them there is no language' (Milton, 2009:3).

Cohen (1998, p. 1) states that strategies can be very different in nature, ranging from planning the organization of one's learning (a metacognitive learning strategy) through using mnemonic

devices to learn vocabulary (cognitive learning strategy) and rehearsing what one expects to say (a performance strategy) to bolstering one's self-confidence for a language task by means of "self-talk" (an effective strategy).

Strategies help language learners retrieve and store material, and facilitate their learning by structuring its environment (Gardner & MacIntyre, 1992, p. 219). Not only do LLSs facilitate learning but also accelerate it. Strategy use correlates with students' language proficiency (Oxford, 2001, p. 170) and self-confidence (Chamot, 1994, p. 331). Concerning language learning strategies (LLSs) designed to encourage students to relate sentences to things they already know, Willingham (2006, pp. 42-43) adds that by prior knowledge, students are encouraged to apply what they know from their own lives to the text, or to consider the theme of the text before reading it, and by vocabulary comprehension relationship Willingham (2006) states that students are encouraged to use background knowledge to make educated guesses about the meaning of unfamiliar words.

In terms of Hedge (2000), such strategies can be either cognitive (i.e., direct mental operations to understand and store new words) or meta-cognitive (i.e., indirect strategies that facilitate the conscious efforts to remember new words). Some researchers have revealed that indirect strategy instruction is more effective in developing vocabulary learning storage (Saragi, Nation, & Meister, 1978; Jenkins, Stein & Wysoki, 1984).

The present study is an attempt to shed more light on the role of Cooperating with peers as an indirect vocabulary learning strategy to *examine the impact of this strategy on the Iranian learners' reading comprehension at intermediate level*. Cooperating with peers as an indirect Vocabulary learning strategy is the main variable of the present study and also is considered one of the vocabulary learning strategies. Exploration of this strategy has helped learners use processes to improve their skills in a foreign language.

## LITERATURE REVIEW

As far as the review of literature is concerned, there are very few studies which have focused on the effect of indirect vocabulary learning strategy generally and Cooperating with peers specifically in a second or foreign language and reading comprehension ability in that language. So, the following sections concerning the subject of the study, first vocabulary learning strategy, indirect vocabulary learning strategy in reading comprehension have been reviewed briefly, followed by an overview of the some experimental studies of indirect vocabulary learning strategies in English linguistic literature. These are the main areas of research directly relevant to this study.

### *Vocabulary learning strategy*

According to Oxford (1990), language learning strategies are particular activities adopted by learners to make learning easier, faster, more enjoyable, more self-directed, more effective, and more transferable to new situations. Utilization of learning strategies is very important in vocabulary learning and depends on learners' attempts to a large extent. According to Nation (2001), vocabulary learning strategies make learners be able to take more responsibility for their own learning. He believes that a large amount of vocabulary can be acquired by using vocabulary learning strategies. Nation (2001) proposes that a large number of vocabulary learning strategies are helpful at all steps of vocabulary learning and can be used to an extensive range of

vocabulary. He points to the fact that language learners by the help of these strategies can control their own learning without the presence of a teacher. In addition, Nation, in his research, reveals that learners are very different in the proficiency that they apply strategies with. Thus, language learners should be instructed in use of vocabulary learning strategies.

### ***Indirect vocabulary Learning Strategy***

Indirect vocabulary learning is defined as a technique of vocabulary learning which occurs without the specific intent to focus on vocabulary. Several studies have been shown the effectiveness of this way of learning word meanings from context (Jenkins, Stein & Wysocki, 1984; Nagy, Herman & Anderson, 1985). Several researchers (Fraik & Tulving 1975, Schmidt 1990) have suggested that the way in which learners' process material influences incidental learning. They stress the importance of 'noticing', or attending, in second language learning and maintain that incidental learning can result from task demands which cause learners to focus attention on specific features of input which are crucial for learning.

### ***Some related experimental works***

Hunt and Beglar (1998) point out that great amount of vocabularies are acquired incidentally through extensive reading and listening. Consequently, motivating students to read and listen extensively can prepare them with great chances to be familiar with new vocabularies. In terms of Huckin and Coady (1999), too, except for the first few thousand most common words, vocabulary learning generally occurs through extensive reading with the learner guessing the meaning of unknown words. This process is indirect learning of vocabulary for the learning of new words and is the byproduct of the reading. However, this process of incidental learning of vocabularies occurs gradually as Anderson (1985; cited in Richards and Renandya, 2002) claims. The indirect vocabulary learning strategy, as Hunt and Beglar (1998) point out; can be a very effective approach for all language learners at all levels.

Shmidt (1990; cited in Nyiazadeh, 2009) also states that indirect learning is surely passive in that it can occur when the focus of attention is on some relevant emphasize of input. However, he believes that since indirect learning is useful in task-based language, pedagogy is still a fruitful area of investigation. He further notes that there is an argument that maintains what is learned—whether indirect or direct—is what is noticed.

Ellis and He (1999) explored the roles of modified input and output in the indirect acquisition of word meaning. Their study proved that interactional output which provides opportunities for learners to use new vocabularies strengthen to better indirect vocabulary learning.

Paribakht and Wesche (1999) also conducted research studying the relationship between reading and indirect L2 vocabulary learning. Their study established indirect acquisition of new lexical knowledge through reading of thematically related texts; hence, vocabulary knowledge may be acquired as a by-product of reading comprehension. In addition, their study displayed that among learners' strategies, inferencing, was the main vocabulary strategy use employed.

Cusen (2005) in his exploratory study used diary to identify and classify vocabulary learning strategies of Romanian English major and minor undergraduates at university of Brasov. He used

Oxford learning strategies classification as the analytical framework of his study. He found that advanced learners with a professional interest in the study of English seem to use almost all the types of strategies from Oxford analytical framework. The learners appeared to use other strategies relatable to the context of his study and/or to each individual.

However, the above mentioned studies did not depict specific the Cooperating with peers as an indirect vocabulary learning strategy in developing vocabulary in reading comprehension. So with the gap existing in the literature, the present study is aimed at identifying the role of Cooperating with peers as an indirect vocabulary learning strategy in reading comprehension among intermediate Iranian undergraduate EFL learners. The rationale underpinning the selecting of the subjects at the intermediate level for the study is that the researcher has wished to focus scrupulously on this level and investigate the role of indirect vocabulary learning strategy on the development of vocabulary in reading comprehension of Iranian learners.

## PURPOSE OF THE STUDY

Most of the latest studies are focused on general language learning strategies. Little attention has been given to vocabulary learning strategies and specially indirect vocabulary learning strategy and reading comprehension. *According to Davies and Pearse (2000), Harley and Hart (2000) and Nation (2003)*, words are the tools we use to access our background knowledge, express ideas, and learn about new concepts. Learners' lexical knowledge is linked strongly to academic success. Vocabulary size was shown to be the best predictor of reading comprehension in L1 and L2 (Coady, 1997).

Therefore, this study was conducted to see the possible effects of Cooperative with peers as an *indirect vocabulary learning strategy on* reading comprehension of Iranian university students in an EFL setting. In Iran, to the best of the researcher's knowledge, very little studies have been conducted investigating the use of indirect vocabulary learning strategy (VLS) and no study found to conduct about Cooperating with peers directly by Iranian EFL learners.

So, teachers can have a clear view to integrate strategy training into the classroom instructional plan to make learners aware of impact of indirect vocabulary learning strategy that they may use unconsciously in order to learn vocabulary items effectively. Exploration of this strategy has helped learners use processes to improve their skills in a foreign language. Furthermore, utilization of vocabulary learning strategies has been found to affect students' performance in language learning (Sarani & Kafipour, 2008).

## RESEARCH QUESTION

The main question to be examined in this study is as follows:

Do Cooperating with peers vocabulary learning strategy has any significant effect on the development of vocabulary knowledge of the Iranian undergraduate intermediate students?

### ***Participants***

The researcher selected 100 English as Foreign Language (EFL) university students from Islamic Azad University of Omidyeh in Khuzestan in Iran studying non-English majors in the course of general English (mostly in the second and third semester) based on non-random judgment sampling. They participated in a homogeneity test adapted from Objective Placement Test (Lesley, Hanson & Zukowski- Faust, 2005) as a homogeneity test and finally sixty students whose scores were one standard deviation above and one standard deviation below the mean ( $M=30$ ) were selected. Then they were randomly divided into two groups; group A (18 female and 12 male) as an experimental group received Cooperating with peers as an indirect vocabulary learning strategy while group B (8 female and 22 male) considered as a control group. The age of the participants generally ranged from 19 to 25. Seemingly, they were originally from different regions of the country.

### ***Instruments***

Initially, the subjects in two groups took the Objective Placement Test of Interchange (Lesley, Hanson & Zukowski- Faust, 2005), which used as a standardized measurement to check the homogeneity level of the subjects in terms of language proficiency. The test contained 40 multiple-choice of vocabulary items. In order to verify the reliability of the pre-test and post-test, the researchers selected 40 students from different departments in Omidyeh Islamic Azad University to participate in the pilot study in two phases, one for the pre-test and the other one for post-test. That is, 20 students for pre-test and 20 for post-test. Calculating the reliability coefficient of the test through KR-21 formula, the researcher found the reliability of the homogeneity test at ( $r=.78$ ).

A post- test including also 40 items was administered to both groups at the end of treatment period after ten sessions. It takes eight lessons and was designed as a summative test. This test indicated 40 multiple-choice items of vocabulary achievement test which was developed by the researcher based on the materials taught in the classrooms. The vocabulary items in the test selected mainly from the new lexical items of reading comprehension texts. The reliability of the post- test was ( $r=.88$ ) based on KR-21 formula.

Another instrument was the reading tasks and activities as the course materials which the researcher afforded to both the experimental and control group. These reading tasks and activities were extracted from the Select Readings (intermediate level) written by Lee and Gunderson (2002).

### ***Procedure***

In this study, 100 Iranian university students who study in a course other than English as their major were selected. To make sure of the homogeneity of the learners, the researcher used an Objective Placement Test as language proficiency test (Lesley, Hanson & Zukowski- Faust, 2005). Having obtained the scores and the average mean ( $M = 30$ ) of the scores calculated. Sixty learners whose scores were around the mean were selected. Therefore the thirty homogeneous intermediate students were selected to utilize Cooperating with peers strategy for developing their

vocabulary storage in reading comprehension and other thirty students in group B were assigned as a control group with no strategy use in teaching and the treatment in this class was as usual as before, the teacher read the text one time and gives the students equivalent or synonym of new words. In this study, the treatment period lasted for ten sessions. On the first session, the students in A Group received introduction on Cooperative with peers vocabulary learning strategy. The procedure was implied by the corresponding researcher (teacher) for both classes. The next section will introduce the treatment period of Cooperating with peers strategy.

### *Cooperating with peers*

As Oxford (1990) mentioned, this strategy involves a concerted effort to work together with other learners on an activity with a common goal. Reading activity, simulations, and other active exercises challenged students to develop their ability to cooperate with peers while using vocabulary learning strategy. Reading, through usually is considered an independent activity, was a cooperative enterprise as well. For example, one student works with his/her group on English-language on reading activity. Each group member had part of the story to read, and together they figured out the entire story through a process of negotiating, requesting, and cooperating (Oxford, 1990).

Therefore, indirect vocabulary learning strategy instruction can be looked at as a process of learner empowerment which raises learner's vocabulary of the more effective strategies for learning the language and by enabling them to employ the strategies in learning vocabularies.

### *Data Collection*

After the treatment, to find out the effectiveness of *Cooperating with peers vocabulary learning strategy on reading comprehension* of experimental group and compare the improvement in two groups, both groups took part in a post-test of the vocabulary and reading comprehension test after completing the course.

The researchers dealt with comparing vocabulary learning strategy regarding, a parametric technique for analyzing the descriptive data. In this way, the study investigated the role of the Cooperative with peers vocabulary learning strategy through independent samples *t*-test analysis, in order to find out, whether these strategy influence students' vocabulary knowledge of Iranian EFL university students at the intermediate level of English reading proficiency or not.

To begin with, an independent sample *t*-test analysis was run on the mean score of the two groups. The results of *t*-test analysis for the effect of this strategy in reading comprehension as an independent variable statistically indicated mean differences are shown in Table 4.1. The data obtained through post-test (Table 1) were analyzed (using SPSS 11.5 software) in different steps.

**Table 1:** Result of the *t*-test (post-test of both groups)

	N	Range	Minimum	Maximum	Mean	Std. Deviation
Experimental G	30	10.00	34.00	40.00	38.5667	1.97717
Control G	30	14.00	29.00	39.00	33.7333	3.26880

The results of the post-test in the two groups were compared using independent samples *t*-test statistical procedure, whose result showed that the mean scores of the experimental group ( $M = 38.56$ ,  $SD = 1.97$ ) was significantly different from the control group ( $M = 33.73$ ,  $SD = 3.26$ ). Also the minimum and maximum scores in experimental group are 34 and 40 while in control

group the minimum and maximum scores are 29 and 39. In other words, the experimental group outperformed the control group on the post-test.

Also, critical  $t$  ( $t= 2.000$ ) was less than observed  $t$  ( $t= 5.45$ ) based on  $df = 48$ . In this case, there was a significant difference between experimental and control group in developing learning vocabulary at intermediate level. In other words, Cooperating with peers strategy was effective in improvement of vocabulary of Iranian EFL learners at intermediate level.

## **RESULT AND DISCUSSION**

The major concern of the present study was to explore the effectiveness of Cooperative with peers on reading comprehension of the EFL students. The results of  $t$ -tests indicated statistically significant difference between the experimental group (A) and control group (B) in reading comprehension achievement post-test. It indicated that the Cooperating with peers is effective in improving EFL vocabulary storage on reading comprehension achievement of university students at the intermediate level of English. This result can be more approved and confirmed by this evidence that there was a significant difference between experimental group (A) who received this indirect strategy and control group (B). Moreover, the mean of experimental group was higher than control group based on the post-test scores.

Although it is generally believed that most words are learned from context and it is a very useful and productive way to learn words, the usefulness of this method of vocabulary learning for all learners at different levels of proficiency is open to question. Waring (1995, p. 2), for instance, argues that, "Beginners need a basic vocabulary before they can even start to learn from context as they have insufficient knowledge and the text is too dense with unknown and partly known words." In fact, they do not also possess enough knowledge of grammar and consequently cannot make use of grammatical contextual clues to guess meaning from the context. He finally recommends that guessing from context be left to a later stage when the learner has enough knowledge base from which to work. However, not all contexts are intrinsically reader friendly.

## **CONCLUSION AND IMPLICATIONS**

This study has been carried out upon the hypothesis that teaching indirect vocabulary learning strategy is comparatively more effective than traditional teaching of vocabulary by providing only the dictionary definitions or list of words and memorizing the words. The instruction lasted for ten weeks. In the course of this time, the researcher (teacher) employed the mentioned strategy and instructed the participants how to use this strategy in their reading comprehension. At the end of the students were administered the reading comprehension post- test and the results of the tests were compared to find the effect of training.

The results indicate that generally there is a great difference between the experimental and the control group performance of the subjects in the learners who were instructed using Cooperating with peers strategy. So presenting the target vocabulary items in context and using indirect

vocabulary learning strategies like the selected strategy make a remarkable difference in terms of overall performance for a particular group of student like intermediate level of students.

The findings of this study indicated that this kind of indirect vocabulary learning strategy had a positive impact on reading comprehension of EFL students because according to the results we got the researcher can claim that, Cooperating with peers vocabulary learning strategy had an impact on students of this study and is an effective strategy. Indirect vocabulary learning strategy is the strategies that suggested for learning vocabulary at a particular level of language proficiency such as intermediate level.

Concerning the implications related to curriculum developers and material producers it can be stated that they should definitely work in cooperation with both teachers and students. Together with teachers, they should decide what learning strategies they need to identify. It should be the curriculum developers' responsibility to allocate enough time in the curriculum for teachers to conduct strategies research in their classes.

With respect to material producers, they should produce materials that teachers will use throughout their class research. That is, the materials they produce should be congruent with students' learning strategies and they should be appealing to students' needs and interests. This process requires continuous evaluation of every single stage or material used. For this reason, curriculum developers and material producers should collect feedback from teachers and students in order to identify the weaknesses and strengths of their products. This will enable them not only to produce better materials but also to develop them. All in all, curriculum developers and material producers should work cooperatively with teachers and students so that they can design a better program, appropriate materials and tasks that will promote a more efficient and a more effective language learning atmosphere. According to the findings of this study, it is suggested that material designers may develop teaching materials based on strategy-instruction especially on indirect strategies.

At the end, the point should be highlighted that the present study had some limitations. This study was just limited to intermediate EFL learner's context. Other contexts like ESL context with different levels of students also should be considered in futures studies. In other hand, the ten-session time frame of this study is too short to provide anything more than an indication of possible direction of the Cooperative with peers vocabulary learning strategy and reading comprehension. With regard to language skills and learning strategies, this study was just limited to reading ability and vocabulary learning strategy of EFL learners. Other skills of language learning for future study also recommended.

## APPLYING THEME AND RHEME IN INDONESIAN EFL STUDENTS' WRITING: AN ATTEMPT TO IMPROVE COHESION AND COHERENCE

**Ekaning Krisnawati**

*English Department, Universitas Padjadjaran, Bandung Indonesia*

*Email: ekaning.krisnawati@unpad.ac.id*

### ABSTRACT

The notions of Theme and Rheme have widely been explored in research on linguistics. However, little research has been carried out about Theme and Rheme in relation to the writing class, referring to the Indonesian students. This paper discusses the theoretical framework of Theme and Rheme and the analysis of Theme and Rheme in some texts of the Indonesian university students of the second semester to improve cohesion and coherence. It has been demonstrated that the understanding and the application of these notions have enabled the students to evaluate their own compositions and improve the coherence of their compositions. It is, therefore, important to teach Theme and Rheme in a writing class.

**KEYWORDS:** Theme and Rheme, Indonesian EFL students, cohesion, coherence

### INTRODUCTION

Most learners find it difficult to write a second or foreign language composition. Some of the reasons are lack of grammatical competence and lack of writing skills of arranging clauses or sentences into a good paragraph or essay. Pertinent to writing skills, one of the crucial elements is developing coherent and cohesive compositions. A coherent and cohesive writing requires the mastery of cohesive devices that can combine the ideas developed in the writing into one complete way of thought.

There have been some researches on cohesion. Studies of cohesion often focus on cohesive ties as part of creating textual cohesion (Halliday & Hasan, 1976). However, according to Stotsky (1983) in Wang (2007) cohesive ties themselves are not sufficient to create a coherent text. A study done by Witte and Faigley (1981 in Mellos, 2011) found that students wrote better papers when they developed an ability to use Theme and Rheme more effectively in their writings. Ventola (1992) argues that vital information on cohesion and coherence can be obtained through textlinguistic research. One of the areas in which cohesion and coherence can be developed is through Theme and Rheme. After conducting a research on Theme and Rheme in compositions of ESL students at San Diego University, Mellos (2011) concludes that "the theme-rheme framework provides students with a grammatical resource to make conscious theme and rheme choices that improve the coherence of their texts by making the connections between ideas clear, allowing for topic development, and giving sentences a clear focus." A study carried out by

Belmonte and McCabe-Hidalgo (1997) has proved that the notion of Theme and Rheme can be very useful in evaluating L2 writing.

The purpose of this paper is to apply insights gained from observing patterns of Theme and Rheme relations in students' writing in Indonesia to help improve coherence at the discourse level. This paper begins with an overview of the theoretical framework underlying this approach, in particular discussing the notions of Theme and Rheme, which is drawn from a Systemic Functional Linguistics. The paper also discusses the results of analyzing twenty five compositions of Indonesian EFL University students obtained during a writing class and the implications for teaching writing.

## **WRITING**

Producing a piece of writing requires some skills that involve the structure of the writing and the sentence skills. In the structure of a paragraph, the structure is a topic sentence, supporting sentences, and a concluding sentence, while sentence skills include verb forms, run-on sentences, fragments, word choices, punctuation, and so on (Langan, 1996). It is important for learners to master these skills in writing.

Besides the mastery of the structure of the writing and the sentence skills, learners are demanded to have the ability to produce a cohesive and coherent piece of writing. Coherence refers to the overall connectedness of the ideas in a piece of writing. Cohesion refers more specifically to connections between sentences. A discourse may be said to be cohesive but incoherent. The following example illustrates a cohesive but incoherent writing.

(1) I am a teacher. The teacher was late for class. Class rhymes with grass. The grass is always greener on the other side of the fence. But it wasn't. (Taken from <http://www.onestopenglish.com/support/ask-the-experts/methodology-questions/methodology-coherence-and-cohesion/154867.article>)

The example (1) shows us that some words are repeated: teacher, class, and grass. However, the coherence is missing since each clause stands alone and does not contribute meaning at discourse level.

## **THE CLAUSE AS A MESSAGE: THEME AND RHEME**

All languages contain messages to be delivered, and they are organized in such a way that the speakers of the language understand. With regard to this, the message is the crucial point of communication to be conveyed through language. In English, meaning which is realized in the clause has three distinct functions. They are the Theme functions, the Subject functions, and the Actor functions. The Theme functions are realized in Clause as a Message. It is this element the speaker selects for grounding what the speaker is going to say. The Subject functions are realized in the Clause as an Exchange, which involves a transaction between speaker and listener. The last functions, the Actor, are represented in the Clause as Representation, in which the Actor is the active participant in the process.

adverbs, prepositional phrases, nonfinite clauses, and finite clauses such as what is more, that is to say. Although linking devices are required to join clauses, at the discourse level, the progression of the Theme is crucial too. The thematic progression can reveal the unity or coherence of a discourse. Being a cohesive discourse does not necessarily mean a coherent one. It is, therefore, important to consider the thematic and rhematic progression.

A parallel textual system to Theme and Rheme is the notions of Given and New information. Given is the information that has already been known to those involved in the interaction. New signals the exciting bit of information that has not been mentioned earlier. The unmarked pattern is that Given information is included in the Theme of a clause and New information is somewhere in the Rheme (Butt, *et al.* 2000: 146). The example of the nursery rhyme *The farmer in the dell* illustrates the thematic progression in a narrative discourse.

- (6)     1        The farmer takes a wife  
          2        The wife takes a child  
          3        The child takes a nurse  
          4        The nurse takes a dog

The thematic progression of the nursery rhyme is illustrated in figure1.

Figure 1: Thematic Progression of *The Farmer in the Dell*

The Themes in the nursery rhyme above demonstrate the interrelated Themes and Rhemes in which the Themes are derived from the Rhemes.

## METHODOLOGY

The data of the research are the explanatory compositions written by EFL university students in Bandung, Indonesia, sitting on the second semester taking Essay Writing course. Twenty five students, divided into two groups, were selected based on the scores they obtained on the first holistic evaluation in week 3. The evaluation was comprised of development of ideas, organization, and grammar/structure with equal weighting. Group I consisted of 10 (ten) students scored 60 or lower, and group II were 15 (fifteen) students scored 61 or higher. On the first piece of writing, all students were asked to write an essay on one of the following topics:

1. The most useful invention
2. The best job
3. A parent's greatest responsibilities
4. Good manners
5. The worst movie of all time

The scores the students obtained on the first evaluation serve as the baseline, and during this time the notions of Theme and Rheme were not introduced but they were guided through the process

of writing. In week 4, the notions of Theme and Rheme were introduced. They were taught to apply the notions of Theme and Rheme for the self-assessment of their own compositions and for peer-editing. In week 8, both groups were asked to write an essay on one of the topics:

1. Life lesson from school
2. Cheating
3. Studying in high school and in university
4. School uniform

Since the essays were relatively long, I put my focus on the introductions of the essays. The justification of the limitation is that the introductory paragraph of an essay is crucial in organizing the essay as the thesis statement located in the introduction guides a writer in writing an essay. Through a coherent introductory paragraph, a writer can better her essay.

## RESULTS AND DISCUSSION

In order to denote the contrast of the introductions of the two groups, I analyzed two introductions written by two students. Text (1) was written by a student in group 1, and text (2) by a student in group 2. Both texts (1) and (2) are about the best job.

Text 1 (by AR)

(1) Which job do you want: a job which can give you a lot of money or a job which can be useful for everybody? (2) Most people want a job which can give them a lot of money. (3) That is a character of human (4) and I don't blame someone who thinks about it. (5) But if we always keep that argument, (6) we don't realize (7) we are like beggars (8) because our mindset is what Indonesia has done for you. (9) We have to change our mindset become what you have done for Indonesia. (10) This mindset belongs to someone who works to create our future. (11) It is a teacher. (12) A teacher is the best job in the world (13) because the duty of this job is to create someone to become a leader in every country and make someone good or smart in academic or action to develop every country, especially our country.

In text (1) two Themes are introduced in clause (1): interpersonal and topical. Interpersonal Theme1 (Th1interpersonal) is *which job*; topical Theme 1 (Th1topic) is *you* and the Rheme 1 (Rh1) is *want a job which can give you a lot of money or a job which can be useful for everybody*. Th2 (*most people*) is a new Theme; Rh2 (*want a job which can give them a lot of money*) is derived from Rh1. Th3 (*that*) is from Rh2; Rh3 is a character of human. In clause (4), the textual Theme (Th4text) is *and*, which signals additional information to clause 3; Th4topic is *I* and Rh4 is *don't blame someone who thinks about it*. In clause 5, there are two Themes, textual and topical Themes. The textual Theme (Th5text) is *but if*, which contrasts and conditions the information in the preceding clause in clause (4) and (5). Th5topic (*we*) is a new Theme since agents mentioned in the preceding clauses are *you*, *most people*, and *I*. Rh5 is *always keep that argument* is derived from Rh2. Th6topic (*we*) is the same as Th5 topic; Rh6 is *don't realize*. Th7topic is *we*, which is also the same as Th5topic 5 and 6. Rh7 is *are like beggars*. Th8 text is *because*; Th8topic is *our mindset* and Rh8 is *what Indonesia has done for you*. Th9topic is *we*, which is also the same as Th5, 6, and 7. Rh9 is *we have to change our mindset become what you*

have done for Indonesia. Th10topic (*this mindset*) is derived from Rh9; Rh10 is *belongs to someone who works to create our future*. Th11topic (*it*) to some extent is derived from Rh10. Rh11 is *a teacher*. Th12topic (*a teacher*) is derived from Rh11; Rh12 is *the best job in the world*. Clause (13) comprises Th13text (*because*), which signals reason for Rh12 and Th13topic (the duty of this job). Rh13 is *to create someone to become a leader in every country and make someone good or smart in academic or action to develop every country, especially our country*. The following figure (Figure 2) illustrates the Theme and Rheme progression of text (1).

Figure 2: Theme and Rheme Progression of Text (1)

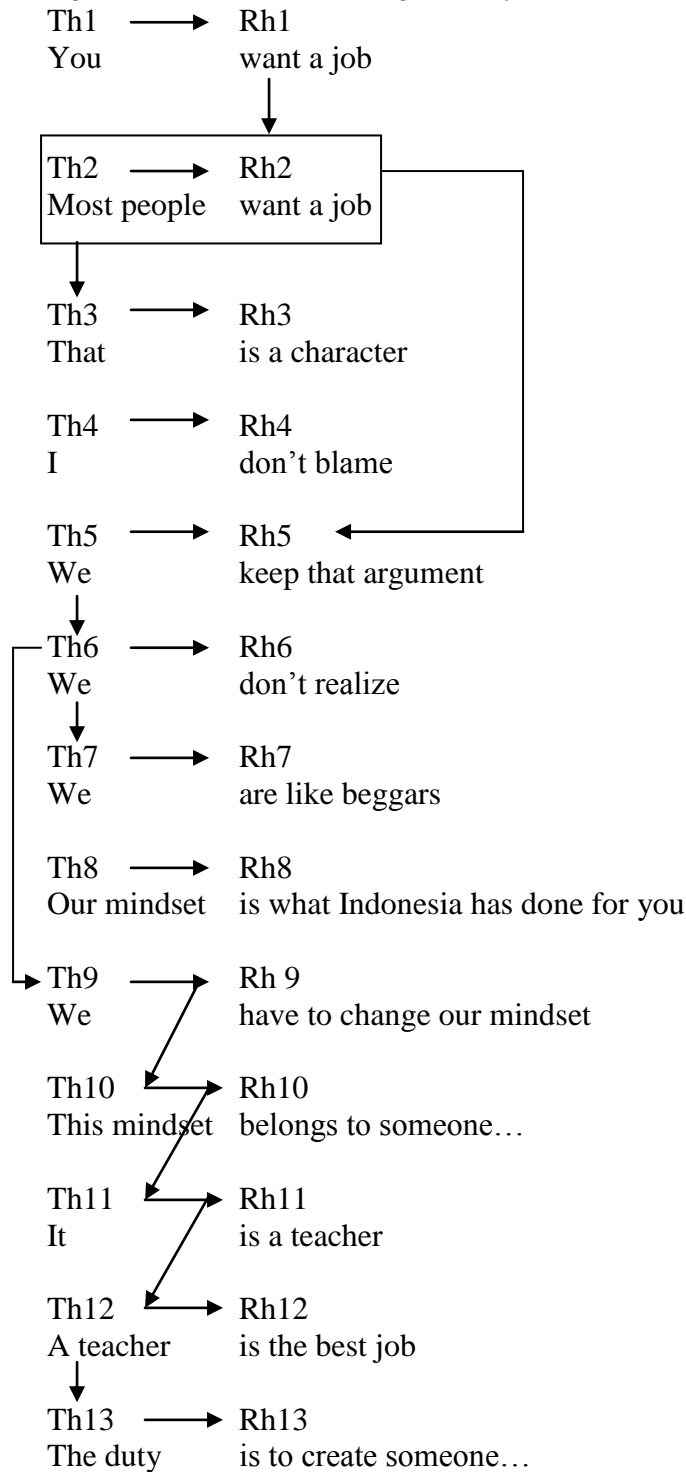

Figure 2 shows us that Th4 and Th5 are not derived from any of the Themes nor the Rhemes. Rhemes (3), (4), (6), (7), (8) are not developed at all. This indicates that the text does not develop the ideas mentioned in preceding clauses. Instead, the student jumped from one idea, a character, to another idea, which tells about a teacher. In terms of cohesion, this text is cohesive as there are repeated words and linking devices.

Text 2 (by AA)

(1) As college students, we should start to think about the future. (2) The future is about (3) what job a college student should take after graduating from college. (4) This problem is what I have started to think recently. (5) The question “What kind of job should I take?” is always stuck in my mind. (6) I finally got enlightened at a time (7) that the best job that would fit and beneficial to you is a job that you like, you master at, and could provide you with the fund to live for the future.

Clause (1) in text (2) comprises two Themes: interpersonal and topical. Th1 interpersonal is *as college students*, and Th1topic is *we*. Rh1 is *should start to think about the future*. Th2topic = (Rh1) is *the future*, and Rh2 is *about*. Th3interpersonal is *what job*; Th3topic is *a college student*, and Rh3 is *should take after graduating from college*. Th4 is the same as Rh3; Rh4 is *what I have started to think recently*. Th5topic (*the question “What kind of job should I take?”*) is derived from Rh3; Rh5 is *always stuck in my mind*. Th6topic (*I*) is a new Theme, but it is clearly one of the constituents mentioned in Rh3 and Rh4. Th6interpersonal is *finally*, and Rh6 is *got enlightened at a time*. In clause (7), Th7text is *that*, and Th7topic is *best job that would fit and beneficial to you*. The Rh7 is *a job that you like, you master at, and could provide you with the fund to live for the future*. The following figure (Figure 3) illustrates the Theme and Rheme progression of Text 2.

Figure 3: Theme and Rheme Progression of Text 2

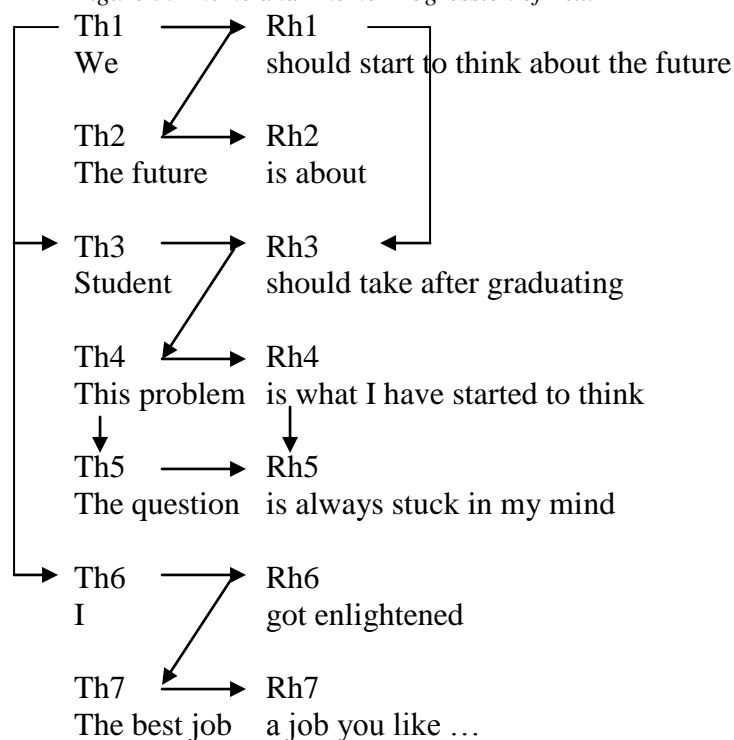

Figure 3 depicts the relationship of the Themes and Rhemes in Text 2. As shown above, the Themes and Rhemes of the text are interrelated. The student referred to preceding Theme and Rheme prior to introducing a new idea. Therefore, text 2 is coherent. Cohesion is seen from repeated words, synonyms, and linking devices.

From the analysis of text (1), it is clear that the relationship of clauses (7) and the subsequent clauses is not clear as the Theme is not derived from any of the Rhemes. Some Rhemes are not further developed and just left hanging without any explanation. Thus, the coherence of the text is not well-built. Text (1) is ended by *A teacher is the best job in the world because the duty of this job is to create someone to become a leader in every country and make someone good or smart in academic or action to develop every country, especially our country*, which does not provide sufficient room for idea development in following paragraphs. On the other hand, the ideas in text (2) are better developed as seen from Theme and Rheme progression. Text (2) is ended by a thesis statement about the criteria of the best job. Text 2, therefore, is more coherent than text (1).

After the application of Theme and Rheme, in week 8, the students were told to write essays on one of the topics (life lesson from school, cheating, studying in high school and university, and school uniform). Each student's introduction was evaluated on the basis of sentence skills and development of ideas. The following text is one sample of the analysis.

Text 3 (by JP)

(1) When I was in elementary school, (2) I think (3) high school was the perfect place to study and improve my skill.(4) It was better than university (5) because my surroundings taught me that university courses were hard to study. (6) But my opinion changed (7) since I was admitted to university. (8) Now, I think (9) that university is the best place to study (10) because I can learn only what I want, improve my soft skills, and be responsible.

Clause (1) of text 3 has two kinds of Themes, namely textual and topical Themes. The student, (JP) thematized textual Theme (Th1text) *when*, and Th1topic is *I*. Rh1 is *was in elementary school*. Th2topic is *I* and Rh1 is *think*. Th3topic is *high school*; Rh3 is *the perfect place to study and improve my skill*. Th4topic is *it* (*high school*=Rh1), and Rh4 is *better than university*. In clause 5, Th5text is *because*, which signals reason of Rh4, and Th5topic is *my surroundings taught me that university courses were hard to study*. In clause (6), the beginning is Th3text *but* to signal contrast with clauses (3) and (4). Th6top (*my opinion*) is the same as Rh3; Rh6 is *changed*. Th7text is *since*, Th7topic is *I*. Rh7 is *was admitted to university*. Th8text (*now*) begins clause (8), which denotes the change in time course referring to clause (1); Th8top is *I* and Rh8 is *think*. Th9topic is *that* and Th9topic is *university*; Rh9 is *the place to study*. Th10topic *because* begins clause (10); Th10topic is *I* and Rh10 is *can learn only what I want, improve my soft skills, and be responsible*. The Theme and Rheme progression indicates that JP developed the ideas well as seen from the Themes derived from Themes or Rhemes of preceding clauses.

Overall result of the students' performance after the application of Theme and Rheme is displayed in Table 1.

Table 1: Student Performance

Group	Number of students	Performance
1	2	Low
	8	Improved
2	9	Stagnant
	6	Improved
Total	25	

From the table, we can see that 8 students in group 1 who were in the low achievers, could improve their performance and produced more cohesive and coherent introductions; 2 students did not get any improvement. Six students belonging to group 2 improved their performance, and the performance of 9 students remained the same.

Significant results were obtained from students of group 1 because 8 out of 10 could improve their writing skills, particularly in coherence. Only 6 students of group 2 improved, while others remained the same. The reasons for this are unrevealed since no interview was undertaken. However, I assume this could be caused by their awareness and understanding of producing coherent and well-developed ideas in their compositions due to their higher level of English proficiency.

## CONCLUSION

This study proves that the notions of Theme and Rheme is useful to guide students in developing ideas; thus, the application of Theme and Rheme can improve coherence in writing. With regard to teaching writing, it is highly recommended that teachers understand the development of ideas through Theme and Rheme. With such analyses I have demonstrated, teachers can diagnose students' weaknesses in writing. Students, on the other hand, will benefit the insight of Theme and Rheme and apply them when drafting and revising their compositions. This will certainly produce more cohesive and coherent compositions. In addition to this, students themselves can self-evaluate the way they develop their ideas in their compositions. Despite the fruitful results of the application of Theme and Rheme on Indonesian EFL students' writing, to obtain more comprehensive accounts on the application of Theme and Rheme, further research on different text-types is required.

## **Authenticity and Sampling in C-Tests: A schema-Based and Statistical Response to Grotjahn's Critique**

**Ebrahim Khodadady**

*Ferdowsi University of Mashhad*

### **ABSTRACT**

The paper aims to respond to Grotjahn's (2012a) critique of Khodadady and Hashemi's (2011) paper "Validity and C-Tests: The Role of Text Authenticity" by employing reduced redundancy (RR) and schema theories. It counter argues that developing conventional C-Tests on several short texts and modifying their contents do not render them "genuine" for RR has nothing to do either with the number and length of texts to be chosen or with mutilating a set number of words constituting those texts. Without acknowledging, however, the conventional C-Test designers resort to the macrostructural view of schema theory to justify measuring "special knowledges" assumed to be conveyed in several texts. They do, nonetheless, utilize its micro structures, i.e., their constituting words, when they mutilate every second word from the second sentence and onwards. Based on the RR and schema theory as well as the texts selected and the data presented by several authors, the points raised by Grotjahn are discussed and suggestions are made for future research.

**Keywords:** Schema theory, reduced redundancy, sampling, authenticity

### **INTRODUCTION**

Critiquing my joint paper "Validity and C-Tests: The Role of Text Authenticity" (Khodadady & Hashemi, 2011) [henceforth K&H] Grotjahn (2012a) announced that "it was severely flawed" (p. 12). Although the very time Grotjahn had spent on the critique necessitated appreciation, I found it rather surprising that he had not mentioned even a *single* strongpoint in the entire paper. As a language educator who has offered various courses in applied linguistics at both undergraduate and graduate levels in general and language testing in particular for over two decades to both native and non-native speakers of English, I have always done my best to help both language learners and teachers see the advantages of a research project, however flawed it might sound to them, before they focus on its possible disadvantages. Therefore, I appreciate Grotjahn's (2012) critical reading of my earlier paper as well, i.e., C-Tests: Method Specific Measures of Language Proficiency (Khodadady, 2007), which provides the necessary background for the points I will raise to address the *assumed* flaws. In contrast to Grotjahn, I will choose more *positive* headings in order not to activate unfavorable schemata in my reader's minds before they formulate their own on the basis of what they read. I will first focus on review of literature and then address the theoretical foundation of C-Tests and the authenticity of texts upon which they must be developed if they are accepted and employed as measures of language proficiency.

## REVIEW OF LITERATURE

Grotjahn (2012a) claimed that “K & H’s literature review is incomplete” (p. 12). However, instead of referring to K&H to support his claim, he refers to Khodadady (2007). In addition to the fallacy of criticizing the content of one study on the basis of the content of another, what Grotjahn quotes from Khodadady is, unfortunately, removed from its context. Based on the decontextualised phrase “lack of research on C-Tests” quoted from Khodadady, he announces that “C-Tests are among the best researched testing instruments” (p. 21) and provides Eckes and Grotjahn (2006) and Grotjahn (2010, 2012b) as his chief references.

Since in his critique Grotjahn (2012a) might have unintentionally left out the paragraph preceding the quoted phrase, it is quoted below to provide the necessary context.

Although C-Tests were invented in 1981, they have received little attention in *English* language testing literature. For example, in his fairly comprehensive review of correlational studies conducted on C-Tests so far, Sigott (2004, pp. 61-65) could tabulate 28 among which only 11, i.e., 39%, have been in English. This is reflected in textbooks written for teacher training programs, e.g., Madsen (1983), Heaton (1988), Baker (1989), where C-Tests are not even mentioned. Similarly, there is no entry for C-Tests in the *Dictionary of Language, Teaching and Applied Linguistics* (Richards, Platt, & Platt, 1992). Bachman (1990), however, referred to C-Tests as variants of cloze tests in passing (Khodadady, 2007, p. 21).

Based on the reasons outlined above for the lack of long due original research papers written in *English*, which was originally italicized in the quoted paragraph to emphasize the variable of language in which the research projects need to be done *as well as* reported, Khodadady (2007) argued that

The overall public and expert inattention might be attributed partly to a lack of research on C-Tests and partly to their nature. Davies (1990) dubbed them ‘a particular and rather recondite use of the cloze test’ (p. 94) and thus obliged researches like the present one to contribute to those studies which have already shed some light on their internal, empirical and factorial validity (p. 21).

The first directly quoted paragraph preceding the phrase quoted in the paragraph above, i.e., a lack of research on C-Tests, is composed to draw the attention of testing experts and students alike to the very fact that there is still an urgent need to design and conduct research projects on C-Tests and report them in *English* so that scholars who write textbooks in English can include C-Tests as important, though method specific (Khodadady, 2007), measures of language testing. While I appreciate the attempt of designers of the site given by Grotjahn, i.e., [www.c-test.de](http://www.c-test.de), to provide interested readers with open-access links on C-Tests, *even* that site falls short of providing diverse enough studies written in English to support his decontextualized argument. Out of 43 links, only 18 (41.9%) are in *English*, showing statistically that 58.1% of links are all in *German* not in *English*. Furthermore, C-Tests need to be developed in Arabic, Persian, and Turkish, to name a few. [This suggestion does not mean that I am unaware of the C-Tests designed in languages such as French and Japanese!]

### ***Prescriptive Vs. Descriptive Approach in Testing***

Grotjahn (2012) claimed that the K & H's C-Test developed on a single authentic text is not *genuine*. The claim is based on Klein-Braley's (1997, p. 65) belief that "because the C-Test consists of a number of different texts the sampling of content classes is better. Examinees who happen to have special knowledge in certain areas no longer have substantial advantages over other examinees" (p. 65). According to Grotjahn (2012a) the belief "implies that C-Tests *always* [Italics added] consist of several texts and that therefore a single long C-Test text with 180 gaps such as K & H's authentic C-Test (AC-Test) is not a genuine C-Test" (p. 21). With due respect, I disagree with Klain-Braley's belief and what it implies to Grotjahn. What she says is not an *absolute* rule to be followed by test designers. I strongly believe that the time for prescribing certain rules to be followed by everyone is long over. As a matter of fact, science established itself as an indispensable tool to understand the functioning of various variables when it questioned the validity of some beliefs held by authorities.

It is, for example, argued in this paper that Klain-Braley (1997) contradicted herself unconsciously when she employed reduced redundancy (RR) as a theoretical rationale for C-Tests but followed schema theory in practice. While the former has nothing to offer as far as the number of texts employed in C-Tests is concerned, the latter does address and necessitate the selection and inclusion of various texts by resorting to its macro structural approach. To support the argument, schema theory will be described, albeit briefly, and then C-Tests will be analyzed within an RR perspective.

### ***Macro and Micro Structural Views of Schema Theory***

According to schema theory, reading comprehension ability can be measured either macro structurally or micro structurally (Khodadady, 1997, 1999). A given text is viewed as a single schema or macro structure which requires "special knowledge" in Klein-Braley's (1997, p. 65) words or "a conventional knowledge structure that exists in memory" in Yule's (2006 p. 132) perspective. However, no one still knows, as Grabe (2002) put it, "how it would work for reading comprehension" (p. 282). Although cloze tests were developed originally as measures of readability, they were later employed in language testing as integrative measures of language proficiency assuming that test takers' would employ their language proficiency, not their "special knowledge" of *a* given text, to restore its deleted words on the basis of hypotheses they formulate as they read the text (Khodadady & Herriman, 2000). Klein-Braley, however, interpreted language proficiency as "special knowledge" of *a* given text and extended it to "*special knowledges*" of several texts. (Notice that the plural morph –s is deliberately added to knowledge by the present author.)

Although Klein-Braley (1997) subscribed to the macro structural view of schema theory when she emphasized "*special knowledges*" measured by several short texts, she violated one of its main principles when she developed her C-Tests on *general topics* assuming that these general topics are synonymous with *allegedly different* areas of human knowledge. In order to help the test takers activate their "special knowledge" of a certain text or schema test designers conventionally provide its title and leave its first sentence intact. However, Klein-Braley

employed Text 1, 2, 3 and 4 as the titles of the four piloted texts on which she developed her final C-Test. She did, nonetheless, leave the first sentences of these texts intact as the second principle followed by followers of macro structural/top-down approach of schema theory stipulates. (It must be emphasized that reduced redundancy cannot, by its very nature, say anything about providing the title and first sentences because its occurrence is based on randomness or probability. In natural settings any part of any text can go missing because of variables such as noise and distraction.)

Since there is no title for the texts employed by Klein-Braley (1997) to address the nature of “special knowledge,” the titles of the texts selected by Babaii and Ansary (2001) are given here. These conventional C-Test designers have been chosen because Grotjahn (2012a) seemed to have agreed with their selection of texts and reliability analyses. The titles are “A slip of the Tongue”, “the End of the World”, “A 50 Percent Thief”, and “Keep the Torch Burning”. These topics deal, according to the present author, with the usual issues encountered by almost all proficient English readers. It remains to be found out how Klein-Braley and Grotjahn would justify their claim that the “special knowledge” of a given test taker of C-Test developed on “A slip of the Tongue” will, for example, be different from, say, that of the second or third test taker?

Similarly, it remains to be explained by Grotjahn how, say, the first test taker’s “special knowledge” of “A slip of the Tongue” will be different from his knowledge of “The End of the World” or “A 50 Percent Thief”. This assumption violates Spolsky’s (1973) insistence on a *single* “knowledge of the language” (p. 7) based upon which a test taker can restore the missing parts of a message. In other words, *a single knowledge of the language* will be enough to restore the missing parts of *any* given text and thus assuming the existence of “*special knowledges*” on the part of test takers violates the principle upon which C-Tests are designed.

Interestingly enough Grotjahn (2012a), however, objected to K&H’s use of using *C-Tests* in plural and emphasized that Klein-Braley used its singular form, i.e., *C-Test*. As discussed previously, the use of *C-Test* is not only misleading but also flies against the results reported by Klein-Braley (1997) herself as shown in Table 1. In describing the table she wrote, “the reliability coefficients have been calculated for the *individual tests* [italics added] using KR-21” (p. 67). As can be seen, the descriptive statistics of C1, C2, C3 and C4 are reported as *individual tests*. Since Klein-Braley could not solve the self-created problem of using the singular C-Test for each of its four constituting tests, she employed C1, C2, C3 and C4. Khodadady (2007) simply referred to them as C-Test 1, C-Test 2, C-Test 3 and C-Test 4, respectively, and treated them as *individual tests* as Klein-Braley (1997, p. 67) herself did.

**Table 1: Basic test statistics for the tests of reduced redundancy (Klein-Braley, 1997, p. 67)**

Test	Mean	SD	P	$r_{KR(21)}$	$r_{COSTA1}$
CLOZE1	6.38	2.91	.32	.51	.71
CLOZE2	4.34	2.58	.22	.52	.58
C1	15.15	4.28	.61	.70	.68
C2	10.69	5.85	.43	.86	.66
C3	14.86	4.98	.60	.79	.53
C4	10.42	4.71	.42	.78	.45
MC1	16.32	3.31	.63	.46	.55
MC2	13.47	3.35	.56	.49	.61
CE1	14.10	4.89	.56	.72	.56
CE2	8.64	5.45	.35	.64	.45
DICT	31.36	12.54	.62	.94	.71
DELTA	83.40	22.07	.58	.93	1.00

It is further argued in this paper that the assumed “special knowledge” of a given text is based on macro structural school of schema theory adopted and operationalized by the designers of earlier IELTS modules (e.g., Clapham, 1996, Kelly, 1978). The assumption was that since the background knowledge required for understanding a given field such as humanities is different from another field such as engineering, the test takers wishing to continue their academic studies in engineering in English would be at a loss if their reading comprehension texts were chosen from humanities. What Klein-Braley (1997) and other designers of conventional C-Tests such as Babaii and Ansary (2001) did not notice was that neither titleless and numbered texts such as 1, 2, 3 and 4 nor texts dealing with general topics such as “a slip of the Tongue” and “the End of the World” are field-dependent and thus could not represent various types of “special knowledge”. Even if they did, studies after studies showed that proficient test takers having “special knowledge” of a given field did not necessarily perform significantly differently on the tests developed in their field than those possessing “special knowledge” in a different field.

### ***C-Tests and Reduced Redundancy***

Since providing an operationalized definition of “special knowledge” in terms of schema theory to establish C-Tests as macro structural measures of language proficiency is too difficult, if not impossible, Klein-Braley (1997) employed RR as a viable rationale to provide C-Tests with a theoretical foundation. Similar to her, Spolsky (1973) is quoted below in order to find out whether it can be applied to conventional C-Tests.

The non-native’s inability to function with reduced redundancy, evidence that he cannot supply from his knowledge of the language the experience on which to base his guesses as to what is missing. In other words, the key thing missing is the richness of knowledge of probabilities - on all levels, phonological, grammatical, lexical, and semantic - in the language (p. 17)

According to Klein-Braley (1997), Spolsky assumed that “knowing a language certainly involves the ability to understand a distorted message, to make valid guesses about a certain percentage of omitted elements” (p. 47). As can be seen, there is no indication of “special knowledge” of the distorted message neither in Spolsky’s nor in Klein-Braley’s quoted claims. Klein-Braley does, however, provide a lengthy review of literature dealing with cloze test as measures of RR without any indication of how “special knowledge” relates to RR and whether she has borrowed the concept from top-down models of reading or schema theory.

As discussed before, choosing a number of texts for the development of C-Tests is based on macro structural view of schema theory. If test takers coming from diverse fields such as humanities and engineering are going to take them as valid measures of language proficiency then choosing representative texts from their respective fields would be justified. However, it does not apply to the tests developed by Klein-Braley (1997) because they are not developed on any “special knowledge” which might be known to certain test takers, say those of humanities, and stay unknown to others, say engineering. It is, therefore, suggested that instead of choosing a number of short texts dealing with general topics, more C-Tests be developed on single authentic texts written for the literate English speaking public as K&H did. It is also suggested that C-Test

items be developed on first sentences to find out whether their being kept intact has any significant effect on test results.

### ***Randomness and Reduced Redundancy***

This paper attempts to show that RR has nothing to do with “special knowledge” upon which Grotjahn (2012a) questioned the development of an authentic (A)C-Test on a single text. It also tries to show that neither cloze tests nor C-Tests comply *fully* with the stated principle of RR as conceived by Spolsky. The concept of noise as the main cause of distortion in native speakers’ reception of messages in real life is based on *probability*, i.e., it occurs randomly and may affect any parts of an authentic text. Although Spolsky (1973) had observed the occurrence of RR, he remained quite vague in its description as far as the present author’s knowledge and experiences allow. Spolsky believed, for example, RR occurred “on all levels, phonological, grammatical, lexical, and semantic - in the language” (p. 17). It remains to be researched, for example, whether and how *semantic* is affected by RR. To begin with semantic is an abstract concept as is phonology. How would Spolsky himself and other believers in RR translate these ***abstract concepts*** into describing ***concrete missing parts*** of a distorted text?

Klein-Braley (1997) seems to be the first who translated Spolsky’s belief into practice *quantitatively* by announcing that “knowing a language certainly involves the ability to understand a distorted message, to make valid guesses about *a certain percentage* [italics added] of omitted elements” (p. 47). Along with her colleagues she developed C-Tests by mutilating *at least* 100 words constituting the second and subsequent sentences of texts. Grotjahn (2012a) offered “a practical advantage” as a rationale saying that “the raw scores do not have to be converted into percentages” (p.24). The present author could not, however, make out how “a practical advantage” can be used as ***a theoretical basis*** as K&H wrote, “there is no theoretically sound basis to establish a cut off number for the items comprising the C-Tests, i.e., 100, as Klein-Braley (1997) did” (p. 35).

The concept of randomness in RR is emphasized in this paper because it embodies several cardinal variables playing significant roles in language testing. Surprisingly however, Spolsky (2001) revealed his unfamiliarity with these variables when he preferred C-Tests over cloze tests simply because the results obtained on the former do not support his *vague* theory of RR. According to him,

By omitting words, which are *linguistic* [italics added] elements with certain properties a cloze test was biasing itself to testing certain areas of language ... the technique she [Klein-Braley] proposed as an alternative, the C-Test, used half words. A half word is much less linguistic - not a discrete item - and so much more information theory-oriented and integrative. Essentially, a C-Test was much closer to a noise test in the *randomness* [italics added] of the reduction of redundancy and so a purer example of an integrative rather than a discrete item test (p. 7).

What Spolsky (2001) stated in the quoted block above is self-condemning for several reasons/variables. *First*, how can deleting complete word be *linguistic* and *non-random* but their mutilation be *integrative* and *random*? If we consider integrativeness as an indispensable part of context, then the opposite will hold true. While it is impossible to restore any omitted word without having access to its context, Khodadady (2007) showed that out of 99 mutilated words comprising Klein-Braley’s (1997) C-Tests, 11 functioned quite well when they were removed from their textual context and presented as single mutilated words to be restored on the basis of

directions given in C-Tests. In other words, test takers could restore eleven percent of items on the C-Test without having any context!

Secondly, RR cannot specify which words/items, i.e., every second word, must be mutilated if they are chosen *randomly*, hence Spolsky (2001) contradicted himself by claiming that C-Tests are “much closer to a noise test in the *randomness*” (p. 7). Thirdly, noise can affect all textual units, e.g., words, phrases and clauses, and the advocates of RR need, therefore, to justify the nature of the missing items in terms of the “phonological, grammatical, lexical, and semantic” levels specified by Spolsky (1973). Fourthly, RR cannot endorse leaving the title and first sentence of a given text intact because these two textual units might also go missing when it takes place in reality. And finally noise distorts *authentic* texts which are produced and processed for *real* purposes in *real* places at *real* times and for *real* purposes.

### ***Text Authenticity and C-Tests***

This paper supports Khodadady (2007) and K&H’ view that authentic texts have **not** been used in the development of conventional C-Tests and questions Grotjahn’s (2012a) decontextualized quotations of K & H’s sentences in order to prove that the development of C-Tests on authentic texts is endorsed and brought up by Klein-Braley (1997) *first*. He writes

Although K & H on p. 31 explicitly refer to Klein-Braley (1997, p. 64), they only state “that between four to six carefully selected texts should be chosen”, omitting the qualification “preferably authentic”. (p. 21)

Grotjahn (2012a) quotes both K & H and Klein-Braley in an ambiguous way. His manner of quotation leads readers to the conclusion that K & H deliberately omitted the phrase “preferably authentic” from the sentence he quotes from K & H. In other words, the quoted *that clause* belongs to K & H, i.e., “that between four to six carefully selected texts should be chosen” (p. 31) whereas the phrase “preferably authentic” belongs to Klein-Braley (1997, p. 64). The following quotation provides the original context to which K & H referred to *indirectly*.

A number of texts, usually between four and six, are put together to make a C-Test. Because of problems with text difficulty, usually overestimated by the test constructor (cf. Klein-Braley, 1985b; 1994), one should begin with more texts than will be finally needed. The texts are ordered intuitively according to difficulty (Klein-Braley, 1997, p. 65).

Klein-Braley (1997) did suggest the selection of “preferably authentic” (p. 64) texts. However, she did not provide her readers with any specific definition of authenticity. Neither did she supply them with any references to verify her suggestion. For example, nobody knows what sources she used to select Texts 1, 2, 3 and 4 to develop her C-Tests from. In contrast, K&H employed “why don’t we just kiss and make up” (Dugatkin, 2005) published in *NewScientist* magazine whose authenticity can be verified by all interested readers. They chose this magazine because its articles are “more academic than ... articles in quality newspapers” (Clapham, 1996, p. 145) and they provide standard scientific texts for public readership.

Not only did Klein-Braley (1997) provide no references to find out what sample authentic texts she had preferred but also she believed that “no language test is *authentic*” (p. 48). She argued that “normal language is not produced in order to be assessed.” The present author, however, argues that English writers produce normal/authentic texts to be read. *Whatever texts which are produced to be read by the literate public are authentic*. This argument was employed to question the construct validity of the TOEFL by highlighting the fact that its reading comprehension texts are written by language testing experts in order to *test* reading comprehension ability (see Khodadady, 1997). Since the texts upon which the TOEFL is designed are not *authentic*, i.e., *they are not written to be read*, it lacks construct validity. The same argument was employed by K&H to show that the four texts employed by Klein-Braley (1997) were not *authentic* because they were not written to be *read*. If they were, she would have provided their sources or references.

### ***Sampling Authentic Texts for C-Tests***

According to Klein-Braley (1997), a number of texts need to be selected to develop C-Tests because their writers may face “problems with text difficulty” (p. 65) and thus may have to do away with some. Finding texts with appropriate difficulty is not only problematic for designing language proficiency tests such as C-Tests, it violates the principle of authenticity in that the authentic texts written to be read by literate public may have all levels of assumed difficulty. Furthermore, it poses a real problem which becomes more complicated and time consuming when the test designers realize that some of their chosen texts have functioned poorly in the pilot phase and they must, therefore, look for suitable substitutes. In Baghaei’s (2008) words,

For developing a C-Test battery the number of the texts used should be more than the number required since even native speakers cannot obtain perfect scores (95%) on some texts. They believe that native speakers should perform perfectly on language tests. To what extent this view is credible is another issue (p. 33).

The selection of texts written to be *read* by the literate public not only ensures authenticity and dispenses with the necessity of administering C-Tests to *native speakers* but also relieves C-Test designers from looking for a number of texts with appropriate difficulty levels. K&H, therefore, chose a single text whose C-Test items functioned as well as conventional C-Tests developed on four texts as will be discussed shortly. The only reason Klein-Braley (1997) provided for the cumbersome and theoretically questionable process of choosing a number of texts instead of a single authentic text is her adamant attempt to sample texts addressing “*special knowledges*”. This attempt is, nonetheless, misplaced because RR has little, if any, to do with text selection.

In addition to the fallacy of employing “special knowledge” as a synonym for a given area of knowledge such as humanities and engineering, the very necessity of choosing short texts in order to account for “*special knowledges*” fails to represent the types of texts proficient test takers are going to read when they enter higher education centers. If we take academic textbooks and articles as the most normal types of texts read by college and university students, none of these texts consist of a single paragraph! In other words, the C-Tests developed by Klein-Braley (1997) and her followers not only fail to accommodate authenticity in content and audience but also misrepresent academic texts as single short paragraphs!

Since Klain-Braely (1997) ***did not*** provide the sources of her texts so that their intended audiences could be objectively explored, those of Babaii and Ansari (2001) will be addressed as representative samples of conventional C-Tests. Their “eight excerpts were taken from two ELT textbooks, viz *Practice and Progress* (Alexander, 1968) and *To start you practicing* (de Freitas,

1974)” (p. 217). Out of eight conventional C-Tests developed on eight texts *written for teaching English*, only five were kept for final administration because three of them did not reveal Babaii and Ansari’s expected item characteristic indices providing further evidence to support the earlier argument made in this paper, i.e., developing conventional C-Tests entails the cumbersome process of choosing more texts and trying them out in a pilot phase.

Babaii and Ansari (2001) distorted not only the texts of their C-Tests but also the title of the first book they gave as one of the two sources of their selected texts. The full title is not *Practice and Progress* but *Practice and Progress: An Integrated Course for Pre-Intermediate Students* which was published in 1967, not in 1968. As the original title implies, the content of the textbook was written for *teaching* English; therefore, the passages developed in the textbook were not *authentic* in that no proficient English user was supposed to *read* them for the sake of comprehension. Furthermore, the stated level of its would-be users is *Pre-Intermediate* which renders the C-Tests developed on the texts of this textbook questionable if not invalid in terms of their construct validity.

In addition to choosing the texts of an inappropriate proficiency level, Babaii and Ansari (2001) simplified the texts Alexander (1967) had already modified the texts to teach English to *Pre-Intermediate Students*. Alexander himself did not state where he got the passages from. However, he did declare that “each passage contains examples of the language patterns the student is expected to master” (xv) implying that they were particularly *written* for teaching purposes because their constituting number of words also varied according to the students’ level of achievement. While the passages employed for Unit 1, for example, consisted of just one hundred words, they increased to 180 in Unit 4. The educational purposes of *artificially written* or *modified* passages is further emphasized in a section called “For Whom the Course is Intended”, Alexander identifies four types of students among whom are “students in need of remedial work: e.g., ... students who have begun English several times and never got beyond the point of no return” (p. xii)

From among the 26 passages presented in Alexander’s (1967) Unit 4, Babaii and Ansari (2001) chose “A Slip of the Tongue” for inclusion in their C-Test. They refer to this passage along with the other three as “excerpts ... *taken* [italic added] from two ELT textbooks” (p. 213). They do not, however, tell their readers that they have *modified* the “excerpts” as well. While the passage they have included in their C-Test consists of only 80 words, it comprises 181 in Alexander (1967, p. 217). In addition to shortening the text, they changed the constituting words of the passage. For example, the sentence “He *was obviously very* nervous ...” is changed to “He *seemed extremely* nervous ...” for no apparent reason. This means that conventional C-Test designers like Babaii and Ansari not only employ language *teaching* materials for *testing* purposes but also impose their own interpretations on what they choose. (The original passage developed by Alexander and the text simplified by Babaii and Ansari are given in Appendix.)

### ***Content Representation and C-Tests***

In contrast to the macro structural approach of schema theory which falls short of providing any objective and measurable unit of “special knowledge” (e.g., Grabe, 2002), its microstructural

perspective considers any word/phrase comprising an authentic text as a schema whose comprehension on the part of its readers depends on its meaning in relation to syntactic, semantic and discursal relationship it holds with other schemata. [Interested readers are referred to Khodadady (2012) for more details.] Since the comprehension of each and all schemata comprising a given text determines their comprehension and thus behave as its main unit, they must be employed as the *best* and *only* units to develop test items on.

Grotjahn (2012a) seemed to be following the microstructural approach of schema theory because he believed that choosing one authentic text to develop AC-Test would under represent content in terms of *lexis*. He wrote

What is new, however, is K & H's use of a single long authentic text, calling this a C-Test. However, using only one text can lead both to content underrepresentation (e.g., with regard to lexis) and to (severe) bias and unfairness (cf. the quote from Klein-Braley), and, as a consequence, can jeopardize construct validity (p. 21).

Not only the first criticism dealing with the *alleged* content underrepresentation of AC-Test developed by K & H but also the second prescriptive criticism regarding the assumed “(severe) bias and unfairness” of the test are subjective because the data support the opposite as shown in Table 2. If we accept Richards, Platt and Platt's (1992) definition of lexis as “the vocabulary of a language in contrast to its grammar” (p. 213), it is best represented by semantic schemata, i.e., adjectives, adverbs, nouns and verbs. As can be seen, Dugatkin (2005) employed 866 semantic schemata to write the single authentic text consisting of three parts. K & H reproduced its introduction section to develop their AC-Test.

**Table 2: The frequency of semantic, syntactic and parasyntactic tokens comprising texts**

Schema domains	Klein-Braley's four texts		K&H's single text		Dugatkin's (2005) text	
	Frequency	Percent	Frequency	Percent	Frequency	Percent
Semantic	174	51.3	271	46.2	866	50.5
Syntactic	148	43.7	222	37.8	638	37.2
Parasyntactic	17	5.0	94	16.0	211	12.3
Total	339	100.0	587	100.0	1715	100.0

As it can also be seen in Table 2, the number of semantic schemata comprising the single AC-Test developed by K&H, i.e., 271, is greater than that of Klein-Braley's (1997), i.e., 174. The Chi-Square analysis of frequency showed that the difference in the number is statistically significant ( $\chi^2 = 21.144$ ,  $p < .001$ ) and thus the AC-Test represents content/lexis significantly better than C-Tests. If we take content representation as a measure of fairness, then AC-Tests are fairer than the conventional C-Tests developed on short and modified texts. It is counter argued in this paper that these are the conventional C-Tests which are biased because their designers manipulate the texts syntactically, semantically and discursively to develop, pilot and select well functioning items. In other words, conventional C-Test writers *write* and/or *modify* a number of short texts dealing with general topics and pilot them in order to get their own desired response.

#### ***Internal Validity of Conventional C-Tests and AC-Tests***

In addition to the statistically significant and higher representation of content, AC-Tests are superior to conventional C-Tests in terms of their internal validity. In order to support the

superiority, K&H followed scholars such as Baker (1989) and specified two indices which must be used *together* in order to establish it *statistically*. They announced, “for determining the discrimination power of items point biserial correlations ( $r_{pbi}$ ) between the total test score and individual items were calculated and coefficient of 0.25 and higher were used along with acceptable  $p$ -values as indices of well functioning items” (p. 34).

Grotjahn (2012a), however, called the results reported by K&H “surprising in several ways” (p. 22). As one of the *allegedly* surprising results, he questions “the small range of item difficulties in the standard C-Test” of K & H which contradicts his “own extensive data sets and also to the data reported by Klein-Braley (1996), Jafarpur (1999) or Babaii and Ansari (2001)”. After focusing on the reported range, i.e., .37 to .73, he wonders “whether the difficulty values in the standard C-Test are correctly calculated.” Table 3, presents the frequency of correct responses given to each item on the conventional C-Tests. They were divided by the number of participants, i.e., 135, to get the  $p$ -values (PVs). As can be seen, the PVs are correctly calculated and reported. (The CRs were not given by K & H because they are conventionally considered redundant. Conventional C-Test designers like Klein-Braley (1997) do not, for example, provide their readers with their mean  $r_{pbi}$  let alone the  $r_{pbi}$  of each item.)

**Table 3: Correct responses (CRs) given to each item on the C-Test and their  $p$ -values (PV)**

Item	CR	PV	Item	CR	PV	Item	CR	PV	Item	CR	PV	Item	CR	PV
1	99	.73	21	75	.56	41	67	.50	61	52	.39	81	72	.53
2	91	.67	22	62	.46	42	83	.61	62	62	.46	82	70	.52
3	76	.56	23	75	.56	43	65	.48	63	67	.50	83	88	.65
4	74	.55	24	80	.59	44	79	.59	64	90	.67	84	61	.45
5	74	.55	25	65	.48	45	77	.57	65	59	.44	85	72	.53
6	78	.58	26	76	.56	46	56	.41	66	62	.46	86	88	.65

Grotjahn (2012a) also stated that K & H should not have generalized from the results obtained on the administration of a single AC-Test to all AC-Tests and their generalization is, therefore, another surprising result which must be treated as a flaw. This statement is questionable at best because all research projects are conducted to generalize their findings otherwise there would be no use for their publication. Klein-Braley (1997), for example, made similar generalizations about testing procedures other than C-Tests. After administering the conventional C-Test employed by K & H along with the tests specified in Table 1 she declared that “the C-Test shows superior performance over the other test procedures in the categories difficulty level, reliability, validity, [and] factorial validity” (p. 71).

Furthermore, Grotjahn (2012a) claimed that “the reported number of well-functioning items in the AC-Test is not correct (at least according to Table 4)” and based on this claim he concluded that “it appears that K & H have taken into account only the values for the discrimination index” (p. 23). Both the claim and conclusion are unfounded because the 97 well functioning items, i.e., 3, 5, 10, 11, 14, 17, 18, 19, 21, 24, 26, 28, 29, 30, 31, 35, 37, 40, 42, 45, 46, 47, 50, 51, 52, 55, 56, 57, 59, 60, 62, 63, 65, 66, 68, 69, 70, 73, 77, 81, 82, 86, 89, 90, 92, 95, 100, 101, 104, 105, 106, 107, 108, 110, 111, 112, 113, 115, 118, 120, 122, 124, 125, 126, 130, 132, 133, 135, 137, 138, 139, 140, 141, 142, 143, 145, 146, 147, 148, 149, 150, 151, 152, 153, 155, 157, 158, 160, 161, 163, 165, 166, 170, 173, 174, 179, and 180, all have acceptable difficulty *and* discrimination indices, i.e., IFs between .25 and .75 and IDs equal to or higher than .25, which can be checked in Table 4.

And finally, Grotjahn (2012a) expressed surprises other than those brought up in previous paragraphs. Since they are all based on the mere assumptions made on the indices employed to determine item functioning, they will not be addressed. (For example, without checking the 97 well functioning items given in Table 4 and enumerated in paragraph above, he announces that “It *appears* [italics added] that K & H have taken into account only the values for the discrimination index” and then based on this totally *subjective assumption* he surprisingly subtracts 12 items from 97 claiming that they “are acceptable with regard to discrimination but not in terms of difficulty.”) Aside from unfounded assumptions he bring up a peculiar objection regarding the standard deviations obtained on conventional C-Tests and AC-Tests which needs to be addressed separately.

### ***Comparing Conventional C-Tests with AC-Test: Standard Deviations***

In order to reject K & H’s adoption of standard deviations (SDs) as indices of comparison between standard C-Test and AC-Tests, Grotjahn (2012a) argued that SDs “clearly depend on the range of the scale and in comparing standard deviations, one has to take this fact into account” (p. 23). Based on this argument he concludes, “therefore the conclusion that the AC-Test distinguishes best among the test takers, because it has the highest standard deviation, is not sufficiently substantiated ...”. This conclusion stands in sharp contrast to its interpretation by authorities such as Thornkdike and Hagan (1977) who declared that the SD “is a measure of variability that goes with the arithmetic mean. It is useful in the field of tests and measurements primarily as providing a *standard* [italics added] unit of measure having comparable meaning from one test to another” (p. 46).

Grotjahn (2012a) brought up the range of a scale in order to reject K & H’s statement that standard deviations are “standardized by their very nature” (p. 35). He seems to have forgotten the fact that SDs are based on the arithmetic mean which derives their strength from normal

distribution and for this very reason SDs provide the best and simplest index to compare two measures such as conventional C-Tests and AC-Tests. According to Thorndike (2005),

This unvarying relationship of the standard deviation unit to the arrangement of scores in the normal distribution gives the standard deviation a type of *standard* [italic added] meaning as a unit of score. It becomes a yardstick in terms of which groups may be compared or the status of a given individual on different traits expressed. For example, if John's score in reading is 1SD above the mean and his score in mathematics is 2 SDs above the mean, then his performance in mathematics is better than his performance in reading (p. 49).

The results of language proficiency tests are used to reach educational decisions. As such they play a significant role in test takers' lives. According to the results obtained by K&H, while conventional C-Tests did not differentiate among many test takers because they obtained the same score, the AC-Test did accomplish the task because of its constituting items and higher magnitude of SD as shown in Table 4. As can be seen, seven test takers have, for example, scored 58 out of 99 on the conventional C-Test and their Z scores are all .40, indicating that they are of the same level of language proficiency. However, while only test takers four and five have obtained the same score on the AC-Test, i.e., 111 out of 180, test taker one's Z-score on AC-Test, i.e., 1.5, is over three times higher than his Z-score on the standard C-Test, i.e., .40, indicating that the former provides a much better measure of his proficiency as those of test takers 2, 3, 4, and 5 do. These differences are all reflected in the SDs of conventional C-Test and AC-Test, i.e., 11.358 and 21.589, respectively (see K & H's Table 2 on page 5 and 6).

**Table 4: The scores of seven test takers on the standard C-Test and AC-Test**

Test taker	Standard C-Test		AC-Test	
	Raw score	Z Score	Raw score	Z Score
1	58	0.40108	130	1.55498
2	58	0.40108	113	0.76754
3	58	0.40108	112	0.72122
4	58	0.40108	111	0.6749
5	58	0.40108	111	0.6749
6	58	0.40108	103	0.30434
7	58	0.40108	98	0.07274

### ***Reliability Estimate of Conventional C-Test and AC-Test***

As a pioneering designer of conventional C-Tests Klein-Braley (1997) employed Cronbach's alpha to explore the reliability of her conventional C-Test on the basis of its individual gaps as reproduced in Table 5 below. K & H applied the same reliability estimate to their data. Surprisingly, however, Grotjahn (2012a) named and criticized Khodadady (2007) specifically for using the estimate and declared that "K & H's reliability estimation for the C-Test and the AC-Test is flawed since the authors calculate Cronbach's alpha on the basis of the individual gaps" (p. 24).

Table 5: Basic test statistics for grouped test procedures reported by Klein-Braley (1997, p. 68)

Test	Mean	SD	P	$r_{t(\text{ALPHA})}$	$r_{(\text{DELTA})}$
ALLCLOZE	10.72	4.79	.27	.66	.65
C-TEST	51.15	16.71	.52	.85	.70
ALLMC	29.90	5.44	.60	.51	.70
ALLCE	22.86	9.28	.46	.75	.65

As an alternative to Cronbach's alpha, Grotjahn (2012a) suggested several approaches whose descriptions run for five paragraphs! What the present researcher understands from the descriptions is that since there is a possibility of "local item dependence (LID) and correlated errors" (p. 24), conventional C-Test designers must employ different approaches whose application is as cumbersome as choosing a large number of texts to replace those which may not function as expected. These approaches are questionable as far as the present author is concerned simply because they are fundamentally utilized to overcome the problem created by *faulty items* and *associated errors*. Using statistics to overcome inherent problems with proficiency tests such as conventional C-Tests, it sounds both esthetically and logically unacceptable. The most feasible approach would be to use the alpha for the tests employed as K & H did or to discard their mal functioning items and to calculate their alpha by employing their well functioning items as Khodadady (2012) did.

## CONCLUSION

This study analyzed conventional C-Tests in terms of the texts chosen by their designers and contended that they are not based on reduced redundancy (RR) because their mutilation of words is systematic rather than based on probability. Neither is the selection of several texts justified in RR because it has nothing to do with "special knowledge" of a given unauthentic text as assumed by Klein-Braley (1997). The conventional C-Tests were developed originally to overcome the shortcomings of cloze tests as integrative/top down measures of language proficiency. They did, however, create shortcomings of their own when their designers adopted a prescriptive approach in their development.

Developing conventional C-Tests on several short and modified texts does not necessarily render them "genuine" as Grotjahn (2012a, p. 21) claimed it to do. Neither do conventional C-Tests measure "special knowledges" because they do not address schemata as macro structures. They are, instead, developed on single words and should therefore be viewed as offshoots of micro structural approach of schema-theory. It is, therefore, suggested that instead of choosing several short texts and modifying them to serve testing purposes, normal/ authentic texts written for being read by literate English users be selected to write theoretically strong and empirically superior C-Test as K & H did.

### Appendix

Alexander's (1967) original text and the text upon which Babaii and Ansari (2001) developed their first C-Test

#### A slip of the Tongue

People will do anything to see a free show- even if it is a bad one. When the news got round that a variety show would be presented at our local cinema by the P. and U. Bird Seed company, we all rushed to see it. We had to queue for hours to get in and there must have been several hundred people present just before the show began. Unfortunately, the show was one of the dullest we have ever seen. Those who failed to get in need not have felt disappointed as many of the artistes who should have appeared did not come. The only funny things we hear that evening came from the advertiser at the beginning of the programme. He was obviously very nervous and for some minutes stood awkwardly before the microphone. As soon as he opened his mouth, everyone burst out laughing. We all know what the poor man should have said, but what he actually said was: 'This is the Poo and Ee Seed Bird Company. Good ladies, evening and gentlemen!' (Alexander, 1967, p. 217)

#### A Slip of the Tongue

On a variety show presented by P. and U. Bird Seed Company, a funny thing happened. It came from the advertiser at the beginning of the program. He seemed extremely nervous and for some minutes stood awkwardly before the microphone. As soon as he opened his mouth, everyone burst out laughing. We all knew what the poor man *should* have said, but what he *actually* said was: "This is the Poo and Ee Seed Bird Company. Good ladies, evening and gentlemen!" (Babaii & Ansari, 2001, p. 217)

### **ABSTRACT**

Reciprocal teaching strategy plays a crucial role in language use, language improvement and language learning. In the context of English language teaching (ELT), reciprocal teaching strategy is an integral aspect of communicative competence that can impact the desire to use the language as well as the quantity and quality of foreign language learning. Although there is a small and committed body of individuals who have worked to encourage the incorporation of reciprocal teaching strategy instruction in English as a Foreign Language (EFL) classes, reciprocal teaching still tends to be the neglected component of many language programs. In this paper, some important goals for RECIPROCAL TEACHING such as increased reciprocal teaching strategy research, focus on developing learners' communicative competence, focus on reciprocal teaching in teacher education, focus on comprehension strategies, focus on discussion and appropriation, and focus on studies about the goals of reciprocal teaching strategy, goals of reciprocal teaching strategy and benefit of reciprocal teaching strategy.

**Key words;** Communicative competence, reciprocal teaching, comprehension strategies, goals of reciprocal teaching.

## INTRODUCTION

In the context of English language teaching (ELT), reciprocal teaching is an integral aspect of communicative competence that can impact the desire to use the language as well as the quantity and quality of reading comprehension development (Palincsar & Brown, 1984). Reciprocal teaching strategy instruction tends to be ignored in the language learning, and teachers need to be encouraged by the idea of teaching through reciprocal teaching instruction in their reading classrooms (Doolittle, Hicks, Triplett, Nichols, & Young, 2006). Yet, reciprocal teaching strategy instruction does not have a secure place in most language curriculums. Within the current trend in ELT, it is up to individual teachers to incorporate reading comprehension in their classrooms. However, a lack of formal training combined with an absence of program directives means that it is up to teachers to inform and prepare themselves for how to best meet their students' needs. Consequently, most teachers do not provide instruction at all and those few that have generally adopted a hit or missing approach rely on materials that lack grounding and the desired results.

Consequently, most teachers do not provide instruction at all and those few who have generally adopted a hit or missing approach rely on materials that lack grounding and the desired results. This condition is worsened by the fact that reciprocal teaching strategy and explicit teaching method is marginalized and treated superficially (Stricklin, 2011).

Therefore, it is important to understand that students are not receiving the training they need in this important aspect of linguistic competence. What would affect and improve reciprocal teaching instruction for English language learners? This study reviews several goals that are very important for teaching reciprocal teaching instruction.

Communicative competence is the purpose of reciprocal teaching strategy instruction teaching and learning (Foster & Rotoloni, 2005). It stresses the need for meaningful communicative tasks in the language classroom, including those which focus on reciprocal teaching strategy in reading comprehension. Reciprocal teaching strategy practices are related to daily use of English language learning including reading comprehension, for instance, small groups working.

Learners can become careful readers in their own reading task. This shows that learners need exposure to reading materials so they can understand different types of texts in comprehension. By using reciprocal teaching strategy instruction, instructors can give students meaningful exposure to variability in reading comprehension and improve their communicative competence (Rubin, 1987).

### ***Why Reciprocal Teaching Strategy?***

Firstly, reciprocal teaching strategy has caused a revolution in reading comprehension which has been advocated by Palincsar and Brown (1984). Reciprocal teaching strategy is an instructional model that improves students' reading comprehension (DEECD, 2008). It also enhances understanding of complex texts and thus facilitates readers to gain confidence and motivation to read (DET, 2006). Secondly, Alvermann (2001) recommends that students' perception of how competent they are as readers affects how motivated they are to learn in subject area such as reading comprehension. Alvermann goes on to discuss that engaging learners in various small groups and intervening tasks as a tool for learning is preferable to intervening task only as a repository of data to be memorized. Thirdly, learners need to be familiar with the reciprocal teaching model and to have experience in using and practicing its functions.

Reciprocal teaching is an instructional model based on helping and fostering practice. In this model, the teacher first models a set of reading comprehension strategies and then step by step transfers responsibility to the readers (Brown & Palincsar, 1985; Palincsar & Brown, 1984). Furthermore, reciprocal teaching strategy involves three main important factors, (1) the teaching and learning of reading comprehension strategies, (2) the dialogue among students and teacher where the teacher models why, when, and where to use these reciprocal teaching strategies, and (3) the determine of the teacher' role by the learners, that is, learners begin to model the reading comprehension model for other learners. Thus, the aims of reciprocal teaching are for readers to learn the reading comprehension strategies, learn how and when to use the strategies, and become independent in reading comprehension.

Reciprocal teaching strategy has the general methodology which consists of teachers and students, usually in small groups, reading a section of text. The teacher models appropriate reading comprehension strategies while leading a dialogue of the task. In the process of discussion and modeling, the teacher encourages readers to generate questions in the text and strategies. The teacher provides this discussion to facilitated both reading comprehension and strategic cognition (Palincsar & Brown, 1984).

This reading, discussion, and questioning continue in the process of the text reading. Moreover, as readers become more proficient with the discussion process and the reading comprehension strategies, the teacher begins to have readers take the role of teacher or discussion leader. As readers begin to lead the discussion process, the teacher plays the role of facilitator, rather than a leader. The teacher models and elaborates different parts of the text to readers only at the level each one of them is able to negotiate at any one time. However, as the students become more proficient, the teacher improves her/his demands, requiring participation at a slightly more challenging level. This changing from a teacher-centered model to a student-centered model is the goals of reciprocal teaching strategy and encourages students to be independent readers (Palincsar & Brown, 1984, p. 13).

### ***Comprehension Strategies***

According to Ahmadi and Hairul (2012), Palincsar and Brown (1984), along with discussion and the appropriation of the role of a teacher with the students of the reciprocal teaching strategy, the use of comprehension strategies is one of the important of three central pillars. Comprehension strategies are situated to provide better recognizing texts – to help the understanding of meaning during the reading process. Palincsar and Brown (1984) used four kinds of reading comprehension strategies which are explained in the following sections:

#### ***A. Questioning***

The identification of information, themes, and ideas that are important enough to show further consideration is called questioning. And the main important information or opinions are used to generate questions that are used as self-assessment for the reader. Questioning provides a task for understanding the text more deeply and construct the meaning from writing texts.

### *B. Summarizing*

The process of explaining the important information and opinions within a text and integrating these into clear and concise words that communicates the essential meaning of the text is called summarizing. Summarizing can be upon a single paragraph, a section of text, or an entire passage. It involves the motivation to create a context for recognizing the specifics of a text.

### *C. Clarifying*

The elaboration and clarification of unknown, difficult, or unfamiliar aspects of texts are called clarifying. These aspects can include an awkward sentence or text structure, unfamiliar words, unclear references, or obscure concepts. Clarifying motivates readers to clarify confusion through re-reading, the use of context in which the text was written and/or read, and the use of external resources such as a dictionary or ask questions from peers or instructor.

### *D. Predicting*

The combining students' background knowledge, current knowledge from the text, and the text's structure and pictures to create hypotheses related to the direction of the text and the author's intent message is called predicting. Predicting is an overall rationale for reading to confirm or reject self-generated hypotheses.

Palincsar and Brown (1984) explained these four reading comprehension strategies were taught during the discussion in which the teacher modeled the use of each of the strategies. Moreover, others have successfully taught the reading comprehension strategies prior to engaging in the dialogue process.

### ***Discussion and Appropriation***

According to Carter and Fekete (2001), reading comprehension strategies alone are not enough to reach the goals of reciprocal teaching. Discussion is also a main important factor achieving the goals of reciprocal teaching strategy. The discussion refers to the dialogue, questions and answers, and feedback that occur during the process of reading and recognizing the text. During the early steps of reciprocal teaching, the teacher interprets, in small groups, the overall nature of the reading comprehension strategies, why, what, when and how to use the strategies.

The teacher then selects a part of the text and the teacher and learners silently read that section. Typically, reciprocal teaching begins with the reading of short passages, for example, a paragraph or a page, and proceeds to longer passages. After that the teacher begins to model the reciprocal teaching process by generating and asking a question which the students assist to answer. The teacher may ask several questions before summarizing the section of text that was read.

According to Rosenshine and Meister (1994), following the summarization process, the teacher will clarify any difficult sentences, words, or grammar within the text. Then, through the use of text-based cues, the teacher will prepare a prediction for the next paragraph of text. As the teacher improves through questioning, summarizing, clarifying, and predicting, the readers are active and are encouraged to participate in dialogue. Particularly, readers' participation involves (1) explaining or commenting on other readers' summary, (2) recommending other questions, (3) suggesting on another's predictions, (4) asking clarification of material they did not recognize, and (5) trying to resolve problems.

This cycle of dialogical questioning, summarizing, clarifying, and predicting continue as a teacher-centered process until learners figure out the processes themselves. Gradually the teacher

transfers responsibility of the process to the students adopted the role of dialogue leader. These students then begin the discussion questioning, summarizing, clarifying, and predicting process, while the teacher assumes the role of guider and observer.

Similarly, it is concluded that the process of discussion begins with one student generating questions and others preparing answers and suggestions, one student summarizing and others preparing explaining and simplifications, one student detecting difficult sentences and others clarifying and obtaining relevant resources, and one student predicting the upcoming paragraph and others refining and provide alternative hypotheses. The use of this discussion, in conjunction with the reading comprehension strategies, leads to the satisfaction of the previously identified goals of reciprocal teaching. Readers learn the reading comprehension models need to learn what, when and how to use the models of reading comprehension strategies, and become independent in the use of these strategies (Hart & Speece, 1998; Rosenshine & Meister, 1994).

### ***Foundations for the Use of Reciprocal Teaching Strategy***

Vygotsky (1978) stated that the use of the reciprocal teaching strategy consist of reaching for the goals of reciprocal teaching and it is based on the literature and social constructivist philosophy and cognitive psychology theory. This is essential as it separates the reciprocal teaching strategy from other reading comprehension strategies and provides a particular model for its use.

Social constructivism, as a basis for reciprocal teaching strategy, emphasizes the social generation of knowledge. Every function in learners' cultural improvement has two parts; first, on the social part, and on the individual part (Vygotsky, 1978, p. 57). This social generation of knowledge involves three elementary assumptions: (1) knowledge and meaning are active creations of socialization; (2) knowledge and meaning are social creations and as such reflect social negotiation and consensus; and (3) knowledge and meaning are constructed for the goals of social adaptation, discourse, and goal achievement (Gergen, 1999; Prawat & Floden, 1994).

Reciprocal teaching is based on active socialization on these three assumptions, both teacher-centered and students-centered, where the knowledge that is constructed from the given text is negotiated within dialogue communities and is not merely transferred from teacher to student. Furthermore, reciprocal teaching focuses the instrumentalist supposition that knowledge should be useful. That is, reciprocal teaching focuses the role of language in communication, recognizing, and activities. While social constructivism prepares a solid philosophical for the use of reciprocal teaching, cognitive psychology prepares a solid theoretical foundation.

There are several empirical studies from cognitive psychology to prove the usefulness of reciprocal teaching in fostering reading comprehension. Rosenshine and Meister (1994) investigated a meta-analysis of sixteen quantitative studies emphasizing on reciprocal teaching strategy and the result showed that firstly, reciprocal teaching has an important effect on students' reading comprehension performance, secondly, reciprocal teaching has an important effect on students' reading comprehension performance relative to standardized tests. Accordingly, Rosenshine and Meister (1994) explained that reciprocal teaching is most important for poorer

readers. These results showed that reciprocal teaching strategy should be considered in different level of studies.

### ***Studies on the Goals of Reciprocal Teaching Strategy***

Palincsar and Brown (1986) explored that when reciprocal teaching was examined in a group of students from just fifteen to twenty days, the result showed that students' reading comprehension improved from thirty to eighty percent. Accordingly, Palincsar and Klenk (1991) found in their study that students not only increased their comprehensive proficiency at once, but students also kept the developed comprehension proficiency when tested a year later. Reciprocal teaching strategy is especially important when incorporated as part of a treatment for struggling students (Cooper et al., 2000) and it is used with low-performing learners in various situations (Carter, 1997).

Reciprocal teaching originally designed for small-group instruction with struggling students and has proved to yield positive and consistent results with different levels of students who are taught in groups working and affected their activities in reading comprehension (Cooper et al., 2000; Palincsar & Brown, 1984, 1986; Palincsar & Klenk, 1991, 1992). According to Rosenshine and Meister (1994), conducted sixteen studies of reciprocal teaching strategy in their investigations and explored that reciprocal teaching strategy is a model that develops reading comprehension. Similarly, Lubliner (2001) detected that reciprocal teaching strategy is an effective technique for teaching that can enhance on the kind of reading comprehension that is necessary not only for developmental test scores but also for an information age.

Lori D. Ockus (2003) explained that there is a need for readers to learn sophisticated reading skills that they can utilize in the workforce and in a world that is exploding with print materials and information. Readers need to be prepared to understand and monitor various complicated texts from books to electronic sources, and it is believed that the reciprocal teaching approach can facilitate achieving goals.

### ***Goals of Reciprocal Teaching Strtaegy***

Ahmadi and Hairul (2012), Ahmadi and Pourhossein (2012), McLaughlin and Allen (2003), Pearson, et al., (1992) interpreted that reciprocal teaching strategy was designed by Palincsar and Brown in 1984 with different goals and helps students reading comprehension at different grade levels. The goals of reciprocal teaching strategy are as follows:

1. To enhance learners' reading comprehension through four reciprocal teaching strategies (making prediction, generating questions, clarifying, and summarizing).
2. To frame the four reciprocal teaching strategies by modeling, helping, guiding, and, providing the strategies while reading.
3. To direct learners to become meta-cognitive and reflective in using the four strategies.
4. To assist learners evaluate their reading comprehension through reciprocal teaching strategy.
5. To utilize the classroom environment of learning to increase and frame reading comprehension.

6. To empower instruction in a different classroom environment, help students in reading comprehension.
7. To be part of the bigger framework of reading comprehension strategies that provide reviewing, generating questions, making predictions, evaluating, and monitoring.

Accordingly, McLaughlin and Allen (2002) and Pearson, Roehler, Dole, and Duffy, (1992) explained that reciprocal teaching strategy has different goals as follows;

- To promote student's reading comprehension through various kinds of reciprocal teaching strategy; predicting, questioning, clarifying, and summarizing and to make the four strategies by modeling, helping, and applying the strategies while reading and assist students to utilize metacognitive and strategy in their reading activities.
- To guide students control their reading comprehension and use monitoring strategy through four sub-sections of reciprocal teaching, to utilize the social nature of studying to enhance and scaffold reading comprehension.
- To empower teaching in different classrooms setting and to be part of the broader framework of comprehension strategies that comprises previewing, self-questioning, making connections; visualizing, knowing how words work, monitoring, summarizing, and evaluating.

### ***Benefits of Reciprocal Teaching***

Several investigations (Carter, 1997; Palincsar & Brown 1984, 1986; Palincsar, Brown & Campione, 1989; Palincsar & Klenk, 1991, 1992) have found that students who have been teaching with reading comprehension and are taught how to think about texts, in this way are able to feel comfortable to participate in dialogues and engaging with both fiction and non-fiction grade level texts. They understand how to make sense of what they are reading whether it is in the context of interest reading, classroom reading, social studies text, science text, or even in other word problems and their reading comprehension levels develop strongly.

According to Oczkus (2003), reciprocal teaching used in collaborative groups among students for three weeks and enhanced reading comprehension on assessments by thirty to eighty percent. Palincsar and Klenk (1991) explained that students developed reading proficiency immediately and also showed that they had maintained these proficiency on tests performed a year later. It can be concluded that reading comprehension was improved through the use of this instructional model and students who used reciprocal teaching strategy benefited from this strategy and improved their reading competency (Oczkus, 2003).

Allen (2003) elaborated that reciprocal teaching instruction for a while of two weeks was taught to the students prior to teaching it. Feedback was given to the students on a daily basis. The study

found positive changes in the students' abilities to generate questions, answer questions, and summarize information.

Hashey et al., (2003) stated that the instructors found improvements in students' confidence and success, in their recognizing and use of strategies, and in their enjoyment of literature. This study concluded, most of the students agreed that reciprocal teaching helps them understand the book more and facilitates their reading comprehension (Hashey et al., 2003).

Accordingly, a revised version of reciprocal teaching can benefit learners who try to comprehend not only mathematical vocabulary problems but also all the field of target language learning programs. The four components of this strategy as: clarifying, questioning, summarizing and planning (Van Garderen, 2004). In a reciprocal teaching math classroom, one learner is assigned to be the group leader. He or she leads the other learners through each of the four sub-sections of reciprocal teaching strategy. The group members first clarify any vocabularies or phrases that are not recognizable. Then the leader uses questions to help the groups in identifying the key parts of the problem. Next, the leader summarizes the purpose of the word problem and finally helps the group in creating a plan to solve the problem. Each person in the group takes a turn being the leader (Van Garderen, 2004).

## CONCLUSION

Reciprocal teaching is a powerful teaching strategy which allows students to play different roles to practice prediction, questioning, clarifying and summarizing. These are important strategies for fostering and monitoring comprehension. To make it a success, it is important to find the right passage for students to practice these strategies and for students to practice these strategies regularly. Most teacher preparation programs can introduce some focus on reciprocal teaching strategy issues and that strategy can be better incorporated into language learning curricula and better assessed. We are now at a point where most EFL/ESL teachers recognize that there is nothing wrong with having an appropriate strategy in fostering EFL/ESL learning programs, and that programs should be the goals of reciprocal teaching approaches. Reciprocal teaching strategy in reading comprehension is advancing and there is a key role of virtual worlds and other sorts of practical opportunities informed by research. There are always students involved in real communication with texts and they need to try to achieve the goals of reading and comprehend the written message/messages, rather than putting all the responsibility on the shoulders of the teacher. Teachers in the field of study, teaching and research are the people best equipped to help students. For those of us who teach at universities and colleges, we can start with our own students. A major change in teachers' attitudes towards reciprocal teaching instruction is indispensable and it is their job to speed up change. By incorporating current research and its implications into their teaching practice, teachers can help learners gain the skills they need for effective improvement in English language learning activities. It must be borne in mind that teachers are the models for their learners, so first of all they should have a good strategy in their teaching; otherwise, they can harm their students.

### **ABSTRACT**

“Needs analysis” is an important stage in language curriculum design as learners’ language needs in the target literacy contexts can be determined. Nonetheless, many higher learning institutions overlook this component and hastily jump into designing a language course on an ad hoc basis due to the hassles of conducting it and a lack of awareness of needs analysis as a tool in curriculum development. The findings of this study offer a potential solution for institutions with similar contexts. Drawing upon two comprehensive needs analysis approaches – Target Situation Analysis and Present Situation Analysis, this study investigates the academic English language needs and language ability of the pre-university students at The University of Selangor, Malaysia. Data from multiple perspectives: students, ESL (English as a Second Language) lecturers and subject lecturers were collected via three sets of questionnaires. Empirical evidence indicates that the students had greater difficulty with the language rather than the content of subject matters. Besides that, another interesting finding is the differing opinions between the ESL and subject lecturers regarding the students’ ability in handling writing and listening tasks. The results also indicate that English for Specific Academic Purposes (ESAP) courses are more suitable to fulfil the students’ current learning needs as compared to English for General Academic Purposes (EGAP) courses. These findings have implications on curriculum planning and review, materials development and implementation of teaching methods.

**Keywords:** English for General Academic Purposes (EGAP), English for Specific Academic Purposes (ESAP), Needs analysis, Curriculum design

## ENGLISH FOR ACADEMIC PURPOSES AND NEEDS ANALYSIS

At the tertiary level, there are three types of English language courses which are commonly offered to students – general English proficiency courses, English for Occupational Purposes (EOP) courses and English for Academic Purposes (EAP) courses. In the discussion of curriculum development for EAP, which is also the focus of the present study, “needs analysis” or assessing students’ language needs is always considered a crucial component and is fundamental to an EAP approach to course design (Tajino, James & Kyoichi, 2005; Jordan, 1997). Nonetheless, many institutions are lacking awareness of or have overlooked this important component in course design (Cowling, 2007) and due to this reason, Jordan (2002) criticised that the language support that is provided to university students tended to be on an ad hoc basis. Hamp-Lyons (2001, cited in Tajino et al., 2005) articulated that “EAP begins with the learner and the situation, whereas General English begins with the language” (p. 27). It is understood that the nature of EAP courses is different from other types of English language courses. Thus, institutions or course developers should consider the users’ voices (both lecturers and learners) when deciding on the course content.

The growth of EAP is derived from the awareness of ESP practitioners that all the tertiary level students possess different learning needs which is hardly to be fulfilled by teaching them the same type of English language (Soo & Tam, 2011). This view is in line with Sabariah and Rafik-Galea’s (2005) claim that the development of EAP is a result of dissatisfaction with the lack of generalizability of ESP courses. In a study conducted in Hong Kong to find out tertiary students’ English language needs, Evans and Green (2007) found out that most undergraduates actually need language support that is oriented towards academic rather than general English. Thus, the value of EAP cannot be ignored as it is closely associated with students’ academic success. There are two sub-strands under EAP - English for Specific Academic Purposes’ (ESAP) and ‘English for General Academic Purposes’ (EGAP) (Blue, 1988a cited in Jordan, 1997). The difference between ESAP and EGAP is that ESAP courses focus on the actual tasks that students have to carry out while EGAP courses select more general contexts (Dudley-Evans & St. John, 1998). To be specific, ESAP is the language required for a particular academic subject such as medicine and engineering, and its contents include the language structure, genres, vocabulary and the particular skills needed for the area of study. Whereas EGAP selects a more common or non-subject-specific type of language elements such as study skills and its main objective is to equip learners with the necessary skills to complete tasks in a general academic setting (Jordan, 1997).

With reference to what should be focused in needs analysis, Wei and Flaitz (2005) perceived it as something which is subjective as learners’ needs in several skills or only a specific skill can be examined. They also reported that in conducting needs analysis to identify students’ academic language needs, researchers can collect data to identify the tasks students will encounter in university content classrooms and also to analyse the skills the students need to perform those tasks successfully. The latter focus is actually concerned with the student learning styles and strategies which is seen as an important aspect in needs analysis by Kavaliauskiene and Uzpalienė (2003). Thus, needs analysis can be regarded as the process of establishing what and how of a language course (Mo, 2005).

To look more closely into this issue, Dooley (2006) speculated needs analysis as a very practical and the most effective way of identifying specific English language needs. It is considered practical because it is context specific and therefore the information used to design the curriculum is reliable which will then definitely match with the real needs of the learners.

Additionally, it is considered an effective way of assuring the value of the language programme because both students and lecturers will contribute in the needs analysis and this step could provide a more complete and comprehensible picture when deciding on the language course content. Therefore, the designing of any language programmes with needs analysis being conducted will help both instructors and learners to clear some doubts on the effectiveness of the language course.

After being aware of the fact that every individual, in the process of language learning, has certain needs to be fulfilled, institution or to be more specific the language course developers should not take things for granted by just putting in their own assumptions only to predict what might work best for the students. It is believed that the hassles that one might face while conducting needs analysis is the main reason that cause those involve in programme design abandon this important step. Although it is less time consuming and could develop and implement a programme in a shorter time, they will foresee a lot of other important aspects which are not possible to be predicted by any party except the target users. With such a concern, needs analysis is a good platform to elicit information on what the students want, need and already know using their perspectives. Due to this reason, Liz Hamp-Lyons (2000, cited in Jordan, 2002) noted that needs analysis is “fundamental to an EAP approach to course design and teaching” (p.74).

In view of the above, the purpose of this study is (1) to identify the difficulties encountered by the students in using English language in their learning tasks with regard to listening, reading, speaking and writing skills, and (2) to seek the views on the degree of importance of the various language skills in helping the students to learn.

## **METHODOLOGY**

The theoretical aspect of this study is based on the Target Situation Analysis (TSA) and Present Situation Analysis (PSA) approaches (Hutchinson & Waters, 1987; Dudley-Evans & St. John, 1998). The TSA approach is used to determine the learners’ academic English language requirements and the PSA approach is applied to assess the learners’ strengths and weaknesses in different language skills.

### ***Subjects***

Three groups of respondents participated in the study: 93 first year undergraduates, 10 ESL (English as a second Language) lecturers and 8 subject lecturers. This is in line with the suggestions that needs analysis should use multiple sources to increase its reliability and validity (Brown, 1995; Long, 1999; Witkin & Asltschuld, 1995; Keita, 2004). The students of this study were the second semester degree students from three faculties of the University of Selangor, Malaysia, and all of them were also post-foundation students in the same university. The inclusion of both ESL and subject lecturers in the study is considered important as their respective demands and needs pertaining to the students’ language needs could be different.

Therefore, this is an additional dimension to overcome the gap of responses derived from both lecturers as the use of multiple sources such as learners, teachers and domain experts (Long, 2005) can ensure that a wide variety of data can be gathered and compared.

### ***Instrumentation***

Questionnaire was selected as the instrument for the study because it can be used to collect data with large numbers of people and it is easy to administer and analyse if possible response are structured (Faiz, 2005). It is also the least consuming ways of collecting information, and this is why learners' needs are usually specified through questionnaires which enable researchers to determine long-term aims and short-term objectives (Kavaliauskiene & Uzpaliene, 2003).

In developing the questionnaires, several related studies on needs analysis were referred to, including Hutchinson and Waters, 1987; Dudley-Evans and St. John, 1998; Deutch, 2003; Saraswathy, 2003; Muhammad Nadzri, 2004; Banerjee and Wall, 2006; Evans and Green, 2007 and Cowling, 2007. Besides that, the researchers' own experience in teaching EAP courses in the university also contributed to the construction of the questionnaires. Although a number of questionnaires from previous works were used as reference, it had to be modified in a way where it can fulfil the objectives of this study especially after considering the focus of the study, institutional setting and more importantly the respondents of this study. A few shortcomings were detected in those questionnaires, for instance, the choice of language and terminologies used in the questions which were considered inappropriate and hardly understood by students who are not from language education or linguistics background. Three different questionnaires were used to collect the data for the study, one for the students, one for the ESL lecturers and a parallel one for the subject lecturers. These survey questionnaires consist of 71 close-ended questions or items and 8 semi close-ended questions. As Creswell (2008) states that semi close-ended question has all the advantages of close and open ended questions and while it also provides limited open-ended information to encourage responses, it does not overburden the researcher with information that needs to be coded. As these questionnaires were developed for the purpose of this study which was based on the specific need of the present research context, no assumptions were made about either the dimensional structure or internal consistency of the items. Instead, each statement or item was analysed individually.

### ***Pilot Study***

The student questionnaire was piloted on 34 students who were in their third semester and the lecturer questionnaire was piloted on 4 ESL lecturers and 2 subject lecturers. The students were chosen for the pilot study because they had undergone the same courses as the respondents of this study in an earlier semester. On the other hand, the lecturers were selected based on their experiences of teaching the students. They were invited to comment on the questionnaire layout, content, item wording, instruction and the constructions of questions in the survey. This was to test the comprehension of the items in the questionnaires and to eliminate misunderstanding and ambiguities when answering the questions. From the pilot study, it was found that the students faced problems in understanding some of the technical terms such as 'subject matter', 'organization of texts', 'abbreviations', 'supporting details' and 'scanning'. Besides that, they had problems in distinguishing the meaning conveyed by some of the questionnaire items. With the feedback, the researchers removed some of the difficult or technical terms and replaced them with simpler words. The researchers also combined similar items and rephrased them.

***Data Collection and Analysis***

The student questionnaires were administered and completed by the students while they were attending lectures in the classroom. Permission was obtained from the lecturers in advance before collecting the data. The researcher gave an explanation of the objective of administering the questionnaires and the way to answer the questions. The researcher was present throughout the session to help the students if they were facing any problems in answering the questionnaires and this was also to ensure the return of all questionnaires distributed. For the lecturers' questionnaires, it was sent to the lecturers by the researchers. They were briefed on the objective of the study personally and the importance of their involvement in the study. Descriptive statistics were used to report the analysis. The responses from the questionnaires were tabulated and analysed using the Statistical Package for the Social Sciences (SPSS) software.

**DISCUSSION OF FINDINGS**

***Students' English Language Proficiency***

Judging from the emerged responses, the students showed much more confidence in their receptive skills (reading and listening) than in their productive skills (speaking and writing), which reported higher percentage of students with average and lower proficiency level. The ESL lecturers, on the other hand, seemed to have negative perceptions of the students' ability in all the four skills. In their opinions, the students had only achieved average or lower level of proficiency in the four skills. The subject lecturers' responses were also relatively similar with the ESL lecturers' responses. In their view, the students seem incredibly weak in writing and speaking as compared to listening and reading skills. However, despite the strict feedback given by the ESL lecturers, there was still an obvious agreement between them and the students that the students' reading skill was better than the other skills and writing was the most serious problem among them.

***English Language Ability in Reading, Listening, Speaking and Writing Skills***

Although a greater number of students expressed some degree of ease in most of the reading sub-skills as compared to the others, they do face difficulties also in certain sub-skills such as to understand difficult words in reading texts, reading quickly to get the general meaning of reading texts, identifying main points and supporting details. The problem of understanding difficult words, which was claimed difficult by most of the students (44.1%), could be the main factor that directly causes them to face difficulties in other sub-skills. As Coady and Huckin (1997) believe that vocabulary acquisition is the central and the most primary in language learning. Thus, it could be inferred that their lexical competence has an impact on reading ability. The ESL lecturers also found that the students had difficulty (a lot and some) in sub-skills like understanding the content of textbooks, identifying main points and supporting details and skimming to get the general meaning of reading texts. Of all these, having to understand the content of reading materials like textbooks and journals was identified as the students' most serious problem. One lecturer commented in the questionnaire that "*the students will normally take a long time to finish reading just one-page long text*". Besides that, one lecturer also wrote that "*without an English-Malay dictionary, I don't think they can survive*" while another

mentioned that “*they feel bored whenever I ask them to do reading comprehension exercise*”. Thus, there is a need to strengthen students’ reading sub-skills.

In terms of listening, having to understand lecturers who speak fast in English was considered as their major difficulty (having a lot of difficulty and some difficulty - 53.8%). This is followed by difficulty in taking lecture notes (34.4%) and getting the important points of lectures (33.3%). In comparison with the students’ responses, the ESL lecturers reported that the students experienced the most difficulty in following a classroom discussion which is conducted in the English medium and in understanding lecturers who speak fast in English. For the first problem, it was perceived that the students struggled to understand the content of the discussion. One ESL lecturer wrote in the questionnaire that, “*It is hard to have classroom discussion with students especially when the issue discussed are beyond their existing knowledge*” while another also commented that “*It is hard to get them to respond in classroom discussion as they always look blur...in fact they are not clear of what is going on*”. However, the subject lecturers generally felt that their students did not face serious problems in most of the listening sub-skills.

As for speaking (Table 1), the students perceived that they faced a lot of and some difficulties in almost all the speaking sub-skills. At the top of the list is the ability to use correct pronunciation (58.1%). This is followed by difficulty in using suitable words and sentences (54.9%), getting ideas to speak (52.7%), speaking confidently (51.6%), speaking fluently (49.5%) and giving presentation in class (49.5%). This finding lends support to those presented by Evans and Green (2007), whose subjects reported that they find it difficult to speak accurately, communicate ideas fluently and present information orally. On this matter, Evans and Green advocate that students’ development in fluency and accuracy is probably impeded by the fact that subject lecturers place greater emphasis on content rather than other criterion.

Table 1: Students’ perceived difficulties when speaking and communicating in English (N=93)

	A lot of difficulty	Some difficulty	Little difficulty	No difficulty
Speaking sub-skills	Percentage (%)			
Using correct pronunciation	14.0	44.1	32.3	9.7
Speaking fluently	11.8	38.7	46.2	3.2
Speaking confidently	16.1	35.5	37.6	10.8
Getting ideas to speak	9.7	43.0	35.5	11.8
Using the right words and sentence patterns	6.5	48.4	38.7	6.5
Giving presentation in class	14.0	36.6	38.7	10.8
Asking and answering questions	7.5	37.6	39.8	15.1
Participating in small group discussions	5.4	18.3	40.9	35.5
Participating in large group discussion	4.3	32.3	38.7	24.7
Speaking with friends in English outside the class	8.6	30.1	33.3	28.0

Table 2: Comparison of ESL and Subject lecturers' perceptions towards the difficulties faced by the students while speaking and communicating in English

Speaking sub-skills	A lot of difficulty		Some difficulty		Little difficulty		No difficulty	
	Percentage (%)		Percentage (%)		Percentage (%)		Percentage (%)	
	EL	SL	EL	SL	EL	SL	EL	SL
Using correct pronunciation	60.0	-	40.0	62.5	-	37.5	-	-
Speaking fluently	100.0	50.0	-	50.0	-	-	-	-
Speaking confidently	100.0	50.0	-	50.0	-	-	-	-
Getting ideas to speak	40.0	62.5	60.0	37.5	-	-	-	-
Speaking grammatically correct English	70.0	50.0	30.0	50.0	-	-	-	-
Using the right words and sentence patterns	20.0	-	80.0	-	-	50.0	-	50.0
Giving presentation in class	60.0	-	40.0	-	-	62.5	-	37.5

Participating in large group discussion	50.0	-	50.0	-	-	50.0	-	50.0
Speaking with friends in English outside the class	80.0	62.5	20.0	37.5	-	-	-	-

EL – ESL lecturers (N=10); SL – Subject lecturers (N=8)

As shown in Table 2, while some of the students rated themselves as facing only a little or no difficulty, all the ESL lecturers reported that all of their students, in fact, had either a lot of difficulty or some difficulty in all the speaking sub-skills. On this matter, some of them commented that *“the students are too shy to speak in front of the class”, “they are lack of confidence to present ... dare not to project their voice”, “they are unable to construct proper sentences and always use back the same words”, “they will never speak English with friends and the worst is they continue speak Malay to me although I only use English with them”* and one lecturer even wrote that *“when I ask them to speak in English, they always reply me by saying ‘tak pandai’ (not capable of). The comments demonstrate that, besides having problem to speak grammatically correct English, the students are also not confident in using the language to communicate. Moreover, five of them also commented on the students’ poor pronunciation such as “they pronounce English words just like their mother tongues” and “some of the students cannot pronounce or differentiate certain sounds like [th], [e] and [ae]”.*

Similarly, one subject lecturer stated that *“the good ones are ok and not so bad, but the weak ones will always use English with Malay”* while the other one wrote that *“they can’t present and talk smoothly if they don’t refer to papers”*. Apart from this, one of the lecturers realized that although the students were able to give a presentation but they were unable to organize and deliver their ideas or points clearly. He wrote that, *“The way the students present are so not organized... they love to jump from one point to another without linkage...sometimes I also can’t*

get what they mean”. Overall, the above findings are borne out by Jordan (1997) who speculates that the most persistent problem encountered by the students (in most of the surveys conducted) is the lack of ability to express themselves adequately in the spoken language. Moreover, participation in academic discussion has also been noted by him as an area of major difficulty especially in comprehension of spoken English (e.g. when speakers speak too fast and use difficult vocabulary), the pressing need to formulate a contribution quickly (e.g. cannot think of what to say) and inability to formulate an idea in English. In conclusion, the students need be given more opportunities to practise group discussion in order to acquire good oratory skills.

Table 3 below demonstrates the students’ difficulties in writing skills. Among the major difficulties (either a lot or some) encountered by the students are writing grammatically correct sentences, using a variety of sentence patterns and words, using correct punctuation, writing bibliography, writing body section, organizing points and getting ideas to write. The findings, similar to those in Evans and Green (2007), suggest that the students perceive themselves as experiencing greater difficulty with the language rather than the content or structure of academic texts. One of the ESL lecturers commented that “*the students have serious problem in planning for writing...there is no flow in their writing*”. Another lecturer also added that “*It is hard for the weak students to think of idea to write and elaborate points*”. Besides that, one of them stated that “*the students always use direct translation from Malay or Chinese language in composing*” and the other one mentioned that “*they use the same function words throughout... they are very weak in using tenses, subject-verb agreement and preposition*”.

Table 3: Comparison of students and ESL lecturers’ perceptions towards the difficulties faced by the students when writing in English

Writing sub-skills	A lot of difficulty		Some difficulty		Little difficulty		No difficulty	
	Percentage (%)							
	S	EL	S	EL	S	EL	S	EL
Using correct spelling	4.3	-	34.4	50.0	49.5	50.0	11.8	-
Using correct punctuation	5.4	-	43.0	100.0	44.1	-	7.5	-
Using suitable words	6.5	60.0	32.3	40.0	49.5	-	11.8	-
Using varieties of words	5.4	50.0	45.2	50.0	43.0	-	6.5	-
Writing grammatically correct sentences	14.0	70.0	44.1	30.0	40.9	-	1.1	-
Using a variety of sentence patterns	8.6	60.0	45.2	40.0	37.6	-	8.6	-
Linking sentences in a paragraph	2.2	90.0	33.3	10.0	46.2	-	18.3	-

Rewriting other’s ideas using your own words (citation)	7.5	80.0	29.0	-	46.2	20.0	17.2	-
Using suitable format in writing e.g. letters and reports	7.5	-	30.1	80.0	44.1	20.0	18.3	-
Writing bibliography	7.5	-	40.9	60.0	38.7	40.0	12.9	-

S – Students (N=93); EL –ESL lecturers (N=10)

Contradictory to what the students and ESL lecturers had perceived, surprisingly, all the subject lecturers reported that their students did not face a lot of difficulties in most of the writing sub-skills except for citation. A plausible reason for this is that they only require the students to achieve sufficient level of communicative competence or only focus on the subject matter or content and not so much on the writing skills or style of writing. This is affirmed by Weir (1988, cited in Jordan, 1997) where the subject tutors are more concerned with content than with mechanical accuracy features, and their criteria of assessing written work are on the relevance and adequacy of the subject content, the clarity of message and the arrangement and development of written work. On the same matter, Jordan (1997:48) criticises that “the subject tutors are often linguistically unaware and cannot always distinguish a poorly conceived idea from an idea that is expressed through inadequate English”.

### ***English Language Needs***

Generally, most of the students (around 90%) and all the subject and ESL lecturers seemed to indicate support for the relative importance of all the listening tasks as they ranked all the listening tasks as either very important or important to the students. This is closely matched with their perceptions with regard to the students’ listening ability discussed above. The important tasks were listening to understand lectures, to follow discussions, to follow instructions, to understand social conversation and to understand presentation. With regard to this, one ESL lecturer stated that “*the students have to deal with different people such as lecturers, peers and officers from different departments to solve different kind of academic and non-academic matters*”. Similarly, another lecturer also wrote that “*In learning, the students have to engage in various conversations with individuals of different background especially in obtaining information*”.

More than 80% of the students ranked all the speaking tasks as ‘very important’ and ‘important’. The responses, following the degree of importance, were participating in discussion, communicating with lecturers inside and outside of the classroom, presenting written assignments, making suggestions, communicating with other students inside and outside of the classroom and communicating with people in different social situation. Similarly, the ESL and subject lecturers’ responses towards the importance of various speaking tasks were also quite parallel. All the speaking tasks were regarded as either very important or important by them especially in the need to communicate with people in different social situation. In addition, a few lecturers suggested the inclusion of negotiation skills in the English language course.

Similar to the responses gained pertaining to aural and oral needs, an impressively high number of students also viewed the identified reading tasks as being ‘very important’ and ‘important’. These include reading lecture handouts, reading and making own notes, reading newspaper articles and reading technical materials such as journal. According to the perspectives of the ESL lecturers, all the reading skills were considered either ‘very important’ or ‘important’ and the subject lecturers placed the greatest emphasis on the task - reading and understanding technical material where all of them rated it being ‘very important’ to the students.

Overall, the students mainly had the same perceptions when judging the importance of various writing tasks where most of the tasks were ranked 'very important' and 'important' to them. Topping the list of the perceived important writing tasks is taking lecture notes. This is followed by project-writing, summary-writing and report-writing. According to the results, writing daily journals and writing proposals were given the least emphasis. This was probably due to the perception that these tasks were not relevant to their course of study. Conversely, unlike some students' responses, the ESL lecturers considered all the writing tasks as 'very important' and 'important'. In contrast with the ESL lecturers' opinions, writing daily journals was deemed as the least important writing skill by the subject lecturers. The same responses were also obtained from the students. Besides that, the subject lecturers also did not see the importance of summary-writing and presenting visual data.

## **CONCLUSION, IMPLICATIONS AND RECOMMENDATIONS**

The study has identified first year undergraduates or post pre-university students' difficulties in performing various language tasks and perceived needs in EAP learning. This is predominantly helpful to the students as English is the main medium of instruction in most of the courses conducted in the Malaysian higher learning institutions and different demand of the language is required in their learning. The findings of this study in part concur with those revealed in Muhammad Nadzri (2004), Siti Hamin and Ismie Roha (2005), Evans and Green (2007) and Yeoh (2006). It appears that the students encounter a number of serious problems in the four language skills. Although most of the sub-skills are covered in the present English courses conducted in the university, the responses revealed that they were still not proficient enough in using the language in their study. In this regard, the current syllabus of the language courses should be enhanced or improved so that the students can be exposed to sufficient input of language. With the recommendations to revise the current syllabus, the mismatch between the EAP courses and the students' actual learning needs could be reduced. In other words, designing an EAP course which can cater for the students' real learning needs and the development of learner ability to transfer language knowledge (Kavaliauskiene & Uzpaliene, 2003) would be the current implication for successful EAP teaching and learning.

Some implications with reference to the conduct of needs analysis were also drawn from the current study. The nature or the type of English language courses which are to be offered to the concerned groups of students has to be studied at a wider level where a joint effort should be initiated among the related stakeholders. Most of the previously conducted needs analysis was the initiation of the English department. Although some of the researches involved both the students and the content instructors in giving responses or feedback, they, especially the content instructors, were excluded when writing the language course syllabus. In most situations, the syllabus was written by the English language instructors based on the generalization made from the responses obtained. As a consequence, some important insights which could be derived from the mismatch or discrepancies in opinions might be ignored.

As students' academic language needs should not be restricted to only a specific learning situation (Kavaliauskiene & Uzpaliene, 2003; Wei & Flaitz, 2005), it is also vital to look at the possibility in which the students will engage in any activities or functions that require them to use the language in the institution. This will, then, determine the design of the needs analysis especially in the scope of analysis and the selection of approaches and data-collection instruments.

Some recommendations pertaining to the design of academic language tasks and EAP course delivery are made based on the findings in this study. At the course level, more listening activities that involve taking down notes, identifying main points, understanding social conversation and following a classroom discussion should be carried out in the language class as these are the major listening difficulties encountered by the students. In addition, the ESL lecturers should always be alert of their speed of speaking in class as most of the students and ESL lecturers stated that the students had difficulty in understanding the lecturers when they speak fast in English. Furthermore, as the majority of the ESL lecturers stated that the students had a lot of difficulties in understanding the content of discussion, it is recommended that pre-tasks such as brainstorming should be conducted before the real listening task as it could provide an overview of the issue discussed and also to trigger the students schemata. Besides that, short pauses and recapitulation by the language instructors in between the session would also be helpful to recover the students' memory load. This is rather helpful especially for the low proficiency students.

More speaking activities and time should be allocated in the language class in order to boost the students' confidence to speak in English especially to overcome their language anxiety. The students also need to be given more opportunities to involve in group discussion in order to acquire good oratory skills. In addition, the finding also suggests that the students need to be exposed to some training in phonetic transcription so that they are able to discriminate between consonants, vowels, homophones, etc. The students need the knowledge of how letters and combination of letters are to be sounded as the students perceived that they faced the most problem in using correct pronunciation. Besides that, there is also a need to enhance the students' negotiation skills and ability to converse in different social contexts. This can be done by involving the students in drama activity such as simulation and role-play where the students will engage in various conversations with people of different situations and events. This is also a good method of training students in decision-making.

The establishment of a programme for vocabulary enrichment is another strategy to help the students to expand their vocabulary. The content of the programme could be worked out with the cooperation between the language instructors and content experts. This is in line with the students' major difficulties in understanding difficult words and the content of textbooks. It is believed that the programme could also help the students to improve on other language skills. As Coady and Huckin (1997) believe that vocabulary acquisition is the central and the most primary in language learning, thus, it could be inferred that lexical competence has an impact on learner's overall language ability.

The finding also suggests that ESAP (English for Specific Academic Purposes) courses are more suitable in fulfilling the students' current learning needs as compared to EGAP (English for General Academic Purposes) courses. This is confirmed as the majority of the respondents expect the students to learn the language in a content-based environment where the instructional materials used in the language class should be relevant to the students' course of learning. With

this, it is strongly recommended that, when assigning the students into language classes, they should be streamed according to their respective programme or academic department.

The findings of the needs analysis are predominantly helpful in developing an understanding of the students' learning preferences and provide implications in the process of course development, classroom preparation, curriculum planning and review, material writing and implementation of teaching methods.

One limitation of the present study lies in the research instrument. The data of the needs analysis was obtained using the questionnaires administered to the students, ESL lecturers and subject lecturers. The researchers did not use a combination of methods to collect the data. Besides that, there was no classroom observation and investigation into the materials used in the current language courses. Thus, the outcomes of the needs analysis were fully relied on the perceptions, comments and suggestions of the respondents. Additionally, the present study also did not incorporate any form of tests to examine the students' real ability of handling different language sub-skills. Their strengths and weaknesses in various sub-skills were identified via the perceptions given by the stakeholders in the questionnaires administered. Besides that, the study also did not analyse to what extent the students' level of proficiency in the four language skills were actually matched with their perceived ability in performing the sub-skills. Lastly, more valuable data pertaining to the students' language needs may be attained if all the students and more subject lecturers were involved in the study.

## **An Investigation into Topic Oriented Opinions in Iranian EFL Teachers**

**Afrooz Marzban**

*Department of Foreign Languages, Shiraz Branch, Islamic Azad University, Shiraz, Iran  
afroozmarzban@yahoo.com*

**Firooz Sadighi**

*Department of Foreign Languages, Shiraz Branch, Islamic Azad University, Shiraz, Iran  
firoozsadighi@yahoo.com*

### **Bio Data**

**Afrooz Marzban** received her MA in TEFL. She has been teaching English courses at several academic levels and contexts over the past few years. Her areas of interest include teaching methodology and syllabus design.

**Firooz Sadighi** is a professor of Applied Linguistics and teaches graduate courses (M.A. & Ph.D.) in Applied Linguistics at Shiraz University and Islamic Azad University, Shiraz Branch. His areas of interest include ELT and psycholinguistics

### **ABSTRACT**

The present study aimed to explore whether EFL teachers' opinions based on classroom topics can affect the teaching and learning process. To this end, upon filling in a revised teachers' opinion scale, formulated based on Rumpf's (2010), 15 male and female Iranian EFL teachers at a language institute were assigned to three opinion groups; namely, positive, moderate and negative. Cluster analysis of the scores indicated that Iranian EFL teachers were mostly moderate as far as their opinions about teaching were concerned. A Kruskal Wallis test also approved of the significant differences among the three teacher groups which laid further proof on the validity of the used scale.

**Key words:** teacher opinions, topic orientation, mental process

## **BACKGROUND OF THE STUDY**

It is hard for educators to remain totally unbiased while teaching; especially in Teaching of English as a Foreign Language (TEFL) classes. Because language, in this case English, is important to every individual in various ways. It is clear that teachers' opinions on the subject matter affect the atmosphere of the classroom in positive and sometimes negative ways.

Within the classroom context, some teachers stand out as more excited than others. This is, maybe, because their own personal interests and tastes were being reflected on how they taught certain subjects and topics (Rumpf, 2010). A critical question, thus, is what teachers can do to guarantee that their personal opinions do not influence students learning in a negative way. Teachers must be conscious of the outcome of their opinions on the presentation of the material. They have to see what the students see and get as an objective third party. If a teacher does not really enjoy a topic, they should still teach it as if they are eager about the topic.

The issue of learners' performance as influenced by other factors has been discussed in several previous English teaching studies, contexts and societies. (e.g., Cates, 2000; Rumpf, 2010; Niemi & Niemi, 2007; Heafner & Friedman, 2008). Not only English language but also other areas of social studies have been discussed within this framework. However, different variables other than teacher opinion have been discussed. Such previously discussed variables consist of anxiety, motivation, technology, duration, and atmosphere.

Focusing on what affects learning; the mental processes of English as a Foreign Language (EFL) teachers, topic oriented opinions in this study, is beneficial and helpful in many respects especially for reaching educational aims. Therefore, a significant step taken in this study is looking for the existence of the teachers' opinions as a crucial factor in determining many other subsequent events in the learning environment.

## **RATIONALE FOR THE STUDY**

The result of this study will be primarily helpful and effective for EFL teachers because they notice how important their opinions and attitudes are in learning contexts. Therefore, they would try to monitor their opinions more closely using various strategies by themselves or asking their colleagues for help. Teachers may also want to reflect on their opinions to maximize students learning.

Students who are directly in contact with learning that is influenced by the aforementioned effects can also benefit a more organized teacher opinion with regard to the learning process. Thus, teachers' eagerness may create a positive impact on students' learning, comprehension, problem-solving and analyzing the material in the best possible way.

Teacher opinion seems to be a significant individual characteristic in English as a Second Language (ESL)/EFL teaching and learning contexts. Thus, studying this variable in its own right and also in relation to language skills would yield beneficial results to both learners and teachers.

## **LITERATURE REVIEW**

There has not been much literature on teacher opinion in the field of TEFL or applied linguistics; however, most of the studies conducted in this regard have focused on the impact of teacher opinion on several learning styles, factors and consequences. Rumpf (2010) believed that teachers might want to reflect on their opinions to maximize students' learning in the social studies classroom. Whether a teacher likes or dislikes the topics they are teaching to the students there are impacts on the classroom. When a teacher enjoys the topic has positive impacts on the students sparking enthusiasm and interest. The opposite is when a teacher does not enjoy the topic they are teaching. The quality of learning for the student is not the same when a teacher does enjoy the topic.

Niemi and Niemi (2007) tried to determine how teachers would state their opinions in the classroom, as well as how they let students express their ideas in such an environment. The results stated that teachers expressed their ideas in the classroom, and repressed students' opinions. This was a main factor of students' shortage of incentive and hindrance in the classroom. The research was done through interviews and classroom observations over a course of two months. Through these methods it was concluded that the teachers were expressing their opinions in a more negative manner which was actually creating negative outcomes for the students.

A study done by Fredricks, Alfeld, and Eccles (2010) sought to determine the motivation of students and how their environments increased or decreased their interest in the subject matters. This related to the topic of teachers' opinions which made it obvious that interest on the side of teachers is understood as an advantage to the students.

Rumpf (2010) conducted a study on the influence of teachers' opinions on teaching and learning. The results showed that teachers' enthusiasm created a positive impact on students' learning and the converse was also true. This study was done through a questionnaire, interviews and observations. The population in her study was social studies teachers at the secondary level. There were 14 participants from the middle and high school of one region. These teachers were chosen by a convenience sampling. All participants were white-skinned, middle class teachers between the ages of 30 and 50.

In Niemi and Niemi's (2007) study, teachers were stating their opinions and repressing those of the students. This was in both a conscious and unconscious way. In Rumpf's research the teachers admitted they were not causing negative feeling about topics in the students, but it is obvious that this data contradicts the previous study done by Niemis. Teachers' opinions can have negative effect on the students based on Niemis' study which was not what the participants in her study thought was occurring. So educators really need to be aware that their opinions factually impact the students. Fredricks, Alfeld, and Eccles (2010) mentioned that passion for school is more probable to happen when students felt supported and teachers' model enthusiasm and cause enough learning challenge. This would be similar to Rumpf's study where the results specified that enthusiasm was much more common when teachers liked a topic personally. When the teachers enjoyed a topic they reported such manner and therefore it was seen in their teaching

habits, methods and general classroom experience. The researcher's expectation is that the findings of the present study will correlate with the findings of the studies done by Rumpf (2010) and Fredricks, Alfeld, and Eccles (2010).

Gönen and Kocakaya (2006) sought to evaluate opinions of high school physics teachers on instructional activities and the content of physics textbooks. Effective learning is the chief goal of all educational activities and textbooks are very important for achieving this goal. Textbooks also have an important role in specifying teaching and learning activities in the class. Textbooks not only provide information, but also contribute the improvement of imagining and memory abilities, and intelligence and reading habits (Lockheed, Vail, & Fuller, 1986; Lockheed & Verspoor, 1991). Well prepared textbooks help teachers use the time effectively in lessons and make positive contributions to student achievement. However, if not prepared carefully, descriptions and figures in textbooks may cause misunderstanding.

Ardasheva and Brown (2011) conducted a qualitative study about content-area teachers seeking ELL preparation which discovered the relationship between content-area teachers' ideas, beliefs, and professional experiences and their decisions to seek planning in working with English language learners (ELLs). They administered the survey on six full time teachers, who registered in a graduate-level Sheltered Instruction course at a large U.S. Midwestern university, and interviewed them regarding their enrollment choices. The findings only partially supported the first theory that pre-existing positive ELL attitudes guided the teachers' decisions. Although different across individual teachers, motivational reasons for registration were at first based on (a) expected success in the learning experience (b) the perceived value of ELL preparation for quick and future professional goals and (c) consistency with teachers' self-concepts.

## RESEARCH QUESTION

More particularly, the present research will answer the following research question:

How are the Iranian EFL teachers categorized based on their topic oriented opinions?

## METHODOLOGY

As the study was concerned with questionnaire data, a descriptive correlational study using survey methodology was employed.

### *Participant*

The population targeted for this study consisted of 15 EFL teachers (both male and female) with B.A. or M.A. qualifications in English. The participants were selected through convenience sampling from the teachers at Shamim Arghavan Language Academy in Shiraz, Iran where Touchstone series was taught. All participants were middle class teachers between the ages of 25 and 35. The demographic information about the participants is presented in Table 1.

*Table 1: Demographic information about the participants in both phases*

Demographic variables		Number	Frequency %
GENDER	Male	6	40
	Female	9	60
AGE		15	Mean (30) SD (1.89 )

As Table 1 illustrates, of the 15 teachers, the majority were females (Females: 9 – 60% vs. Males: 6 – 40%). The teachers had a mean age of 30.

### ***Instruments***

The scale used in the study was mostly developed and formulated based on Rumpf's (2010) Teachers' Opinion questionnaire which embedded eleven questions used for collecting the data in the first phase of the study. As far as the validity of the scale was concerned, it was expert validated. Three university lecturers gave their feedback on the scale. Such university lecturers came from a different setting from the institute in which the study was conducted; therefore, it guarantees a greater amount of objective feedback. As for the reliability of the scale, Cronbach's alpha was applied to the scale. A number of 15 teachers teaching at a different institute took part in the reliability verification process. Table 2 shows the reliability of the newly formulated Teachers Opinion questionnaire checked through Cronbach's alpha.

*Table 2: Reliability estimate for teacher opinion questionnaire*

### **Case Processing Summary**

	Excluded <sup>a</sup>	0	.0
	Total	15	100.0

a. Listwise deletion based on all variables in the procedure.

Reliability Statistics

Cronbach's Alpha	N of Items
.963	11

As can be seen in Table 2, the reliability of teachers' opinion questionnaire equals 0.963 which was a satisfactory value.

It took the participants about 10 minutes to fill in the questionnaire to determine whether the teachers are interested in the specific topics or not. The questionnaire included 11 items with a three point Likert scale (see Table 3). The questions were Likert-like. Each response had its value ranging from 1 to 3 (Yes=1, Sometimes=2, No=3). The teachers were asked to rate themselves on a scale from yes to no in order to indicate what their opinions were like during teaching. A pilot questionnaire was sent to a few selected teachers. Such initial responses enabled the researcher to edit and remove the confusing or bad items as well as to adjust and reword questions which were leading to missing data.

#### ***Data Collection Procedure***

The study was carried out at a private language institute called Shamim Arghavan Language Academy in Shiraz, Iran, where Touchstone series was taught at adult level. The data were collected in the spring term of 2012. The first phase of data collection incorporated a descriptive design i.e., survey research based on questionnaire data. In the data collection session, the participants were given a consent form that assured their confidentiality. They were also told that participation was voluntary and they could withdraw from the study any time without penalty. The participants were told about the objective of the study in their native language (i.e., Farsi). Thus, when a participant agreed with an item it was a sign of positive opinion. Any value below the borderline of 2 would point to positive opinion while above the borderline would suggest negative opinion on the side of the participant.

### **FINDINGS OF THE STUDY**

This section depicts the results of the teachers' opinion questionnaire analysis based on the scores the participants obtained in the 3 point Likert scale which incorporated 11 questions. It presents the results in two sections. First, the individual item and composite analysis of the questionnaire mean scores followed by the SPSS cluster analysis of the participants were done in order to group the participants in different opinion groups. A further Kruskal-Wallis test was run to see if the finally formulated groups were distinct from each other.

The participants were reminded before filling in the scale, that the items within the scale were intended to check for their attitudes towards the specific topics, therefore choosing 'Yes' was taken to be the sign of positiveness. Likewise, a mean of 2.00 which equaled the inserted anchor of 'Sometimes' could be interpreted as the borderline of positiveness vs. negativeness. This way, values below the borderline of 2 would show positive teachers' opinions while those above it would indicate negative teachers' opinions. This, of course, depends on their distance from the

mean score of 2.00. The study takes both individual and composite score of teachers' opinion into consideration. That is, individual items of the scale as separate indicators of teachers' opinion and the composite score as an overall sign of their opinions was taken into account. Table 3 presents the participants' mean scores from the scale along with total means of all items.

*Table 3: Scores from the Teachers' Opinion scale*

Item	N	Mean	SD
1. As a teacher of Touchstone textbook 3 do you find the unit topics interesting?	15	1.73	.884
2. Do you feel you teach the topics better because of your personal interest in them?	15	1.60	.737
3. Do you like spending a little more time on the topics during class?	15	1.87	.834
4. Do you think that your enthusiasm for the topics rubs off on the students more than if they were topics you were uninterested in?	15	1.73	.799
5. When you teach your favorite subjects do you see a difference in the grades of your students?	15	1.67	.816
6. Do you like your students to get better grades when you like the topics more?	15	1.80	.775
7. Do you feel that you convey the meanings better than other teachers because you like the topics more?	15	1.80	.862
8. Do you ever try to teach the topics you like using different ways when you find the material difficult?	15	1.73	.799
9. Do you ever try to teach the topics you like using different ways when you find the students bored?	15	2.07	.884
10. Do you think that you can manage the Touchstone-based classes (esp. Touch 3) better than others?	15	1.87	.743
11. Do you find yourself energetic and interested enough to teach the topics?	15	1.67	.816
<b>Total</b>	15	1.7758	.69733

As Table 3 indicates, a classification can be made through the calculation of each teacher's scores and putting him/her in a teacher opinion group ranging from positive to negative. An item-by-item analysis of the scale revealed a mean range between 2.07 and 1.60, and the total score of 1.77, so participants could be categorized according to their kind of opinion; namely, positive, moderate and negative. Thus in order to place the participants in the possible three teachers' opinion groups, a further K-means cluster analysis on SPSS was performed. The results indicated that the participants could be categorized into three distinct clusters according to their scores. Tables 4 and 5 present the results for the identified clusters of teachers.

Table 4: Clusters according to the individual item mean of the questionnaire scores

	N	Mean	Std. Deviation	Std. Error	95% Confidence Interval for Mean		Minimum	Maximum
					Lower Bound	Upper Bound		
positive	4	1.0000	.00000	.00000	1.0000	1.0000	1.00	1.00
moderate	7	1.6494	.21274	.08041	1.4526	1.8461	1.45	2.00
negative	4	2.7727	.11736	.05868	2.5860	2.9595	2.64	2.91
Total	15	1.7758	.69733	.18005	1.3896	2.1619	1.00	2.91

Table 5: Participants grouping illustrated in percentage of each cluster

		Frequency	Percent	Valid Percent
Valid	Positive	4	26.7	26.7
	moderate	7	46.7	46.7
	negative	4	26.6	26.6
	Total	15	100.0	100.0

Table 4 presents three groups (i.e. clusters) of teachers according to the mean of their scores on the scale. The total mean and standard deviation of the group are 1.7758 and .69733 respectively. This indicated that the participants' scores were mostly scattered around the mid-point which was thought to be the borderline of teachers' opinion, so the participants were mostly oriented toward the mid-point. Table 5 further illustrates participants' grouping based on the percentage of each cluster.

Table 4 indicates that there are three different groups of participants based on the mean scores of individual item responses that participants marked in the three point Likert scale of teachers' opinion. As Table 4 shows, four of the teachers that participated in the study were clustered into the positive group as their mean score was below the point of "two" which was the borderline of teachers' opinion. As was expressed before, items on the scale elicited different opinions on the side of the teachers; thus choosing "yes" for each item was the sign of positiveness, so the mean of 1.00 could cluster four of the participants into the positive group.

Likewise, seven participants, i.e. the greater proportion of teachers, were placed in the moderate group (Mean: 1.64) who mostly chose anchor two (sometimes) to react to the items on the scale. The remaining four participants were placed in the negative group (mean: 2.77) because of marking anchor 3 (no) which was above the borderline two (sometimes) and indicated negativeness. Table 5 shows the same grouping based on the percentage of each cluster of participants; namely, four participants in positive group equaled 26.7 % while seven in moderate group equaled 46.7 % and four (26.6 %) belonged to the negative group.

#### ***Differences among the three clusters of teachers' opinions***

An additional Kruskal-Wallis test among the three identified groups further confirmed that the obtained clusters of participants were distinct from one another. Therefore, the differences were

significant enough to think of the formulated clusters as distinct from each other. These differences can be seen in Table 6.

*Table 6: Differences among the three clusters of participants*

group		N	Mean Rank
Teacher	positive	4	2.50
	moderate	7	8.00
	negative	4	13.50
	Total	15	

**Test Statistics <sup>a,b</sup>**

	Teacher
Chi-Square	12.410
Df	2
Asymp. Sig.	.002

a. Kruskal Wallis Test

b. Grouping Variable: group

As Table 6 illustrates, the differences among the three clusters of participants were significant ( $p > .000$ ). This would further prove that the participants' responses to questions within the scale have appropriately categorized them into the three groups of positive, moderate and negative which were distinct enough from one another. The results of data analysis so far suggest that the participants reported a total mean of 1.77, i.e. almost at the borderline, actually mildly below it.

Descriptive statistics combined with cluster analysis and Kruskal Wallis Test led us to three different groups of teachers according to their scores. An important proportion of participants ( $f = 7$ ; 46.67%) exhibited moderate group of teachers' opinion (mean = 1.64), a lower proportion ( $f = 4$ ; 26.67%) had positive opinions (mean = 1.00) and finally another low proportion ( $f = 4$ ; 26.67%) had negative opinions (mean = 2.77). This implies that, expectedly, there are variations among Iranian EFL teachers' opinions and they will not always have the same opinion toward the topics they teach. So the proportion of participants in positive and negative groups were the same while the moderate group incorporated the greatest number of participants. The frequency in each group further clarifies the differences among participants in their opinion; thus, laying further proof to the fact that Iranian EFL teachers didn't have the same opinion and were mostly of moderate type. In order to determine the place of this significant difference among the three groups, a further Scheffe test was applied to the mean scores of the three groups (see Table 7).

Table 7: Scheffe test to locate the place of difference among the groups

(I) Teacher	(J) Teacher	Mean Difference (I-J)	Std. Error	Sig.	95% Confidence Interval	
					Lower Bound	Upper Bound
positive	moderate	-.64935*	.10121	.000	-.9315	-.3672
	negative	-1.77273*	.11418	.000	-2.0910	-1.4545
moderate	positive	.64935*	.10121	.000	.3672	.9315
	negative	-1.12338*	.10121	.000	-1.4055	-.8413
negative	positive	1.77273*	.11418	.000	1.4545	2.0910
	moderate	1.12338*	.10121	.000	.8413	1.4055

\* The mean difference is significant at the .05 level.

#### Teacher Scheffe

Teacher	N	Subset for alpha = 0.05		
		1	2	3
positive	4	1.0000		
moderate	7		1.6494	
negative	4			2.7727
Sig.		1.000	1.000	1.000

Means for groups in homogeneous subsets are displayed.

As Table 7 shows, positive and moderate groups were more similar to each other unlike the negative group (mean: 2.77). This similarity between positive and negative groups is better illustrated in Figure 1.

*Figure 1: Similarity and differences among the three group means*

As Figure 1 illustrates, the mean score of the positive group (mean: 1.00) and moderate group (mean: 1.64) exhibited more similarity to one another as compared to that of the negative group (mean: 2.77). So the variance is observable in the mean score of negative group.

## DISCUSSION

This piece of research aimed at investigating the Iranian EFL teachers' topic oriented opinions in educational contexts. In order to answer this question, 15 teachers (9 female and 6 male) filled in a questionnaire of 11 items. Upon analyzing the results, 4 positive, 7 moderate and 4 negative teachers were selected regarding their opinions on teaching topics. The cluster analysis indicated that the three groups of teachers' opinion were formed according to the analysis of participants' mean scores which were also proved to be distinct enough from one another through a Kruskal Wallis Test.

Fredricks, Alfeld, and Eccles (2010) determined that passion and enthusiasm for school are more likely to occur when students felt supported and teachers' model enthusiasm can create an adequate learning challenge. This would go hand in hand with the present study where the results determined that enthusiasm was much more common when teachers enjoyed a topic personally.

When the teachers enjoyed a topic they reported being more enthusiastic and therefore it was seen in their teaching methods, teaching habits, and overall classroom experience.

In Niemi and Niemi's (2007) study, teachers were expressing their opinions and muffling those of the students. This was in both a conscious and unconscious manner meaning sometimes the teachers were not even aware they were doing so. According to Niemis' study, teachers' opinions can have negative impacts on the students which showed congruence with the findings of the present study. Therefore educators really need to be aware that their opinions do in fact affect the students.

Rumpf (2010) conducted a study on the influence of teachers' opinions on teaching and learning. The results showed that teachers' enthusiasm created a positive impact on students' learning and the converse was also true. Whether a teacher liked or disliked the topics they were teaching to the students, there were impacts on students. The present research almost totally correlates with the findings of this piece of research.

## CONCLUSION AND PEDAGOGICAL IMPLICATIONS

The findings of this study may lead to some general conclusions and implications regarding teacher opinion in EFL contexts. First, teachers' opinion proved to be different in Iranian EFL teachers working at intermediate level; namely, they did not have the same topic oriented opinions. That was why three different groups were formed. Also, it was concluded that the Iranian EFL teachers were mostly shown to have a moderate level of opinion in language teaching. Cluster analysis also approved of this finding where the majority of the teachers were placed in the moderate group and the positive and negative groups were both in the second rank. Thus indicating that the same number of the participants were of positive and negative opinions. Therefore, it can be suggested that teachers in an EFL context like Iran are generally moderate in their teaching opinions.

Second, an important factor which was once again highlighted within this study was enthusiasm. When a teacher is personally interested in the material they can create an individual enthusiasm which shows up more strongly during the teaching of the topic. This enthusiasm helps spark students energy and interest in the material because they are curious as to why the teacher has become excited. Another point that the obtained result indicated was that teachers would tend to spend extra time on topics they were interested in rather than those they did not take a liking to. That is why when they were asked if they would spend more time on something they liked most of them answered 'yes'.

Third, this piece of research implies that teachers' opinions can act either as a kind of hindrance or encouragement in the process of language learning so teachers as influential members in learning contexts are expected to play a role in assisting learners in their efforts to reach greater success in language learning.

Finally, English teachers who participated in this study were mainly found to be moderate as far as their opinions were concerned. As teachers are logically expected to assist their students learning, it turns out to be quite essential for them to improve their opinions positively by, for example, observing the teaching of other classes with more positively-oriented teachers.

The present study could be said to suffer from the following limitations:

1. Although the topic under investigation was probably such a common story amongst all teachers and students in every age and level of education, scope of study incorporated teachers at institute level only.
2. Due to manageability concerns, the researcher applied a sample of convenience to the design of the study. The majority of the sample was middle class teachers aging from 25 to 35 years old. With a wider and more diverse sample of teachers to include in the future studies, the results would be more supported and show a wider area of experience by these teachers. Thus one would need to focus on larger samples from various educational contexts.
3. A single teachers' opinion scale was employed in the present study while it would yield interesting results if the subjects were exposed to other scales of teachers' opinion measurement and a comparison is made among the scales for EFL teachers of other academic levels.

## **ABSTRACT**

The purpose of this study is to develop theoretical foundation for the researchers for empirical analysis in this field. This paper points out the fundamentals that are helpful for improving English Language Teachers' performance. The study is qualitative in nature. A lot of literature has been read by the researchers to find out some basic principles that are necessary for the better performance of English Language Teachers. The researchers have investigated the barriers that obstruct English Language Teachers' performance. It becomes essential to investigate barriers to reach some principles that are useful for increasing English Language Teachers' performance.

**Keywords:** Fundamentals, Improve, English Language Teachers and Performance

## **INTRODUCTION**

After reviewing the literature, the researchers concluded that the factors like knowledge sharing, knowledge creation, knowledge use, job satisfaction and leadership style play a vital role for

improving English Language Teachers' performance in Pakistan. If the teachers are satisfied with their jobs, their performance will be increased. Job satisfaction of teachers comes with positive and encouraging attitude from heads of educational institutes. Conducive leadership style of heads of institutes enhances the teachers' performance. If the teachers are at liberty to share and use their knowledge, the knowledge will be created that will ultimately improve English Language Teachers' performance.

## **USE OF KNOWLEDGE FOR BETTER PERFORMANCE**

Proper use of knowledge increases English Language Teachers' performance. Knowledge management practices ensure the best performance of the teachers. Managing knowledge includes three key processes: creating, sharing and exploiting knowledge. Block and Cameron (2002) opine that knowledge management shows a concern for considering the fact that knowledge possessed by individuals is a valuable asset. They are of the view that the knowledge is an intellectual asset and it must be developed and transferred to others. Liss (1999, p. 1) defines that "knowledge management is a formal, directed process of determining what a company has that could benefit others in the company and then devising ways to making it easily available." Bonner (2000) explains that there are few organizations that use the explicit and tacit knowledge of their employees effectively. Sternberg (1997) defines tacit knowledge as a highly personal and objective form of knowledge that can be only inferred from the discussion of others. Hansen et al. (1999) describe that explicit knowledge is academic data that is described in a formal language. Explicit knowledge needs an academic understanding that is achieved through formal education. Knowledge sharing and knowledge creation are interlinked. Knowledge sharing and its implementation provide solutions to many problems faced by organizations. This process is called knowledge creation. The process of knowledge sharing, knowledge creation and knowledge use is obstructed at the individual level and at the organizational level at the same time.

Siddiqui (2007) opines that the assessment system deeply influences the educational set-up of Pakistan. It does not allow the teachers to utilize their potential for using their knowledge. It is also concluded that nothing has been done to improve this system. Burgess et al, (2002) and Fisher (2004) conclude that prescriptive curriculum and tightly defined assessment system damage teachers' professional autonomy and creativity. Teachers are always bound to follow the instructions given by the heads of their organizations so they cannot use knowledge independently. They have to seek permission from higher authorities at every step. Hanke (2002) believes that if the curriculum and assessment system are not flexible for the teachers, the natural potential for the use of knowledge will be constrained. Scholte (2001) demonstrates that the teachers must enhance the competitive abilities of their students by using a number of technologies. In this way the learning of the students can be made better. It becomes necessary to have well equipped classrooms for using technologies. Less equipped classrooms cannot provide an environment in which the teachers can use their knowledge with ease. Here in Pakistan, lack of resources is an obstacle in making classrooms well-equipped. Crystal (2001) suggests that the

teacher should adjust their curriculum plans to meet the demands of society. But the situation in Pakistan is quite pathetic as far as the curriculum is concerned. The prescriptive curriculum does not allow the teachers to use their knowledge independently. The teachers are always bound to follow this well-defined curriculum. So, this situation is a hurdle for teachers to use their knowledge in classrooms. Heller (2005) agrees that the decentralization and deregulation of English curricula make the schools and teachers more autonomous in using knowledge. But in Pakistan, nothing has been done to change the curricula so the teachers are unable to use their knowledge freely. Smith (2008) says that the institutions are becoming autonomous in developing curriculum. In this way, teachers are free to teach whatever they want according to the taste of students. But in Pakistan, teachers are still bound to teach according to prescriptive curriculum. It hampers the teachers to use their knowledge. Al-Otaibi (2004) is of the view that motivated learners can pay high cost and even make sacrifices to achieve their goals in learning foreign language. It was also found that motivated learners can learn language more effectively. The assumption can be made that de-motivated students themselves are a great hurdle for teachers in using knowledge.

## **KNOWLEDGE SHARING AND KNOWLEDGE CREATION FOR BETTER PERFORMANCE**

If the process of knowledge sharing and knowledge creation is smooth among the teachers, the performance of the teachers will be increased. Leonard-Barton (1995) gives his opinion that an organization is both the storage of knowledge and creator of knowledge at the same time. Storage of knowledge is in the form of employees replete with unique skills and expertise and some formal knowledge in the explicit form. Knowledge creation starts after knowledge sharing. Shared knowledge of employees puts forward solutions to problems faced by an organization. Problem solving is one of the major knowledge creating activities. The positive role of an organization is very important in the effective process of knowledge sharing and knowledge creation process. Nonaka and Takeuchi (1997) are of the view in their knowledge conversion model that knowledge creation happens when there is the interaction between explicit and tacit knowledge. Knowledge conversion activities include externalization, internalization, combination and socialization. Nonaka and Takeuchi (1995) also explain that tacit knowledge gets converted into tacit knowledge by sharing experiences. Tsai and Ghoshal (1998) demonstrate that the interaction built through socialization among the employees of the organizations facilitates the knowledge sharing activities. So it can be concluded that the absence of socialization in the organization hinders the knowledge sharing and knowledge creation process. Lin (2008) explains that knowledge sharing behavior of the employees in organizations is very important in order to transfer the knowledge of an individual to many individuals to make the organizations successful. Jiacheng et al. (2012) agree that knowledge sharing behavior among employees creates cooperation for mapping out the fortunes of the organization. Szulanski (1996) suggests that some individuals are unwilling to share their knowledge because they feel that it will bring others to their level and their promotions will be disturbed. Abrams et al. (2003 p. 65) point out that “trust leads to increase overall knowledge exchange, makes knowledge exchanges less costly, and increases the likelihood that knowledge acquired from a colleague is sufficiently understood and absorbed that a person can put it to use.” Tsai (2002) gives his view that decentralized structure of the organization promotes communication and causes increase in employees’ motivation and satisfaction. Damanpour (1999) considers decentralized structure of the organization facilitative to the success of knowledge management activities and methods.

## **ROLE OF LEADERSHIP FOR BETTER PERFORMANCE**

Leadership directly influences the performance of the employees. If the leadership is conducive for the employees, the employees' performance will be improved. Leadership is a way to influence the groups' behavior and direct them towards achieving the defined goals (Robbins, 2003, P. 314). There have been discussions about leadership and leaders since man started working in group. A Leader can be defined as a person who has managerial authority and can influence others. Leadership is simply what the leader does. Leaders should have the qualities like drive, desire to lead, honesty and integrity, self-confidence, intelligence, job-relevant knowledge and extraversion. Leaders influence the behavior, feelings and performance of their subordinates. Performance of subordinates is improved if they are positively influenced by their leaders. Researches have been conducted to explore the leadership styles to find the most effective one for both the quality and quantity of work. The autocratic style, the democratic style and laissez-faire style and their impact on employees' performance have been deeply researched. In autocratic leadership, work methods are dictated to the employees not involving them in decision making process. In laissez-faire leadership, the leaders let the group make decisions and complete the work in whatever way it saw fit. In democratic leadership style, the employees are involved in decision making. It is concluded that democratic style is the most effective to make employees' performance better. Recently, the researches are being carried out to investigate the influences of transactional and transformational leadership on employees' performance. Burns (1978) opines that transactional and transformational leadership styles are more prominent among leadership styles. Transactional leaders give rewards and punishments to encourage performance, making the leader/worker relationship essentially an economic transaction (Bass, 1985). Transactional Leaders work with their team members exchanging rewards with them and being responsive to their immediate interests. Transformational leaders are active leaders that have four distinguishing qualities: charisma, inspiration, intellectual stimulation and individualized consideration (Bass, 1985 & Conger, 1999). Charisma is the extent of pride, faith and respect leaders encourage their workers to have in themselves, their leaders and their organizations. Inspiration is the ability to motivate followers through communication of high expectations. Intellectual stimulation is the frequency with which leaders encourage employees to be innovative in their problem solutions. Finally, individualized consideration is the degree of personal attention and encouragement of self-development a leader imparts to the employees (Bass, 1985 & Bass, 1990).

## **ROLE OF JOB SATISFACTION FOR BETTER PERFORMANCE**

Factors like job security, job autonomy, workplace flexibility, handsome salary and soothing leadership style ensure job satisfaction among English Language Teachers. Job satisfaction is a factor that plays a significant role for improving English Language Teachers' performance. Locke (1976) defines the job satisfaction as a positive and pleasing emotional state from the appraisal of one' job or experience. The very definition suggests that the employees' attitude towards their jobs is formed by their behaviors, beliefs and feelings. According to Galup, Klein

and Jiang (2008), successful organizations ensure their employees' job satisfaction realizing the fact that poor job satisfaction can cripple an organization. Kalleberg (1977) suggests that job satisfaction includes two components. These are intrinsic (referring to the work itself) and extrinsic (representing the facets of the job external to the task itself) job satisfaction. Lashbrook (1997) is of the view that leadership style plays an important role in influencing the employees' job satisfaction. Bogler (2001) demonstrates that the different leadership styles engender different working environment and directly influence employees' job satisfaction. Emery and Barker (2007) state that transformational leaders motivate and encourage their followers to take on more responsibility which increases employees' sense of accomplishment and job satisfaction. Castaneda and Nahavandi (1991) indicate that the employees are more satisfied with both relational and task-oriented behaviors exhibiting simultaneously by their heads.

## CONCLUSION

The purpose of this study was to point out some fundamentals that can improve English Language Teachers' performance. The problems that hinder English Language Teachers' performance have been investigated in this study.

Proper use of knowledge increases English Language Teachers' performance. Knowledge management practices ensure the best performance of the teachers. Managing knowledge includes three key processes: creating, sharing and exploiting knowledge. If the process of knowledge sharing and knowledge creation is smooth among the teachers, the performance of teachers will be increased.

Leadership directly influences the performance of the teachers. If the leadership is conducive for teachers, the teachers' performance will be improved. Factors like job security, job autonomy, workplace flexibility, handsome salary and soothing leadership style ensure job satisfaction and job satisfaction improves English Language Teachers' performance.

*Department of Communication Studies, University of Cape Coast, Cape Coast, Ghana*

### **ABSTRACT**

Attitudes towards languages in Ghana are influenced by historical, sociological and cultural factors, the most prominent of which is a long period of British colonial rule (1821-1957), leading to the establishment of English as the most prestigious and the only official language of the country. In communicating language attitudes in Ghana, people are affected by the functions that English and the local languages perform as well as their potential use in a range of linguistic domains. As Ghana has not taken a definite stand on the national language issue, English performs many communicative functions; it is the language of the media, education, religion, government, judiciary, commerce and social interaction. Measures to promote indigenous languages have often been unsuccessful as knowledge of such languages generally does not confer any appreciable economic advantages. The present paper explores how Ghanaians communicate their language attitudes and reveals the current trend where Ghana's indigenous languages are being relegated to the background.

**Keywords:** Language attitudes, indigenous languages, English, multilingualism, communication.

### **INTRODUCTION**

Ghana has a uniquely complex linguistic landscape. The number of indigenous languages that are spoken has been estimated between 50 and 80. Different scholars have given varied figures for the number of languages of Ghana in view of the difficulty in classifications of varieties as either language or dialects (Bodomo, 1996, 1997; Dolphyne, 1988; Agbedor, 1996; Dakubu, 1988; Laitin, 1994; Gordon & Grimes, 2005). It is worth noting that eleven of the indigenous languages are government sponsored. These are Twi, Fante, Nzema, Ewe, Ga, Dangme, Dagbani, Dagaare, Gonja, Kasem and Gurunne. These government sponsored local languages are supported by the Bureau of Ghana Languages. During the periods when Ghanaian languages were used in primary education, these were the languages which were employed for instruction in schools.

Before formal education was introduced into Ghana, traditional education was conducted in the indigenous languages. With the introduction of formal education and the subsequent use of English as the medium of instruction, the indigenous languages were relegated to the background (Bamgbose, 2000). The situation, however, changed with the arrival of the missionaries who resorted to the development of the local languages in both their educational and missionary efforts. The use of the indigenous languages during the pre-colonial period (1529-1925) survived even during the time when the British Colonial government took over the administration of education in the country. During this period, a systematic pattern began to emerge with regard to both education and language use. The first legislation on the use of a local language in education was promulgated: An indigenous language was to be used as the medium of instruction while at the lower primary levels with English used thereafter (MacWilliam, 1969; Graham, 1971; Gbedemah, 1975). The policy was reversed and became unstable when the administration of the country came under the jurisdiction of indigenous Ghanaians in 1957. Since independence, the use of a Ghanaian language as the medium of instruction at the lower primary level has had a check-like history (Owu-Ewie, 2006). It is worth noting that the rise of nationalist movements in the Gold Coast was hardly linked with the development of the common language argument. What these Ghanaian nationalists had in common was a foreign language, English, which they used to condemn colonialism both on the political platform and on paper (Boadi, 1971). At present, the policy states that English should be used as the medium of instruction from primary one, with a Ghanaian language studied as a compulsory subject to the senior high school (Ameyaw-Akumfi, 2002). While post-independent governments appear to be making language policy, most of the time, they are only perpetuating colonial language policy (Bamgbose, 1991, 2000). Undoubtedly, if a country has had long history of contact with English, if in the multilingual situation it is the only link language among speakers of different languages, and if contacts with other countries through trade, industry and higher education are in English, it is logical that English occupies a central role in the language policy of the country in question. The main fact of language policy discourse in the world today is the role of English in relation to other languages. Language attitudes in Ghana tend to be affected by the functions that English and the indigenous languages perform in the everyday lives of Ghanaians. In comparison with the local languages, English has been used as an official language since Ghana was colonized by Britain and still enjoys an overwhelming position as the language of education and of mass communication.

## **LANGUAGE ATTITUDES OF GOVERNMENTS: FROM A HISTORICAL PERSPECTIVE**

After establishing trade contacts with the Gold Coast, the British colonial Government became more directly involved in administering the country and extending influence and jurisdiction beyond the coastal communities. The impact of some of the various social, political and administrative institutions that were established by British Colonial governments on the spread and influence of the English language was immense. During the reign of Sir Charles McCarthy (1822-1824), he made sure that English was more properly taught in government schools and English ways of life were more widely diffused among the local population. Not only did he order textbooks for use in the schools, he also introduced the wearing of European dress among the local people. By 1824, English was the only language spoken in the Cape Coast Castle School. This was in consonance with the report by the Education Committee of the Privy Council to the Colonial Office in 1847 which, among others, emphasized the need to disseminate a grammatical knowledge of the English language as the most important agent of civilization (Forster, 1965). Educational ordinances passed by the British Government in the nineteenth

century did not favour the indigenous languages. For instance, schools which used the indigenous languages as medium of instruction could not qualify for British aid. Lord Derby was reported to have said at the Colonial Office in Britain in 1883 that instruction in the native language may safely be left to the stimulus of self-interest and government subsidies are not required for its encouragement.

The rapid expansion in facilities and number of school attendants at both the primary and secondary school levels did not help the promotion of the use of the indigenous languages. Accelerated demands for education led to the appointment of a special committee in 1955, the Barnard committee, to investigate the possibilities of adopting English as the medium of instruction throughout the elementary school course. It is worth noting that it was an African government preparing itself for independence in 1957 that, in 1955, cast doubts on the use of the indigenous languages as medium of instruction by appointing the Barnard Committee (Sackey, 1997). Throughout the colonial period up to 1957, it can be realized that because Ghana had no common indigenous language which could serve as a national vehicular language for all the citizens, and also function as the language of government, law, education and social interaction at all levels, it was relatively easy for English assisted by the colonial government, to penetrate various spheres of life of the citizens. Out of the numerous indigenous languages in Ghana only four: Twi, Ga, Fante and Ewe were recommended for use in schools by 1927. Unlike most francophone countries which had French forced on them as medium of instruction through the Brazzaville Conference of 1944 and forbade the use of local language in schools (Djite, 2000), Ghana had the British, to some extent, lay a foundation for the use of the government sponsored indigenous languages as medium of instruction at the lower primary level.

As the language of formal education, English had to be learned at school. Without it, there could be no full participation in the social, economic and political life of the urban societies that were emerging. English became a language used for certain purposes by the educated Ghanaians. These eventually formed an elite group whose influence over the rest of society lay partly in their use of English and in the high degree of social advancement which this new status conferred on them. The educated elites varied widely in the areas of education, occupation and income. However, they were generally speaking, a cohesive group, cut off to some extent from their counterparts in traditional society by their status and use of English. Bilingualism became a hall mark of the educated Ghanaian. Nonetheless, political, social and economic prestige was attached to English alone. As the language of government, the legal practice and administration, English was socially sanctioned, especially in terms of political and economic benefits. It was the language used by lawyers and judges at courts above the level of those of the local councils.

The institutional structures making use of English did not cease after independence, they multiplied as many more people could read and write English. The English language today has to a large extent retained its pre-eminent position as the language everybody must learn if they are seeking employment in the civil and public sectors of the economy. However, there have been attempts made to challenge English as the official language. Since independence in 1957 there have been, at least, three institutional attempts from the political arena to raise the issue of a national language for Ghana. In 1961, the Convention People's Party (CPP) government opened

a debate in parliament on the national language case. Although Akan won some support, the government deferred its decision, arguing that Akan had not developed enough to handle high technical and technological issues.

In 1971, the national language case was again raised in parliament. Among the arguments raised were the widespread use of Akan in the country and the emotional satisfaction of using an indigenous language as a national language or lingua franca. The point was also made that the continued use of English prevented the vast majority of Ghanaians from participating in discussions of national matters. The parliamentary debate ended with the House adopting the motion that in view of the importance of a national language as a factor for national unity in Ghana, the House should take note of the necessity of a modern language or lingua franca. There was the admission that the English language was serving as a neutral binding force, and the choice of an indigenous language might raise opposition from speakers of other languages.

In 1992, the National Democratic Congress (NDC) Government had to deal with the national language issue in Parliament since not all Honourable members were in favour with the use of English as the language of debate or discussion. In September 1995, parliament resolved by standing order that the proceedings of the House shall ordinarily be conducted in the English language, except that, a member may exercise the option to address the House in either Akan, Nzema, Ga, Ewe, Hausa, Dagbani, Dagaare or other local language provided facilities exist in the House for their interpretation. This decision was not implemented because Honourable members who chose to use an indigenous language in parliament might be ridiculed. Another reason was that interpreters would have a difficult task interpreting technical terms in the indigenous languages.

## **LANGUAGE ATTITUDES IN THE EDUCATIONAL SYSTEM**

In Ghana, a minority of the populace are able to speak English, although a certain level of proficiency is required for occupying any public office and for involvement in many and diverse facets of national life. Series of opinions from the public compelled the government to publish cultural and other educational materials in the eleven government-sponsored indigenous Ghanaian languages (Ga, Dangme, Ewe, Twi, Fante, Nzema, Gonja, Kasem, Dagbani, Dagaare and Gurunne). The Bureau of Ghanaian languages and the school of Ghana languages have been charged with the responsibility of organizing teaching courses for both adult and children learners in the local languages. Diploma and degree programmes in some of the indigenous languages are currently run in the Ghanaian public universities and institutions of Ghanaian languages. However, it is worth noting that attitudes towards the use of the indigenous languages within the educational sector remain rather argumentative. Teachers of indigenous languages are not much sought after and, quite often, students do not consider them as proficient academically as teachers of other subjects (Bamgbose, 1991). Indeed, teachers of African languages often try to regain their image by ensuring that they are able to teach some other course as well. Students have very high respect and admiration for teachers and other people who are able to express themselves fluently in English; even teachers have great respect for their colleagues in the English Departments and indeed all those who are very proficient in the use of English (Andoh-Kumi, 1997). Guerini (2007) observed that in most Ghanaian universities, lecturers and professors teaching indigenous languages are looked down upon by their colleagues in the same faculty.

The use of English as the teaching medium within the educational system tends to be preferred to the use of an indigenous language. Some parents are disappointed when they learn that their children are learning their own languages at school. Such parents do not understand why they should pay fees only for their children to learn languages they already speak (Andoh-Kumi, 1997). For most parents in Ghana, the purpose of schooling is to learn and be proficient in the English language. Competence in English is a means to one's well-being and prosperity. English therefore consolidates its position as the only language suitable for use in the local educational system. Dakubu (2005) reports that in the middle of the 20<sup>th</sup> century, the German missionary, Rapp, noted that Ga teachers were not particularly interested in teaching Ga, but refused to teach Akan (which they all spoke) as a matter of ethnic pride, and consequently taught only in English. Colin Baker (1992) describes this linguistic situation as a language conflict attitude where languages in contact are in competition, with one language threatening, as it were, the other.

In 2008, the Ministry of Education Science and Sports, Ghana, in collaboration with the Ghana Education Service introduced a new instructional approach under the National Literacy Acceleration Programme (NALAP). The rationale behind the adoption of this approach is the overwhelming evidence that mother tongue based instruction is a powerful tool for the acquisition of literacy skills. The NALAP is a contribution to the implementation of the former official language policy which stipulates that the Ghanaian language prevalent in the local area be used as the medium of instruction at the kindergarten and Lower Primary Levels while English is studied as a subject and used where necessary. By Primary Four, English replaces the Ghanaian language as medium of instruction and the Ghanaian language treated as just another subject. The use of Ghanaian language at the Kindergarten and lower primary level serves as background or pre-existing knowledge upon which conclusions and predictions can be made to facilitate transfer (Saville-Troike, 1988). Although the use of the child's primary language at the early stages of education has been empirically confirmed to be beneficial, the policy was changed because students' English language proficiency fell (Andoh-Kumi, 1994) leading to the abysmal performance in English and other subject areas. Other challenges the old language policy faced were the multilingual situation in Ghana especially in urban schools, the lack of teachers specifically trained to teach content subjects in the Ghanaian language and the prestige English enjoys as the official language.

Today, in some public Kindergarten Schools in Ghana, both the local languages and English are employed in communication but the latter has a higher percentage of usage. On the other hand, in private schools of the same level, only English is used in interaction. At urban areas, many pupils in Kindergarten can speak English since their parents speak English with them at home. Teaching children at that early stage of education in English is facilitated by the choice of English over the local language by parents. At the Basic School Level, English is the main language of instruction especially in urban areas. Teachers communicate in English with their pupils and encourage them to speak English always. Pupils are told to read the newspapers and story books in order to improve upon their proficiency and competence in English. It is at the rural areas that teachers occasionally combine English and the local language of the community in instructing their pupils. The Senior High Schools and the tertiary institutions in Ghana, really exhibit the official function of English as the language of instruction in education. At these levels students and teachers are

drawn from the heterogeneous ethnic regions of Ghana. Due to the multilingual nature of these educational institutions, English functions as lingua franca. The English language is sometimes code mixed with the local language in informal spoken discourse; where interlocutors share no common Ghanaian language, they are forced to use English (Torto, 2011). In these institutions English is used at all social gatherings. All notices and other forms of communication are in English. It is only in some rural Senior High Schools where occasionally the local language of the community is used concurrently with English at special functions like a durbar or Speech-and-Prize-Giving Day when many of the indigenous people are present.

## LANGUAGE ATTITUDES IN CHURCHES

During the British colonial era in Ghana, the Wesleyan mission, more than any other, supported colonial language policy in education. Being an English mission, the Wesleyans were immensely favoured by the colonial governments. Until the 1880s, English was generally not only the medium of instruction in all Wesleyan schools but also the language of preaching in their churches. African preachers often spoke to their indigenous congregations through interpreters. Rev. Thomas Birch Freeman, the Wesleyan Methodist Superintendent, argued that the use of the English language in Wesleyan schools and churches was part of a programme of hope for the time when the English language will become the classical language of all the tribes and people (Freeman, 1841). In comparing Basel Mission policy of encouraging use of the indigenous languages with Wesleyan emphasis on English, Freeman saw advantages for Methodist youth in respect of job opportunities in the government sector. On the other hand, Basel Mission policy though disqualified its youth from occupying important government and commercial positions, protected them from the negative influences associated with English language education. In religion, English was largely the language of worship in the Christian churches. It was more particularly linked with Wesleyan, Catholic and Anglican missionary activities than with the Presbyterians. In general, the more urban the society, the more English that was used. On the other hand, the more rural, the less English that was used and the more of the indigenous languages.

In recent times, the charismatic or modern churches that have emerged at the urban areas of Ghana use English instead of the language of the community. The local languages are used in some of the charismatic churches in the delivery of sermons and for the dissemination of vital information. The greater parts of the religious activities are in English. Similarly, liturgical activities in some orthodox churches (Methodist, Anglican, and Catholic) at urban settings in Ghana are basically in English. For instance, the Catholic Chaplaincy at the University of Cape Coast, Ghana uses only English during daily and Sunday masses. This attitude is due to the linguistic heterogeneity of the university community. However, at the Pedu Parish, (a suburb of Cape Coast) both English and Fante (the language of the community) are used during worship. For instance, the Bible readings, the sermon and eucharistic prayers are in both languages. One would expect that the language of the community (Fante) would dominate in the religious discourse but English features more. In the Presbyterian Church in Ghana, the indigenous languages feature more in their worship than the other orthodox churches. In an urban area the Bible readings could be in different local languages. It is at the rural areas of Ghana that Christian religious proceedings are in the indigenous languages only but in the cities and towns English dominates.

Given the fact that in Ghana, literacy in English is acquired through formal education, and that a sizable percentage of children have no access to formal education, it is not surprising that the English-speaking population is not a large one. However, what English lacks in numbers, it makes up for in prestige, status and functionality. Hence, language policy discourse in Ghana incorporates the role of English as an official language. One consequence of making a language an official language is the status it confers on the language and its speakers. The official language becomes dominant and other languages become disadvantaged and policies affecting such official languages affect the viability and stability of other languages used (Herriman & Burnaby, 1996). As an official language in Ghana, English holds a dominant position over the indigenous languages. In practically all African countries colonized by Britain, English remains an official or co-official language. Attempts to promote the use of any other language as national or official have resulted either in failure or partial success.

In Ghana, English is consistently employed in television and radio broadcasts, in daily newspapers and magazines, in almost all the administrative and legal documents published within the country, as well as in all official transactions (Huber, 1999). In Ghana, English enjoys great prestige as it is seen as a language of power and security. Competence in English gives one the power to exercise authority; it is a key to one's advancement in society. A person who wants to feel secure learns English as it is one of the requirements for employment in many areas (Saah, 1986). Educated politicians who visit their constituencies would rather speak English than use the dominant language of the area and educated chiefs would speak English to their subjects whenever they have the privilege of a visit by a minister of state or the president of the country (Sackey, 1997). Under normal circumstances, it is unlikely that a student would choose to learn a language that does not offer the prospect of a good job or social advancement. Many parents in Ghana send their children to English-medium schools (Andoh-kumi, 1999). Some parents insist on their children speaking English at home without regard to the indigenous language of the community. The idea is to position the children for a good education and prospects of economic advancement. Given the prevailing attitude that English-medium education is best, it is not surprising that parents opt for it in the belief that the earlier a child is exposed to instruction in English, the better will be its chances of success in higher cycles of education. Speakers of other languages are, to some extent, responsible for the hegemony of English, particularly in terms of their attitudes to their own languages. A family that abandons the mother tongue in favour of English as the medium of communication in the home cannot at the same time complain that its mother tongue has been marginalized in other domains.

It is worth noting that there is a section of the Ghanaian populace who disregard the importance of English in Ghana (Saah, 1986). For them, the status of English as the only official language of the country is an explicit indication of its dependence on the British administration, both culturally and economically. Another section of Ghanaians also consider the indigenous languages more apt to express traditional values and cultural issues, rather than academic matters. On the other hand, English is associated with western style of life; it is connected to the ideas of

prosperity and economic development. A certain degree of competence in English is a requisite for holding important and remunerative national offices.

Among the indigenous languages in Ghana, Akan is widely spoken (Torto, 2000). Akan enjoys considerable prestige and is currently employed in television and radio programmes, religious ceremonies, in politics, within the judicial system and so forth (Guerini, 2007). Minority local language speakers in Ghana feel threatened not only by the hegemony of English but also by a vehicular language like Akan. Linguistic loyalty tends to arise from resentment against a dominant ethnic group like the Asantes', whose native language has been accorded widespread prominence and prestige since the period of colonial rule (Turchetta, 1996). The case of Akan as a nationwide vehicular language is in conformity with the domain theory in language shift (Fishman 1964, 1991): the idea that when one language gets an expanded domain of use over others there is the tendency for bilingual speakers to shift to it. Dakubu (2005) reports that there is a perception among the Ga people of Ghana that they are losing their land, culture and language. The Gas feel their language is dying. This feeling is the result of usurpation of the functionality of the Ga language by other ethnic groups that have migrated to the capital city of Ghana where the Ga language dominates. Such conflicting attitudes by speakers of the indigenous languages tend to generate a situation in which linguistic policy reforms are executed intermittently in order to avoid ethnic tensions.

In comparison with other parts of the world where English is spoken, the language still plays a prominent role. In South Africa, where nine African languages are recognized as co-official languages with English and Afrikaans, English stands out as the dominant language. Furthermore, compared with English-medium education, education in an African language does not confer any significant benefits, either in terms of social mobility or better economic prospects (Alexander, 2001; Kamwangamalu, 1997). Consequently, there is increasing rate in enrolment in English-medium schools, with the result that loyalty to the mother tongue by the younger generation is weakening and competence in the mother tongue is decreasing (deklerk, 1999). Although it has been suggested that neither Afrikaans nor most of the indigenous African languages are in any danger now, the point has also been made that language shift towards English is clearly taking place at an accelerated rate, and the number of domains in which languages other than English can be used is rapidly declining (Reagan, 2001). In Japan, where English is not a central basis for deciding who has access to economic resources and political power (Tollefson, 2000); it is still the case that English is prestigious particularly in international business relations and communication. In other countries, where English is used for internal purposes, it is a major determinant of position and power. In Europe, where there are well-entrenched national languages, it is said that the popularity of English is also a looming threat (Dicker, 1996). It is reported that in Europe, English has become almost a lingua franca in, for example, Scandinavia and the Netherlands, and is the preferred first foreign language taught in schools in virtually all of Europe (Hoffman, 1988). In Switzerland, French Swiss are said to be more attracted to English than to German, while German Swiss also tend to favour English over French as a second language (Dicker, 1996). English has enormous prestige mainly because of its instrumental value. The impact of globalization has also accelerated the use of English in Europe. In Ghana, lack of familiarity with English constitutes one of the greatest impediments; it affects access to education, public services, jobs, political positions and effective functioning in society. The hegemony of English may be said to be beneficial when one considers its communicative and instrumental function, its role as lingua franca and its global attributes (Pennycook, 1994). However, the English language in Ghana poses a direct threat to the very existence of other languages (Pennycook, 1994) and to the country's linguistic and cultural diversity (Webb, 1996).

## CONCLUSION

In communicating their language attitudes, Ghanaians place a high premium on the English language at the expense of the numerous indigenous languages. Today, the English language is the most prestigious and the only official language of Ghana, a privileged position that the colonial language has enjoyed since independence till the present time. Though the minority of the population of Ghana are literate implying that the non-literate function well in the indigenous languages, the use of English continues to dominate the social, political, cultural and economic circles of communication. In Ghana, the indigenous languages are used in fewer domains and speakers are becoming less proficient in their mother tongues leading to code-mixing and possibly language shift. The current situation is that the indigenous languages are being relegated to the background in many spheres of the lives of the people of Ghana and this poses a great threat not only to the culture and traditions, but also to the very existence of the people. While government is concern about the pedagogy and acquisition of English in educational institutions, the crucial role of Ghanaian languages in forging national cohesion should also be considered. The multilingual situation in Ghana should be managed properly in order to protect the nation's indigenous languages from potential threat of death.

## BIO DATA

*Iraj Noroozi is an assistant professor in TEFL graduated from the Islamic Azad University, Science and Research Branch. He has been the head of the English department for two consecutive years and has also been the head of the faculty of the literature and humanities at the Islamic Azad University, Varamin-Pishva Branch for three years. He has published six course books under the title of general and specialized English for the university students and has developed twenty articles in the realm of language learning and teaching. He has conducted four research projects thus far as well. He has also the command of the French and German languages.*

## ABSTRACT

This article expatiates upon the full-fledged impact of the enlarged vocabulary on the overall dexterity in picking up L2s in general and reading comprehension in particular. The Involvement Load Hypothesis is counted as a prolific approach in heightening and broadening the vocabulary knowledge of L2 learners. To prove this, three approaches of L2 vocabulary learning that is, synonyms, definitions, and exemplifications are discussed. 180 male and female students participated as the participants of this study classified into 2 phases. In the first phase, these participants were divided into three 60 male and female subject groups (A, B, and C). Each group was supposed to have six classes during regular 50-minute English class sessions where they centralized on one of the three approaches, that is, synonyms, definitions, and examples, within the passages in order to learn new words in English. The findings based on the ANOVA test statistically unraveled that the participants who availed themselves of the definitions of the new terms did a better job on the test and excelled the other two. In the second phase, the 180 participants were classified into six 30 subject groups and got separate instructions on synonyms, definitions, and exemplifications. The results acquired through this phase were analyzed by a two-way ANOVA. The *F*-observed value for the interaction between the sex of the participants and the input modification on the performance of the participants on the posttest revealed that the input offered through giving definitions to the complicated words had a significant effect on the performance of the female participants only. Exemplification helped the male participants more than the female ones, and the passages along with the synonyms of the new terms helped the female and the male participants' performance to an equal degree. In the long run, the product of this study can broadly help L2 practitioners in the domain of teaching and materials development and the differences between the two sexes from the cognitive and metacognitive point of view in learning and teaching.

**Key Words:** definition, exemplification, involvement load hypothesis, language practitioners, synonyms

## **INTRODUCTION**

Schmitt (2008) holds that for both second language teachers and learners vocabulary is obviously a top priority (p. 18). Having an extensive vocabulary is believed to help L2 learners to partly handle unpredictable communicative situations (Nunan, 1999, p. 103). For L2 learners, big words (i.e., content words) are indisputably the very elements that make it possible for them to figure out meaning (Vanpatten, 2004, p. 276).

Despite the importance of vocabulary in L2 learning, there has been conspicuously less theoretical headway in this domain. A growing number of studies in recent years have examined the effectiveness of several techniques to promote incidental vocabulary learning through reading, such as glossing (i.e., providing the meaning of obscure words in the margins of a text). Because texts offer learners rich input where lexical items are highly contextualized, the addition of some kind of lexical intervention might further nurture lexical development. However, studies investigating the effectiveness of different lexical intervention tasks during reading have led to conflicting results (Long, 1985, p. 89).

The notion of involvement load includes both motivational (e.g., need) and cognitive components (e.g., search and evaluation). They also state that incidental tasks with a higher degree of involvement load are more conducive to the type of processing that is deemed crucial for learning. This hypothesis has important pedagogical implications and it allows us to manipulate task features and predict what tasks will be more effective. However, more empirical evidence is needed in order to support it. In the present study, incidental learning is interpreted as a learning condition in which learners process an L2 for meaning rather than for form (i.e., their goal is text comprehension rather than vocabulary learning) and unintentionally learn L2 forms and/or their meanings. Within this framework, learners may or may not pay attention to words and become aware of them while they are reading for meaning. Therefore, the notion of incidental learning is distinct from the notion of implicit learning, which takes place outside of awareness. While implicit learning can be incidental only, explicit learning can be both intentional and incidental. This view is different from others, where incidental learning is considered to occur when the object of learning is not the focus of attention. Most studies that are premised on the role of involvement, attention, and depth of processing in incidental vocabulary learning have rarely employed process measures, such as think-aloud protocols (Grabe, & Stoller, 2002). While attempts are made to mull over different areas of SLA, this task still needs to be undertaken in studies on incidental vocabulary learning. Moreover, Jiménez (1997) assumes that many of these studies will be incidental if learners are not instructed to learn the words. On the other hand, studies on intentional L2 vocabulary learning (Kamhi-Stein, 1998) have showed that type of words such as concrete and abstract nouns might have an effect on vocabulary learning. This issue remains mainly unexplored and intact in incidental vocabulary learning areas; however (Laufer & Hulstijn, 2001, p. 45-55). The Involvement Load Hypothesis, although not at first formulated in the context of form-focused instruction, claims that in incidental learning situations the retention of forms (i.e., words) depends on the manipulation of cognitive and motivational variables within tasks. This claim can arguably constitute a technique in form-focused instruction

that, in effect, is very different from the default position taken in vocabulary learning and (Swain, 1985, p. 231).

### ***Sex Differences in Cognition and Metacognition***

Hapler (1992) maintains that while it is clear that males and females are physically different, the question of whether there are clear gender differences in intelligence, personality, cognition, or behavior are more difficult to address. Males and females do behave differently in some distances. For example, they appear to think differently, in other words, some psychologists (Lavadenz, 2000) would argue that males and females differ in term of fundamental cognitive processing.

Lavendez believes there are many stereotypes concerning gender differences, some are as follows:

1. Females are more caring and nurturing, and therefore become better teachers, nurses.
  2. Males are more suited for leadership, managerial roles in business and politics.
  3. Women have better verbal abilities, talk more, and are interested in social relationships and emotional issues.
  4. Males are less friendly, are more interested in objects than, and do not show their emotions.
  5. Females are poor in spatial skills, particularly if machines are involved (like parking a car), they cannot find their way easily and are hopeless at throwing.
  6. Males are better at science and math, while females are better at art and social science subject.
- (p. 25)

### ***Evidence for Sex Differences in Cognition, Perception and Attention***

Baker (1987) argues that all of our information about the world comes from our sensory systems, and the cognitive process begins with the ability to sense changes in the environment and to make some meaning out of this bombarding array of sensory stimuli. The first steps in the cognitive process are perception and attention, and possible sex differences in these earliest stages of information processing are interesting for two reasons:

This would provide a theoretical basis for sex-related differences at later cognitive stages. Perception and attention are two areas in which there are no sex-role stereotypes because we have little conscious awareness of the ways in which these systems function.

He also summarizes sex-related differences in perception and attention. Some examples are as follows:

- **Hearing:** Females are better at detecting pure tones.
- **Vision:** Males are better at detecting peripheral visual movements, while females have better acuity.
- **Taste:** Females have lower threshold for detecting sweet, sour, salty, and bitter substances.
- **Touch:** Females are more sensitive to touch on most regions of the body.
- **Attention Disorders:** Sex ratios for Attention Deficit Hyperactivity Disorder (ADHD) show a much greater proportion of males' suffers (Baker, 1987, p. 87).

### ***General Intelligence***

Winograd and Hare (1988) maintain that male brains on average are larger than female brains, but size is no guarantee of intelligence, and the common finding on standardized tests of general

intelligence (IQ) is that males and females show no differences. However, sex differences do emerge in terms of general knowledge. It has been found that males outperformed females in history, politics, geography, and science, while females only outperformed males in art (p. 94). More recently, it was unraveled that males performed better in sport, science, affairs, geography, politics, and history; whereas females outperformed males in cookery and medical activities (Robinson, 1995, p. 5).

### ***Verbal Abilities***

Chamot and O'Malley (1994) concluded that during the early school years, girls outperform boys in most aspects of verbal performance, for example:

1. They say the first word earlier.
2. They articulate more clearly at an earlier age.
3. They use longer sentences.
4. They are more fluent.
5. They learn to read sooner.
6. They perform better on tests of grammar, spelling and word fluency.

Anderson (1999) adds that differences in verbal ability are the first to catch the eyes among the two sexes. For instance, females aged 1-5 were more proficient at L2 skills than were males of the same age. There is also evidence that girls begin to talk earlier than boys, and when they do, they produce longer utterances with more advanced linguistic forms, and make fewer errors. McGuiness (2001) also conducted a large-scale longitudinal study on more than 9,000 children for 6 years and found that girls consistently scored higher on spelling, punctuation, language use, and comprehension. A strong female advantage in verbal abilities was taken for many years. McGuiness (2001) also found that all of the differences were very small, and an analysis by age showed no differences in the magnitude of gender differences. (Maccoby & Jacklin, 2004, p. 54)

Haplern (1992) also posits that females only seemed to outperform males in verbal fluency and synonym generation, and males outperformed on verbal analogies (p.216). Maccoby and Jacklin (2006) concluded that there was little evidence for a clear sex difference in verbal ability. However, some of the clearest evidence comes when we consider the lowest end of the verbal abilities distribution. Stuttering is overwhelmingly a female problem with a ratio of something like 4:1 in favor of females. Similarly, severe reading disabilities (i.e., dyslexia) are also a predominantly male problem with the severe forms of dyslexia occurring 10 times more often in males. Even boys who are not classed as language impaired are much more likely to show speech production problems and are usually slower at learning to read. Finally, after brain damage when language has been affected, males suffer more language impairment and take much longer to recover language skills compared to females who have suffered similar case (p. 47).

## BACKGROUND

### *Synonyms*

Newton (2001) holds that synonym is the derivative of the Greek word with the roots referring to the words that are different but have the same or similar meaning. AS a result, these words are called synonymous; for instance, *seek* is synonymous with *hunt*. They are found in all areas of speech including verbs, nouns, adjectives and others. Those who are involved with producing dictionaries posit that there are no synonyms that have the exact same meaning whether in social levels or context. This they say is because of phonic qualities, usage, and ambiguity of words. Some words just differ in seriousness; for instance, *cat* sounds more informal than *feline*. In the case of usage, some synonyms may have the same meaning when referring to one thing and not the same in others, for example *extended* and *long*. Synonyms are also an important resource for euphemisms that help in language usage. Synonyms can be used to reduce the repetition of certain words that reduces monotony of overusing a certain way. A thesaurus is a large database of synonyms and can be used to greatly enhance writing by offering a wide variety of synonyms. It is important though to understand a context before choosing synonyms. (p. 23)

He also goes on and maintains that different words with very similar or identical meanings are called synonyms. The words *beast* and *animal* are synonyms because they have very similar meanings. Similarly, the words *woods* and *forest* are synonyms. Words that are synonyms are said to be synonymous. In a figurative sense, two words having the same connotation are also said to be synonymous. Note that no word means exactly the same as any other word and, therefore, there are no exact synonyms with identical meaning in English. Certain words may convey the same general notion. For example, the words *slay*, *kill*, *murder*, *execute*, and *slaughter* all convey the same general idea. They are, therefore, employed as synonyms even though they are used in different senses and in different contexts. Words of any part of speech can be synonymous. But remember that if one member of the pair is a noun, the other member must also be a noun. Similarly, the synonym of an adjective will also be an adjective.

However, some words can have more than one meaning. For example, the word *pupil* can mean either student or the aperture in the iris of the eyes. Hence, *pupil* is not synonymous with *student* when it refers to a part of the eye. Similarly, the sentence *He expired* means the same as he died. Here the words died and expired are synonyms. But the sentence My passport has expired does not mean the same as My passport has died. The words expired and died are not synonyms in this context.

A good knowledge of synonyms will help you express the same idea in very many ways.

### *Definition*

Clark (2002) believes that a definition is a passage that explains the [meaning](#) of a term (i.e., a [word](#), phrase, or other set of [symbols](#)) or a type of thing. The term to be defined is the [definiendum](#). A term may have many different senses or meanings. For each such specific sense, a definition is a cluster of words that defines the term.

A chief difficulty in managing definition is the need to use other terms that are already understood or whose definitions are easily obtainable. The use of the term in a simple example may suffice. By contrast, a [dictionary definition](#) has additional details, typically including an [etymology](#) showing snapshots of the earlier meanings and the parent language. Like other words, the term definition has subtly different meanings in different contexts. A definition may be descriptive of the general use meaning, or stipulative of the speaker's immediate intentional

meaning. For example, in formal languages like mathematics, a stipulative definition guides a specific discussion. A descriptive definition can be shown to be right or wrong by comparison to general usage, but a stipulative definition can only be disproved by showing a logical contradiction.

A precise definition extends the descriptive dictionary definition (i.e., lexical definition) of a term for a specific purpose by including additional criteria that narrow down the set of things meeting the definition. Stevenson (2001) has identified persuasive definition as a form of proper definition that purports to describe the true or commonly accepted meaning of a word, but in reality stipulating an altered use, perhaps as an argument for some specific view. Stevenson has also noted that some definitions are legal or coercive whose object is to create or alter rights, duties, or crimes.

Providing the definition of the new words is another effective approach to teach the words; it connects the words being taught with their context and with the learners' prior knowledge. Concept of definition reflects the idea that students need to have some understanding of what a definition is and how it works before they can give the meaning of a word on their own. The concept of definition shows common elements of a dictionary definition. These elements include (1) the category to which the word being defined belongs (*What is this?*), (2) some characteristics of the word (*What is it like?*), and (3) some specific examples of the word. Learners refer to context, their prior knowledge, and dictionaries to find the elements needed to complete the map. Teaching learners to recognize and use information from word parts such as prefixes, suffixes, and roots can be an especially effective word-learning strategy for use with content area texts. These texts can contain many words that are derived from the same word parts. Although words such as *misread*, *interdependent*, and *substandard* can often be figured out from the context, decomposing such words into known parts like *mis-*, *read*, *inter-*, *depend*, and so forth not only makes the words themselves more memorable, but, in combination with sentence context, may be a useful strategy in determining the meaning of unknown words. Learners can acquire the meaning of word parts by inference as they read. Although such a strategy may be part and parcel of normal reading, many learners are unaware that breaking words into their parts can be a way to determine their meanings. In addition, learners often do not know the meanings of common word (Stevenson, 2001, p. 114-117).

### ***Exemplification***

Stahl (1986) holds that through this approach readers have a full access to the detailed examples of the new words and expressions in different sentences right following each of the new words and expressions within the context, and it is a productive helping readers to catch on the real meaning of the new word (p. 23).

He also holds that examples help people to understand far more than explaining the concepts in a paragraph. It takes more work to create examples, but even the simplest examples put side by side aid your readers' understanding while helping you to ensure that you actually know what you are talking about (p. 25).

## **STATEMENT OF THE PROBLEM**

Comprehending and summarizing L2 passages has always been considered as a complicated task for L2 learners. The approach in teaching reading comprehension has been predominantly communicative that emphasizes implicit, incidental learning. The techniques used in comprehension teaching include inferring the meaning of lexical items from the context in which they occur using the dictionary, realia, etc. (Richards & Rodgers, 1996).

According to Sokmen (1997), the argument against implicit instruction to facilitate L2 learning comes from a number of potential problems associated with inferring words from context (p. 237). A large number of studies on teaching reading comprehensions have shown the ineffectiveness of just using explicit instruction and the need to accompany it with implicit instruction or in context explanation of the new words and expressions (p. 202). To promote better learning, the current reading comprehension instruction emphasizes both implicit and explicit learning. While there is now more emphasis on explicit learning, it has been argued that the comprehension development of an L2 is more likely to be generally implicit or incidental beyond a certain level of proficiency (Carter & McCarty, 1998, p. 95).

L2 teachers often believe that providing the appropriate synonyms for the new terms in the passages would help L2 learners to better grasp the clear meaning of the overall passage. On the other hand, there are many L2 practitioners who argue that preparing the definition for the new words would be more fruitful for L2 learners to catch on the widespread meaning of the passages. Notwithstanding, in the third camp some L2 teachers are persuaded that the exemplification of the new term works definitely better to let L2 learners become aware of the essence of the meaning of the passages.

This study attempts to explore the effect of synonyms, definitions, and examples, on L2 learners' reading comprehension ability. On the other hand, educational practitioners, syllabus designer and material developers are expected to differentiate the male and female's amount of reading comprehension when they are exposed to the three aforementioned inputs.

## **RESEARCH QUESTIONS**

1. Do different kinds of teaching reading through synonyms, definition, or examples make any significant difference on L2 learners' overall reading comprehension?
2. Is there any significant difference between reading comprehension ability of those L2 learners who have been taught to employ synonyms, those who have taught to use definitions, or those who are provided with examples of the new words within the context?
3. Is there any difference between the male and female L2 learners to benefit from the three aforementioned approaches to comprehend the essence of the reading passages?

## **STATEMENT OF THE HYPOTHESES**

In order to gain access to more or less convincing findings to remove the pertinent ambiguities following null hypotheses were suggested.

H<sub>01</sub>: There is no significant difference between the amount of reading comprehension of the foreign language learners when they are exposed to synonyms, definitions or examples in the text.

H<sub>02</sub>: There is no interaction of comprehension input – namely, synonyms, definitions, or examples in the overall comprehension of passages between the sex and the method.

## **METHODOLOGY**

### ***Participant***

This study, conducted in June 2009, involved 300 Iranian university students, who were all freshmen. Among them, 100 participants who participated in the pilot studies were excluded from the main study. All were Iranian L2 students between 19 and 25 years of age enrolled in the Islamic Azad University located in Pishva city in Iran. On the basis of their scores on the TOEFL the participants who got more than 70% of the scores were selected as the participants of this study- 180 male and female students. The Levene's test was also conducted and their homogeneity was confirmed- that is, they were more or less of the same level. This study involved two phases. In the first phase the 180 participants were categorized into three groups.

- Group A was assigned to get the reading passages provided with the synonyms of the new words.
- Group B was assigned to get the reading passages along with the definitions of the new words.
- Group C was assigned to get the reading passages along with the examples of the unfamiliar words and inside the texts.

An ANOVA test was run to compare the difference among the means.

In phase two, the participants were divided into six subgroups- that is, 30 male groups and three 30 female groups. A factorial design was assigned to illuminate the interaction between sex and methods.

It is also expedient to mention that all the tests that appeared in this research study had been diligently verified in terms of reliability and validity through the proper statistical measures.

### ***Instruments***

#### ***Phase 1***

In this phase the following instruments were employed:

1. Reading passages selected from TOEFL (Barron's, 1989)
2. Six intermediate piloted reading passages selected from the book titled *Developing Skills* (Alexander, 1967a) with the level of difficulty determined through the Fog index model.

#### ***Phase 2***

In this phase hereunder instruments were utilized:

1. Six intermediate piloted reading passages selected from the book titled *Developing Skills* (Alexander, 1967a) with the level of difficulty determined through the Fog Index model.

## ***Procedures***

### ***Pilot Studies***

As a preliminary step, two pilot studies were conducted 4 weeks before the main study. The purpose of the first pilot study was to choose 6 out of 10 passages that were appropriate in difficulty and content for use in the main study to identify vocabulary and information that needed modification. After constructing the multiple choice comprehension questions test on the six reading passages thus chosen, it was pilot tested in order to identify and modify items that were too easy or too difficult. For instance, items that almost all the participants had answered correctly or incorrectly were revised to make them more discriminating.

### ***Main Study***

The main study was administered in two separate phases. In the first phase 180 participants were divided into three 60 male and female subject groups (A, B, and C). Each group was supposed to have six classes during regular 50-minute English class sessions where they centralized on the synonyms, definitions, and examples within the passages. Three types of test booklets were prepared, each consisting of only one of the three versions (A, B, and C) reading task and test. Within each class, the same procedure was followed. The participants were told to read and try to understand the six short passages and to answer reading comprehension questions (10 items) and 20 multiple-choice questions.

In the second phase the same 180 participants took part, but this time they were divided into six groups- that is, 30 female and three 30 male participants.

Sex	Synonym	Methods Definition	Example
Male Subjects	G1	G2	G3
Female Subjects	G4	G5	G6

In this respect, other different piloted passages in three forms with the same level of difficulty- six passages for each vertical group- were assigned. These participants had also six classes during regular, 50-minute English class sessions. They were also given three kinds of test booklet, each involving exclusively one within each class, the same procedure was followed. The participants were told to read the short six passages based on the three versions (A, B, and C) and try to answer 20 multiple-choice questions.

## **DATA ANALYSIS**

### ***Phase 1***

The data obtained through the procedure described above were analyzed by the analysis of variance (ANOVA). Tukey's HSD tests were also used in post hoc analyses to examine which of the mean differences among the three subject groups were statistically significant. Statistically, it

was unraveled that the participants who availed themselves of the definitions of the new terms did a better job on the test and excelled the other two. Hence, the first null hypothesis was rejected.

### ***Phase 2***

The results acquired through the procedure described above in phase two were analyzed by the two-way ANOVA on the total comprehension scores. The *F*-observed value for the interaction between the sex of participants and the input modification on the performance of participants on the test revealed that the input offered through giving definitions to the complicated words had significant effect on the performance of the female participants only. Exemplification helped the male participants more than the female ones, and synonyms of the new terms helped the female and the male participants' performance to an equal degree. Thus, the second null hypothesis as there is no significant interaction between the gender of the participants and the methods of teaching on their performance on the test was rejected, and it could be claimed that there was a significant interaction between the two variables.

## **CONCLUSION AND THE PEDAGOGICAL IMPLICATIONS**

The major findings of the present study can be summarized as follows:

First and foremost, learners perceive their comprehension to be higher when they receive the modified input than when they receive unmodified one. Likewise, synonyms, definitions and examples within the passages have a more positive impact on the learners' reading comprehension than the intact reading passages. Elsewhere, examples input significantly enhance the reading comprehension of learners of the both sexes, but males are more benefited in this respect. Further, female learners benefit more than male learners when they are exposed to the definition input. On the other hand, definition helps the both sexes to better comprehend the essence of the passages. Last but not least, the sex of the learners and the type of input enjoy positive interaction.

Accordingly the findings of the present study suggest that the provision of any types of information in written input enhances reading comprehension. This study also unravels that female readers are cognitively and metacognitively different from male readers, and females are more sensitive and adoptive to the passages along with the definitions of the new words than the males. This trait of equality should also be taken into consideration in educational arenas.

On the other hand, Craik (2002) postulates that assessment is an essential part of the educational system (p. 120). In recent years, however, its importance has increased, and there are more assessments in schools. It also improves the instructional status of pupils and educational system as a whole. Because of this, it is crucially important that assessment is considered in terms of its fairness for the students of both sex as a measure of achievement. Put simply, the problem of equality and equity among male and female L2 learners should also be considered by test developers.

## LIMITATIONS OF THE STUDY

Despite the researcher attempted to conduct a sound study some limitations popped up in the current work as follow:

1. This study was administered in the Islamic Azad University, while the state universities were disregarded.
2. Specific range of the participants' age was utilized in this study, whereas other age ranges were ignored.
3. The participants were city dwellers, while the residents and students living in the remote rural areas were not considered at all.
4. There are absolutely other techniques to propel the vocabulary knowledge of the L2 learners, but nothing was stated in this respect.
5. The dexterity of the teachers in the area of teaching the pertinent techniques were not concerned whatsoever.

## AIMS AND SCOPE

The international journal of language learning and applied linguistics world performs as a platform for the new scholars to share their insights with other scholars in the form of original papers.

The international journal of language learning and applied linguistics world is a double-blind peer-reviewed international journal dedicated to promoting scholarly exchange among teachers and researchers in the field of language teaching and applied linguistics. Papers submitted to the journal will immediately be sent to two related reviewers who are responsible to provide feedback on the content and the language use.

The journal is published monthly in online and print versions. The scope of the journal includes, but not limited to, the following fields:

*Theory and practice in English*

*Language teaching & learning*

*Teaching English as a second or foreign language*

*Applied linguistics*

*Discourse studies*

*Syllabus design*

*Language learning problems*

*Computer assisted language learning*

*English for specific purpose*

*English for academic purpose*

*Language teaching & testing*

*Translation studies*

## ABSTRACT

This research, entitled “Categorical Function and Lexico-grammatical Meaning as New Theories in Indonesian Linguistics,” aims at introducing and applying new concepts/theories to Indonesian Linguistics. Using qualitative method, it collects data from Indonesian online newspaper published in 2013, *Tata Bahasa Baku Bahasa Indonesia*, *Kamus Besar Bahasa Indonesia*, and personal compositions. The research finds that affixes attached to base morphemes are either inflective or derivative—changing word categories). In relation to that, derivative affixes are called categorical function affixes for they can be used to verbalize, nominalize, adjectivalize, numeralize, and adverbialize. Affixes attached to base morphemes of which categories are verbs and non-verbs will result in varying lexico-grammatical meanings due to their verb inherent aspectuality and sub-categorical lexical meaning of each non-verb category.

**KEYWORDS:** *affixes, function, categorical, lexico-grammatical meaning*

## INTRODUCTION

Every language has its own system which consists of several components, namely phonology, morphology, syntax, and semantics. Grammar of a language is built on two of the four components, i.e. morphology and syntax. Indonesian morphology covers word formation by means of combining morphemes, affixation and composition, and reduplication. Accordingly, speaking about morphemes also entails examining morphological processes.

In a morphological perspective, word forms can be classified into base words (*makan*), affix-attached words (*mengkaji*, *membukakan*, *menjalani*), reduplicated words (*terbayang-bayang*), and composition words (*rumah sakit*). As for categories, they are classified into verb, noun, adjective, adverb, pronoun, number, preposition, and conjunction.

Being part of morphological processes, affixation offers vast attractions since it can be discussed from almost all aspects, to name but a few: affixes, base morphemes, and meanings. Affixation covers prefixes, infix, suffix, confix, and affix combination with base morphemes. In Indonesian language, they are evident in words such as *menuai*, *kinerja*, *satukan*, *pelatihan*, *menganugerahkan*, and *menganugerahi*. Indonesian prefixes are *me-*, *ber-*, *ter-*, *di-*, *ke-*, *se-*, *pe-*, and *per-*; infixes: *-el-*, *-em-*, *-er-*; and *-in-*, *sufiks*: *-kan*, *-i*, and *-an*, *konfiks*: *ke-an*, *pe-an*, *per-an*, *ber-an*, and *se-R-nya*; affix combination: *me(N)-kan*, *me(N)-i*, *memper-*, *memper-kan*, *memper-i*, *ter-kan*, *ter-i*, *di-kan*, *di-i*, *ber-kan*, *ber-an*, *per-kan*, and *per-i* (Kridalaksana. 1994:40--74).

As for syntax, the topic covers phrase, clause, and sentence, all of which can be examined with a focus on several aspects such as type, construction, and distribution.

Semantics talks about meaning in language. It can also be said that semantics talks about the structure of language in relation to the meaning of utterance or speech (Kridalaksana, 2008:216). It discusses the meaning of language units.

Palmer (in Djajasudarma, 2008:5) argues that examining meaning means interweaving language units. In other words, speaking about meaning (*makna*) entails understanding one word and its difference with another (Lyons in Djadjasudarma, 2008:5). Another term for meaning in Indonesian, i.e. *arti*, conveys lexical meaning of a word as lexeme. Sugono et.al. (2008:87) believes that *arti* covers the use of function that a unit of language carries. The last term for meaning is *erti* which can be understood as sub-entry. When attached with affixes, *mengerti*, the word can mean to know or understand (Sogono, et.al. 2008:381). Going from understanding the three terms, studying meaning can be said to be more relevant.

Research on morphology and semantics has been rigorously carried out, especially by several Indonesian linguists as follow:

1. Badudu, *Pelik-Pelik Bahasa Indonesia* (1993), on attaching affixes with base morphemes that create function and meaning.
2. Ramlan, *Ilmu Bahasa Indonesia Morfologi Suatu Tinjauan Deskriptif* (1987) on the function and process of affixation and reduplication
3. Kridalaksana, *Pembentukan Kata dalam Bahasa Indonesia* (1992) on types of affixes in relation to their varying function and meanings
4. Alwi, et.al., *Tata Bahasa Baku Bahasa Indonesia* (2003) on types of affix attached to base morphemes
5. Chaer in *Linguistik Umum* (1994), Kridalaksana in *Kamus Linguistik* (2008), and Djajasudarma in *Semantik 2 Pemahaman Ilmu Makna* (2009) on types of meaning—consisting of narrowed meaning and extended meaning, cognitive, emotive-connotative, referential, construction, lexical, grammatical, ideational, proposition, central, intentional, figurative, associative, contextual, idiomatic, and sayings.

The pieces of research in the above, however, have yet to cover:

- (1) concept/theory of affixes attached to base morphemes with categories such as verb and non-verb such as noun, adjective, pronoun, adverb, quantifier, and conjunction;
- (2) concept/theory of lexicogrammatical meaning, popularly known as grammatical meaning;
- (3) causes of divergent lexicogrammatical meanings attached to base morphemes with verb and non-verb categories.

The three aforementioned aspects are partly examined in my dissertation.

## **METHODOLOGY**

The research uses qualitative method which, according to Djadjasudarma, is a procedure that results in descriptive data, both written and oral. Its objective is to create clear description on factual and accurate data or phenomena being scrutinized in the research.

Sudaryanto (1993:133) argues that collecting data can be carried out through *metode simak*, which consists of several basic techniques, namely *sadap*, *libat*, *cakap*, *simak bebas libat cakap*, *rekam* and *catat*. This analysis makes use of the last technique which covers:

- (a) reading and marking sentences that contain affixes attached to base morphemes;
- (b) taking notes and collecting all elements in part a;
- (c) composing corpus

In addition, it also makes use of distributional study, which is a method that relies on elements of the said language. This approach is based on a consideration that every language unit is related—building an integrated entity (Saussure in Djajasudarma, 1993:60).

## ANALYSIS AND FINDING

### *Categorial Function*

The concept of categorial function is examined because, in Indonesian language, every affix attached to a base morpheme is either inflective (unable to change word category) or derivative (able to change word category).

When affixes, such as *me(N)-*, *me(N)-kan*, and *me(N)-i* are attached to base morphemes, whose categories are verb or non-verb (noun, adjective, adverb, and number), in a morphological perspective, the affixes form derivative category. For example, affix *me(N)-* when attached to adjective *kecil* becomes *mengecil*; *me(N)-kan* when attached to number *dua* becomes *menduaskan*; *me(N)-i* when attached to noun *batu* becomes *membatui*. Such function, I argue, is called categorial function. The function of the three affixes when attached to base morpheme is to verbalize—making derivative verbs.

Such concept is also applicable to other affixes, resulting in certain morphological functions of verbalizing or non-verbalizing. The following are some examples:

- (1) *Pendaki gunung itu tewas di ketinggian 3.700m. (KBBI/2008/1469)*
- (2) *Ia meragukan kejujuran anak muda itu. (KBBI/2008/591)*
- (3) *Pikiran yang dikemukakannya bernilai. (TBBBI/2003/94)*
- (4) *Gadis itu bermobil ke sekolah. (DB/2013)*
- (5) *Dari semua kakaku Kusnolah yang terpandai. (TBBBI/2003/187)*
- (6) *Pak Lukman adalah orang terkaya di daerah kami. (DB/2013)*
- (7) *Terdakwa telah mengakui perbuatannya. (KBBI/2008/32)*
- (8) *Kami berlima akan mengikuti perlombaan itu. (DB/2013)*
- (9) *Keenam siwa yang hilang itu akhirnya ditemukan. (DB/2013)*
- (10) *Kami bekerja sekantor dengan orang Arab itu. (DB/2013)*
- (11) *Kami mengharuskan mereka tidur sebelum pukul 21.00. (KBBI/2008/486)*
- (12) *Juara pertama itu mendapat medali emas. (KBBI/2008/293)*
- (13) *Sebaiknya, Saudara cepat menyelesaikan tugas itu. (DB/2013)*
- (14) *Setinggi-tingginya kapal terbang tidak akan sampai ke langit. (DB/2013)*
- (15) *Kelengahannya menyebabkan dia terjatuh. (KBBI/2008/1235)*
- (16) *Masalah penduduk memerlukan penanganan yang serius. (TBBBI/2003/217)*
- (17) *Manisan buah-buah di Cianjur cukup mahal. (DB/2013)*
- (18) *Kekasih Riva bernama Zulham. (DB/2013)*

In the above sentences, affixes are attached to free morphemes. In sentences (1) and (2), affix *ke-*, attached to adjectives *tinggi* and *jujur*, carries a categorial function of nominalizing. In sentences (3) and (4), affix *ber-*, attached to nouns *nilai* and *mobil*, carries a categorial function

of verbalizing. As for sentences (5) and (6), affix *ter-*, attached to adjectives *pandai* and *kaya*, carries a categorial function of adjectivalizing. In sentences (7), affix *me(N)-I*, attached to personal pronoun *aku*, carries a categorial function of verbalizing. In sentences (8) and (9), affixes *ber-* and *ke-*, attached to numbers *lima* and *enam*, carry categorial functions of verbalizing and numeralizing, respectively. In sentence (10), affix *se-*, attached to noun *kantor*, carries a categorial function of numeralizing. In sentences (11) and (12), affixes, *me(N)-kan* and *me(N)-*, attached to adverbs *harus* and *dapat*, carry a categorial function of verbalizing. In sentences (13) and (14), affix *se-nya*, attached to adjectives *baik* and *tinggi* (reduplicated), carries a categorial function of adverbializing. In sentences (15) to (18), affixes *me(N)-kan*, *pe(N)-*, *-an*, and *ke-*, attached consecutively to conjunction, verb, adjective, and adverb—*sebab*, *duduk*, *manis*; and *hendak*, carry categorial functions of verbalizing and nominalizing

Table 1: Affix Categorial Functions

No.	Base Morphemes/Category	Affixes	Word Formation	Categorial Function
1	<i>tinggi</i> /adjective	<i>ke-an</i>	<i>ketinggian</i>	nominalizing
2	<i>jujur</i> /adjective	<i>ke-an</i>	<i>kejujuran</i>	nominalizing
3	<i>nilai</i> /noun	<i>ber-</i>	<i>bernilai</i>	verbalizing
4	<i>mobil</i> /noun	<i>ber-</i>	<i>bermobil</i>	verbalizing
5	<i>pandai</i> /adjective	<i>ter-</i>	<i>terpandai</i>	adjectivalizing
6	<i>kaya</i> /adjective	<i>ter-</i>	<i>terkaya</i>	adjectivalizing
7	<i>aku</i> /personal pronoun	<i>me(N)-i</i>	<i>mengakui</i>	verbalizing
8	<i>lima</i> /number	<i>ber-</i>	<i>berlima</i>	verbalizing
9	<i>enam</i> /number	<i>ke-</i>	<i>keenam</i>	numeralizing
10	<i>kantor</i> /noun	<i>se-</i>	<i>sekantor</i>	numeralizing
11	<i>harus</i> /adverb	<i>me(N)-kan</i>	<i>mengharuskan</i>	verbalizing
12	<i>dapat</i> /adverb	<i>me(N)-</i>	<i>mendapat</i>	verbalizing
13	<i>baik</i> /adjective	<i>se-nya</i>	<i>sebaiknya</i>	adverbializing
14	<i>tinggi</i> /adjective	<i>se-nya</i>	<i>setinggi-tingginya</i>	adverbializing
15	<i>sebab</i> /conjunction	<i>me(N)-kan</i>	<i>menyebabkan</i>	verbalizing
16	<i>duduk</i> /verb	<i>pe(N)-</i>	<i>penduduk</i>	nominalizing
17	<i>manis</i> /adjective	<i>-an</i>	<i>manisan</i>	nominalizing
18	<i>hendak</i> /adverb	<i>ke-</i>	<i>kehendak</i>	nominalizing

### Lexico-grammatical Meaning

Beside the categorial function in Indonesian linguistics, this research also examines lexico-grammatical meaning. Theory on lexico-grammatical meaning, I argue, is resulted from critiques on and elaboration of studies on grammatical meaning that has been popular among linguists. Whether realized or not, many believe that affixes convey grammatical meanings. The claim that affixes are grammatical comes from the fact that it is related to a subsystem in language organization in which meaning units combine and form bigger units of meaning (Kridalaksana, 2008:73). Grammatical meaning, therefore, can only be formed if there are joining language

units. Consequently, the notion that affixes are grammatical, in my opinion, is partly incorrect. The claim should say that affixes have the potentials of carrying grammatical meanings. Affixes that have yet to combine with language units would properly be called pre-grammatical.

Lexico-grammatical meaning in Indonesian linguistics was first coined by Professor Tadjuddin, my dissertation advisor. The term originates from lexical meaning and grammatical meaning. According to Tadjuddin (2013:30), “Lexical meaning is the meaning of a word in relation to phenomena outside language in a form of physical world description such as earth, sea, and man or of abstract concepts such as humanity, animalism, and plantation.” As for grammatical meaning, Tadjuddin (2013:32) argues that “it is generated by interaction or combination among various formal components.” Furthermore he divided grammatical meaning into grammatical invariant and lexico-grammatical meaning.

Grammatical invariant is a general meaning inherent in bound affixes, for example affix *me(N)-* when attached to verb *pukul*, noun *jamur*, dan adjective *merah* only carries verbalizing meaning with one grammatical invariant, namely active voice (transitive/intransitive)-- *memukul*, *menjamur*, and *memerah*.

This meaning is also evident in other affixes such as *be(R)-* and *te(R)-*. Affix *be(R)-* when attached to nouns *atap*, *sepeda*, and *telur* becomes *beratap*, *bersepeda*, and *bertelur* and carries verbalizing meaning with one grammatical invariant, which is active-intransitive. Affix *te(R)-* when attached to verb *baca* and *injak* becomes *terbaca* and *terinjak* also carries verbalizing meaning with one grammatical invariant, which is passive voice.

As for lexico-grammatical meaning, Tadjuddin argues that it comes from the integration of lexical forms with their lexical meaning and grammatical forms with their grammatical meaning. Affix *me(N)-*, for example, when attached to derivative verbs *memukul*, *menjamur*, and *memerah* with their differing lexical meanings results in varying lexico-grammatical meanings. The three words now mean to do (to hit-*pukul*), to become like (mushroom-*jamur*) and to turn (red-*merah*).

Similarly, affix *be(R)-* in *beratap*, *bersepeda*, and *bertelur* now have lexico-grammatical meaning to have (roof-*atap*), to ride (bicycle-*sepeda*), and to lay (egg-*telur*). Affix *te(R)-* in verbs *terbaca* and *terinjak* carries lexico-grammatical meanings to be able to be (read-*baca*) and to be (stepped on-*injak*).

The following data contain other affixes carrying several lexico-grammatical meanings.

- (19) Dalam rangkaian kegiatan Festival Bunga dan Buah Nusantara 2013 diselenggarakan Lomba **menggambar** Tingkat SD ....

In sentences (19) to (24), affixes *me(N)-*, *me(N)-kan*, dan *me(N)-i* are attached to verbs *gambar*, *angkat*, *beli*, *sakit*, *tembak*, and *pandang*. The lexico-grammatical meaning that affix *me(N)-* carries is activity (action within a long duration) and semelfactive (momentarily); affix *me(N)-kan* carries a lexico-grammatical meaning to have someone do something or causative. Affix *me(N)-i* is iterative (in repetition) and continuative (continuous).

The varying lexico-grammatical meanings are due to the inherent aspectual meaning of verbs; activity verbs (*gambar* and *beli*), punctual verbs (*angkat* and *tembak*), and stative verb (*pandang*).

*In sentences (30) to (38), affixes pe-, ke-, -an, se-nya, and se- are attached to punctual verbs (tinju and timbang), adjectives (panas, tua, cantik, kaya, and mahal), dynamic verbs (pilih), inanimate nouns (rumah and kilas). Affix pe- carries lexico-grammatical meanings profession and tool. Affix ke- carries lexico-grammatical meanings chief and rank. Affix -an carries lexico-grammatical meanings result and tool. Affix se-nya carries a lexico-grammatical meaning intensity. Affix se- carries lexico-grammatical meanings one and temporary.*

The varying lexico-grammatical meanings that those affixes carry when attached to non-verbs are resulted from sub-categorical lexical meaning that each category has.

Table 2: Lexico-grammatical Meanings of Affixes

No.	Base Morpheme	Category/Sub-category	Affixation	Lexico-grammatical Meanings
1	<i>gambar</i>	dynamic verb	<i>menggambar</i>	activity
2	<i>angkat</i>	punctual verb	<i>mengangkat</i>	momentary action (semelfactive)
3	<i>beli</i>	dynamic verb	<i>membelikan</i>	action for indirect object
4	<i>sakit</i>	stative verb	<i>menyakitkan</i>	causative
5	<i>tembak</i>	punctual verb	<i>menembaki</i>	iterative
6	<i>pandang</i>	stative verb	<i>memandangi</i>	continuous
7	<i>sepeda</i>	inanimate noun	<i>bersepeda</i>	to possess/to ride
8	<i>main</i>	dynamic verb	<i>bermain</i>	activity
9	<i>pakai</i>	dynamic verb	<i>terpakai</i>	to be + past participle
10	<i>kaya</i>	adjective	<i>terkaya</i>	superlative
11	<i>jatuh</i>	punctual verb I	<i>terjatuhkan</i>	perfective
12	<i>tinju</i>	punctual verb I	<i>petinju</i>	profession
13	<i>panas</i>	adjective	<i>pemanas</i>	tool
14	<i>tua</i>	adjective	<i>ketua</i>	chief
15	<i>satu</i>	cardinal Number	<i>kesatu</i>	rank
16	<i>timbang</i>	punctual verb	<i>timbangan</i>	tool
17	<i>pilih</i>	punctual verb	<i>pilihan</i>	result
18	<i>cantik, kaya, mahal</i>	adjective	<i>secantik-cantiknya,</i> <i>sekaya-kayanya,</i> <i>semahal-mahalnya</i>	intensity
19	<i>rumah</i>	inanimate noun	<i>serumah</i>	one
20	<i>kilas</i>	inanimate Noun	<i>sekilas</i>	momentary

## CONCLUSION

The analysis on the categorial function and lexico-grammatical meaning finds that

- (1) Affixes in Indonesian language when attached to morphemes carry categorial functions of verbalizing, nominalizing, adjectivalizing, numeralizing, and adverbializing.
- (2) Affixes when attached to base morphemes of both verb and non-verb categories have varying lexico-grammatical meanings consisting of activity, to do something for (indirect object), semelfactive, causative, iterative, continuative, to have/to use, superlative, tool, profession, to be+past participle, perfective, result, chief, intensity, and one.
- (3) The variation of lexico-grammatical meanings that affixes carry is caused by (a) verb sub-category inherent aspectual meaning and (b) lexical meaning sub-category of every non-verb.

### ABSTRACT

The present study focused on the difference between English as a foreign language (EFL) introvert and extrovert learners regarding their reading and listening abilities. Instruments for this study included Preliminary English Test (PET), Eysenck Personality Inventory (EPI), test of listening tasks (6 kinds of listening tasks, 80 items), test of reading tasks (8 kinds of reading tasks, 60 items). The study was conducted on 150 intermediate female EFL learners at Soodeh Language School and Kish Institute who participated and answered a PET test. The 108 homogeneous participants who scored one standard deviation below and above the estimated mean responded to EPI and based on the result of this questionnaire, they were divided into two groups of extroverts and introverts. Then both groups took the same test of listening and reading tasks and their results were compared. Finally, to observe whether or not there were any significant differences between the two groups in terms of performing reading and listening tasks, an independent t-test and a Mann-Whitney U test were run as the assumptions for a MANOVA were violated. The results indicated that introverts perform significantly better in listening tasks than extroverts. But in reading section there was no significant difference between the two groups of students.

**KEYWORDS:** Personality, Extrovert, Introvert, Task, Listening Comprehension, Reading Comprehension.

### INTRODUCTION

In recent years increasing numbers of teachers, in all subjects, have been looking for ways to change the traditional forms of instruction in which knowledge is transmitted. They have sought ways to make the classroom more “student-centered” and have investigated the different ways in which students can play more active roles in discovering and processing knowledge (Littlewood, 2000). In the field of language teaching, the approach which is currently best known in this respect is “task-based language teaching”.

For the past 20 years, task-based language teaching (TBLT) has attracted the attention of second language acquisition (SLA) researchers, curriculum developers, educationalists,

teacher trainers and language teachers worldwide. Long (1985) and Prabhu (1987), in their seminal writings, among others, supported an approach to language education in which students are given functional tasks that invite them to focus primarily on meaning exchange and to use language for real-world, non-linguistic purposes.

One of the major goals of EFL instruction is to prepare learners to be able to understand their interlocutors. The importance of listening cannot be underestimated since as Brownell (1995) believes that listening skills are as important as speaking skills. Speaking does not itself constitute communication unless what is said is comprehended by another person. Teaching the comprehension of spoken speech is therefore of primary importance if communication's aim is to be reached. Considering the importance of listening skill, Chastain (1988) maintains that, "to learn to speak, students must first learn to understand the spoken language they hear. The negative effect that undeveloped listening skills have on second language learning is quite profound. To communicate with native speakers, students must first learn to understand enough in real language situations to comprehend the gist of what native speakers are saying" (p. 193).

Another skill that should be considered in learning foreign languages is reading comprehension. Reading is an important skill for most students of English throughout the world, especially in countries where foreign language learners do not have the opportunity to interact with native speakers but have access to the written form of that language (Rivers, 1968). In the past reading was considered as a language learning process in which the teacher used reading materials to teach vocabulary and grammar, but nowadays it is considered as a communicative process in which reading for meaning is the core objective. Reading can be considered as a source of information, as a pleasurable activity, and as a means of extending one's knowledge of the language (Rivers, 1968).

"In the classroom there is a danger that reading or listening takes place in a void, without purpose or challenge. But it is possible to design tasks which will provide a context for written or spoken texts in order to provide the purpose or challenge which is basic to reading or listening in the real world. These tasks are valuable learning activities in themselves and by providing a context they also make the reading or listening into a meaning focused activity" (Willis & Willis, 2008, p. 33). The purposeful nature reading and listening enhance learning.

The concept of language teaching has always been with us at different stages. Some experts like Busch (1982) who writes about second language learning make the point that language is closely bound up with human behavior and personality. Nowadays, with so many people being interested in learning English, the factors that could impact on their learning effectiveness become more important to know. As we all know, many factors influence the second language learning process. Yet one of the most important elements for SLA research to explain is the great individual variability second language learners obtain in their respective second languages, so it's getting more important to know more about the influence of personality on SLA. Personality factor theory is founded upon the work of Jung (1923). Bradley and Hebert (1997) state that "according to the personality factor theory, individuals are predisposed to one of four preference alternatives in their behavior: (a) How a person is energized - designated by extrovert (E) versus introvert (I); (b) What information a person perceives - designated by sensing (S) versus intuition (N);

(c) How a person decides - thinking (T) versus feeling (F); (d) The life-style a person adopts - judging (J) versus perceiving (P)” (pp. 340-341).

In order to provide effective sensitive instruction, teachers of second or foreign languages need to learn to identify and understand their students’ significant individual differences (Ehrman & Oxford, 1995b; Ehrman, 1993). Among personality factors, Extroversion and, its counterpart introversion, are also potentially important factors in the learning of a second language.

The researchers believe that in spite of the attempts which have been made in the TBLT area to produce authentic, purposeful, informative, enjoyable and motivating contexts to encourage students to use language (especially in listening and reading skills) students’ achievement also depends on their personality type, particularly extroversion and introversion types because these personality types may influence students’ motivation, the strategies they choose to learn a language, classroom management and teaching language.

### ***Task-based Language Teaching***

The task-based approach to language teaching, according to Foster (1999), has evolved in response to a better understanding of the languages learned. Task-based language teaching (TBLT), according to Richards and Rodgers (2001), refers to an approach based on the use of tasks as the core unit of planning and instruction in language teaching. It may be considered as a logical development of communicative language teaching, since it draws on some of the following principles of communicative language teaching movement from the 1980s:

- Activities that involve real communication are essential for language learning.
- Activities in which language is used for carrying out meaningful tasks promote learning.
- Language that is meaningful to the learner supports the learning process.

They also suggest that tasks are proposed as useful vehicles for applying these principles. These principles provide a link between outside classroom reality and inside classroom pedagogy. At the interface with outside classroom reality, communication tasks enable the course to be organized around chunks of communication which reflect students’ needs, interests and experiences. At the interface with inside classroom pedagogy, they provide an organizing focus for the individual components of language that students have to learn in order to communicate.

Nunan (1991) states that task-based language teaching has the following characteristics:

1. Emphasizing on interaction in the target language.
2. Using authentic texts.
3. Focusing not only on language, but also on the learning process itself.
4. Enhancing learner’s own personal experiences.
5. Linking classroom language outside the classroom (p.68).

Tomlinson (1998) states that tasks have been used in foreign language classrooms since the mid-1970s. Since learners need to be able to communicate in English, the best way to develop communicative competence is to use the target language for communication.

Littlewood (2004) argues that there is continuity between task-based language teaching and the broader communicative approach within which it is a development. He further suggests that in a task-based approach “tasks serve not only as major components of the methodology, but also as units around which a course may be organized” (p. 324).

### ***Listening***

Lundesteen (1971, cited in Devine, 1978), states that listening is “the process by which spoken language is converted to meaning in mind” (p. 296).

One of the major goals of EFL instruction is to prepare learners to be able to understand their interlocutors. Rivers (1981) states that listening is not separated from speaking. In fulfilling a communication what is being said should be comprehended by another person. Rehearsed production is useless if we are to respond to the reply that it generates from our interlocutors.

Also Chastain (1988) maintains that both language teachers and students tend to overlook the importance of listening comprehension skills. They do so because their attention is fixed so completely on their ultimate goal, speaking, that they fail to recognize the need for developing functional listening comprehension skills as a prerequisite to developing skills.

### ***Reasons of Negligence***

As Chastain (1988) maintains, the reasons of neglecting the listening skill can be summarized as:

- 1) The listening comprehension process is internal and thus not subject to direct, external observation, examination, and correction. Therefore, language teachers and students tend to overlook its prerequisite importance in language learning because there is no immediate observable output.
- 2) Many teachers have learned that they should base classroom activities on behavioral objectives, so they expect students to produce a product that they can hear or see.
- 3) They can correct students' errors only if they hear them say something or if they read what they have written.
- 4) They feel more comfortable conducting activities in which they can control what the students are doing.
- 5) Tradition also contributes to the slight attention paid to listening in many language classes. Teachers tend to teach as they were taught, and the students tend to expect the same types of classes they have learned to associate with language classes. The result is that neither teachers nor students question the validity of traditional class activities.
- 6) Since teachers have little experience providing classroom activities that help students develop listening comprehension skills, they may not be prepared to generate and conduct the appropriate activities (p. 192).

Modi (2012) maintained that “while traditional approaches to language teaching tended to underemphasize the importance of teaching listening comprehension, more recent approaches emphasize the role of listening in building up language competence and suggest that more attention should be paid to teaching listening in the initial stage of second or foreign language learning” (p. 57).

### ***Factors Influencing Listening Comprehension***

Anderson and Lynch (1988) also identify factors that influence listening comprehension as follows:

#### ***Personal Style***

A more patient, reflective person takes more time to listen and, consequently, may be perceived as listening more effectively.

#### ***Intelligence***

Because intelligence, as a listening variable, interacts with number of factors such as personality, motivation, attitude, and interest in the subject.

#### ***Anxiety and Stress***

High anxiety in listening situations may lead to asking questions that have already been answered or making statements unrelated to current topic of discussion. While the fear of speaking is probably related to social approval, the anxiety one experiences as listener is more likely consequence of his fear of, misinterpreting or misunderstanding of the speaker.

#### ***Attitude***

Even under the best circumstances one tends to listen selectively. If one dislikes a speaker and anticipates that the speaker will have nothing valuable to say, it is likely that what one hears will confirm his expectations.

#### ***Gender***

Coleman (1978, cited in Anderson and Lynch, 1988) was among the first to suggest that females perform better on tasks that involve verbal ability, while men perform better when visual skills are involved.

#### ***Culture***

An individual culture, background, role, and other variables determine listeners' unique perspective.

#### ***Message and Speaker***

The clarity of the organization has a significant impact on listener's ability to comprehend and recall the information he hears. Speakers who use clear organizational strategies are easier to follow than those who present ideas randomly. A speaker's mannerism and delivery have an impact on credibility and affect the listener's attention, comprehension and retention (pp. 35-38).

### *Reading*

Many foreign or second language teaching authorities like (Richards and Renandya, 2002; Anderson, 2003; Nunan, 2004) believe that reading is the most important language skill. Richards and Renandya (2002) argue that in many second or foreign language teaching situations, reading receives a special focus. He believes that there are a number of reasons for this. First, many language foreign language students often consider reading as one of their most important goals. They want to be able to read for information and pleasure, for their career, and for study purposes. In fact, in most EFL situations, the ability to read in a foreign language is all the learners ever want to acquire. Second, written texts serve various pedagogical purposes. Extensive exposure to linguistically comprehensible written texts can enhance the purpose of language acquisition. Good reading texts also provide good models for writing and provide opportunities to introduce new topics, to stimulate discussion, and to study language. Reading, then, is a skill which is highly valued by students and teachers (p. 273).

Grabe (2001) highlights the importance of reading in academic settings. He states that in academic settings, reading is assumed to be the central means for learning new information and gaining access to alternative explanations and interpretations. Reading also provides the foundation for synthesis and critical evaluation skills. In addition, reading is the primary means for independent learning, whether the goal is performing better on academic tasks, learning more about subject matter, or improving language abilities (cited in Celce-Murcia, 2001).

Rivers (1968) believes that reading is a basic skill through which students at a higher level can learn to read great quantities of authentic material and to read for communication. They can also increase their knowledge and understanding of the culture of the speakers of the language, their people and their ways of thinking, their literature, and their past and present civilization.

### ***Reading Comprehension and Communicative Tasks***

Nunan (1993) defines a communicative task as a "piece of classroomwork which involves learners in comprehending, manipulating, producing, or interacting in the target language while their attention is focused on meaning rather than form" (p. 59). Strictly speaking, in task activities, the goal is nonlinguistic. The idea is to get something done via the language, to read a text and do something with the information (Long & Crookes, 1992). According to Knutson (1998) whole tasks involve performance of reading in conjunction with other skills: listening, speaking, or writing. For example, students in a small group might read a number of texts, such as brochures, timetables, or maps, and listen to radio weather or traffic reports in order to carry out the larger task of deciding on the best method of transportation to use on a trip. In such an activity, each student deals with one category of information, and all students must communicate their information to one another to come up with the best plan for the trip.

According to Davies (1995) "traditional reading exercises, such as multiple-choice, are extremely limited in their potential as learning activities. Reading tasks can probably be used as an alternative to the traditional approach to reading comprehension because they not only make use of authentic and challenging texts, but also involve the students interacting with the text and with each other. These two features of reading tasks, along

with other features, may motivate the reader to engage in the learning process more actively, hence, to learn the language better” (p. 144).

### ***Difference between Introverts and Extroverts***

According to Hjelle and Ziegler (1992) most of the efforts have been aimed at determining whether there are significant differences in behavior associated with individual differences along the introversion-extroversion continuum. Some empirically established ways in which introverts and extroverts have been found to differ include:

1. Introverts prefer theoretical and scientific vocations (e.g., engineering and chemistry), whereas extroverts tend to prefer people oriented jobs (e.g., sales and social work).
2. Introverts attain higher grades in college than extroverts. Also, students who withdraw from college for psychiatric reasons tend to be extroverts.
3. Introverts show higher arousal levels in the mornings, whereas extroverts show higher arousal levels in the evening. Furthermore, introverts work better in the morning, and extroverts work better in the afternoon (p. 284).

### ***Introversion-Extroversion and Reading and Listening comprehension***

The study of personality factors, in general, and extroversion/introversion, in particular, with regard to second language acquisition has recently begun to attract increasing attention. Several studies have been carried out to investigate if extroversion/introversion personality trait plays any role in the process of language learning. Pazhuhesh (1994) studied the relationship between the personality dimension of extroversion/introversion and reading comprehension. In her studies introverts were significantly better than their extrovert counterparts. Nasrabadi (1996) examined the role of extroversion-introversion personality dimension in EFL listening comprehension in Iran. He found significant results for extroverts. Daneshvari (1996) also examined the role of E/I in EFL listening comprehension in Iran. He concluded that extroverts were better listening strategy users in comparison with introverts. Brown (1994) “claims that extroversion may be a factor in the development of general oral communicative competence, which require face to face interaction, but not in listening, reading, and writing” (p. 174). But, Tucker, Hamayan and Genesee (1976) found that the more outgoing adventurous students in a one-year late (grade 7) French immersion program performed better on tests of listening comprehension and oral production than did the quieter students. Busch (1982, cited in Brown, 2000) tried to determine whether there would be any relationship between extroversion/introversion and English proficiency among the EFL students in Japan. The study came out to reject the hypothesis that the extraverts are more proficient than the introverts. The study clarified that extroversion had negative correlation with proficiency and the introverts had better reading comprehension and grammar proficiency than the extraverts.

There is no doubt that personality is one of the important factors which impact the second language acquisition, and it is a complicated aspect which is affected by different factors, such as ethnic background, culture, and environment, and so on. Although many

researches, as mentioned before, have made a lot of endeavors to study this, it is not surprising that the results of so many experiments are unclear, and that any conclusions can only be viewed as tendencies, not absolutes. More new findings are expected to come up with further development in the personality research area, and to put them into teaching practice of second language in order to the rapid development of second language teaching.

Although the importance of task- based teaching has been accepted by scholars like Skehan (1996); Willis & Willis (2001); Nunan (1991) in the field of language teaching, and despite the research projects (ex: Bangalore Communicational Teaching Project, 1979-1984, by Prabhu, & Ramani-cited in Long and Crookes-1992) done on the influence of task-based instruction on reading and listening skills, to the best knowledge of the present researcher, no important and substantial research has been conducted on studying the relationship between personality types (Extroversion/Introversion) and performing listening and reading tasks at least in Iran. Therefore, the purpose of the present study was to compare the performance of Extrovert and Introvert Intermediate Female EFL learners on listening and reading tasks. To fulfill the purpose of the present study which was to see whether there were any significant differences between the performance of Extrovert and Introvert Intermediate Female EFL learners on listening and reading tasks, the following questions were raised:

1. Is there any significant difference between the performance of Extrovert and Introvert Intermediate Female EFL learners on listening tasks?
2. Is there any significant difference between the performance of Extrovert and Introvert Intermediate Female EFL learners on reading tasks?

## **METHODOLOGY**

In order to find appropriate answers to the posed questions, the researchers followed certain procedures and made use of certain instruments, which are reported in this section.

### ***Participants***

One hundred and eighty female EFL learners participated in this study, 30 of them who attended the pilot study were intermediate EFL learners at an English institute. And 150 intermediate learners who studied English at a language school and an institute took part in the main study. There was no random selection, and the researcher was not free in selecting the classes and instructional materials. Their age range varied between 13- 24.

### ***Instrumentation***

To meet the purpose of the study, the researchers used following instruments:

Preliminary English Test (PET): This test is designed by Cambridge ESOL and is used as a proficiency test for selecting the intermediate sample among the whole participants. PET consists of three main sections: a 35-item reading comprehension test and an 8-item writing test in the first part (1 hour and 30 minutes), a 25-item listening comprehension test in the second part (35 minutes) and a speaking test consisting of four sections in the third part (10-12 minutes).

Eysenck Personality Inventory (EPI): EPI is a self-report personality inventory based on Eysenck's (1947-1952) factor analysis of personality which assumes three basic factors (the two

most important being extroversion/introversion and neuroticism). The original version of this test contains 57 yes/no questions based on which the degree of extroversion and introversion becomes clarified, but only 24 of them related to measuring the degree of extroversion and introversion. So in this study the Farsi translation of EPI test which contained 24 yes/no questions was administered. The translated version of EPI has been proved to be highly reliable at 0.8 level of significance and published in some books. But the English version of it was translated again to Farsi by a professional translator and compared to Farsi translation of EPI which was already translated and published. They were identical.

**Test of Listening Tasks:** This test was constructed by the researchers and consisted of 84 items which decreased to 80 items after piloting and doing item analysis. The test consisted of 6 kinds of listening tasks as follows:

Listening Cloze Tasks, Information Transfer Tasks, Communicative Stimulus-Response Tasks, True/ False Listening Tasks, Matching Tasks, Multiple Choices listening Comprehension Tasks.

**Test of Reading Tasks:** This test was constructed by the researchers and consisted of 63 items which decreased to 60 items after piloting and doing item analysis. The test consisted of 8 kinds of reading tasks as follows:

Matching Tasks, Gap-Filling Tasks, True/False Reading Tasks, Multiple Choice Guessing Meaning Tasks, Paraphrase Recognition Tasks, Multiple Choice Reading Comprehension Tasks, Ordering Tasks, Multiple Choice Cloze Vocabulary/Grammar Tasks.

### ***Procedure***

Initially, PET, Listening Tasks and Reading Tasks were piloted. Then PET was administered to the 150 subjects in order to come up with a group of EFL learners at approximately the same level of language proficiency but because of practicality issues and time limitation only listening and reading comprehension parts of the PET was administered in this study. Then, those whose score fell in one standard deviation above and below the mean of the sample were selected. The outcome was a homogenized group of 108 learners.

To determine the personality type of the subjects in terms of Extroversion/Introversion, the Eysenck Personality Inventory (EPI) was administered on 108 learners. Through this questionnaire the learners were divided into two groups of extroverts (63 learners) and introverts (45 learners). In order to have equal number of participants in each group, the researcher randomly selected 45 of the extroverts to be in the Extrovert group and excluded the rest.

After determining the groups of introvert and extrovert, the test of reading tasks was administered. The test contained 60 items in three parts which was administered in three sessions because of the limited time that the institute and school allocated for administering the tests. Subjects took one part of the test in each session in 30 minutes.

After the test of reading tasks, the researcher administered the test of listening tasks. The test contained 80 items and was administered in 3 sessions. It took 30 minutes in each session to

administer the parts of the test. The participants listened to each part twice and filled out the answer sheet simultaneously.

After administering the tests and gathering the data, the Descriptive Statistics were estimated then a Mann Whitney U test was run to compare the mean score of introverts and extroverts on listening tasks and an independent t-test was run to compare the mean score of introverts and extroverts on reading tasks.

## RESULTS

This study was aimed to compare the performance of introvert/extrovert EFL learners on tasks of listening and reading. The design of this study is “A Criterion group design” which is a subset of Ex post facto design. In this study the personality type (Introversion and Extroversion) was the independent variable, the performance of students on listening and reading tasks were dependent variables and the level of language proficiency (intermediate level) and gender (female) were control variables.

### *The Homogeneity test*

A mock Preliminary English Test (PET) was used as a proficiency test for selecting the intermediate sample among the whole participants. Because the focus of this study was on the listening and reading skills; therefore just the parts of listening comprehension and reading comprehension of PET were used in this research. In order to check the reliability of the test, first of all PET was piloted among 30 intermediate EFL learners of an Institute. After analyzing item facility, item discrimination, choice distribution, and reliability (calculated through the KR-21 formula), PET was recognized suitable for being used in the study (table 1).

*Table 1: Results of the PET in the pilot study*

N	No. of items	Mean	Range	Variance	SD	r
30	60	35.43	45	225.84	15.02	0.95

As it is shown in the above table the reliability coefficient turned out to be 0.95 which assured the researcher that it could be used safely for the purpose of screening the main participants.

Therefore, this test was administered to a group of 150 intermediate EFL learners of a Language School and an Institute to homogenize subjects of the study. Based on the PET, those participants whose score fell in one standard deviation above and below the mean of the sample through the test were selected for the research. Therefore, 108 of the learners were selected to take part in the study. The results are presented below (table 2).

*Table 2: Results of the Homogeneity Test*

N	No. of items	Mean	Range	Variance	SD
150	60	41.40	44	125.10	11.18

In another step of the piloting, the test of listening tasks was administered. It took one session (1 hour and 45 minutes). And in the next session Reading Tasks were administered in one session (1 hour and 45 minutes). After piloting the Reading and Listening Tasks, Item analysis, Reliability

(calculated through the KR-21 formula) and Internal Consistency of the tests were checked. According to the piloting results, Listening Tasks decreased from 84 items to 80 items and Reading Tasks decreased from 63 items to 60 items (tables 3 and 4).

*Table 3: Results of the test of listening tasks in the pilot study*

N	No. of items	Mean	Range	Variance	SD	r
30	84	50.26	64	450.82	21.23	0.9667

*Table 4: Results of the test of reading tasks in the pilot study*

N	No. of items	Mean	Range	Variance	SD	r
30	63	38.33	39	226.29	15.04	0.94

In the last step of the piloting, in order to check the effect of discarding items on the reliability of the tests, the reliability and descriptive statistics of the test of listening tasks with 80 items and test of reading tasks with 60 items were analyzed, checked and estimated again. Results showed a very good degree of reliability. So, the tasks were recognized suitable for using in the study (tables 5 and 6).

*Table 5: Results of the test of listening tasks in the pilot study*

N	No. of items	Mean	Range	Variance	SD	r
30	80	46.8	64	441.06	21	0.9680

*Table 6: Results of the test of reading tasks in the pilot study*

N	No. of items	Mean	Range	Variance	SD	r
30	60	36	40	226	15.03	0.95

### ***The Descriptive Statistics: Test of Reading and Listening Tasks***

After determining the groups of introvert and extrovert through the administration of EPI, the test of reading and listening tasks were administered. Both groups of introverts and extroverts took the same tests. The test of reading tasks comprising 60 items in three parts was administered in three sessions and the test of listening tasks consisting of 80 items was administered in three sessions too. The descriptive statistics (mean, range, variance, standard deviation and also reliability) of the tests of reading and listening tasks were calculated. Reliability of the tests was calculated through the KR-21 formula. The results are shown in tables (7 and 8).

*Table 7: Results of the test of reading tasks for extroverts and introverts*

	N	No. of items	Mean	Range	Variance	SD	Reliability (r)
Extroverts	45	60	41.15	37	64.90	8.05	0.81
Introverts	45	60	43.8	34	108.34	10.40	0.90

*Table 8: Results of the test of listening tasks for extroverts and introverts*

	N	No. of items	Mean	Range	Variance	SD	Reliability (r)
Extroverts	45	80	51.84	53	169.63	13.02	0.90
Introverts	45	80	57.22	52	209.99	14.49	0.93

***The Inferential Statistics: Test of Reading and Listening Tasks***

To examine whether the null hypotheses were supported or rejected, the data gathered in this study was subjected to Multivariate-ANOVA (MANOVA), since there were two dependent variables (reading and listening) and one independent variable (personality trait). But, firstly the assumptions of the test should be met: 1. Normality of the distribution of each set of scores, 2. Homogeneity of variances. The following table (table 9) shows the descriptive statistics including skewness ratios used by the researcher to check the first assumption.

*Table 9: Descriptive Statistics of the scores obtained by the two groups on listening and reading tasks*

	N	Minimum	Maximum	Mean	Std. Deviation	Skewness		Skewness Ratios
	Statistic	Statistic	Statistic	Statistic	Statistic	Statistic	Std. Error	
extroverts' reading	45	21.00	58.00	41.1556	8.05649	-.301	.354	0.85
Introverts' reading	45	25.00	59.00	43.8000	10.40891	-.350	.354	0.98
extroverts' listening	45	25.00	78.00	51.8444	13.02437	-.087	.354	0.24
Introverts' listening	45	24.00	76.00	57.2222	14.49120	-1.000	.354	2.82
Valid N (listwise)	45							

As shown in table 9 above, the last column, the skewness ratio belonging to the Introverts' listening scores exceeds the normality range of  $\pm 1.96$ , while the rest fall within the range. Therefore, as the first assumption was not met, running a MANOVA was not legitimate, and since there is no non-parametric equivalent for MANOVA, independent t-tests had to be run.

First, to see if there was any significant difference between the reading scores of introverts and extroverts, a t-test was run. The normality of the distribution as one assumption for a t-test is met, as shown in table 9. As table 9 indicates, the introverts outperformed the extroverts in the reading test (43.80 vs. 41.15). But, a further statistical analysis was needed to show whether the difference is significant or not. The following table (table 10) shows the result of the t-test:

*Table 10: Independent Samples t-test on the mean scores of reading tasks*

	Levene's Test for Equality of Variances		t-test for Equality of Means						
									95% Confidence Interval of the Difference
	F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	Lower	Upper
Reading Equal variances assumed	3.506	.064	-1.348	88	.181	-2.64444	1.96216	-6.54382	1.25493
Equal variances not assumed			-1.348	82.795	.181	-2.64444	1.96216	-6.54724	1.25835

With the equal variances assumed as the second condition for t-test ( $F=3.50$ ,  $p=.06>.05$ ), the t-test result is interpreted as there was no significant difference between the two groups regarding

their reading skill ( $t=1.34$ ,  $p=.181>.05$ ). So the null hypothesis stating that *there is no difference between the performance of extrovert and introvert female EFL learners on reading tasks* is maintained.

To see the difference between the listening skill of the two groups another t-test is needed, but as one set of scores belonging to the introverts was not normally distributed, the first assumption of t-test was violated. Therefore, the non-parametric equivalent test, Mann-Whitney U test, was run. The following tables (tables 11 and 12) show the result:

Table 11: Ranks of the two groups on the listening task

grouping		N	Mean Rank	Sum of Ranks
Listening	extroverts	45	39.59	1781.50
	introverts	45	51.41	2313.50
	Total	90		

As table 11 displays, the introverts obtained a higher mean rank (51.41) compared with the extroverts (39.59). The following table (table 12) indicates the significance of the difference:

Table 12: Test Statistics<sup>a</sup> of the listening scores

	listening
Mann-Whitney U	746.500
Wilcoxon W	1781.500
Z	-2.148
Asymp. Sig. (2-tailed)	.032

a. Grouping Variable: personality trait

As table 12 depicts, the difference between the two groups turned out to be significant ( $M=746.5$ ,  $p=.032<.05$ ). Therefore, the null hypothesis stating that *there is no significant difference between the performance of extrovert and introvert female EFL learners on listening tasks* is rejected, with the conclusion that introverts performed significantly better in listening tasks than extroverts.

## CONCLUSION

In this study it was demonstrated that the introvert EFL learners were significantly better at listening tasks than the extrovert ones. One possible explanation for such a finding is that according to the personality characteristics of introvert learners, they tend to be better performers in receptive skills like listening, reading, and structure, since according to Eysenck (1965) “they generally have a reflective and thoughtful personality type that suits the receptive kinds of tasks” (p. 59-60). Another reason according to Eysenck (1965) is that “the typical extrovert does not like studying by himself and is generally impulsive individual” (p. 59-60). Also Burrus and Kaenzig (1999) claim that introverts prefer to work on their own than in groups, they do not like being in the center of attention and need time and space to complete the tasks. They need to know what they are expected to do and have suitable condition to concentrate. On the other hand extroverts require high stimulation, cooperating with others and movement to learn and do the tasks. They also like open discussions and discovery activities. Therefore based on the above mentioned findings we can conclude that the special characteristics of introverts: like high concentration and their eagerness to listen rather than to speak and also the kind of listening tasks and the context in which the listening tasks were administered could help them to perform better than extroverts in doing listening tasks.

As for the second hypothesis the researcher was interested to know if extrovert and introvert students were different with regard to their performance on reading tasks. It was shown that the introvert learners with the mean score of (43.80) perform fairly better as compared with extrovert learners with the mean score of (41.15). However the difference between their performances was not statistically significant. One of the justifications that we can come up with might be that introverts have been known as studious and hard-working students compared to more extroverted and outgoing ones. It gives the impression that they are more attentive and conscientious in certain receptive tasks like reading. Therefore, this attentive personality type may contribute to their performance on the types of tasks which need concentration. More over as reflected in table 10, there is a trend in the difference between extroversion-introversion when it comes to reading tasks that is in general, both extroverts and introverts had almost the same performance on the reading tasks part.

This finding is also in line with the finding achieved by Astika, Carrol, and Moneta (1996) which indicates no significant relationship between extroversion-introversion and reading section of the English language proficiency test and there was just a negative trend between extroversion and learners’ performance on the reading section. Also Vehar (1968) found no such significant difference in reading test performance between extroverts and introverts. Brown (1994) “claims that extroversion may be a factor in the development of general oral communicative competence, which require face to face interaction, but not in listening, reading, and writing” (p. 174). The reason for lower performance of extroverts has been explained more in the works of following scholars:

Ellis (1994) presents two major hypotheses concerning the relationship between extroversion/introversion and L2 learning. The first is that extroverted learners will do better in acquiring basic interpersonal communication skills (BICS). Extroverts are more eager to talk, to

join the groups and participate in classroom activities. They will use the language more in and outside the classroom. The second hypothesis is that introverted learners will do better at developing cognitive academic language proficiency (CALP). Entwistle and Wilson (1977) claim that introverts will achieve more because they have better long-term memory than extroverts. Besides, they take learning a language in a more serious way and spend more time on reading and writing due to their personality trait. The extroverts are not able to concentrate for a long time and are too sociable to learn with the same attention (Eysenck, 1957). Based on the above mentioned factors, one possibility for the findings of this study might be due to the kind of tasks used in this study. The tasks used in reading and listening tests did not have interpersonal communication characteristics. Therefore, based on the personality characteristics of extroversion and introversion which was mentioned before, extroverts could not show their ability better than introverts in performing reading and listening tasks.

Therefore, by studying the difference between extroverts and introverts and their probable effect on language skills like reading and listening comprehension, teachers can predict what kinds of activities and tasks students will enjoy, what sort of teaching methods they require and what their learning styles are. Therefore it can be concluded that using tasks for teaching listening and reading comprehension to introvert students is a useful approach but it does not mean that using these tasks for instructing listening and reading comprehension to extroverts is not useful. Thus, it is felt that this study has made some important contributions towards a better understanding of the extroversion-introversion personality variable and its relationship to some learning outcomes (i.e., performance on reading and listening tasks).

## **LIMITATIONS**

Like many other studies, the present study suffered from some limitations.

1. Due to the regulation of language schools and English institutes, the researcher was not able to deal with male students. The subjects who participated in this study were all female students. Therefore, the findings of this study may not be generalizable to male learners.
2. The probable effect of some other variables related to learners such as previous learning backgrounds and age, which might have affected their performance in reading and listening tasks, could not be controlled.
3. Because of shortage of time, the number of task-types which were chosen to apply was limited. And the researcher was not free to use a variety of tasks in tests.
4. Since the researcher was not allowed to select the participants or even classes, there was no random selection.
5. Since the selection of subjects was according to their level of language proficiency, there was not control over the age of the subjects.
6. The subjects participating in this study were selected from intermediate learners, because the researcher only had access to the intermediate level. So, only female EFL learners at intermediate level in a Language School and a Language Institute in Tehran were selected for this study; therefore, the findings are limited to them and might not be generalized to other levels.

**Behdokht Mall-Amiri** is Assistant Professor of TEFL at Islamic Azad University, Central Tehran. She has published several articles in domestic and foreign academic journals. She is specifically interested in research areas related to translation, cognitive and learning styles, motivation, and program evaluation.

**Nazanin Nakhaie** holds an MA degree in TEFL from Islamic Azad University, Central Tehran Branch. She has been teaching English in different language schools, ex: Kalam & Gooyesh and Soodeh in Tehran for the last six years.

# IMPROVING STUDENTS' ACHIEVEMENT ON WRITING DESCRIPTIVE TEXT THROUGH THINK PAIR SHARE

**Dr. Tiur Asih Siburian**

*Faculty of Languages and Arts*

*Universitas Negeri Medan, Indonesia*

*Email. sanjayaddnatrah@yahoo.com*

## ABSTRACT

Students' achievement in writing descriptive text is very low, in this study Think Pair Share (TPS) is applied to solve the problem. Action research is conducted for the result and qualitative and quantitative technique are applied in this research. The subject of this research is grade VIII in Junior High School, Rantau Parapat, North Sumatera, Indonesia. In the first test, the students get the mean of mark 66,4375. It dramatically increases on the second test, which gets 78,125. Additionally, on the third test the mean of students' mark reaches a pick on 87,5625. Observation result showed that the students gave their good attitudes and responses during teaching and learning process by applying the application of TPS (Think Pair Share) method. Questionnaire and interview report showed that students agree that the application of TPS (Think Pair Share) method had helped them in writing descriptive text. It can be conclude that the students' achievement is improved when they are taught by TPS Method.

**KEY WORDS:** *Achievement, Writing, Descriptive Text and Think Pair Share*

## INTRODUCTION

### *The Background of The Study*

English is the language of global terms that need to be developed in Indonesia. Due to the ability to speak English, people have been able to obtain and provide information that was very important to develop oneself and the environment. Therefore, in Indonesian language has been incorporated into the curriculum of English schools and colleges so that English can be taught to the Indonesian people well and in line with expectations stated in the opening of the 1945 constitution that was to increase the nation intellectual life.

In learning the English language, there are four skills that should be taught to students. They are speaking, listening, reading and writing. In practice, learning the lessons taught writing after speaking, listening and reading. But this does not state that learning writing is not important. In fact, writing is a very important skill as writing needs practice and wring is the very difficult subject for the students. It is related to Oshima and Hogue (1999:3) that writing, particularly academic writing is not easy. It takes study and practice to develop this skill. For both native and new learners of English, it is important to note that writing is a process, not a "product". This means that a piece of writing, whether it is a composition for your English class or a lab report for your chemistry class is never complete; that is, it is always possible to review and revise, and review and revise again.

Writing is a very important capability for being owned by students, writing is also an excellent

communication tool. Through writing, each person is able to convey feelings, ideas, and announcements to others. Sharples (1999:8) actually, writing is an opportunity; it allows students to express something about themselves, explore and explain ideas. Student can convey their ideas in their mind by organizing them into a good text so that the others know them and they can think critically. Therefore, learning is very important for improved writing in particular learning of English in Indonesia because the writing is a process of transformation of thoughts and ideas into tangible forms of writing. In addition, many people choose writing as a means of effective and efficient communication of information to be conveyed in some ways like posting letters, business letters and important information in a company's product.

In the *Kurikulum Tingkat Satuan Pendidikan (KTSP)* 2006 syllabus of junior and senior high schools curriculum requires students to be able to write some kind of genre in writing. They are narrative, recount, descriptive, report, explanation, analytical exposition, hortatory exposition, procedure, discussion, reviews, anecdote, spoof, and news items.

Based on the above, the descriptive text is one genre that must be mastered by students in learning English. And theoretically, according to Ervina Evawina S (2010:7) descriptive paragraph is a paragraph vividly portrays a person, place, or thing in such a way that the reader can visualize the topic and enter into the writer's experience.

In fact, not all students are able to write descriptive paragraph properly and in accordance with the existing elements in the descriptive text. Based on the researcher's observation at the time of the teaching practice program (PPL) contained 75% of students who were unable to write a descriptive paragraph. Teachers of English already have taught the material to students well but the students still had the problem in writing descriptive paragraph. In addition, the researcher also had looked the teachers of English language teaching by lecture, and then asked the students to write descriptive paragraph individually.

From the above, student's ability to write descriptive paragraph is very less because the learning methods that is adopted by teachers of English language was a method that does not fit anymore in this day because it reduces the interest and liveliness of the students in the learning process so that students are bored and do not want to continue learning as they have to do.

At this present time, there are already implementations Learning Revolution in teaching and learning that is learning is no longer centered on teachers. In other words, it is called "Teacher Centered Learning (TCL)" but it has been centered on students. It is called "Student Centered Learning (SCL)". Theoretically, SCL is an approach to education focusing on the needs of the students, rather than those of others involved in the educational process, such as teacher and administrators (<http://en.wikipedia.org>). So the teacher is only as facilitators and a provider of solutions in learning is no longer only as a source of knowledge in the learning process.

Based on the above, the researcher offers a method that have to be applied in the learning process of writing descriptive paragraph because Ransdell and Laure Barbier (2002: 143) maintain that a good writing strategy can be trained, and it can improve writing performance. The method that is offered by researcher is the implementation of Student Centered Learning

(SCL) and the development of Cooperative Learning (CL) that according to Slavin (1995:2) Cooperative Learning refers to variety of teaching methods in which students work in small group to help one another learn academic content. In cooperative classrooms, students are expected to help each other to discuss and argue with each other, to assess each other's current knowledge and fill in gaps in each other's understanding, so that the interest and active students in the learning process can be improved not only individually but in groups or together. Learning method, which the researcher refers to, is Think Pair Share (TPS).

Think Pair Share (TPS) is one of the Cooperative Learning methods which poses a challenging or open-ended question and gives students a half to one minute to think about the question. Students then pair with a collaborative group member or neighbor sitting nearby and discuss their ideas about the question for several minutes. The think-pair-share structure gives all students the opportunity to discuss their ideas ([www.wcer.wvasc.edu](http://www.wcer.wvasc.edu)). It is designed to motivate the students to tackle and success at problem, which initially are beyond their ability. It is based on the simple nation of mediated learning. Obviously, one alternative to solve the problem of writing descriptive paragraph is by applying TPS.

With the application of this method is expected to enhance students' skills in writing descriptive paragraph properly and in accordance with the existing elements in the descriptive paragraph.

### **THE PROBLEM OF THE STUDY**

Based on the background of the study, the problem of this study was formulated as follows:

“How do apply Think Pair Share method to improve the students’ achievement in writing descriptive Text?”

### **THE OBJECTIVE OF THE STUDY**

In relation to the problem, the objective of the study was to investigate and to find out the improvement of students achievement in writing descriptive text through the application of Think Pair Share (TPS) method.

### **THE SIGNIFICANT OF THE STUDY**

Finding of this study are expected to:

1. to motivate the students to be better on writing descriptive paragraph,
2. to provide significant information for the English teacher in their attempt to decide the TPS in teaching descriptive writing in senior high school,
3. to increase the readers knowledge about TPS and descriptive paragraph and,
4. to help the next researcher candidate of the teacher to apply a model in teaching learning process.

### **THEORETICAL FRAMEWORK**

#### ***Achievement***

Travers (1970:447) states that achievement is the result of what an individual has learned from some education experience. Additionally, Yelon, Weinstein, and Weener (1977:301) express achievement as the successfulness of individual, while another source Smith and Hudgins (1964:95) says that achievement is to do one's best, to be successful to accomplish tasks

requiring skill and effort and to be recognized by authority.

Based on the opinions above, it can be concluded that achievement is the result, the successfulness, the extent or ability, the progress in learning education experiences that the individual indicates relation with his/her educational learning. Achievement concerns with what someone has actually learnt whereas aptitude is the potential for learning something. In other words, achievement is a success in reaching particular goal/status or standard, especially by effort, skill, courage, and so on.

### ***Writing***

Writing is a process of formulating and organizing ideas in right words to deliver the aim and present them on a piece of paper. According to Jones in R. Cooper and Odell (1977:33) writing is synonymous with discourse, and discourse is discussed in terms of its aims, it relate to the function of language, and in terms of its feature, which are the separate elements, devices, and mechanism of language.

On the other hand, Reinking, Hard and Osten (1993:188) state that writing is a way of communication and of course communicates all the time. And then Deporter and Heracki (2002:179) explain that writing is a whole brain activity, which uses bright brain side (emotion) and left-brain side (logic). Although right and left-brain sides are used in writing, right brain side has a big position because it is a place, which appears new ideas and emotion.

From the explanation above, we can state that writing is a whole brain activity to formulate and to organize ideas in right words to deliver and communicate the aims to the reader and present it on a piece of paper.

### ***Descriptive Text***

A descriptive text is a piece of writing that is intended to convey meaning to the reader through sensory details and provides image to the reader (<http://www.ehow.com>). Additionally, descriptive text is a paragraph that is defined as a group of sentences that are closely related in thought and which serve one comment purpose often used to describe what a person looks like and acts like, what a place looks like, and what an object looks like (<http://www.examples-help.org.uk>). Furthermore, Pardiyono (2007:34) state that description paragraph is a type of written text paragraph, in which has the specific function to describe about an object (living or non-living things) and it has the aim that is giving description of the object to the reader clearly.

From the definition above, it can be concluded that description paragraph is a paragraph that describes a particular person, place or event in great deal. Description writing vividly portrays a person, place, or things in such a way that the reader can visualize the topic and enter into the writer's experience. It is a way to enrich others forms of writing or as a dominant strategy for developing a picture of what something looks like.

Furthermore, Jolly (1984:470) asserts there are five types of descriptive writing paragraph. They are:

a. Describing Process

Describing a process not only explains how something was done, but also explains why it was done and what was needed to complete the process.

b. Describing and event

To describe an event, a writer should be able to memorize and remember what happened in the event. Supposed the writer will write about Tsunami that was happened in Japan. In this case, he / she has to explain all details related to the event, so that the readers can imagine the real situation and condition.

c. Describing a personality

In describing a person, the first thing that we do was recognizing his/her individual characteristics. We need to describe people occurs fairly areas of physical attribute (hair, eyes), emotional (warm, nervous), moral attributes (greedy, honest, worthy, trust), and intellectual (cleverness, perception)

d. Describing a place

Presenting something concrete was the way to describe place, for example: a home, a hospital, and school.

e.

f. Describing an object

To describe an object accurately was done by providing the physical characteristics of the object such as the color, form, shape, and so on.

***Part of Descriptive Text***

There are three part of descriptive text. They are: 1. Social function, which is to describe a particular person, places, or things. 2. Generic Structure, which is divided in to two. They are: a) identification: identifies the phenomenon to be described, and b) description: describe parts, qualities, characteristics. 3. Significant lexico-grammatical feature, that is focus on specific participant, use simple present tense. (<http://teacherside.blogspot.com>). Other source, Pardiyono (2007:34) maintain that three parts of descriptive, they are (1) communicative purpose, that was to describe an object (human and non-human), (2) rhetorical structure, there are two parts of rhetorical structure a) identification, that was statement that consist of one topic to describe; b) description, that was consist of the detail description about object that identify in identification, and (3) grammatical patterns, it was needed to understand that in descriptive paragraph, declarative sentence was used and using present forms.

From the two explanations above, we can conclude that the part of descriptive paragraph was divided in to three parts, they are:

a. Social Function

Describe the characteristics and conditions of the object person, thing, place, or animal) by using adjective and attribute.

b. Generic structure

It was divided into two part they are a) identification was to identify the phenomenon that was described, and b) description was to describe the qualities, characteristics, condition, and part of

an object in detail.

c. Grammatical feature

In description paragraph, it uses present tense as normally.

***Think Pair Share (TPS)***

The think, pair, share strategy is a cooperative learning technique that encourages individual participation and was applicable across all grade levels and class sizes. Students think through questions using three distinct steps:

1. **Think:** Students think independently about the question that has been posed, forming ideas of their own.
2. **Pair:** Students are grouped in pairs to discuss their thoughts. This step allows students to articulate their ideas and to consider those of others.
3. **Share:** Student pairs share their ideas with a larger group, such as the whole class. Often, students are more comfortable presenting ideas to a group with the support of a partner. In addition, students' ideas have become more refined through this three-step process.  
(www.teachervvason.fen.com)

On the other hand, Think-Pair-Share is a strategy designed to provide students with "food for thought" on a given topics enabling them to formulate individual ideas and share these ideas with another student. It is a learning strategy developed by Lyman and associates to encourage student classroom participation. Rather than using a basic recitation method in which a teacher poses a question and one student offers a response, Think-Pair-Share encourages a high degree of pupil response and can help keep students on task.

***The steps of Think Pair Share***

1. With students seated in teams of 4, have them number them from 1 to 4.
2. Announce a discussion topic or problem to solve. (Example: Which room in our school was larger, the cafeteria or the gymnasium? How could we find out the answer?)
3. Give students at least 10 seconds of think time to THINK of their own answer. (Research shows that the quality of student responses goes up significantly when you allow "think time.")
4. Using student numbers, announce discussion partners. (Example: For this discussion, Student #1 and #2 was partners. At the same time, Student #3 and #4 will talk over their ideas.)
5. Ask students to PAIR with their partner to discuss the topic or solution.
6. Finally, randomly call on a few students to SHARE their ideas with the class.

Teachers may also ask students to write or diagram their responses while doing the Think-Pair-Share activity. Think, Pair, Share helps students develop conceptual understanding of a topic, develop the ability to filter information and draw conclusions, and develop the ability to consider other points of view.

(<http://olc.spsd.sk.ca>)

**METHODOLOGY**

This research is conducted as an action research procedure since involved a substantive act with a research procedure to find the improvement. Stringer (2007:1) maintains that action research is a systematic approach to investigation that enables people to find effective solutions to problems they confront in their everyday life. Action research focused on specific situations and localized solutions. Action research provided the means by which people in schools, business and community organizations; teachers; and health and human services may increase the effectiveness of the work in which they are engaged.

In this research, the data was collected by quantitative and qualitative approach. Quantitative data is collected by administrating composition text and qualitative was one research method that was describing the situation and the event (Sugyono, 2004:4).

Quantitative data is collected through evaluation sheet, which is administrated by the researcher. For gathering the qualitative data, the researcher used observation sheet, interview sheet and questionnaire. Observation sheet is used to identify all the condition that happened during the teaching learning process including teacher, students and the context of situation that are done by the collaborator, interview sheet is used when the writer want to identify the problems occurred in the learning process and questionnaire as the personal records which usually taken by the writer that was written up daily.

A collaborator is asked to observe and evaluate all the situations during the teaching learning process, the researcher, the students and the class in the teaching learning process.

## RESULT AND DISCUSSION

The students' score increases from first evaluation to third evaluation. The writer gives the evaluation in second, fourth, and six meeting. During the research, it was found out that the students' score kept improving from first evaluation to last evaluation. By application TPS the students' score was significantly improved. The ranges of score improvement can be seen in the following table:

*Table 1: Range of Score Improvement*

Range of Score Improvement	Total Students
26-36	7
21-25	8
16-20	9
11-15	5
6-10	3
Number of Students	32

### a. Students who got the improvement score about 26-30:

- from 60-90
- from 60-90
- from 60-90
- from 60-90
- from 65-94
- from 60-88
- from 62-89

There were 7 students who got the improvement of score 26 – 30. They were students who did

not like English. But, after the teacher paid attention to them more, asked them problem, and applied TPS Method, they became interested in writing descriptive text.

**b. Students who got the improvement score about 21-25**

- from 65-90
- from 65-90
- from 63-88
- from 65-90
- from 70-93
- from 67-90
- from 65-87
- from 65-86

There were 8 students who got the improvement of score 21 – 25. They were active students during teaching learning process. Almost of them got points 87 up in the last evaluation. They were active from the first until the last meeting in asking questions and they discussed every problem that they faced with their own team and pair so that their scores also kept improving.

**c. Students who got the improvement score about 16-20**

- from 64-84
- from 70-90
- from 69-89
- from 63-83
- from 68-87
- from 70-88
- from 73-90
- from 70-86
- from 74-90

There were 9 students who got the improvement of score 16 – 20. Even though the improvement was not so high, it did not mean the students in this range were not competent in writing descriptive text. Two of them achieved satisfying score up to 90 that are PH and SF in the last evaluation. Then the low score in this range was just 83, it meant they could pass the test well.

**d. Students who got the improvement score about 11-15**

- from 75-90
- from 70-85
- from 70-85
- from 65-80
- from 60-75

There were 5 students who got the improvement of the score 11-15. The score improvement was not too high almost students in this range were smart students. There was one student who got the score just 75 in the last evaluation. It was RTI, but RTI still passed the evaluation.

Because they were very smart students, sometimes they did not pay attention to the teacher and in their own team, they were not serious to hear the explanation. But, they kept improve their score until the last writing evaluation because of the TPS method.

**e. Students who got the improvement score about 6-10**

- from 80-90
- from 76-85
- from 73-80

There were 3 students who got the improvement of score 6-10. The score improvement was low, but in these range just three students who got the improvement from 6 until 10. Then no one got lower than 80. It meant they are good students but they did not pay attention to the lesson that was given by the teacher.

There were difference in the lowest and the highest of students' writing score in each writing evaluation, which was given during the research. The differences showed that there was a significant improvement of students' writing. The improvement of students' score in each writing evaluation can be seen in the following table:

*Table 2: Comparison Score of Students' Writing Evaluation*

Type of Score	Evaluation I	Evaluation II	Evaluation III
	M1	M4	M6
	Cycle I	Cycle II	
Lowest Score	60	70	75
Highest Score	80	85	90
N	32	32	32

*Note: M = Meeting      N = Number of Students*

From the table above, it was seen that students' score kept improving. In writing evaluation I, the lowest score was 60 and the highest score was 80. In writing Evaluation II, the lowest score was 70 and the highest score was 85 whereas in the last writing evaluation, the lowest score was 75 and the highest score was 90. It showed the significant improvement in students' writing descriptive text.

The improvement of students' score in writing descriptive text through TPS (Think Pair Share) also can be seen from the mean of the students' score in every writing evaluation. The mean of students' score can be seen below:

$$\begin{array}{rcl}
 & & \underline{2126} \\
 \text{Xfi} & = & \\
 & & 32 \\
 & & \underline{2500} \\
 \text{Xfi} & = & \\
 & & 32 \\
 & & \underline{2802} \\
 \text{Xfi} & = & \\
 & & 32
 \end{array}$$

*Table 3: The Improvement of Mean Scores of Students' Writing*

Meeting	Total Score	Mean
Evaluation I (Cycle I)	I	2126
Evaluation II (Cycle I)	II	2500
Evaluation III (Cycle II)	III	2802

The mean of the students' score in the first meeting was the lowest of all meetings. In the last meeting, the students' score improved. From the data analysis, the mean score of the students' writing increased from 66, 4375 to 87, 5635. It meant that the ability of students in writing descriptive text was improved.

In this research, the indicator of successful in writing descriptive text was if 75 % of students have got score up to 75 in their writing evaluation because the English passing grade at the school was 75. The number of the students who were competent in writing descriptive text was calculated below:

$$P1 = \frac{2}{32} \times 100 \% = 6,25 \%$$

$$P1 = \frac{26}{32} \times 100 \% = 81,25 \%$$

$$P1 = \frac{32}{32} \times 100 \% = 100 \%$$

*Table 4: the Percentage of Students' Writing Descriptive Text*

Evaluation	Cycle	Meeting	Students who got score 75 up	Percentage
I	I	I	2	6,25 %
II	I	IV	26	81,25%
III	II	VI	32	100%

In writing evaluation I, there were 2 students who got point 75 up. The percentage of students' achievement in descriptive text kept increasing when TPS method was applied. In the first cycle, 6, 25 % students got points 75 up whereas in the second cycle 100 % students who got points 75 up. The range of the first meeting (6, 25%) and the last meeting (100%) was 93, 75 %. It had been proved that 93, 75% students got the good score on their writing achievement. It can be concluded that TPS method worked effectively and efficiently in helping students in improving their achievement in writing descriptive text.

### ***Qualitative Data***

The qualitative data were taken from observation sheet, questionnaire sheet and interview that gained within two cycles.

### ***Observation Sheet***

From the result of observation sheet, it can be concluded that teaching learning process by applying TPS method run well. The situation of teaching learning process was comfort, lively, and enjoyable. Because from the data that was taken from the first (I) meeting to the last (VI) meeting we can find out that the Note in the data got good and very good. It means the score in this data was just gotten from 3 to 4.

So this TPS method created a good environment in teaching learning writing in which students became active in the process of writing, focus their mind to the teachers' explanation, and share in their team and pair and then finish in individually. In individually work, the students could improve their confidence to finish the work because they had discussed in team and pair.

### ***Interview***

From the interview data those were taken by the teacher and the students from the first meeting and the last meeting, we could find out that the teacher was very interesting to the students because the students were very active and enjoyed with English but students ability in writing descriptive text was not good enough and then the teacher did not have effort to improve it.

From the interview with the students in the first meeting, it can be found out that the students very interesting with English and most of the students like to write descriptive text, because from 6 students that the writer interviewed said like. So from this data we can conclude that most of the students like to write the descriptive text. That was why it was needed to improve their achievement in writing descriptive text by the application of TPS.

From the second interview that was taken from teacher, it can be find out that the application of TPS in teaching learning process especially in writing descriptive text was very helpful to improve the ability of students in writing descriptive text. And according to the teacher this method was very good because can make the students became active and enjoy the lesson.

Furthermore, from the last interview that was taken from the students it can be find out that most of the students like this method and the said that this method was very good to improve their achievement in writing descriptive text because they could be active and enjoy the material. And from the 6 students, all of them said TPS was very good and just one student said that it was very busy but the student also like. So, from the entire interview, it can be concluded that TPS method was very good to improve the students' achievement in writing descriptive text at Junior High School, grade IX and the teacher will apply TPS in teaching learning process not only writing but also another subject.

### ***Questionnaire***

From the result of questionnaire, it can be found out that TPS method can improve the achievement of students because from the data no one of the students fill in disagree and strongly disagree then no more than 4 students fill in the neutral. So most of the students fill in agree and strongly agree. It meant that this TPS method was very good for the students.

In significantly, from the data that was taken from questionnaire sheet I we could account that from the statement 1 until statement 8, the percentage of strongly agree was 331 with mean 41, 40625%, agree 431, 25 % with mean 53, 90625 % , neutral 37, 5 % with mean 4, 6875 % and disagree and strongly disagree 0 %. So, from this questionnaire data we can concluded that the students was very interesting and enjoy the TPS method in teaching learning process especially in writing descriptive text.

Besides that, from the data that was taken from the questionnaire sheet 2 it can be found in the

first statement that the percentage of students who chosen a was 71,875 %, b was 3, 125 %, c was 25 % and d was 9, 375 %. It meant that most of students had learned to work to gather from this TPS method. So they were active in teaching learning process. And then from the statement 2 the students who chosen a was 43, 75 %, b was 28,125 %, c was 15, 625 % and d was 12, 5 %. It meant that most of students had learned about pair accountability and pair responsibility. In additional, from the statement 3 the students who chosen was 84, 375%, b was 6, 25 %, c was 6, 25 % and d was 3, 125 %. It meant that most of students in this research had learned to produce something alone.

From the all questionnaire data, it can be concluded that the students were very interesting and enjoying the TPS method and they the students were not only improve their achievement in writing descriptive text but also improve their teamwork, responsibility and self-confidence.

## **CONCLUSION AND SUGGESTION**

### ***Conclusion***

Having analyzed the data that have been presented in the previous chapter, it was found that average scores of students in every evaluation kept improving. It can be said that there is a significant improvement on the students' achievement in writing descriptive text by applying the application of Think Pair Share method. It can be seen from the improvement of mean of students' score, namely: the mean of first evaluation (66,4375) sharply increased to the mean of second and the third evaluation, which have 78,125 and 87,5625 respectively. The score continuously improve from the first evaluation to the third evaluation. Observation result shows that the students give their good attitudes and responses during teaching and learning process by applying the application of TPS (Think Pair Share) method. Questionnaire and interview report shows that students agree that the application of TPS (Think Pair Share) method have helped them in writing descriptive text. It can be concluded that the application of TPS method significantly improves students' achievement in writing descriptive text.

### ***Suggestion***

The result of this study showed that the application of TPS method could improve students' achievement in writing descriptive text. In relation to the conclusion above, some points are suggested, as follow:

1. The English teachers are suggested to use TPS (Think Pair Share) method as teaching method to stimulate the students' learning writing spirit in teaching writing process.
2. For the readers who are interested for further study (university students) related to this research should explore the knowledge to enlarge the understanding about how to improve students' achievement in writing and search another reference.

## **LIMITATIONS OF THE STUDY**

There are three limitations of this study; the first is administration procedure as the school in which the research was conducted was very difficult to get the permission from the Head Master. The researcher had to get the permission letter from the office of education as the requirement of doing the Unluckily, the researcher had spent the time to get the letter for two weeks. The second is the facilities on the school. There were many media that cannot be

provided by the school so that the researcher had to take the media from other institution. The last but not least is the cooperation with the students. Some of the students did not want to fill in the questionnaire, as we know this is one of the assessments in this study.

## TOM STOPPARD'S 'SPIRITUAL LONERS': A STUDY OF FOUR EARLY ABSURD PLAYS

Dr. Hana' Khalief Ghani  
Department of Translation  
College of Arts  
University of Al-Mustansiriyah  
Email: h.horizons2013@gmail.com

### ABSTRACT

Tom Stoppard is a leading figure in contemporary British drama. He began his writing career in the early sixties. He was considerably influenced by the dominant literary trends in the first half of the twentieth century, the most important of which is absurdism, both thematically and technically. In the plays dealt with in this paper; namely, *The Dissolution of Dominic Boot*, *'M' Is For Moon Among Other Things*, *If You're Glad, I'll Be Frank* and *Albert's Bridge*, Stoppard not only employs the elements of the absurdist drama, but also presents a series of spiritual loners who are helpless and unable to cope with the realities of life. They are condemned to a life of boredom and meaninglessness and are put in a series of absurd situations.

**KEY WORDS:** Stoppard, absurd, spiritual loners, *The Dissolution of Dominic Boot*, *'M' Is For Moon Among Other Things*, *If You're Glad, I'll Be Frank* and *Albert's Bridge*.

### TOM STOPPARD'S 'SPIRITUAL LONERS':

#### *A Study of Four Early Absurd Plays*

Tom Stoppard belongs to the playwrights of the 1960s, who represent, according to Taylor(1971), "the Second-Wave" of post-war dramatists. This means that Stoppard burst upon the English theatrical world at a critical juncture. At that time, British theatre was almost completely 'Naturalistic' and was showing concern for social 'message' and involvement (Bigsby, 1976, p.3). However, in 1981, Stoppard told *Gambit* that his early writing career could best be seen in terms of his sense of alienation from the Osbornian school of angry young men writing socially-engaged dramas. (qtd in Sammelles, 1988, p.131) Keeping this fact in mind, one realizes the importance and special position of Stoppard's plays in the 1960s. Furthermore, Stoppard admits at this stage of his literary career that he has very few social and political preoccupations so that he writes without any social objectives in his mind. (Stoppard, 'Something to Declare', 1968, p.47)

The sixties was a decade of relative prosperity in England as far as mass production and accumulation of wealth were concerned, but it was a period of social and political confusion as well. This confusion was not restricted to England only. Indeed, people were facing hard times in many parts of the western world. In as far as Stoppard's literary career is concerned, Billington

(1987) gives an accurate diagnosis of the sixties as a decade of social, cultural and political chaos:

Stoppard was writing in the mid-sixties at a time of considerable political disturbance and social change: the Americans had begun bombing North Vietnam; racial riots had erupted in the Watts sections of Los Angeles; the Vatican Council had called for the modernization of the Catholic Church...While the Beatles have erupted all over British life. There was no reason why any of this should not find its way into Stoppard's work, but even his early plays hint that life is too much; that the best thing is to escape...from the surrounding chaos. (p.26)

As a result of this breakdown in man's confidence of finding consolation in the social or political structure of his country, he began to question more acutely issues such as the established religious convictions, the values of family life, and the meaning of his own existence.

Stoppard's early plays reflect his deep awareness of, and sensitivity to, the plight of modern man, by putting his characters under many kinds of pressure-psychological, financial, or metaphysical. He produces in these plays a series of 'spiritual loners,' people who reject and are rejected by their societies. (Sammelles, 1988, p.89) His early heroes, as Bigsby has well explained, are all trapped within a hostile mechanistic world, which is at odds with individual inspiration. (In Roberts, 1978, p.86) Dominic Boot in *The Dissolution of Dominic Boot*, loses his job; Glayds, in *If You're Glad, I'll be Frank*, is on the verge of a breakdown, due to her feeling of the meaninglessness of her life; and Albert, in *Albert's Bridge*, escapes from his harsh chaotic world and finds order in the structure of the bridge, an order not available on the ground.

Moreover, Stoppard emphasizes the importance of seeing his plays in performance. In an interview, he declares that he does not write plays "for discussion...I think of a play as an event in the theatre: to look for a kind of cryptogram in a play is to approach it in a way not really to do with theatre" (qtd in Bareham, 1990, p.34). In fact, he does not write plays primarily to be read or discussed, but to be performed, and to be seen in performance. This concern with the creation of a theatrical event on stage to alienate the audience and to keep them critically detached, besides being extremely entertained and concerned about the whole performance, is what links Stoppard with the Brechtian theatre.

This may explain why Stoppard likes to involve himself in playing around with quite complex theatrical effects and images, which link both thematic and technical adaptations of original theatrical themes that in turn projects the dilemma of man existing in a world devoid of meaning. (Hayman, 1977. pp8-9)

Another aspect of Stoppard's early theatrical career was his exploitation of the opportunities radio offered to the dramatists of the post-war period. Radio drama, in fact, is an excellent form; it sets an interesting challenge to the writer, the producer and the actor, while the listener is allowed to use his own imagination, instead of having everything imagined for him on the stage or the television screen. In commenting on radio as a theatrical medium, Guralnick (1990) rightly points out: "radio plays typically establish, and exploit, an unusual intimacy with the listener; they lend themselves easily to the dramatization of a character's interior thoughts, particularly dreams, fantasy, and the absurd; and they sometimes aspire to the condition of music, as in the plays of Samuel Beckett." (p.229) Indeed, radio is more effective than stage or television in conveying interior monologues, stream of consciousness and recollection. In *Albert's Bridge*, we

go inside Albert's thought, while a good deal of *If You're Glad*, happens inside Clayds's head. Listening to these radio plays, one feels that it would be a pity to present them visually on stage. (See Esslin, 1975, pp.38-42, and Wain, 1971, pp. 61-65)

At this stage of the discussion, it is necessary to study some of Stoppard's plays that were written during the 1960s, to point out those thematic, stylistic, and technical features of Stoppard's early plays that link them with the theatre of the Absurd.

*The Dissolution of Dominic Boot* (henceforth *Dominic Boot*)(1964) reflects Stoppard's employment of a situation rather than a plot: "I have tremendous difficulty in seizing a 'plot' but I am probably to tackle a situation" (qtd in Fleming, 1996, p.124).

Indeed, *Dominic Boot* is essentially an extended joke, as Fleming describes it (Ibid.). It has an autobiographical element, as Stoppard suffered from financial difficulties in his early career as a dramatist. Stoppard himself describes the four years between 1963 until his first success with *Rosencrantz and Guildenstern are Dead* (1967) as "mainly self-unemployed"(Ibid, p.116). However, and in spite of these hard circumstances, Stoppard, like *Dominic Boot*, rarely refrained from taking taxis instead of using public transportation.

Stoppard was not the only person who suffered from unemployment and financial straits during the sixties. Many young men in Britain shared with him the same hard situation. This may help to explain Stoppard's preference of writing about "human beings under stress-whether it is about losing one's trousers or being nailed to the cross" (Berlin in Bareham, 1990. pp.107-108).

The play's idea is as simple as it is interesting. Stoppard summarizes it as follows: "The peg for Dominic Boot-man riding around in a taxi trying to raise the money he needs to catch up with the meter-is the only self-propelled idea-for-a play I ever had and I think I wrote it in a day"(Stoppard, 1983, p.7). The opening moments of the play give us an idea about the eternal characters' personalities as well as Dominic's distress:

*Fade in street-traffic.*

Vivian: Well, thanks for the lunch-oh, golly, it's raining.

Dominic: Better run for it.

Vivian: Don't be silly...(Up) Hey, taxi!

Dominic: I say Viv...

Vivian: Come on, you can drop me off. (*To driver*) Just round the corner, Derby Street Library. (*They get in-taxi drives*).

Dominic: Look, Vivian, I haven't got...

Vivian: Dush it-that's taken about ten shillings out of my two guinea hairdo-honestly, I'm furious. Don't you ever have an umbrella?

Dominic: Not when it's raining. (Ibid, p. 49)(All subsequent quotations are from this edition)

We immediately understand from this shorthand conversation what kind of relationship exists between Dominic and his selfish, demanding fiancée, Vivian. She gives him no chance to admit

his lack of money. Also, this scene signals the lack of love, warmth and understanding between them.

Stoppard presents here one of his Prufrockian characters-after T. S. Eliot's Alfred Prufrock in his poem "The Love Song of J. Alfred Prufrock." These characters are characterized by their helplessness and inability to cope with the realities of life. However, in spite of the hard situation in which Dominic finds himself as he fails each time he tries to raise the required taxi-fare, we never hear him complain about, or explain, his predicament to anyone.

All we hear is Dominic's inner thoughts and the chinks of the coins as he tries to meet the fare. He decides to go to the Metropolitan Bank in Blackfriars. At the bank, we are informed by Shepton, whom Dominic assumes to be Honeydew, that Dominic is overdrawn and that the bank has already refused two cheques from the restaurant at which he lunched with Vivian. These events are to be repeated in a second and a third bank.

What happens in the three banks clearly reflects Dominic's carelessness about other people and about his being continuously under stress. Despite that, Dominic struggles valiantly to keep in control. He tries to borrow from his work mates, Bligh and Cartwright. However, his requests are turned down. Even Dominic's mother, who is as self-centered and demanding a woman as Vivian, proves to be of very little help to him. This shows the difficult situation Dominic is suffering from, as he is expelled from his job. He is unemployed at the present time, and this will eventually lead to the mounting of his financial hardships. Also, his shorthand conversations with his mother reflect his feelings of loneliness and solitude and his need of someone to listen to, and sympathize with him in his predicament.

Indeed, it is rather interesting to notice that, in spite of the lack of communication among the characters, Dominic agrees with his mother that "It's quite wrong not to keep in touch with one's father"(p.54). Unfortunately, Dominic's father also fails to support him, as he receives him rather coolly and formally:

Dominic: Well, I was missing you, Father.

Father: Don't be *absurd* .....(p.56)(Italics mine)

The reply of Dominic's father here represents a severe and painful blow to all his attempts to communicate with others. Dominic Boot is an utterly desperate man now, especially after being let down by his mother, father and friend Charles Monkton. Here, Stoppard asserts people's need for mutual love, understanding and emotional involvement in their lives. It seems that Dominic is the only character in the play who is seeking others' understanding, and who is not imprisoning himself in a world of his own making. He thinks of asking Vivian's help who pushed him into his blight in the first place, but she proves to be extremely callous and apathetic to Boot's needs. Their meeting in the library ends up with a pathetic cry from Boot, in which he pours out all his anger and indignation at the absurd and meaningless situations he is constantly put in. He shouts at her: "OH, YOU STUPID COW, SHUT UP AND GIVE ME TEN POUNDS FOR THE LOVE OF GOD!"(p.57).

Finally, Dominic decides to sell everything he owns, except for a pair of pajamas, to the driver, who owns a shop where he sells a variety of goods, in exchange for the fare. At the end of the play, Stoppard presents a very ironical and painful picture about the blight of Dominic Boot. In fact, there is no remedy or solution for Dominic's ordeal, since the last scene is a repetition of the

first one. Dominic is left helpless, insecure, unable to communicate with others, and utterly lonely. Also, he is penniless, unemployed and in tears, for he realizes that he is trapped in a web of difficulties.

To sum up, this play is about a man who is always being urged to pull his socks up. This reminds us of Prufrock, who finds nothing to do but to pull his socks up. He is also desperate and on the verge of a nervous breakdown because of suffering endlessly in a world whose characters are enclosed in little boxes, unaware of the existence of the rest of people.

Wearing a raincoat and pyjamas only and without an umbrella, Miss Bligh hails a taxi while addressing Dominic, saying: "Taxi!...come on, Mr. Boot. Come on, you can drop me off..."(p.58). One can do nothing but smile at this ridiculous situation. In fact, the closing joke of the play suggests that Dominic is trapped in an unending cycle of financial problems.

As we shall see, such images of 'circularity' abound in Stoppard's other early plays.

Reading, or listening to, *'M Is for Moon Among Other Things* (henceforth *'M' Is for Moon*)(1964), one immediately notices how similar it is to many of Ionesco's plays, since it gives us a portrayal of a middle-aged, childless couple, and as it presents dramatically the boredom, loneliness and meaningless existence of the couple's lives.

In this play, Stoppard, like Ionesco, concentrates mainly on showing the mutual isolation of human beings and the meaninglessness of their daily actions, which constitute the major portion of their existence on earth.

Both Alfred and Constance imprison themselves separately in small boxes, unaware of each other's needs and desires. Actually, Stoppard succeeds in this play, as he begins to "explore the pathos of imprisoned littleness" (Jenkins, 1987, p.8).

Alfred and Constance are fully aware of their 'littleness' and meaningless existence. Therefore, they try to invest their lives with meaning. In other words, they try to evade the barrenness of their married life. Constance seeks to achieve this by attempting lexicography. She spends her time by browsing through her monthly installment of the M-N volume of encyclopedia, while her husband, Alfred, fantasizes about what he reads in the newspapers and hears on the radio- with the main story being the death of the American film actress, Marilyn Monroe. Alfred, while ignoring his wife's desires, dreams of being Marilyn's comforter, of holding her close to him, of helping her, and easing her traumatic experience.

Stoppard conveys the pair's boring existence in an interesting way. He begins with something of a sound puzzle. There is "*Silence- a man grunts and shakes his paper- a woman flips over the pages of a book and sighs*" (Tom Stoppard, 1983, p.61).(All subsequent quotations are from this edition) In fact, most of the play's dialogue, as we shall see, happens inside the characters' minds; that is, interior monologues, which help to give us an "autumnal picture of middle-aged,..., childless couple, whose thoughts and aspirations are richer than their humdrum lives," as Jenkins (1987) points out (p.12).

What we see here is a typical couple, married for a number of years, yet they do not know each other. What Stoppard wants to say is that people are isolated, lonely; people never really know each other, even when they are living together in the closest possible relationship.

Because of the meaninglessness of her life, Constance is increasingly preoccupied with time and counting the dates. She is appalled by the idea that time flies out without using it properly. Like Clayds, in *If You're Glad*, she is obsessed with time, and is extremely frightened by the fact that on "August the fifth, nineteen-sixty two...in half an hour I'll be exactly forty-two-and-a-half years old"(p.62).

She was born just as the clock struck half past ten at night. This means that she will be a day older each day the clock strikes half past ten. Constance may not be so worried about her being forty-two years old, or anxious about time, if her life with Alfred was happy and normal. However, this is not the case here. In fact, Constance sums up the whole of her meaningless life when she says: "Forty-two-and-a-half, and all I've got is a headache"(p.63). The word 'headache' is indicative, for it connotes that Constance has never been happy in her life with Alfred, that she is leading a miserable and lonely existence, and that even when she tries to voice her feeling to Alfred, he is not there to listen to, and comfort her. This reminds us of the fact that, as characters in an absurdist play, they are living in a world where love is unattainable and understanding is absent. A comparison with Ionesco's couples in *The Chairs*, *The Bald Soprano* and *Amedee* may be relevant here. These plays tell stories about the meaningless and absurd existence of middle-aged couples who use nonsensical language and clichés as a form of escape from, or a cover-up for, their purposeless lives.

Constance's reaction to Marilyn's death is quite different from Alfred's. Constance sees nothing specific in the death of Marilyn, since the latter does not appear in her encyclopedia, whereas Alfred invests the incident with his own fantasies.

Stoppard often refers to '*M' Is for Moon* as "his Marilyn Monroe's play," (Fleming, 1996, p.125) in the sense that Marilyn's death is pivotal to the play's action, for it helps to shed light on the characters' personalities, dilemmas and aspirations.

Constance is indifferent to Marilyn's death, because Marilyn represented everything that Constance is not. She became very famous as an actress during the fifties. The film producer turned her into a profitable project, in the sense that she became a victim of their materialistic greed. Marilyn lived paradoxically: she was under stress from the outside world which wanted her to be a paragon of sex. As a film star, she got all she aspired to, such as wealth, beauty and fame. However, she was suffering, like Constance, from loneliness in her empty life, which ended by her decision to commit suicide. This fact signals out the spiritual emptiness that spreads over in Western civilization, as suicides are largely due to the waning of religious beliefs and the dominance of materialistic philosophy and individualism.

Alfred's reaction to Marilyn's death takes another shape. To Alfred, her death is symptomatic of a hard, selfish world in which there is "no one to recognize her needs...No one to turn to, I mean. No wonder the poor girl got desperate. Those actors...they've got no humanity, no understanding..., it's such a selfish society"(p.66). Actually, Alfred gives us, in this statement, an accurate description of the world he, Marilyn and Constance were living in. Alfred, in fact, pities

Marilyn's death as he sees in it the death of his fantasies and dreams of a happy marital life. In another instance, Alfred almost identifies himself with Marilyn as he thinks:

Alfred: (*Thinks*): Abandoned...no love...like a child...(p.64)  
Alfred:...It's such a cold shallow world she was living in. No warmth or understanding- no one understood her, she was friendless (Ibid.)

These musings represent an accurate description of Constance's life. Also, Alfred comments indirectly on the nature of the world people live in, as they suffer from an increasing sense of isolation and loneliness in spite of the scientific developments in mass communication and the invention of many means of entertainment.

The crucial question, which Stoppard tries to answer in '*M' Is for Moon* is: What is the meaning of our life? In fact, he leads his listeners through making Constance question whether her life has any meaning, into questioning the meaning of their lives and their daily actions and, at the same time, makes them realize the absurdity and futility of their lives.

Constance tries, through writing entries in the encyclopedia, to invest her life with meaning. She thinks that, by doing this, she makes use of time: "...it's just that the time isn't all a waste" (p.65), in spite of Alfred's continuous ridiculing comments on her efforts. She also regrets losing her happy childhood and her ability to take decisions. When she was seventeen, she decided to change her name from Millie to Constance, for "it sounded more grown-up"(p.63). She yearns for the simple world of her childhood ABC, where each letter stood for one object only. It was years before she realized that 'M' was for moon, among other things. She is utterly desperate now, because she feels that she is compelled to go on in her tedious, monotonous life and actions. Commenting on the characters' attempts to make their lives meaningful, Billington (1987) remarks about the play:

It...adumbrates one of Stoppard's recurrent themes: the attempts of human beings to find some pattern or scheme that will somehow shape and explain the meaningless flux of existence... Stoppard himself- rather like his characters- seems to be yearning for something to counteract the randomness of experience. All art is, by definition, an attempt to order chaos (pp.21-22).

Finally, the play ends as it begins, for Stoppard repeats the first scene at the end of the play, to emphasize the fact that both Alfred and Constance are, like Dominic Boot, trapped in an increasing cycle of misunderstanding, loneliness, and boredom. Alfred, while failing to give his wife any kind of comfort, retreats into the fantasy of being Marilyn's comforter, while Constance, who again misunderstands her husband's solicitude and thinks he intends it for her, retreats to bed with her M's from her encyclopedia, rattling in her mind.

Stoppard's next play, *If You're Glad, I'll be Frank* (henceforth *If You're Glad*) (1966), represents his mediation on the nature of time and how modern society is imprisoned by it. The play "actually had its origins in a series the BBC were contemplating ...about people in absurd jobs

which did not really exist, and the idea of doing one about the speaking clock girl occurred to me then,” as Stoppard (1974) points out. (p.8) Gladys is the voice of the telephone-speaking clock, and she is doomed endlessly to announce the passing seconds. Her husband, Frank, is a bus driver and, like her, is doomed endlessly to drive his car from one station to another.

As a matter of fact, the special nature of their professions turns them into slaves to time, as they are so tied to timetables and schedules that they become almost machine-like objects, deprived almost of all free will. They function mechanically within a totally artificial inhuman framework, consequently imprisoning themselves in little boxes or cells that separate them from the outside world and from each other.

Man was and is still interested in the concept of time and its impact on him. His preoccupation with, and interest in time has escalated, due to the achievements in big strides in the scientific world, to the extent that people have started to be slaves to timetables, programmes and schedules.

Unlike other characters, Gladys objects to the prevailing, collective experience of time. For her, the scale of human life has been reduced to ‘nothing.’ Everything becomes petty and insignificant when measured against the omnipotence of time. Gladys suffers from spiritual dislocation whenever she ponders over things beyond the tiny world of the Post Office where she works, and her bus-driver husband’s enslavement to his timetable. She says:

And I feel sick  
When you look down from a great height  
You become dizzy. Such depth, such distance,  
Such disappearing tininess, so  
far away, rushing away,  
reducing the life size into nothing-  
it upsets the scale you live by.  
Your eyes go first, followed  
by the head,  
and if you can’t look away  
you feel sick,  
And that’s my view of time. (Stoppard, 1969, p.12)( All subsequent  
quotations are from this edition)

Actually, Gladys rejects the common notion of time; she insists that time is impartial, disinterested, and god-like. Consequently, she gives up everything, including her husband and other human beings, who think that time is something they invented for their own convenience and divided up into years, months, days, hours, and so on. People rely heavily on this division of time so as to make their lives orderly and systematic, and to know

When to retire;  
When to leave the station,  
renew their applications  
When their subscription  
have expired;  
....., etc, etc, (p.11)

T. S. Eliot presents, in 'Burnt Norton,' the same view point of time as impartial and indifferent to human beings. He believes that time is a continuum, an endless flux that engulfs man's existence. Man, in order to understand this continuum, imposes this division of time into past, present and future:

Time present and time past  
are both perhaps present in time future  
And time future contained in time past  
If all time is eternally present  
All time is unredeemable (Eliot, 1982, p.171, ll1-5)

Stoppard presents through Gladys another of his 'spiritual loners,' as she desperately attempts to evade the harsh realities of her world. In the past, she failed to gain admission to a nunnery. She sought 'serenity' and quiet life, but was rejected by the religious authorities because of her religious doubts. Gladys lives in an age of reason, in which rational thinking dominates especially in western societies. These societies witnessed, since the scientific works of Darwin and other scientists, many moral shocks that led to the prevalence of spiritual emptiness and religious doubts. Gladys is eager to escape this world, with its chaos and turbulence into an orderly existence, a world that provides her life with meaning and logical explanations. Her job as the speaking clock offers her this kind of order. However, as she goes on announcing the passing seconds, she is appalled by the omniscience of time. Through this unending repetition of time, Gladys experiences a portion of eternity as the seconds stretch ahead and behind her to infinity. Time, she believes, flows endlessly and reduces man within it to a very tiny part of its flow, in fact to nothing. Realizing that time is indifferent to human beings, she is driven to breakdown by this Olympian vision of time and its impartial progress. One of her wishes is to 'cough,' 'sneeze' and to whisper an obscenity (p.28), while she is performing her tedious and repetitive task. However, she is reluctant to do so, because this means the collapse of the system at the Post Office, though she is fully aware that this disruption would make no difference:

It can go without me  
and it will  
Time doesn't need me-  
They think I am time, but I am  
not-  
I am Gladys Jenkins...(p.27)

It is this keeping of her dull and monotonous job, despite her knowledge of its absurdity, that makes her position absurd and puts her on the verge of psychological breakdown.

Gladys's relationship with Frank is another piece of evidence of her enchantment with serenity and the quiet life. Frank, Gladys tells us, is as reliable and punctual as a clock; she informs us that he took his timetable seriously, to the degree that "you could set your clock by him"(pp.19-20). Frank is surprised to recognize, while dialing 'Tim' that the speaker is his wife, Gladys. He decides to rescue her, because he thinks that she is kept there against her will. However, he is unable to reach Gladys or release her from her ordeal, since he is a slave to his timetables and work routine. He is beaten back and ridiculed each time he enters the Post Office to meet the top

man or to ask about his wife. Finally, Frank is given a very severe blow when the First Lord replies callously and unsympathetically: “First Lord (*Chuckling*): My dear fellow-there’s no Gladys- we wouldn’t trust your wife with the time- It’s a machine, I thought everyone knew that...”(p.30).

This reply gives a true portrait of what life in the twentieth century has come to. We are going, like Gladys, to be machines or cogs in a big wheel. Here, Stoppard warns us that we will be reduced to puppets in a universe unsympathetic to our needs, if we lose our ability to master time, and reminds us that the clock is made for man and not vice versa.

Frank’s separation from his wife, and his inability to communicate with her, are aspects of the absurd situation they are put into. However, it strikes one as a hopeful gesture that- although the action is circular and the characters are imprisoned and repeat the same action- Frank will never stop looking for Gladys, as Gladys will keep on informing us about time.

The final scene of the play represents another image of circularity, as the First Lord manages to defeat Frank’s efforts to liberate Gladys from her self-inflicted prison, and as she will go on in her Sisyphean and self-consuming job “ad nauseum”(p.12). So will her husband.

As in *Dominic Boot* and *‘M’ Is for Moon*, the situation in *If You’re Glad* will remain the same, since Gladys will always be under the mental and psychological pressure of her work, and as she will be forced “to pull [herself] together, stop crying, and to control [her] voice”(p.31).

Levin (1976), in a comment on the significance of the play, points out that it represents:  
an assault on the whole concept of time as the irresistible force that compels societies...to trot obediently in its wake. It is a dazzling piece of work...juggling excellent but straightforward jokes...with a constant stream of time-metaphors turned inside out, all spinning round the still human nature of Gladys...The scenes switch between no fewer than six acting areas, with the cross-references of speech, movement, and lighting, all controlled by the inexorable pips.(p.38)

To depict Gladys’s predicament effectively, Stoppard creates an inner and outer voice, one for the speaking clock and the other for her inner thoughts. The latter, of course, has the dominant value in the play, for it informs us of her personal anguish, ordeal and private feeling in regard to the absurd limbo she finds herself in.

*Albert’s Bridge* (1967) is similar to *If You’re Glad* in many respects. Like Gladys, Albert is another character in Stoppard’s series of ‘spiritual loners.’ Like her, he tries to impose order on his chaotic life by devoting himself to repainting a bridge. Moreover, man for Albert, as for Gladys, becomes insignificant if measured from the height of the Clifton Bay Bridge, on which Albert is employed as a painter.

Albert was a philosophy student, and he wanted to stay on at university, but “they wouldn’t have [him]”(Stoppard, 1970, p.14). (All subsequent quotations are from this edition) It seems that studying philosophy made him unable to cope with ordinary life and human relationships. One notices that there is hardly any relation between Albert and those around him. This may explain his utter disregard for Fraser’s attempts to commit suicide and his wife’s desertion with their child. His feelings of loneliness and isolation make him seek resort in the bridge. Indeed, the play’s title reflects Albert’s obsession with bridges and towers. He chooses Paris as place for

spending his holidays with Kate, because this enables him to visit the Eiffel Tower. Besides, almost all the play's events take place around or on the bridge.

Albert has been painting the bridge for a number of years. He is quite happy and content in his job, for it offers him a pattern or an order that helps to shape his meaningless life.

However, Albert's solitude and quite life will not go on forever like that. The city engineer, Fitch, who is also obsessed with logic and patterns, produces to the town's Bridge Committee a scheme to save money by using a paint that will last eight years, and, therefore, the committee needs only one painter. Albert applies for the job and succeeds. He likes the distance it offers him. The clutter of everyday world looks like a neat pattern when viewed from the bridge, and the bridge itself has a self-contained logic-the whole thing utterly fixed by the rules that make it stay up. (p.16) Albert here has assigned himself a Sisyphean task of endlessly repainting the bridge. Unlike his work mate Dad, who gives up his job as a bridge painter, Alfred sees this endless task as a finite achievement:

Albert: Simplicity-so...contained; neat; your bargain with the world,  
your wages, your time, your energy, your property, everything you took  
out and everything you put in, the bargain that has carried you this far-all  
contained there in ten layers of paint-accounted for.(p.9)

Albert has forsaken everything, including his wife, child, and mother, in order to work on the bridge. His mother thinks that philosophy has changed him. It has made him think all the time. Like Beckett, Stoppard suggests that knowledge sometimes leads to bewilderment and uncertainty, as one is subject to different cultural trends and philosophies. (Wellwarth, 1971, p.46) As a philosophy student in the twentieth century, Albert comes across different and contradictory philosophical concepts. Apparently, this helps only to increase his confusion and bewilderment. Instead of wasting his time on philosophy, as his mother thinks, Albert could have been now a trainee executive with his father in the factory. Stoppard here develops the theme of non-conformism, which occurs in several of his early plays. Albert continues his job as a bridge painter and refuses to step on the treadmill of business and industry.

Albert gets married to Kate without an obvious motive. This again reflects his indifference to those around him. However, unlike the protagonists in the plays of the Absurd, Albert does not regret having a family. He does want to make them happy. The problem with Albert is that he does not feel really at home in the society in which he is condemned to live. When he is not on the bridge, he is haunted by the pettiness and futility of all he intends to do. His perspective about the world assumes another shape when he is on the bridge. He is happy there and thinks that there are some logical rules that govern the world and make it comprehensible to us. In this respect, Albert is like Gladys, a victim of perspective. He is seduced by the distant view of life as seen from the bridge, while Gladys is imprisoned into the infinite horror of time.

Another victim of perspective is the would-be suicidal maniac, Fraser. Just like Albert, who sees the whole town, people, university, and even his wife and daughter from the bridge as bricks, dots and beetles-that is, an existence orderly arranged- Fraser, who is appalled at the fragility of

the chains of economic causes and effects which keep civilization going on when he is on the ground, sees everything from the bridge as “Quite ordered, seen from above. Laid out in squares, each square a function, each dot a functionary. ...from a vantage point like this, the idea of society is just about tenable” (p.32). Fraser realizes that the only direction left for him to go in is upwards. So, he decides to climb the bridge, to escape the world and its miseries.

In his conversation with Albert, Fraser diagnoses the ills of modern British society. One can safely say that many parts of the world in the twentieth century suffer from similar problems. Fraser poses the well-known problems of mass production, unemployment, financial pressures, the feeling of insecurity in a world of shattered beliefs, noise and population explosion. Fraser realizes that “There is too much of everything, but the space for it is constant. So the shell of human existence is filling out, expanding, and it’s going to go bang” (p.30), and that “One is forced to recognize the arbitrariness of what we claim to be order. Somewhere, there is a lynch pin, which, when removed, will collapse the whole monkey-puzzle” (Ibid). Actually, this is exactly what happens at the end of the play when **1800** painters come to help Albert in painting the bridge in one day. Neglecting the rules of physics that keep the bridge stay up, it collapses under the weight of those men and with it Albert’s dreams of order and quiet life. The collapse of the bridge represents another kind of reduction to ‘nothing’ by taking a neat logic to its extreme.

Because of his deep sense and preoccupation with the bridge, Albert regards any visitor as a threat to his world of make-belief on the bridge. He asks Fraser to descend, but once he is told that Fraser intends to jump off the bridge, Albert says:

Albert: You come up to go down?

Fraser: To jump.

.....

Albert: Jump off? You’d kill yourself. Ah.

.....

Albert: Well, jump.

Fraser: Aren’t you going to try or to talk me  
out of it?

Albert: You know your own mind. And you’re  
holding me up. I’ve got to paint where you’re  
standing. (p.31)

This conversation shows Albert’s apathy towards human life and existence. Indeed, the bridge, for Albert, becomes both a symbol of life and a retreat from it. The bridge becomes his life and his final destiny, for in his insistence on working on it, he resigns himself to the ultimate truths of life, namely life and death.

The bridge, in fact, may give Albert a sense of importance, a sense of being in “the centre” of things” (p.37). This is why Albert and Fraser are horrified as the army of painters approaches. They recognize that it is their ultimate tragic end, and they sense the approaching collapse of their world. Hayman (1977) describes the death scene thoroughly:

Like Ros and Guil [in *Rosencrantz and Guildenstern are Dead*], who are almost flattered by the tragedy of their death, never having believed themselves to be important enough, Albert is caught by surprise: “Eighteen-hundred men-flung against me by a madman! Was I so

important?(p38) He knows that the basis of his existence is destroyed; he doesn't yet know that his life is. The changing tone of the marching indicates that more and more of the men have left terra firma and started the ascent. Soon we hear the noise of the rivets popping out of place. Fraser's apocalyptic prophecies are being carried to dramatic fulfillment and Albert...., dies with him as the bridge collapses. (p.68)

Stoppard ridicules here the bureaucracy that dominates our life through the character of Fitch, who loves efficiency as much as Albert does. For him, painting a bridge is "poetry ... a perfect equation of space, time, and energy" (p.18). It is the pointlessness and illogicality of his miscalculation that ultimately bring about the death of the 1800 painters and the collapse of Albert's world.

In these four radio plays-*Dominic Boot*, *'M' is for Moon*, *If you're Glad*, and *Albert's Bridge*-Stoppard writes on the anxiety and confusion of life, on modern man's plight as he is subject to ever-increasing pressures from the outside world, a world that is hostile to man's dreams and pushes him either to death (in the case of Albert in *Albert's Bridge*) or to an endless cycle of personal miseries and troubles in the other plays.

It is noteworthy that in these plays Stoppard exploits the medium of radio to write tightly-constructed plays, in which he effectively uses different characters' voices and sound effects in order to create different layers of meaning and to enhance aurally the experiences in a way which distinguishes them from works for the stage. In *'M' is for Moon*, Stoppard misleads his listeners several times. Constance: (*Thinks*):...I think enough for tonight-I wish the print wasn't so small...Have you seen my pills anywhere?(p.61) and her counting off months in her head lead some listeners to think that the dates and pills are related to contraception, but later on we know they are not. This kind of deception has served to shed light on Constance's loneliness and her unhappy married life with Alfred.

In all these plays, Stoppard largely succeeds in drawing his listeners' attention closely to his characters' worlds, by using condensed plots, interior monologues, shorthand dialogues, sound effects, and by moving rapidly from one scene to another, thereby forcing us to deduce much of what is happening, to participate and to share in their little lives, and in their dilemmas. His writing in these plays proves to be extremely deft. He wastes no sound, and many serve a double function. By using these techniques, the listeners are drawn more intimately to the action, since it is our responsibility to imagine what is going on. Jenkins (1987) points out that "in these scripts, Stoppard finds his own voice and his own vision of life's puzzling uncertainty." (p.8)

### Biography

**Dr. Hana' Khalief Ghani** was born in Baghdad 1969. Ph.D in English literature from Baghdad University, College of Arts, Department of English (2005). B.A (1991) and M.A (1999) in English literature from University of Al-Mustansiriya, College of Arts, Department of English. Major fields of study include English Literature, Modern English and American Drama, Greek Tragedy and comparative studies. She is working a teaching staff in Al-Mustansiriya University, College of Arts, Department of Translation (2004-). She published twelve papers inside and outside Iraq. She also translated eight books into Arabic.

## DEVELOPING DATABASES-DRIVEN WRITING FOR WRITING ACADEMIC PAPERS BY IRANIAN ACADEMIC MEMBERS

### ABSTRACT

Iranian academicians cannot usually express their own findings within particular discipline domain because there are particular gaps between what is traditionally known and what is expected in the academic writing situation. This paper has been developed to help Iranian academic members, who are nonnative speakers of English, regularly find the writing of English paper a very challenging affair. On the other hand, candidates in this study are adults, fully occupied and workshops/overseas presentations have proved to be not enough effective instruments to shift them toward authentic writing, database-driven writing seems to work. Therefore, it seems databases for Iranian academicians in English for academic purposes should be developed to help individual academic members to know musts and musts not in their academic writing. These searchable databases must be designed in such a way that satisfies the constructivists' requirements for learner- autonomy and learner- orientation. Data elicited based on online interview and corpora analysis in form of CBDTS (corpus based descriptive translation studies) - on micro and macro levels, are put into matrices and their analyses are supportive of academicians' reliance on different types of mental translation use and their shift toward authentic writing after receiving feedback from searchable online databases.

**KEYWORDS:** Academic writing; CBDTS; Searchable online databases; Learner autonomy; Learner orientation

### INTRODUCTION

Academic members are introduced with their papers and expertise in writing scholarly articles by accurate and effective language use. Due to the cultural and educational distance between native and nonnative writers, some researchers have suggested that there may be more differences than similarities between L1 and L2 writing (Grebe & Kaplan, 1996). Assuredly, Academic writing is an intricate activity that needs academicians have the declarative knowledge about how to organize different parts of paper writing and the procedural knowledge of how to follow the values and goals of community in order to communicate

information to a particular audience. This study is useful and valuable, because it intends to provide a chance for academic members to have consciously use databases, which lead them to reliable success and prestige in writing academic papers.

On the other hand, in spite of the great progress made through the second language writing model in previous studies; little attention has been paid to how make databases, which academicians use practically them during academic writing in second language. Therefore, by considering that the Iranian academicians aren't socially and culturally familiar with audience expectations, rhetorical patterns and genre in English academic writing necessitate this study, specifically by representative documented databases, to deal positively with the needs and concerns of non-native writers and to provide genre and discourse pattern for Iranian academic members. Within the framework of writing research, this study first of all has a survey on existing scholarly literature review, and for eliciting data, the researcher relies on two methods; the former is an online interview and the latter is corpora analysis. Qualitative Survey and online interview technique for data collection will be favored; corpora analysis will also be used to find the necessitate elements for second language writing for Iranian academicians. The researchers believe that new finding of this study will be appealed to board audience, particularly Iranian academic member for writing their papers in English language.

Designing these online databases is becoming increasingly significant because they can be accessible and intentionally have been designed to help Iranian academicians succeed in the writing scholarly tasks by giving needed and applicable information. Clearly, Iranian academicians don't enough time to search every beneficial guideline for writing an authentic academic paper. Therefore, designing available electronic databases to illustrate an approach how to write scientific paper for most multidiscipline Iranian academic members are required. In each case, these electronic databases will let Iranian academicians access available a list of tips, which are required to be considered, for writing an international scientific paper. These databases cause to speed up their work and allowing them to produce better quality research. Surely, academic writing has its perfect and rational body, which makes it model as a self-study and reference guide for academicians needing to work independently. Consequently, the researcher tries to reach a situation in which all kinds of information are freely available to every Iranian academic member, while dealing academic writing.

## **RESEARCH QUESTION**

Are archived academic, stereotyped, cliché expressions effective and promoting means for academic members in their paper writing?

## **THEORETICAL AND METHODOLOGICAL ISSUES**

In spite of basic similarities between L1 and L2 composing process, recent studies have disclosed that there are also important differences such as fundamental cognitive, linguistic, discourse, genre and audience related issues between L1 and L2 composing systems. Paying attention to the differences between first and second language writing, L2 learners compel themselves to match with the adoption of writing instruction to suit the special needs of L2 writing. Kroll argues that "we [still] have very little information on how people actually learn to write in second languages or how teaching might influence this" (Kroll, 2003, p.6). ESL teachers and SLA researchers have long been aware that ESL learners often have difficulties with academic writing in English (Lieber, 1980; Reid, 1989).

According to Raimes, “all of us who have tried to write something in a second language ... sense that the process of writing in an L2 is startlingly different from writing in our L1” (Raimes, 1985, p.93). Likewise, Aliakbari (2002) argued that L2 writing ability had no meaningful relationship with L1 writing. L2 writing ability and L1 writing ability were two separate tasks; that is, writing in L2 is a language-specific phenomenon, not a writing problem. These studies suggest that learners, especially those with inadequate proficiency in L2, rely on their L1 to achieve their goals and to solve any problems they encounter when composing in a new language. Thus, a major problem for these learners is how to overcome the negative effects of “transfer, or interference, of their L1 writing conventions in L2 writing” (Kubota, 1998, p.69).

Iranian academicians cannot usually express their own ideas and findings within a particular discipline domain because there are particular blanks between what is traditionally known and what is expected in the essay writing situation. Subsequently, they need to develop their knowledge about linguistic competence in terms of appropriate vocabulary and writing style and familiarity with the writing modes and skills required in the academic culture.

Kaplan (1966) contends that many students in ESL programs write texts which are significantly different from those written by native speakers of English. He notes that the writing problems, which L2 learners encounter, are not merely a byproduct of structural interference from their native languages; rather, they are result of transfer of rhetorical strategies and rhetorical patterns from their native cultures. Undoubtedly, culture affects the use of language in writing because each culture has its own patterns of discourse. L2 writer's text is intuitively recognized from that of an L1 writer by native speakers because L2 writers are likely to convey their native schemata to L2 writing position and they present written ideas in different ways from native speakers. The link between rhetorical features and writers' educational and cultural background can also be an important consideration in writing L2 papers because rhetorical features are culture-dependent.

Similarly, Kaplan (1966) asserts that differences in L2 writing might reflect different writing conventions that are learnt in L1 culture and may interfere with L2 writing. In contrast, some researchers (e.g., Cumming, 1989; Matsumoto, 1995) have claimed that L1/L2 writers may oscillate between the two languages whenever the need arises. L2 writers may bring their own sets of culturally and cognitively defined criteria to writing based on their L1 disciplinary, cultural and cognitive experiences internalized as different writing patterns.

Since, writers from different cultures present written ideas in different ways, L2 writer audience sense may be culturally different from L1 writers (Silva & Matsuda, 2001). In fact, the focus is on how a community defines writers and writing; how texts represent that community; how the community, its discourse, and disciplinary knowledge are constituted and reconstituted; and how participants in discursive practices form and are formed by these practices and the disciplinary and professional formations in which they participate (Kennedy, 1998).

In general, proficient L2 learners do not depend heavily on the L1 to drive the writing process because they have a sufficient level of L2 automaticity and knowledge to think and plan in the L2 (Jones & Tetroe, 1987). However, lower L2 proficiency writers rely more heavily on their L1 during the writing process in order to sustain the process and prevent a complete breakdown in language (Arndt, 1987; Cumming, 1989; Raimes, 1985; Uzawa & Cumming, 1989).

Concluded L2 writing research has indicated that L2 writers use their first language (L1) while writing in L2 (some researchers such as, Friedlander, 1990; Krapels, 1990; Uzawa, 1996; Woodall, 2002). Investigations have clearly shown that through organizing a text, L2 writers use their L1 strategies (Beare, 2000; Jones & Tetroe, 1987; Krapels, 1990; Uzawa & Cumming, 1989; Wang, 2003; Woodall, 2002), create ideas or expand text (Beare, 2000; Beare & Bourdages, 2007; Knutson, 2006; Krapels, 1990; Qi, 1998; Roca de Larios *et al.*, 1999; Uzawa & Cumming, 1989; Wang, 2003; Whalen and Me´nard, 1995; Woodall, 2002), or for overcoming linguistic problems such as vocabulary and grammar difficulties (Beare, 2000; Centeno-Corte´s & Jime´nezJime´nez, 2004; Cumming, 1989; Jones & Tetroe, 1987; Lay, 1982; Wang, 2003; Woodall, 2002).

A translator must be aware of genre, since language features will often vary depending on which genre is being translated. Culture affects the use of language in many ways and contrastive rhetoric research has discovered that each culture has its own patterns of discourse. Therefore, L2 writers are likely to transfer their native schemata to L2 writing situations (Hyland, 2002). ESL teachers and SLA researchers have long been aware that ESL learners often have difficulties with academic writing in English (Lieber, 1980; Reid, 1989).

Therefore, these theoretical and methodological problems show that because L2 writers are likely to be less fluent, less accurate and be less effective writers than L1 writers, they transfer subconsciously writing conventions of their L1 into L2 writing when confront with difficulties in L2 writing. Subsequently, academic writers become aware of the rhetorical differences in discourse and genre through exposure to academic essays and receiving feedback from online databases.

## **RESEARCH METHOD**

### ***Introduction***

Iranian academic writers usually know how to cope with specific writing format in their native language but when the demand of writing task changes in the English language, unfortunately they cannot cope with new situation because they do not have sufficient cognitive and metacognitive skills for new writing tasks.

### ***Participants***

The participants in this qualitative survey consisted of 30 Iranian academicians that were selected based on the index of their progressive presentations and publications to show their progress in academic paper writing, majored in Science and Engineering, from different disciplines, either from state or non-state funded Iranian universities; all have received their Ph.D. degree from Iranian Institutions. The number and level of their paper presentations are key factors in their selection. Possibility of their being connected to on-line system is another prominent factor in their participation to the study.

### ***Instrument***

To elicit reported strategy use from the target population, a 30 item semi-opened on-line interview, with five open-ended questions, in synchronous L1/L2 format was designed, including biographical questions, their attitudes toward English as well as questions concerning their use of communicative strategies.

On the other hand, because think-aloud writing study has limited generalizability, the other method as corpora analysis is used for documentation in this survey. The rationale behind using interview in this survey as one of the instrument is to help the researcher unmask the writers' requirements in terms of academic writing task (introspection) and pave the path to develop their own specific databases, e.g. archived End- note database format to avoid trial and error technique in future English academic paper writing.

Hence, corpora analysis was used as a second method in this survey, which is based on CBDTS (corpus based descriptive translation studies); in order to confirm the construct validity of the interview. For corpus analysis, parallel texts are needed for text analysis; therefore, academicians were asked to furnish us two papers: one was their first published paper in English and the other one was their latest published paper in English after learning new conventions of style, referencing and formation in second language through databases in order to provide an overall idea about their writing progress in the L2.

### **RESULTS**

On-line interview, as it appears in the (Table: 1) was analyzed. The qualitative data were converted into numerical matrices and they were analyzed. The analysis proves that 93 % of the candidates did not have a clear understanding of writing academic papers in their first writing academic paper but 67% of them have learned the meaning of authentic writing in their latest writing academic paper. Results taken from corpora analysis confirm authentic writing for 69 % of the candidates through using online searchable databases for academic writing.

## DISCUSSION

Corpora analysis of the two parallel texts was done on the basis of CBDTS in two levels, micro level and macro level.

Micro level refers to surface structure of the text, in which elements such as grammar, vocabulary, punctuations and text, in general were focused.

Iranian academic members had low linguistic knowledge of L2 because they had experienced less implicit or explicit exposure to the target language. Accordingly, they have not enough experience for starting formal writing.

Grammar is checked to verify written text for grammatical correctness. Usually, grammar of each sentence will be checked in a text pursue using various rules, detecting various errors, such as agreement in tense, number and word order. Each word is checked and looked up in dictionaries, and then the attempt to parse the sentence into a form that matches a grammar was checked.

Punctuation marks are symbols that indicate the structure and organization of written language. To become a sound and a successful writer, using proper punctuation is necessary. Without putting punctuation marks, documents can easily become misread and incomprehensible. Unfortunately, for many Iranian academicians, putting proper punctuation mark in the text is a difficult task.

Cohesion is the grammatical and lexical relationship within a text or sentence. Cohesion causes a link among linguistic elements to make a text semantically coherent together. Low skilled academic writers express their own opinion alone in words without the ability to relate their thought to the main idea and with noted facts.

Macro level of CBDTS refers to deep structure of text such as style, genre, texture, utterance meaning and discourse analysis. Style refers to how to structure what you want to say. When you are writing an academic essay, it requires a reasonably formal style of writing. This does not mean that you use long sentences with multisyllabic, obscure and colloquial words for expressing your new idea and findings. As matter of fact, style of writing scientific papers is different from literary essays; i. e. in academic essay, the writer expresses his/ her main idea firstly and then a series of details are added to support the main idea. Its logical progress will be covered just to support the main idea, but the style of literary essays is exactly the reverse.

Non-native speakers may need explicit instruction of what is socially and culturally appropriate in terms of the writers' roles, audience expectations, rhetorical patterns, stylistic conventions and contextual features in L2 written discourse (Silva & Matsuda, 2001; Leki, 1992).

Firstly, with regard to the Table 2, Iranian academicians undoubtedly made errors at the sentence level, which refers to grammar and sentence structure, (articles, modifiers, wordiness, passive voice use, conjunctions, nouns, incorrect use of numbers, incorrect use of prepositions, pronoun agreement, use of adjectives and adverbs, comparing two or more things, faulty parallelism, incorrect use of negatives, use of qualifiers and quantifiers, subject and verb agreement, verb agreement, verb form use, modal verbs and conditional sentences.), that were expected to overcome these grammatical and sentence structure errors by themselves as soon as possible. Poor grammar will undermine the writer credibility more swiftly than any other

single problem because readers become frustrated and prevent them from gleaning desired information.

Table 2: Frequent Errors at the Sentence Level by Iranian Academic Members

Four hundred people were interviewed for the survey then the results were analyzed.	Four hundred people were interviewed for the survey, <b>then</b> the results were analyzed. <a href="#">(Explanation)</a>

### **Genre**

Genre (sometimes called text genre) refers to a distinctive type of discourse. It is best defined as a set of patterns/forms/styles/structures, which transcend individual films besides texts, and which supervise both their construction by the film-maker plus their reading/viewing by an audience. They are also part of the "frames of recognition", which govern the institutional production, marketing and distribution of texts, besides the selection as well as consumption of those texts by viewers or readers.

Some [common genres](#) in languages of the world are

- Narrative (recounts events)
- Hortatory (suggests or commands actions)
- Expository (explains or argues)
- Procedural (details how to do something)

A translator must be aware of genre, since language features will often vary depending on which genre is being translated. Culture affects the use of language in many ways and contrastive rhetoric research has discovered that each culture has its own patterns of discourse. Therefore, L2 students are likely to transfer their native schemata to L2 writing situations (Hyland, 2002).

L2 writing tends to be a more laborious process for most non-native students with more attention paid to sentence construction and less to generating ideas, planning and goal setting (Wang and Weng, 2002). Since, writers from different cultures present written ideas in different ways, the L2 writer audience sense may be culturally different from L1 writer (Silva & Matsuda, 2001).

A second language academic writer must be aware of specific genre (patterns/forms/styles/structures) relating to text who wants to write. Unfortunately, many academicians without considering genre, which is confined to that specific essay, write down on paper what comes to their mind with translation through their first writing paper. Subsequently, Iranian academic members become aware of the rhetorical differences in discourse and genre through exposure to academic essays and receiving feedback from online searchable databases.

### **Style**

There are no rules for academic style that apply to all situations. The following styles (Table.4) are guidelines that should help academicians develop style of their own writing.

*TABLE 4: Standard Styles for Writing Academic Papers*

Incorrect	Correct
Avoid using two-word verbs such as go on or bring up.	Use continue or rise.
Avoid using etc. or and so on.	Insert and before the last item
Do not use question forms such as Why did war break out in 1914?	use statements: There were three reasons for the outbreak of war . . .
Good / bad are simplistic.	Use positive / negative
Do not use "I think" in your article writing	It is too personal
Do not use "are ok" in your article writing	It is too informal
Do not use "When we think about this"	It is too personal
Do not use idiomatic or colloquial vocabulary: kids, boss.	Instead use standard English: children, manager.
Be as precise as possible when dealing with facts or figures. Avoid phrases such as about a hundred or hundreds of years ago.	If it is necessary to estimate numbers use approximately rather than about.
Conclusions should use tentative language. Avoid absolute statements such as unemployment causes crime.	Instead use cautious phrases: unemployment may cause crime or tends to cause crime.
Do not contract verb forms: don't, can't.	Use the full form: Do not, cannot.
Avoid use of like for introducing examples.	Use such as or for instance .
Avoid use of thing and combinations nothing or something.	Use factor, issue or topic.
Avoid use of lots of.	Use a significant / considerable number.
Avoid use of little / big.	Use small / large.
Avoid use of 'get' phrases such as get better / worse.	Use improve /deteriorate.
Do not use of good / bad.	Use positive / negative, e.g. the changes had several positive aspects.
When writing lists, avoid using etc. or and so on.	Insert and before the last item
Do not use of past tense for expressing facts and hypotheses.	Use of present tense for known facts and hypotheses.
Do not use of first person pronounce.	Use of third person instead of first person
Avoid express your result in past tense.	Results description in your paper should be expressed in present tense because your results are not yet accepted as "facts"

## CONCLUSION

In fact, neglecting the Iranian academician's needs to publish in international publications for academic audiences without accurate and effective language use is not desirable. This survey indicates that Iranian academicians greatly got more writing feedback from online databases than alternative feedbacks, such as oral presentations, workshops and editors' feedback. Oral presentations in conferences do not provide opportunities for face-to-face Iranian academic writers' individually attention and discuss their writing problems and needs. By comparing the first written essay with the latest written essay by Iranian academicians after learning new conventions of style, formation and the other aspects of second language writing paper through designed online databases, they positively and clearly use all valuable comments for their writing developments.

One of the most efficiency of designing searchable database in this study is that the researcher of this study mostly focuses on repeatedly errors, which are mainly seen in the Iranian academicians' papers, in order to lead and encourage Iranian academic members to authentic writing papers. It is important to claim that most of feedbacks on second language writing in the previous studies were dedicated to limited time that causes to reduce lexical and grammatical errors in following writing. Therefore, one of the highly significant factor in this research study is that online searchable databases, which demonstrate information in order to choose the appropriate language and style, make a reference for every Iranian academic member to improve his/her academic writing for long-term period.

The other significant factor in this research is that it encourages Iranian academicians to receive constructivism instructions through their second language academic writing. Thus, when Iranian academicians directly use online/off line writing databases cause to save themselves from destructive effect of critical comments and suggestions. However, these searchable online databases lead indirectly Iranian academicians to learner-autonomy and learner-orientation to develop both manuscript and their writing abilities.

Online databases make Iranian academic members a chance to respond to the diverse cultural and educational backgrounds, and their writing needs by clarifying examples for resolving ambiguities in detailed explanations marking of papers by saving their time. In fact, searchable databases give Iranian academic members clear idea of their strengths and weaknesses in order to push them to autonomy on the base of written feedbacks.

Databases can not only lead to revisions in subsequent drafts but also have lasting effects on improving writing in later assignments.

Through the use of questionnaire and the think-aloud protocol in this study as first instrument, which is based on self-reporting because respondents cannot imagine the full context of situation therefore, they may read differently into each question and reply based on their own interpretation, it may have limited the enough information on writers' source use accurately or confidently when they are engaged in writing. Consequently, the researchers confronted with limited reliable and valid results from questionnaire.

The design of this study is process-oriented academic writing through using designed online searchable databases and few studies have been done on a process- orientation basis in writing academic writing subsequently, any study in this field is valuable to increase the reliability and viability of this research.

## CRITICAL READING AMONG COLLEGE STUDENTS

**Mahboobeh Keihaniyan**

*Young Researchers and Elit Club, Najafabad Branch, Islamic Azad University, Najafabad,  
Isfahan, Iran*

*Email address: m\_keihaniyan@yahoo.com*

### ABSTRACT

Critical reading is an important component of developing literacy. It is commonly described as involving higher order thinking skills. The challenge for instructors is to activate students' awareness of this skill. Critical reading plays a central role in university study, yet how to develop this skill is not often discussed. Problems arise when adult learners are confronted with testing situations that require specific responses to text. The purpose of this study is to help you develop the skills to read, think and write more critically. The procedure involved several interventions: 1) reviewing current research on metacognition, critical thinking, and critical reading; 2) probing student awareness of critical thinking by a questionnaire; 3) adjusting teaching strategies to address the needs for critical reading skills. Results of pre- and post-questionnaires, analysis of quiz and tests, and a review of written reflections by students and instructor reveal learners' awareness and application of higher level critical thinking and critical reading skills. This research project was beneficial to both students and instructor in several areas; activating prior knowledge of critical thinking, reviewing of major aspects of critical reading, and increased focus on text structure and test question- and-answer relationships.

**KEY WORDS:** critical thinking, critical reading, metacognition

### INTRODUCTION

Critical thinking is also claimed to be important in the acquisition of language skills particularly writing and reading (Moore et.al, 2003). Two indispensable language skills that can help undergraduates secure, their academic success. However, studies on the relationship between critical thinking and these two language skills, especially those which use second language learners as the sample are still not sufficient. Similarly, there are not many studies conducted on the relationship of the aforementioned construct with general language proficiency. Research on critical thinking in relation to second language learning is still in its infancy stage. Scholars such as Carpenter & Johnson (2001) and Gordon (2004) consider critical thinking as a form of western cultural thinking and they hold the view that Asians students are not able to think critically because such nature of thinking is a form of cultural thinking that is alien to Asians. Nevertheless, two studies carried out on Japanese students Lipson & Wixon (1991) produced results which are able to refute the claim that Asians are deficient in critical thinking skills. The findings of the studies did not only show that Japanese students had critical thoughts but also indicated that critical skills could be taught to these students in an English language class. However, more researches need to be conducted in other Asian contexts. The importance placed on the need for university students to be critical in thinking and proficient in English is partly attributed to the problem of high unemployment rate in many countries. Several studies done to

determine the causes of high unemployment rate produced findings which indicate that competency in critical thinking and English language are among the abilities highly sought after by employers. A study involving 2,274 graduates who graduated in 2001, Meyers (2000) revealed communication skills as one of the main skills needed by the graduates to secure a job; i.e., most of the unemployed graduates in the study were found to have low proficiency in English. Another study on 241 employers' view on requirements sought in the graduates, Kurland (2000) confirms the finding of the former study indicating communication skills, particularly English communication skills, as one of the main six competencies required of the graduates; in addition, thinking skills were also rated to be important competencies by the employers who were interviewed. Similar results were found in a survey study on the perceptions of fifteen human resource personnel of national and multi-national organization in Malaysia. Weiner & Bazerman (2002) Proficiency in English was a quality that the personnel sought after when hiring new employees and was perceived to be an important contributing factor to an individual's success in the related organizations. These studies have raised awareness among many relevant parties on the crucial need to improve the standard of English and thinking skills among undergraduates to enable them secure a job upon completing their studies at the university. Critical thinking ability has been identified as one of the constructs which has been proven to be a good predictor of academic performance (Barnes, 1992). Hence, it is important for relevant university authorities to be informed of the critical thinking ability level of their undergraduates. To non-critical readers, text provides facts. Readers gain knowledge by memorizing the statements within the text. Critical readers thus recognize not only what a text says, but also how that text portrays the subject matter. They recognize the various ways in which each and every text is the unique creation of a unique author. A non-critical reader might read a history book to learn the facts of the situation or to discover an accepted interpretation of those events. A critical reader might read the same work to appreciate how a particular perspective on the events and a particular selection of facts can lead to particular understanding.

### **GOALS OF CRITICAL READING**

Text books on critical reading ask students to accomplish certain goals:

1) to recognize an author's purpose, 2) to understand tone and persuasive elements, 3) to recognize bias. Notice that none of these goals actually refers to something on the page. Each requires inferences from evidence within the text. Critical reading is not simply close and careful reading. To read critically, one must actively recognize and analyze evidence upon the page.

### **STATEMENT OF THE PROBLEM**

How can a teacher more effectively teach critical reading skills? What strategies can a teacher implement to increase students' critical reading skills? How much practice in simulated tests do students need to increase their critical reading skills, so they can pass a standardized reading comprehension test at the end of a developmental reading course? The problem is that students did not make accurate judgments on the questions that were given in the reading comprehension test. This was especially difficult for adult learners who had not been in school for awhile, and who function on the literacy level of a junior high school student. The students need the knowledge of specific reading comprehension strategies.

### **RESEARCH QUESTIONS**

With regard to what has been presented above, the present research will address five major questions:

1) Is there any relationship between text structure and critical reading?

- 2) Is there any relationship between learners' knowledge of selected vocabulary, key ideas in sentences, paragraph patterns and critical reading?
- 3) Is there any relationship between the comprehension of denotation, connotation, the meaning of the text and critical reading?
- 4) Is there any relationship between stated or implied ideas, ordering of ideas, questions about a paragraph and critical reading?
- 5) Do learners benefit their metacognition in critical reading?
- 6) Do learners feel they had improved their critical reading?

### **SIGNIFICANCE OF THE STUDY**

Students benefit from critical reading skills because it increases their abilities to respond to, evaluate, and remember text. The students benefit from a modeled step-by-step process of critical reading. Both students and instructor benefit from synthesizing, organizing, and interpreting ideas as presented in well-written texts on a variety of subjects. By responding to a questionnaire, students benefit by thinking critically and clarifying their perceptions. The instructor benefits by creating better analogies that address the students' diverse learning styles. Students also benefit by a review of the rudimentary terms of instruction; story grammar, expository text structure, metacognition, figurative language, controlled inference, assumption, deduction, and interpretation. The ultimate benefit is efficiency in reading and how to pull out of the material what you need.

### **METHODOLOGY**

#### ***Participants***

The participants of this study ranged from 20 to 25 year-old students selected randomly from 25 female students studying English as a foreign language (EFL) where the researcher is an instructor of a General English course. They were in the second year when learners exposed to a kind of learning to develop their critical thinking. A Nelson test was administered to the students to select and homogenize the intended number of students for the study. Next, 16 students, whose scores were between one standard deviation above and one standard deviation below the mean in Nelson test, were selected to answer these tests, questionnaire, quizzes and learning logs. Cooperative learning groups were randomly formed and remained stable until the end of the research project. In groups, they could discuss their thinking and answers to reading selections from reading textbook. Learners discussed their responses in their cooperative learning groups. They listened to the reasons their fellow students chose other answers, argued, re-examined the text. The focus was on arriving at the best answers to the questions, but the learning groups prompted the students to appreciate the diversity in thinking that was evidenced by their answers.

#### ***Instruments***

1) A Nelson test Dadkhah (2002). It consisted of 40 multiple-choice items on grammar and vocabulary to estimate the proficiency level of the learners. The validity of the test was established by consulting with three experts. Its reliability was measured via cronbach's alpha that was 0.75.

- 2) The nine reading passages that are from one to three paragraphs long on diverse topics and dense with information. Three to five questions follow each passage and test readers' ability to discern main ideas, sentence relationships, conclusions, point of view, author's tone, and controlled inference.
- 3) Pre -questionnaire distinguish among the various expository text structures; enumeration/description, chronological order, comparison/contrast, and cause/effect. Students answered that they could identify relationships among main ideas and details.
- 4) A Quiz that followed several classes where learners discussed main ideas, significant details, sentence relationships and paragraph patterns.
- 5) Test 1 focused on denotation and connotation of words in sentences. Critical reading questions related to a short reading passage and a longer essay on how news is reported.
- 6) Test 2 focused on stated or implied ideas in paragraphs, key ideas in sentences, ordering of ideas in sentences, questions regarding a paragraph on classification, and critical reading questions related to an essay.
- 7) Learning Logs that is about seven students wrote responses to critical reading assignments. This seemed to benefit their metacognition because they extended the reading topic by relating to it personally.
- 8) Post- Questionnaire that is used at the end of Test 2, students responded to questions related to how they felt they had improved their critical reading.

### ***Procedure***

Data were collected through the following stages: At first, the participants of this study selected randomly from 25 female students studying English as a foreign language. Then, via the administration of the Nelson test, 16 students were selected as the participants of the study. Also, the procedure involved several interventions. All interventions focused on critical thinking and critical reading skills. The first one involved explaining the problem to the students. The researcher discussed critical thinking/critical reading skills; how they related to daily situations, testing situations, and college course reading requirements. The second intervention was a questionnaire that helped to focus the role of critical thinking in their daily lives. The third one was metacognitive modeling by the instructor using reading comprehension test passages and other text. Carmen (1994) calls this process *thinking aloud*, and by using specific reading passages with questions the instructor can detect sentence relationships and model analytical processes involved in comprehension.

### **RESULTS OF PRE- QUESTIONNAIRE**

The students generally expressed great confidence in their knowledge of text structure. Most answered that they could sometimes distinguish among the various expository text structures; enumeration/description, chronological order, comparison/contrast, and cause/effect. Students answered that they could identify relationships among main ideas and details nearly all of the time; only a few answered that they did not need clarification on this aspect. But most of the students answered that they needed clarification of the elements of grammar and examples that demonstrated the differences between narrative and expository text. The students appeared to be confident and knowledgeable about text structure, yet they needed support and review of the terms of instruction with examples of sophisticated text generally regarded as at college level. Students answered six questions related to metacognition; purpose for reading,

self-questioning, monitoring comprehension, use of strategies, and constructing meaning. Most students answered that they were generally aware of the purpose of their reading and consciously adjusted their speed and attention to suit the task. The students answered less confidently about the process of continual self-questioning to help determine if they were following the author's message, yet most answered that they understood what they were reading and stopped when they did not understand. Most students felt they could recognize statements of fact and opinion and about half answered that they sought answers for their questions when reading difficult text. Two students responded that they needed clarification of these terms and strategies. Students responded with less confidence to the ideas regarding their critical reading skills. The majority of students answered that they sometimes could detect source credibility, author's mood, and techniques. Many answered that they did not know how to establish evaluation criteria before making judgments about information they read.

### **RESULTS OF QUIZ**

Quiz followed several classes where learners discussed main ideas, significant details, and detected sentence relationships and paragraph patterns. Students had by then read several selections and answered critical comprehension questions. Also, the researcher had modeled critical reading comprehension test passages and reasoned the process of understanding question-and-answer relationships. Quiz tested their knowledge of selected vocabulary, key ideas in sentences, and paragraph patterns. An analysis of their scores revealed fourteen of the sixteen students passed with 78% or higher. An analysis of responses revealed errors in vocabulary comprehension as well as in detecting key ideas in sentences. Almost all students scored well on recognizing paragraph patterns. The students were required to outline a paragraph on a given topic according to their choice of a) chronology, b) place order, c) order of importance, d) listing of details, e) classification, f) comparison and contrast, or g) cause and effect. Then they wrote out the paragraph according to the outline. Two students were on the edge of failing; they claimed they did not know there would be a quiz and therefore hadn't studied.

### **COMPARISON OF TEST 1 AND TEST 2**

Test 1 focused on denotation and connotation of words in sentences, a related section on the shades of meaning, and critical reading questions related to a short reading passage and a longer essay on how news is reported. Test 1 was given three weeks after the treatment. Eleven out of sixteen students achieved 80% or better and two students failed. Test 2 focused on stated or implied ideas in paragraphs, key ideas in sentences, ordering of ideas in sentences, questions regarding a paragraph on classification, and critical reading questions related to an essay on auto sales practices. Test 2 was given six weeks into this research, and three weeks after Test 1. Eight out of sixteen students had improved their scores. Of those, the most dramatic improvement came from two students who had consistently written in their learning logs in response to critical reading prompts in class. In addition, they had received help through the researcher. But there was not a marked improvement in everyone's scores.

## **LEARNING LOGS**

About seven students wrote responses to critical reading assignments. This seemed to benefit their metacognition because they extended the reading topic by relating to it personally. Also they clarified their thinking by writing, and reinforced the meaning of what they had read. Because many of students were also workers and the lack of time were the reasons cited for not writing in the learning logs.

## **RESULTS OF POST- QUESTIONNAIRE**

At the end of Test 2, students responded to questions related to how they felt they had improved their critical reading. All of the sixteen students answered that they felt they had improved their understanding of critical reading. Two students remarked that they had never read critically before this course. One attributed her increase in comprehension to the vocabulary development. Another wrote that he had always read critically and that the strategies discussed in class helped his reading. Six students felt a slight improvement, and expressed the need for more practice in getting main ideas, concentration, retention of material, and distinguishing fact from opinion.

## **CONCLUSION**

The findings of the present study imply that more work needs to be done towards upgrading the standard of English language and critical thinking ability. The observed facts showed that the undergraduates did not have critical thinking ability level. So, further inquiry needs to be made regarding the low percentage of students who pass the test of reading comprehension. Increased communication with other instructors is recommended, and structured opportunities to share ideas about teaching strategies and critical reading materials would be helpful. Finally, the students had developed a tension concerning the subjective and objective elements of their critical reading. This was revealed by their answers to questions that were in some cases clearly ambiguous. It is important for instructors to recognize the subjective beliefs, values, and emotions behind learners' arguments. An atmosphere of anxiety, disequilibrium, and even discomfort is to be expected, and perhaps encouraged, because the process of developing critical reading mental structures will eventually challenge old ways of thinking and lead to an acceptance of new perspectives. Also, Ministry of Higher Education to upgrade the standard of English at the university, include critical thinking in the curriculum and promote assessments with emphasis on higher order thinking. At present, due to insufficient amount of empirical evidence, the general critical thinking ability of undergraduates is still not that transparent. Relevant information on the matter will help the university authority to both improve the academic performance of the students and better prepare them for future work.

## **LIMITATION OF THE STUDY AND SUGGESTIONS FOR FURTHER RESEARCH**

No study is complete by itself and cannot take every detail into consideration. Therefore, there are always aspects which are not accounted for. This research is no exception. There are some issues which were not controlled in this study and can be topics for further research by other researchers.

- 1) This study was done only in one city with a limited number of students. It is suggested that another study be performed with large numbers of students from more cities.
- 2) In this study only female students were questioned. Some other studies can be performed on both genders.

3) In this study, the participants were adolescents; in other studies adult language learners can be the focus of attention to see whether the same results will be obtained.

## ABSTRACT

In recent years, research on the role of pre-task planning and its effect on vocabulary performance of learners has grown galore. In the same line, this study examined the effect of employing pre-task planning through split information and brainstorming activities on learning vocabulary of intermediate Iranian learners of English. To this end, six intact classes (N=42) were selected: Four experimental groups and 2 control groups. Oxford Solution Test scores revealed the homogeneity of learners. During 4 sessions of instruction, two classes practiced the vocabulary items through split information activity as pre-task planning; the other two classes worked on words through brainstorming; and the control groups learned the words through a traditional method of instruction without any pre-task planning. The results of *t-tests* indicated pre-task planning through split information and brainstorming activities enhanced vocabulary learning of the experimental groups; moreover, the experimental groups outperformed in vocabulary learning compared to vocabulary recall. According to the results of One-way ANOVA, although there was no significant difference between the experimental groups, a significant difference was observed between the experimental groups and the control groups in vocabulary learning and recall. Implications are for teachers, students, and materials developers.

**KEY WORDS:** Brainstorming; pre-task planning; split information; task; vocabulary learning

## INTRODUCTION

Vocabularies are foundation of each language; language is our basic tool for transferring messages. Importance of vocabulary can be seen from the researches that have been recently done. As the practitioners, we have to know the best ways of approaching teaching vocabulary, strengths and weaknesses of methods to be dominating in their application and to be effective in our purpose. Since, acquiring vocabulary through traditional method is a very problematic and difficult process, the most of language teachers and learners want to know which method or activity is more beneficial.

Lewis (1993) for the first time proposed the lexical approach and argued the lexis as the basis of language and necessary part of effective communication. He based this approach on grammaticalized lexis, not lexicalized grammar. He also states that the mastery of lexical relations is the key element of successful native-like performance in a foreign language.

Nation (1980) describes two strategies for learners to deal with new vocabulary. The first is learning words in a list and the second is approaching words using context clues. He also states that once learners know about three thousand words they can use the second strategy. By this point, he restricts the second approach (using context clue for learning vocabulary) to the more advanced learners.

Step by step, the trend of teaching and learning language slowly moved toward task- based approach. A quick literature review shows that task- based learning (TBL) has become a noticeable approach in the last decade. In a TBL context, students are free of language control and natural context is developed. Also, there are much more exposure to language and language arises from learner's need that is very enjoyable and motivating in the way of being learner-centered. According to Bowen (2012), the main advantage of TBL is using language for communication purpose and its main aim is to integrate all four skills and to move from fluency to accuracy; whereas, the main aim of traditional model is to move from accuracy to fluency.

Oxford (2006) introduced many types of well known tasks including problem-solving, decision – making, opinion gap, picture stories, and etc, which are employed in different situations to different purposes for activating different skills. The outstanding factor to designing of a task is making decision about its difficulty level. Ellis (2003) suggests that teacher can adjust the difficulty of a task by incorporating a pre-task and ensure that students have necessary abilities and strategies to engage in that task. According to this fact, the wide range of available activities are restricted to split information and brainstorming in this study.

Newton (1993) investigated superiority of communication tasks such as split information over shared information on the basis of how much negotiation of meaning in each type of task is available. Qualitative analyze of negotiations in Newton's study (1993) shown split information produce more negotiation than shared information task. However, qualitative analysis of negotiation suggested that more negotiation does not necessarily provide superior condition for language development. Also, the result of Yuan and Ellis (2003) study on pre-task and on-line task planning show that pre-task planning has positive influence on grammatical complexity. Their results shown that pre-task planner produce more fluent and lexical varied language than on-line planner. Newton (2001) suggests that dealing with new words during task performance by negotiation results not only rich language achievement, but longer retention.

Keating (2012) states that as Laufer and Hulstijn (2001) proposed, word learning and retention in a second language are contingent upon the amount of need, search and evaluation, in short, task's involvement that is impose. de la Fuente (2006) also states that different pedagogical (traditional vs. task-based) has no impact on immediate retrieval of learning vocabulary, but it has an impact on long term retrieval. In this respect, task-based lesson seemed to be more effective than traditional approach.

One of the noticeable theories in task-based teaching is that of Foster and Skehan (1996). They state that pre, mid and post task activities can help learners pay a balanced attention to both form and meaning and improve their learning. Since planning in pre-task stage is one of the task condition factors that largely affect second language production, there have been plenty of studies

that have focused on the interaction of planning and task performance (Ellis,1987; Foster & Skehan, 1996 ; Robinson, 1995; Yuan & Ellis, 2003). Although, these studies mostly concern oral task performance, still more researches are needed to explore its other areas.

In this study, focus is on examination of effect of pre-task planning through split information and brainstorming on vocabulary learning and recall of EFL learners. According to the some studies empirical task-based implementations show strong effect on learning language and task is an effective way of conceptualizing and learning (e.g. Ellis,1987; Foster & Skehan 1996). Even though, the researches to date provides general support to the claim that pre-task planning impacts positively on language production, especially in the case of fluency and complexity (Housen & kuiken 2009), the case of this design has not been touched before.

## RESEARCH QUESTIONS

In this study, it has been tried to find answer to some questions that have been raised about the already mentioned pre-task planning methods (brainstorming and split information activity) and its effect on learning and recall of vocabulary which is rarely investigated before. In this means, answer to the follow research questions is the main concern of this study:

- 1-Does pre-task planning through split-info activity have any effect on learning vocabulary of the Iranian EFL learners?
2. Does pre-task planning through brainstorming have any effect on learning vocabulary of the Iranian EFL learners?
3. Do different types of pre-task planning activities have any effect on long-term recall of the EFL learners?

To be shortened, this study is focused on the possible effect of pre-task planning with split information and brainstorming on learning and recall of vocabulary. Actually, comparison between these methods and traditional one in a similar context with the variables under the control can throw the light on the issue and the questions which are under investigation.

## METHODOLOGY

### *Research design*

The study employed a quasi-experimental design. The main purpose of the study was to examine the effect of independent variables on participants learning vocabulary. Another purpose of study was to investigate delay effects of mentioned strategies and to do more exact judgments for pedagogical purposes. Independent variables were pre-task planning through split information and brainstorming while dependent variable was learning vocabularies. There were 6 classes involved in the research, 4 of which belonged to the experimental group and 2 belonging to the control group. All classes were in intermediate level on the basis of test of proficiency at the beginning of term.

### *Participants*

Total number of participants was 42 Iranian English as a foreign language (EFL) learners (all female between 14-26 years old in Tehran's Shokoh and Simin institutes). The selection of 6 classes was based on intact group selection, and to make sure of the homogeneity of the learners a version of Oxford Solution Test was administered by the institutes at the beginning of the new term. All the participants were in intermediate level according to the proficiency test. Six

participants were in class A and 8 in class B. with mean age of 19.53 and age SD of 3.94. These two classes were assigned to the split information group. There were 7 and 8 people orderly in Class C and D. With mean age of 17.84 and age SD of 4.14; they were assigned to the brainstorming group. Six participants were in class E and 7 in class F. These two classes randomly were assigned to the control group. Mean age of control group was 17.85 and their age SD was 4.46.

### ***Material***

#### ***Teaching material:***

The intermediate *Oxford Word Skill* book written by Gairns and Redman (2008) was used as teaching vocabulary material. Since the mentioned book was the common and necessary supplementary teaching material in Shokuh institutes, instructors preferred to utilize it. Target vocabularies were 100 words from 4 topics of this book. Selected units were 5, 19, 21 and 23 in which new words were introduced in the context of short readings plus a glossary section. Following each unit, there were at least 3 exercises in different styles requiring blank spaces to be filled in: true or false, spelling, and writing.

Unit 5 encompassed the two sub-topics of discussing both male and female appearance. Unit 19 included four sub-topics of talk about before, during, after sleep and sleep habits. Unit 21 involved sub-topics of car parts and driving tips. Unit 23 encompassed talking about fashion with two sub-topics of cloths and fashion. Material in pre-task planning sessions for split information groups was made up of 2 pictures and their related word/definition on separate papers.

#### ***Testing material:***

An Oxford Solutions Placement Test in the form of 50 multiple choice questions was used to assess the knowledge of grammar, vocabulary of participants, and homogeneity of prior knowledge in the classes which were selected to be involved in the study. In addition to the proficiency test, there were 3 sets of thirty-item multiple choices tests as pre-test, post-test, and delay test. Calculated reliabilities for pre-test were about 0.53. The reliability of post test and delay test were 0.69 and 0.65 respectively.

### ***Procedure***

At the beginning of the term and a week after conducting the pre-test, instructors had started to apply the methodology. Participants in all groups had received 4 sessions of 40 minutes. Four topics and 100 words were already determined as material and each topic was covered in a session with a week interval from the next one. Control groups received no treatment (pre-task planning) with the same time as the experimental groups.

For experimental groups, around ten minutes of each session were allocated to pre-task planning and 2 to 3 minutes before starting new topic were spent reviewing of last session vocabularies. There was not any pre-task planning in the control groups; they just did the task. Instructors first introduced related topic to act upon it in pre-task. In the remaining time, participants conducted the main tasks which were actually reading, glossary section, and answer to follow up exercises.

At the end of session answers were checked with classes. For keeping the condition unify and preventing halo effect, the same instructor was employed for classes with the same method.

*Pre-task planning through split information activity*

In all split information sessions, participants worked in pair and materials were divided into two parts: words plus definitions (word/definition) and pictures. Common characteristic of this planning was division of materials. It means each student received just a part of materials. In other words, half of the words/definitions and pictures were put in charge of one and the rest was put in charge of the partner. They had to take turn for asking their partner for the information they did not have. The pace in all split information planning sessions was the same: students were asked to interact for exchange of idea just in English and in certain time line (7 minutes for first subtopic and another 7 minutes for other subtopic).

*Pre-task planning through brainstorming activity*

There was an outline in all brainstorming sessions. Students sat on their seats which had been put around a table. Before beginning, instructor explained to them about the challenge they were due to face. To start the session, the topic was introduced and sub topics were made and written on board with students' participation. After introducing and categorizing, each student was given an index card. Participants were told that they had around a minute to record their ideas on an index cards and then had to pass it to the person on their left and continue until all the cards were written on.

The instructor asked students to write their ideas on each subtopic just in English. In the case that they didn't know the word and couldn't write an explanation instead, they were allowed to insert their word in Persian. Each session also had a certain time line that was told to the participants before beginning. There was, for example, just a minute for each index card and totally 8 minutes for all, depending on the number of participants and subtopics.

*Traditional method*

As with the other two previous methods, in traditional method there were 4 sessions and in each session one of the topics was covered. The primary difference between this and two previous methods was the absence of pre-task planning. The students were asked in the first session to study the reading section and related glossary from their book and then do the following exercise. At the end, the answers were checked with the class. At the beginning of each session, about three minutes were allocated to reviewing the vocabularies of the last session. All of 4 task topics in split information and brainstorming methods were covered with the same pace.

## **RESULTS**

*Statistical analysis*

To test the research hypotheses, descriptive statistics of each test (measures of central tendency and measures of dispersion) were run. Then the related normality tests were applied to decide upon the type of statistical tests to examine the research hypotheses. For more assurance, we used both numerical and graphical methods of testing normality to prove that data in this survey were normal. Since the obtained data were normal, and other assumptions of parametric techniques were met, the parametric statistics were utilized. The selected tests in accordance with research questions and hypotheses were independent paired *t-test*, paired *t-test*, and One Way ANOVA.

### Testing normality

Initially, for examining the normality of each group three factors of skewness, One-Sample Kolmogorov-Smirnov test (K-S), and Q-Q plot were used and it has been concluded that distribution of scores for all group was normal to a large extent.

### Reliability of tests:

In addition to Oxford Solution Test which was used as the proficiency test, there were three more tests in this study that their reliabilities have already been calculated using KR- 21 formula. According to this formula, reliability of the pretest is about .53. This value is .69 for the posttest and .65 for the delayed test.

### Findings of the study:

#### Findings of hypotheses one and two:

H0 1: Pre-task planning with split information activity method has no effect on learning vocabulary of the Iranian EFL learners.

H0 2: Pre-task planning with brainstorming activity has no effect on learning vocabulary of the Iranian EFL learners.

The first and second hypotheses were tested through two different methods: independent sample *t-test* and paired sample *t-test*. According to the findings and on the basis of calculation of sample *t-tests*, observed value of 2- tailed statistic for the experimental groups and the control group (.00) was less than the alpha level of .05. So, we concluded that there was a significant difference between the experimental groups and the control group in their performance on the posttest. Also, observed value (.00) of 2- tailed test for the experimental groups in pretest and posttest was less than the alpha level of .05. It can be, therefore, concluded that there was a significant difference between performance of the experimental groups from time 1 (pretest) to time 2 (posttest). With a quick review of these findings we can figure out that the experimental groups out performed both in comparison to its own pretest and in comparison to the control group's posttest. Since, all the variables were constant and groups were homogeneous; it can be inferred that the higher performance of the experimental groups was as result of employing split information and brainstorming activities as pre-task planning. The null hypotheses, thus, were rejected.

( See Table 1. Table 2, Table 3, and Table 4 for the results of testing hypothesis one and hypothesis two)

*Findings of hypotheses three and four:*

H0 3: there is no difference between groups that received split information and brainstorming activities as pre-task planning and control group in learning vocabulary.

H0 4: there is no difference between groups that received split information and brainstorming activities as pre-task planning and control group in delayed recall of vocabulary.

We inferred from the test of homogeneity of variance that the groups were homogenous; so, One Way ANOVA was employed to test these hypotheses. Based on the results of this test, significant observed value (.00) for between group and within group was less than .05. So, it can be concluded that there was a significant difference between the groups that received split information and brainstorming activity as pre-task planning and the control group in learning and recall of vocabulary.

In multiple comparisons among the groups, the split information group had no significant difference with the brainstorming group, but it had significant difference with the control group in both learning and recall of vocabulary. The brainstorming group had also a significant difference with the control group, but no significant difference with the split information. Obviously, the experimental groups achieved the better results than the control group in recall and learning of vocabulary. For making a concluding remark according to the observed results of this study, we can say that learning and recall of vocabulary through different pre-task planning strategies are more effective ways than the traditional method. Therefore, the third and fourth null hypotheses were rejected and concluded that there is a significant difference between the groups which received split information and brainstorming activities as pre-task planning and the control group in learning and recall of vocabulary.

(see Table 5, Table 6, and Table 7 for the results of testing hypothesis three and Table 8, Table 9, and Table 10 for hypothesis four)

	group3	group1	-7.621*	.931	.000	-9.99	-5.25
		group2	-5.692*	.916	.000	-8.02	-3.36

*Findings of hypotheses five and six:*

H0 5: Pre-task planning through split information activity has no effect on delayed recall of the Iranians EFL learners

H0 6: pre-task planning with brainstorming has no effect on delayed recall of the Iranian EFL learners.

Selected statistics for the hypotheses five and six was paired samples *t-test* between the posttest (time 2) and delayed test (time 3) of the experimental groups separately. Although, there was a significant difference between scores of the experimental groups from time 2 to time 3, based on the posttest and delayed test means, mean score of posttest had a decrease. So, the null hypotheses were accepted and concluded that pre-task planning through split information and brainstorming activities had no effect on recall of vocabulary of EFL learners in this study. ( see Table 11 and Table 12 for the results of testing hypothesis five and Table 13 for hypothesis six)

## DISCUSSION AND CONCLUSION

There are some researches that support the findings of this study and are focused on examination of the effect of pre-task planning and split information activity on learning vocabulary. Newton (1993), for instance, examined the superiority of communication tasks including split information over tasks which involve shared information. He claimed that negotiation of meaning while performing task has a deterministic role on the learning. His study's results showed that split information has more repetition and negotiation of meaning and these negotiations result in measurable learning of new words.

Foster and Skehan (1996), also, found that pre-task planning and task-based activities have positive effect on complexity and fluency of learners' language. In a study, Hall (1992) found that acquisition of vocabulary through split information activity was greater than reading activity. Hall (1992), likewise, found that vocabulary learning of students through interactive activities was greater than that of teacher fronted arrangement with a reading focused activity.

Even, we can claim that the results of this study are in the line with Nation (1990), Foster and Skehan (1996), and Hall's (1992) findings who believe that pre-task planning and split information have positive effect on learning vocabulary. Yuan and Ellis's study (2003) on pre-task and on-line task planning proved that pre-task planning has positive influence on grammatical complexity. Their results shown that pre-task planner produce more fluent and lexical varied language than on-line planner.

Notwithstanding all, some researcher's findings are against that of this study. For example, Nassaji (2012) suggest that collaborative task (cloze task) did not lead to greater learning vocabulary than individual task (editing task) and the latter was more successful in promoting negotiation and learning. Also, Mullen, Johnson and Salas (1991), and Diehl and Strobe (1987) show that people who work in isolation outperform both in quality and quantity of generated idea than who work in group. de la Funte (2006) also discusses that different pedagogical (traditional vs. task based) has no impact on immediate retrieval of learning vocabulary.

Long (1996), however, stated that the negotiation of meaning facilitates acquisition. Also, Fuente (2002) and Branden (1997) stated that negotiation of meaning has positive effects on learning lexical items. On the basis of a meta-analytic research, Mullen, Johnson and Sala (2010) reported a great deal of productivity loss in brainstorming group in comparison with nominal group, in terms of both quality and quantity. Although, everyone thinks working in group is always more efficient than working in isolation; recent researches (Mullen, Johnson & salas,1991; Diehl & Strobe, 1987) show that people who work in isolation outperform both in quality and quantity of generated idea than who work in group. Therefore, Mullen, Johnson, and Salas (1991), and Diehl and Strobe (1987)'s findings support this study's findings.

According to the obtained results, we might conclude that pre-task planning through split information and brainstorming activities have positive effect on vocabulary learning of EFL learners in this study, but no effect on delayed recall of vocabulary. By examining the results, subjects who received split information and brainstorming activities as pre-task planning have no significant difference in learning and recall of vocabulary. However, they have significant difference with the control groups in learning and delayed recall of vocabulary.

Despite the fact that these activities have no effect on delayed recall of vocabulary according to our findings, the performance of the subjects who received them as pre-task planning was higher than those in the control groups in recalling vocabulary. By examining the results of this study, one can see that the experimental groups' achievements are about the same in learning and recall of vocabulary; however, they are significantly different with the control group. To sum up, we can say that pre-task planning through split information and brainstorming activities enhanced

vocabulary learning of the experimental groups; moreover, the experimental groups outperformed in vocabulary learning compared to vocabulary recall.

## LIMITATIONS

In fact, one of the limitations of the study which has to be highlighted here is reliability of tests; with the values of .53 for pretest, .69 for the posttest and .65 for the delayed test that all are below .70, we can hardly claim that our tests are strongly reliable. Moreover, sampling from the same background, limited age and sex who are at the same context (available institutions) and using the small number of participants (42 people) have an influence on generalization of the results. The other issue is possibility of remembering the test items. Although there is enough interval time (a week) between pre-test and instruction, there is still the possibility of remembering the test items by the students and this means that recall of vocabulary may not be totally as a result of teaching methods. Besides, making decision about the target words which finally have to be tested and how of testing is also controversial.

## HOW TO IMPROVE COLLEGE STUDENTS' AUTONOMOUS?

**MAHBOOBEH KEIHANIYAN**

Isfahan, Iran*

*Email address: m\_keihaniyan@yahoo.com*

### **ABSTRACT**

Studies on autonomous learning based on different theories show new ideas for teaching English. This study investigated 60 college students taking English reading course. A Nelson test was used to homogenize learners. For Group A, four periods of computer-aided learning were offered per week in order to strengthen the students' autonomous learning competence. The students in Group B were taught in a traditional way, working in classrooms for eight periods. The independent t-test was used to determine whether the means of the two groups were statistically different from each other or not. The most significant findings are that the new method promoted students' English language much better than that of traditional methods. The findings of this study are useful for teachers to apply motivative methods to improve learners' motivation. Also, students who take responsibility for their learning enjoy the freedom and power to make decisions in their learning. Knowing that learning is a product of one's own activities, a student feels more rewarded and enhances his/ her courage to get involved in an active learning process.

**KEY WORDS:** autonomous learning, traditional methods, motivative methods

### **INTRODUCTION**

Jenus and Lens (2005) believe that teaching a foreign language has problems to which teachers must pay attention in order to improve the learning process: 1) Language teaching requires not only skillful teachers but also innovative teaching techniques. 2) Teachers have to find practical ways to motivate students to learn the language and at the same time to sustain students' interests in the language learning process. According to Armstrong et al. (2009), teaching is a complex act because it deals with human beings. In fact, in a teaching class which consists of thirty students, teaching is a more complex job because these students usually come with varying needs, abilities, motivation and prior experiences. According to Biggs (1999) engaging with preferred individual learning styles is regarded as an important aspect for promoting the learning process. Many foreign researchers studied autonomous learning through classroom case studies such as Lee (2000) and Spratt et al. (2003). However, according to Gao (2005) case studies are not adequate for a long period of time. Still, the studies on autonomous English learning were focused on traditional college English education program. The development of college education, the special curriculum requirements of the program and the needs of students made it necessary to study the proper and effective way of English teaching and learning in college education.

### **LITERATURE REVIEW**

For a definition of autonomy, we might quote Holec (2000: 3, cited in Benson & Voller, 1999: 1) who describes it as 'the ability to take charge of one's learning'. On a general note, the term autonomy has come to be used in at least five ways (Benson & Voller, 1999: 2):

- for situations in which learners study entirely on their own;
- for a set of skills which can be learned and applied in self-directed learning;

- for an inborn capacity which is suppressed by institutional education;
- for the exercise of learners' responsibility for their own learning;
- for the right of learners to determine the direction of their own learning.

It is noteworthy that autonomy can be thought of in terms of a departure from education as a social process, as well as in terms of redistribution of power attending the construction of knowledge and the roles of the participants in the learning process. The relevant literature is riddled with innumerable definitions of autonomy and other synonyms for it, such as 'independence' (Sheerin, 2006), 'language awareness' (Lier, 2005; James & Garrett, 1991), 'self-direction' (Candy, 2003), 'andragogy' (Knowles, 1988; 2000) which testifies to the importance attached to it by scholars. As has been intimated so far, the term autonomy has sparked considerable controversy, inasmuch as linguists and educationalists have failed to reach a consensus as to what autonomy really is. For example, in David Little's terms, learner autonomy is 'essentially a matter of the learner's psychological relation to the process and content of learning--a capacity for detachment, critical reflection, decision-making, and independent action' (Little, 2000: 4). It is not something done to learners; therefore, it is far from being another teaching method (*ibid.*). In the same vein, Leni Dam (1990, cited in Gathercole, 1990: 16), drawing upon Holec (1998), defines autonomy in terms of the learner's willingness and capacity to control or oversee her own learning. More specifically, she, like Holec, holds that someone qualifies as an autonomous learner when he independently chooses aims and purposes and sets goals; chooses materials, methods and tasks; exercises choice and purpose in organizing and carrying out the chosen tasks; and chooses criteria for evaluation.

To all intents and purposes, the autonomous learner takes a (pro-) active role in the learning process, generating ideas and availing himself of learning opportunities, rather than simply reacting to various stimuli of the teacher (Boud, 2002; Kohonen, 2001; Knowles, 2000). As we shall see, this line of reasoning operates within, and is congruent with, the theory of constructivism. For Rathbone (2000: 100, 104, cited in Candy, 2003: 271), the autonomous learner is a self-activated maker of meaning, an active agent in his own learning process. He is not one to whom things merely happen; he is the one who, by his own volition, causes things to happen. Learning is seen as the result of his own self-initiated interaction with the world. Within such a conception, learning is not simply a matter of rote memorization; 'it is a constructive process that involves actively seeking meaning from (or even imposing meaning on) events' (Candy, 2003: 271). Constructivism is a philosophical orientation in teaching theories. According to the theory, learning is constructed by the brain as it seeks to relate new knowledge to prior knowledge. Therefore, each student will have a unique construction. Such "inventories" of characteristics evinced by the putative autonomous learner abound, and some would say that they amount to nothing more than a romantic ideal which does not square with reality. This stands to reason, for most of the characteristics imputed to the "autonomous learner" encapsulate a wide range of attributes not commonly associated with learners. For instance, Benn (2000, cited in Candy, 2003: 102) likens the autonomous learner to one '[w]hose life has a consistency that derives from a coherent set of beliefs, values, and principles--[and who engages in a] still-continuing process of criticism and re-evaluation', while Rousseau (1999, cited in Candy, 2003: 102) regards the autonomous learner as someone who 'is obedient to a law that he prescribes to

himself'. Within the context of education, though, there seem to be seven main attributes characterizing autonomous learners (Omaggio, 2003, cited in Wenden, 2002: 41-42):

1. Autonomous learners have insights into their learning styles and strategies;
2. take an active approach to the learning task at hand;
3. are willing to take risks, i.e., to communicate in the target language at all costs;
4. are good guessers;
5. attend to form as well as to content, that is, place importance on accuracy as well as appropriacy;
6. develop the target language into a separate reference system and are willing to revise and reject hypotheses and rules that do not apply; and
7. have a tolerant and outgoing approach to the target language.

### **THE SIGNIFICANCE OF THE STUDY**

In this research, the English language level of the students had faced even greater challenges. As a whole, the college English language teaching has some problems. Specially speaking, the traditional college teaching method does not take the special needs of individual students into account and pays little attention to the learning strategies of the learners. Zhao (2008) found that many College students spend as many as twelve years studying English, but students who are just taught in the classroom environment by teachers are more likely to hold a somewhat passive attitude, and low motivation, towards what is being learnt. Just because students have not been exposed to the actual communicative environment for so many years, they are not able to communicate in English with a real target language community. In sum, the problem with them was that their English language learning habits needed great improvement since they had been less able to manage their English learning effectively in their English learning activities for several years in middle school. It was important to consider how best to improve the teaching and learning styles in order to qualify them to an adequate degree in English language competence.

### **OBJECTIVES OF THE STUDY**

It was expected that students would learn to manage their English language learning activities and become independent of teachers which would make a better preparation for their future study abroad.

### **RESEARCH QUESTIONS**

With regard to what has been presented above, the present research will address two major questions:

- 1) Could the new teaching and learning model save classroom teaching time? If so, how much time could be saved in our experiment?
- 2) What were the psychological benefits that the experimental students would get from the new learning model?

### **METHODOLOGY**

#### ***Participants***

The participants of this study ranged from 19 to 21 year-old students selected randomly from 100 female students from the University of Najafabad. The learners were freshmen and their major was computer science. A Nelson test was administered to the students to homogenize the intended number of students for the study. Next, 60 students whose scores on the Nelson test were between one standard deviation above and one standard deviation below the mean were selected to take part in the study. The students were from four teaching classes: two classes (Group A, 30 students) were involved in the experiments while the other two classes (Group B, 30) were taught in the traditional way.

### ***Instruments***

Data in this study were collected through using instruments as follows:

- 1) A Nelson test (1999, as cited in Dadkhah's thesis, 2002). It consisted of 40 multiple-choice items on grammar and vocabulary to estimate the proficiency level of the learners. The validity of the test was established by consulting with three experts. Its reliability was measured via cronbach's alpha that was 0.78.
- 2) The teaching book was *Concepts and Comments* by Patricia Ackert.
- 3) A questionnaire checklist to find out the future developments of their computer-aided autonomous English learning skills and their learning attitudes.
- 4) An interview checklist to show learners' autonomous learning process and their self-evaluation during it.

### ***Data Analysis and Procedure***

In this paper, the first comparison was via the administration of the Nelson test to show the two groups were at the same level in their English competence when they were admitted to the college. In the second semester, the classroom time of Group A was shortened to six periods, but another four periods of computer-aided learning were offered per week in order to strengthen the students' autonomous learning competence. The students in Group B were still taught in a traditional way, working in classrooms for eight periods and in computer-room for two hours each week. The independent t-test in SPSS software was used to determine whether the means of the students' English scores of the two groups were statistically different from each other or not. In our research, the two groups were compared on the first school year. The students' English scores of Group A and B in the examinations during the study were compared by using t-tests. At the same time, the relationship of autonomous learning time spent by the experimental group and the learning effectiveness would help to find out how much classroom teaching time was saved by adopting autonomous learning model.

## **THE RESULTS OF THE ANALYSIS**

### ***The teacher's role and Teaching Methods in both Settings***

The teacher's role and Teaching Methods in this study varied according to different teaching and learning settings. Teachers made use of the texts to warm up students for the new teaching and learning model. In this sense, this part was also used as a good training of English learning skills as well as to make students aware of the new learning process. Students were asked to discuss questions related to learning strategies in English to perceive the differences between the traditional learning model and the computer – aided learning model. Generally speaking, students were encouraged to make best use of the learning materials selected via Internet in exploring each topic, which is offered in each unit in their course books. Teachers also forced them to analyze and re-organize these materials for their classroom presentation to check their language level. After evaluating the students' learning outcome, further suggestions from the teachers would be given to individual student for their future learning. The teachers also encouraged students to raise questions if they have any. Teachers also asked more questions to check and promote their learning. Therefore, questioning acted as an important step in developing and ensuring students' autonomy.

### ***Student Assessment***

Generally, student assessment is divided into two parts: one is by examination scores and the other is to measure students' daily working performance. However, the former has been too much emphasized in the traditional education system. Stiggins et al. (2004) pointed out that assessment is an important dimension of the learning process and should also be defined as assessment for learning. That is to say, sound assessment procedures become a learning experience eventually. Besides, learners usually desire indications of success and data gathered from fair and appropriate assessment procedures can provide these affirmations. Stiggins (2000) also claimed that evidence of success motivates learners to continue working and creates an expectation of future success. Performance assessment is especially useful in evaluating learner behaviors associated with such tasks as working with others, giving oral presentations, participating in discussions and using computers.

Although many important education objectives require performance assessment, the more important point is that in our experiment, the purpose of assessment was not to judge a student's once and for all, but to help her to develop her autonomous English learning competence.

## OUTCOMES AND FINDINGS

### *Post-tests and Scores Comparing between Group A and Group B*

At the end of the first semester and the second semester, all the first-year students took the final examination in English reading, listening and writing using the same papers. Score compared were conducted in reading scores, between group A and B were showed in table.

Group	cases	mean	St.d	Standard error mean	variances	T	Sig (2-tailed)
A	60	70.41	9.74	1.21	Equal variances assumed	3.95	.000
B	60	63.71	9.36	1.17			
A	60	23.08	6.70	.83	Equal variances assumed	.538	.592
B	60	22.47	6.00	.76			

From the table, it was found that, at the end of the first semester, the reading scores of group A were significantly different from those of Group B, with the former group having higher scores than the latter one in the two courses. This suggests that the English language level of Group A, the experimental group, was higher than Group B after three months 'computer-aided autonomous learning. Equally important, at the end of the second semester, the scores of the two groups had no significant difference, which suggested that the advancement of Group A was the same as Group B during the whole year's learning. Given two hours 'decrease of classroom teaching time and 2 hours 'increase of computer-aided autonomous each week in the second semester, it meant the higher effectiveness of English learning of Group A.

### *Interviews of the Students*

At the end of the second semester, 12 students from Group A were chosen at random to be interviewed about the autonomous learning process and their self-evaluation during it. The questions asked in the interview were:

- 1) Have you realized the differences between computer-aided autonomous English learning and traditional learning in terms of your responsibility?
- 2) Have you fully got involved in computer-aided autonomous English learning up till now?
- 3) Have you applied the autonomous learning strategies into your daily learning activities? If so, how to?

From the interview, it was noted that 90% of the students who were involved in the experiments claimed that they had gained knowledge about the responsibility of themselves in college English

language learning and had been trying to apply more and more of the strategies into their daily learning activities. Each student perceived and told about their different advancement in English level and English learning skills, with most of who felt satisfied with the whole years 'English learning process and outcomes. All the experimental students showed an active and expecting attitude towards the future language learning and using. On the other hand, the students in Group B, who experienced the traditional learning process, showed much less awareness and tended to be less proactive in their English learning.

### ***Questionnaires***

In the second semester, the second questionnaire was given to Group A to find out the future developments of their computer-aided autonomous English learning skills and their learning attitudes, with 60 copies of the questionnaire being available.

From the students' answers to the questionnaire, it was noticed that most of the students understood more about autonomous English learning and the majority of the students got more involved in it.

### **CONCLUSION**

It is found that the classroom teaching became more and more active and efficient. Experimental students learned more about each unit before class and they could explore further during the classroom learning and co-working. Teachers found it easier to achieve the teaching purposes working with the experimental students since both teachers and students have enjoyed class with the new teaching and learning model. According to the above mentioned data, the answers to research questions 1 and 2 are:

- 1) The teaching experiments also suggest that the new teaching and learning model saved classroom time. Specifically speaking, two periods 'time was saved each week, which would up to thirty -two periods in the whole semester.
- 2) According to the time spent on autonomous English learning and activities taken part in by the students during the time, the findings of the interviews and questionnaires, the experimental students felt quite positive about computer-aided autonomous English language learning and got more motivated during the first year. After the students found that they had learned a lot they eventually became proactive not only during the process, but also in future English learning.

### **LIMITATION OF THE STUDY AND SUGGESTIONS FOR FURTHER RESEARCH**

No study is complete by itself and cannot take every detail into consideration. Therefore, there are always aspects which are not accounted for. This research is no exception. There are some issues which were not controlled in this study and can be topics for further research by other researchers.

- 1) This study was done only in one city with a limited number of students. It is suggested that another study be performed with large numbers of students from more cities.
- 2) In this study only female students were questioned. Some other studies can be performed on both genders.
- 3) In this study, the participants were adolescents; in other studies adult language learners can be the focus of attention to see whether the same results will be obtained.

### ABSTRACT

In the developing quality of knowledge that university expands to each other's the cooperation and collaboration, especially in academics programs. They communicate to each others in written business English Language so that they use linguistics units in their communication. This writing explains one of the functions of negative politeness strategies in university business English letters, impersonalized subject “we” as a sender of the letters that belongs to sender not to impinge the receivers. University business English letters are represented or focused on cooperation where impersonalized “we” as a leader in the project who signed the letters, as team of power university authority and asking cooperativeness with the partners. Impersonalized subject “we” in the university business English letters are found out as many as 72 words from 30 letters. They are analyzed not only by combining of opening section, propositional section is the biggest portion and closing section as part of University business letters but also by inclusive dual, inclusive plural is the biggest portion, exclusive dual, and inclusive dual as part of referential.

**KEY WORDS:** Negative Politeness Strategies, Impersonalized Subject “we”, University Business English Letters and Referential

### INTRODUCTION

The most rapidly developing trend in higher education is a doing corporation between universities all around the world. They are not only joining the programs but also sending the students to each others, making contract with companies to apply their knowledge, asking some recommendations for passport and visa from the embassy. The international officer of university expands the reach of its partner institutions and gives them access to get an outstanding international program. This is a benefit for university and partner institutions so that they make it higher and better in academic knowledge.

In the joining program, they send their program and proposal to each other and they use English language as foreign languages. They use spoken and written language. In the written language, they send letters to each others. Thus it is not only necessary for the sender and receiver to know gramatical rules and large number of vocabulary of words but he or she must also know how to use language in various situations and cultures have also different norm concerning communication. The users of language must know not only structure, grammar rules but also all of the linguistic units.

Three are many definition of politeness. Brown and Levinson's (1987). Lakoff (1973). Smith (1992). Brown (1993). Holmes (1995). Christie (2002). Mills (2003). Fukushima (2000) Günthner (2000). Ide et al (1992).

There is a definition of Politeness is the sign of human civilization in social activities.

“Politeness is the attitude of one party to another party. It comes to both parties. It called the two parties "self " and "other". In letters, "self" usually means to the writer, and "other" may be the receiver, or a third party who has been mentioned or not mentioned in the letter”. (Leech: 1983, cited by Ya, S., 2011).

Impersonalize the Speaker and Hearer is the way of indicating reluctance to impinge on the hearer is to phrase the FTA as if the agent were other than the speaker. They consist in the omitting of the ‘I’ and ‘You’ pronouns.

The analysis of the university business English letters is based on the term of inclusive and exclusive. Inclusive or exclusive category is independent of number pronouns. The number distinct such as dual and plural (Scheibman., , 2004:379) for languages that make such four way distinctions, the inclusive dual refer to the speaker and one addresses (I+You singular). The inclusive plural includes the speaker and more than on addressee (I + You plural). Exclusive form refers to speaker and others who are not directly addressed – one other person in the case of dual (I + She, He, it) and more than one for the plural (I+ They). In Table 1 we can see the referential and patterning.

*Table 1: Referential of Subject subjects “we” and Patterning*

<b>Referential of Subject subjects “we”</b>	<b>Patterning</b>
The inclusive dual refer to the speaker and one addresses	I + You singular
The inclusive plural includes the speaker and more than one addressee	I + You plural
Exclusive dual form refer to speaker and others who are not directly addressed Singular	I + She, He, it
Exclusive plural form refers to speaker and other are not directly addressed Plural	I + They

## THE SURFACE OF UNIVERSITY BUSINESS ENGLISH LETTERS

University Business English letters are formal letters. Every university business English letter is written communication that it has many functions such as not only persuade, influence, invite, inform answer but also reply the receiver or reader to do something. University Business English letters will give us next steps or programs in the next time. Every organization, institution and university must manage out going letters and incoming letters. Business English Letters in presenting a formal letter.

All the business letters have heading, addressee, salutations, date line, the messages and closing. (Gartside: 1981) In the part of business letter that three are "Opening section is contains the salutation, the opening line of the letters and secondary illocutionary as well as propositional elements which locate the letter in the discourse –dynamics perspective and pave the way for subsequent requests. Propositional section is the central part of the letter. It contains the primary proposition of the text and the central communicative aims and core of illocutionary program. The closing section contains elements external or secondary to the illocutionary and propositional program of the text". (Pilegaard: 1997)

## **LITERATURE REVIEW**

There are literature reviews in business letters field. The first is "Toward Business Pragmatics" (Ya, 2001). The Paper discussed about business pragmatics based on the literature review of business discourse research relevant to pragmatics. Business pragmatics is usually evaluative the factors determining successful business interactions, and on how to find out which strategies or behaviors are associated with success. Successful business communication is determined by language use, business people who are pragmatically competent in business contexts and the most important in business pragmatics are business context and business pragmatic competence.

The second is "Discourse Analyses of Business Letter in Iranian and Native speaker" (Arvani, 2006). The paper discussed discourse analysis of business letters that they were written by native English speakers and non-native Iranian communicators. There are as many as 25 follow up letters were written by Iranians and there are 25 letters were written by Native English Speakers. All the letters were analyzed by notion of lexical density and grammatical words was studied. They were analyzed and studied not only notion lexical density, grammatical words, basis of model schematics structure, move and steps but also politeness strategies. The result of the research showed that the letters were written by Iranian In generally that politeness strategies were ignored

The third is "Business Linguistics and Business Discourse" (Daniushina, 2010). The paper suggests that applied linguistics and Business Linguistics were separated. Language used in the business communication and they are explored in linguistics aspect, practical purposes and functional typology of business components in business communication so that the definitions of applied linguistics and functional typology of business component in business communication are found out.

The fourth is “Politeness in Written Business Discourse: A Text Linguistic Perspective on Request”. (Pilegaard.1997). The paper tells us that the principles of business letters and practices of politeness strategies in business communication are analyzed. In the business such as sales letters, inquires letters, quotations letters order letters and others. They are divided into tree categorizes such as making contact, negotiating and in conflict. The senders of letters are correlated to sender status and business letters. Positive and negative politeness strategies were applied into business letters so that monitoring politeness strategies on the text level gives and makes valuable insight into the norms that govern British business communication.

## THE SURFACE OF THE FEATURE IN UNIVERSITY BUSINESS ENGLISH LETTERS

In this research that observes in University Business English Letters Written by Non-Native English speakers in presenting as formal English letters. Those formal English letters have heading, addressee, salutations, date line, the messages and closing. Researchers study as many as 30 in University Business English Letters The smallest business English letters are 57 words and the largest are 209 words and business English letters contains at least 2 paragraphs and the largest are 6 paragraphs.

According to those research in business English letters writing above that we focus on analyzing pragmatics, especially in negative politeness strategies of impersonalize subject “we” in University Business English Letters Written by Non Native English speakers. We are going to discuss impersonalize of subject “we” that are found out in the opening section, propositional section and closing section in university business English letters written by non-native English speakers and will be related to referential of inclusive dual, inclusive plural, exclusive dual and exclusive plural

## METHODOLOGY

The required data are taken from university business English letters. The letters are taken from Directorate of Partnership and International Relations Bandung Institute of Technology (ITB) West Java Indonesia. The university business English letters are from many universities and many countries Non-Native English Speakers. The Data are out going and in coming university business English letters from 2011 to 2013. The writers of the letters are from Directorate of International Affair’s universities, Dean and Rector of university.

There are as many as 30 letters. There are 16 letters from Japan, 3 letters-from Taiwan, 1 letter from Malaysia, 2 letters from German, 1 letter from Finland, 5 letters from Indonesia, 1 letter from Thailand, and 1 letter from ASEAN University Network AUN/SEED-Net. The corpus in this study comprised 30 university business English letters. See in table 2

*Table 2: of impersonalized subject “we” is based on Pilegaard’s theory: Opening Section, Propositional Section and Closing Section. In the contents of opening section that salutation and opening line of the letter are deleted.*

No	Impersonalized subject “we” in university business letters	Paragraph	Name of Institutions	Referential of Inclusive and exclusive
1	We would greatly appreciate it if you could distribute our web address ( <a href="http://io.tmu.edu.tw/">http://io.tmu.edu.tw/</a> ) among your family, friends, and students.	Opening	Taipei Medical University	Exc P

## RESULTS AND DISCUSSION

The result of impersonalized subject “we” based on Pilgaard’s theory: Opening section, Propositional section and Closing Section. We can see in table 3.

*Table 3: The result of impersonalized subject “we” in the part of university Business English letters*

No	Part of University Business English Letters	Total of Impersonalized subject “We”
1	Opening Section	19
2	Propositional Section	29
3	Closing Section	24
<b>Total</b>		<b>72</b>

Based on the result statistics above, there are as many as 30 letters from many universities. The letters were written by Non-Native English speaker. We can see that the letters are analyzed by opening section, propositional section and closing section and there are as many as 72 impersonalized subject “we”. See table 3. Those opening section, propositional section and closing section are analyzed and the result them, we can see in figure1. Researcher found out that in the propositional section is the most usable of impersonalized subject we as many as 29 or 40%. It is because there is the central part or main messages in communicative aims of letters and in the closing section there are 24 or 33% because it elements external or secondary to the main message what will be done in the future time. In the opening section there are as many as 19 or 27% because it is a dynamics perspective and pave the way for subsequent requests or main message. We can see in figure 1.

Figure1: The procentage of impersonalized subject “we” in university business Englis letters.

We can see in table 4, Impersonalized subject “we” divided into referential and part of university letters in university business English letters.

Table 4: Impersonalized subject “we” and Part of University Business English Letters

No	Part of University Business English Letters	Impersonalized Subject “we” and Referential			
		Inclusive		Exclusive	
		Inclusive Dual	Inclusive Plural	Exclusive Dual	Exclusive Plural
1	Opening Section	8	1	3	7
2	Propositional Section	6	3	1	19
3	Closing Section	9	1	2	12
Total		23	5	6	38

Based on the result statistics of referential in university business English letters, The referential of Inclusive dual (ID) and Exclusive Plural (EP) are more than Inclusive Plural (IP) and Exclusive Dual (ED). There are as many as 72 impersonalized subject “we” in university business letters that researcher found out the referential of Exclusive Plural 38 or 53% and referential of Inclusive Dual as many as 23 or 32%. In the referential of exclusive dual is 6 or 8 % of impersonalized subject “we”. Referential of Inclusive Plural is 5 or 7%. We can see in figure 2

Figure 2: Impersonalized subject “we” divided into referential and part of message in university business English letters

The Referential of Exclusive in university business English letters is almost half more in the part of propositional section than in the opening section and closing section. In the Referential Inclusive is found out that in the propositional section is half more than opening section and closing section. But, in the Referential of Inclusive Dual and Exclusive Dual are found out that impersonalized subject “we” is less in the propositional section than opening and closing section.

In Figure 3, We can see in the opening section that Referential of Exclusive Inclusive dual is 42 % it mean that in the opening section of the letters sender and receiver is more powerful in the leading of the cooperation between universities. In referential Exclusive Plural is 37 %. It means that in the opening section refers to the importance of the corporation program is not only for the receiver but also for public in university.

In the exclusive dual is 16 % it means that in the opening section sender want to send the message is not only for receiver but also for students or are not mentioned in the letters specifically. in the Referential Inclusive Plural is 16 % it means that sender want to give the message not only personally but also for the institution.

Figure 3: Opening section and Referential

In the propositional section that referential Exclusive Plural is 66% it means that in the main message of the letters that sender wants to give and informs as much and clear as possible the receivers. The university business English letters is not only for the sender and receiver personally but also receiver and sender are represented as part of the profit of the team of the institution or university but also in making contact is for students and people are not mentioned in the letters. The smallest result referential is exclusive dual. It logically means that the sender and receiver are not involved personally in the main message of the university business English letters. Inclusive dual is 21 % and inclusive personal is 10%. We can see in figure 4.

Figure 4: Propositional Section and Referential

In the referential of Exclusive plural is 50% in closing section in and Inclusive Dual is 30% and Exclusive is 8% and inclusive plural is 4%. See in Figure 5

Figure 5: Closing Section and Referential

## CONCLUSIONS

According to the result above that there are three conclusions. First negative politeness strategies impersonalized subject “we” in the university business English letters are found out as many as 72 words from 30 letters. Second negative politeness strategies of impersonalized subject “we” are found out that it is biggest portion in propositional section. Third according to the referential that Exclusive Plural are found out as a bigger portion in part of the message university business English letters.

### ABSTRACT

This study aimed to find out the effects of peripheral teaching on Iranian EFL learners' writing skills in cyber environments. After administrating a Nelson (Fowler and Coe, 1976) test, a group of 80 homogeneous students at language institute were selected from a total population of 120 at the intermediate level in Dehdasht, Kohgiluyeh and Boyer Ahmad province, Iran. Then, they were randomly assigned to control and experimental groups. While experimental A was assigned to cyber environment and received instructions regarding peripheral teaching, B was selected as the control group. A t-test was conducted to compare the subjects' means and to determine the effect of peripheral teaching. The results depicted that peripheral teaching in cyber environments had a significant effect on improving Iranian EFL learners' writing skills, ( $P < .05$ ).

**KEYWORDS:** Peripheral teaching, Cyber environments, Writing skill

### INTRODUCTION

Creating and supporting learning environments that result in students achieving at the highest levels is a teacher's primary responsibility. To do this well, teachers must engage in professional self-renewal, which means they regularly examine their own and each other's practice through self-reflection and collaboration, providing collegial support and feedback that assures a continuous cycle of self-improvement. This kind of professional learning results in discovery and implementation of better practice for all. As professionals, teachers also contribute to practices that improve teaching and learning consistent with their school's mission and in collaboration with colleagues, school leaders, parents, guardians and other adults significant to students. They demonstrate leadership by modeling ethical behavior and by contributing to positive changes in policy and practice around activities that connect school, families and the larger community.

Scholars are looking for methods rather than the conventional ones to solve the teaching problems of the people living in the modern world, and they prefer to use the modern techniques of the world. Not only these researches verifies the first original findings, but also they say that other stimuli such as spoken words, faces and pictures can facilitate the following decisions as they are introduced under conditions that make it difficult to differentiate one stimulus from the other. Though there are questions about whether the observers will be able to differentiate one stimulus from the other or not, the prevailing conclusion is that noticeable information will be got when the observers experience little or no awareness of the things they perceived as indicated by their difficulty in differentiating one stimulus from the other.

Peripheral training has many applications in different sciences. According to Cracker (1998, P. 121), in weightlifting, "peripheral training is referred to as training the muscles acting on the joints that are farther from the spine". Examples of some muscles would be Biceps, Triceps, Forearms, lower leg muscles, etc. Some examples of exercises would be Leg extension, Hammer curls, Bicep Curls, Calf exercises, etc.

New times require new approaches to education. Today's context presents a complex combination of factors impacting learning. Global economic realities have created an imperative to build systems in which young people graduate high school with an array of skills that prepares them for college, work, and life. The persistence of differences in student experiences and outcomes, combined with high dropout rates create a need to act. And a strong focus on accountability and how to measure teacher and system effectiveness continue to drive the education reform discourse nationally.

Most diverse learning needs can be met in the general classroom when two guidelines are kept in mind by the classroom teacher: (1) Student performance is the result of interaction between the student and the instructional environment and (2) teachers can reasonably accommodate most student needs after analyzing student learning needs and the demands of the instructional environment. In fact, the adaptations made for a specific student's learning needs may be beneficial to many other students in the same classroom. Adaptations are simply good teaching techniques put to use.

Another thing that may have had relation to peripheral teaching is games. Teachers need to be careful that games include peripheral language that is not too difficult for the children. This is especially true when we use a game that was originally designed for native speakers of English. However, one of the wonderful things about games is that "they provide opportunities for children to come across natural chunks of language and use them interactively" (Crenshaw, 1977, P. 78).

#### **LITERATURE REVIEW**

Despite its wide acceptance in applied linguistic research, TESL/TEFL curriculum has not adequately integrated techniques for developing communicative competence or sociolinguistic instruction on form- function mapping, which enables speakers to use language properly according to social expectations. Many current TESL/TEFL programs require courses in traditional grammar (or transformational grammar), communicative language teaching (CLT), and second language acquisition (SLA), all of which have significant shortcomings which require integration of new techniques for language analysis and teaching methodology to be included in future TESL/TEFL programs.

Teaching programs need to focus on not only novice teaching methodologies, but giving tools to practicing teachers to deal with the variety of issues presented in modern classrooms around the world. One problem currently facing institutions which teach EFL learners is the ability to meet the demands and the needs of potential learners. Additionally, many students drop out, because

the course books overloads their English skills, or they have personal challenges, or time management issues. Thus, TEFL programs are not as accessible or student supportive as they need to be. Indeed, because information/communication technology gives such quick and easy access to large amounts of information, it has become important for accredited institutions to critically review curriculum in terms of both accessibility (to learning) and accountability (of skills and knowledge). It is the need for TEFL programs to be more accessible, more instructionally effective and accountable, and more students supportive that motivates the current paper, whose purpose is to propose solution strategies for contemporary TEFL curriculum development (Smith, 2009).

Retaining core teachings serves to preserve the religious capital accrued and valued by existing members. Religious capital refers to members' degree of mastery of an attachment to a particular religious culture (Stark and Finke 2000). Members master their religion by learning the teachings and rituals necessary to comfortably interact with others in their religious group: when to say Amen, how to follow the liturgy, and interpretations of key religious stories (Iannaccone 1990). The core teachings also serve as the foundation for religious activities (e.g., prayer, rituals, miracles, and mystical experiences) that build up emotional ties to a specific religious culture and provide a certainty for the religious claims of the religion. Indeed, the more actively and the longer people practice a religion, the stronger their preferences for that religion (Sherkat 1997). Over time, this religious capital becomes intrinsic to how members experience religion. Revising core teachings, however, can reduce a member's religious capital in at least three ways: decreasing their mastery of the religion, eroding their emotional ties to a unique religious culture, and threatening the certainty of their faith.

Smith (2009), said that " peripheral teaching can compensate for the lack of information that is caused by the limitation of attention and working memory during core teaching" (P.32).

Rich (2009), also said that "young children see auras much easier, because their central vision is not yet damaged" (p. 36). Once they go to school they are told to use their vision in a certain way, and gradually they lose their natural auric sight.

Rich said that for any of you out there who are doing speed reading or trying to learn it may already know of this. For those who are trying and having a bit of difficulty, or even people who have bad vision, this is a way to greatly improve your peripheral vision (looking out the corner of your eye) that will cost you nothing but a few minutes every day. This skill will help you with things like reading, driving, sports activities, even just looking out your window will feel so different because of the range of your vision.

The online learning resources used to support asynchronous learning include email, electronic mailing lists, threaded conferencing systems, online discussion boards, wikis, and blogs. Course management systems such as Campus Cruiser LMS, Blackboard, WebCT, Moodle, and Sakai, have been developed to support online interaction, allowing users to organize discussions, post and reply to messages, and upload and access multimedia (Bourne,1998).These asynchronous forms of communication are sometimes supplemented with synchronous components, including text and voice chat, telephone conversations, videoconferencing, and even meetings in virtual spaces such as Second Life, where discussions can be facilitated among groups of students (Angelo, 1669). Online learning requires a shift from a teacher-centered to student-centered environment where the instructor must take on multiple new roles. The constructivist theory that supports asynchronous learning demands that instructors become more than dispensers of knowledge; it requires that they become instructional designers, facilitators, and assessors of both grades and their teaching methods McQuiggan (2007).

Yet, some researchers have described inconsistencies between teachers' beliefs and their classroom practices (Calderhead, 1996; Kane et al., 2002). For example, Fang (1996), described a number of studies in which researchers found little relationship between teachers' beliefs and their instructional reading practices and suggested that "contextual factors interfered with teachers' ability to consistently apply their beliefs in practice" (p. 8). Results from a study of technology-using teachers supported this as well. Ertmer et al. (2001, P. 75), reported that "teachers' visions for, or beliefs about, classroom technology use did not always match their classroom practices. Despite the fact that most of the teachers described themselves as having constructivist philosophies, they implemented technology in ways that might best be described as representing a mixed approach, at times engaging their students in authentic, project-based work, but other times asking their students to complete tutorials, practice skills, and learn isolated facts". Teachers' explanations for these inconsistencies often included references to contextual constraints such as curricular requirements or social pressure exerted by parents, peers, or administrators. Scott, Chovanec, and Young (1994), observed a similar pattern in their study of the beliefs and classroom practices of 14 college professors. These results, then, point to the need for both researchers and practitioners to be aware of, and to account for, the potential influence of these types of contextual factors when examining teachers' beliefs or promoting teacher change.

Online exchange has also facilitated a greater connection between 'classroom' and 'fieldwork' in foreign language education as learners are now able to engage in 'semi- authentic' interaction with members of the target culture while still benefiting from the guidance and support of their tutors and classmates (Robert, 2010). While extensive periods of study abroad in the target culture continue to be seen as the ideal way to develop linguistic fluency in foreign language learners, online intercultural exchange is now increasingly being considered as an important tool for preparing students for study abroad as it allows them to experience intensive interaction with members of the target culture from the relative 'safety' of their own classroom. The European Commission's recent Green Paper on promoting the learning mobility of young people refers to online exchange as a tool for preparing physical mobility or as a second-best alternative for those students and young people who are unable to engage in traditional mobility programmes (European Commission 2009: 18).

Preliminary results suggest that these types of electronic models can be effective in increasing pre-service teachers' ideas about and self-efficacy beliefs for implementing technology in their classrooms. For example, Roehrig (2011), found that "pre-service teachers, who interacted with a set of multimedia problem-based scenarios in which practicing teachers discussed possible solutions to technology issues, showed significantly greater increases in their self-efficacy for teaching with computers compared to a control group" (P. 202). Other data supported the contention that users had changed their conceptions of how to integrate technology into their teaching. Ertmer and her colleagues (2003), found similar results with 69 pre-service teachers who explored Vision Quest, a CD-ROM that featured six classroom teachers who used technology effectively in their classrooms. Significant increases were noted in participants' ideas about and self-efficacy for technology integration. Although pedagogical beliefs were not specifically addressed in these studies, there is some indication that it may be possible to address teacher beliefs using similar strategies. Additional research, on the effectiveness of these and other methods for changing and/or refining pedagogical beliefs, is needed.

McQuiggan (2007), noted that "teachers' practice is more likely to change as they participate in professional communities that discuss new materials, methods, and strategies and that support the risk taking and struggle involved in transforming practice" (P. 3). "The establishment of a professional

learning community as a means to renew both teachers and schools is a common recommendation in the professional development literature" (Lave & Wenger. 2010).

O'Dowd (2010), stated that "Online exchange has also facilitated a greater connection between 'classroom' and 'fieldwork' in foreign language education as learners are now able to engage in 'semi-authentic' interaction with members of the target culture while still benefiting from the guidance and support of their tutors and classmates" (P. 22). While extensive periods of study abroad in the target culture continue to be seen as the ideal way to develop linguistic fluency in foreign language learners, online intercultural exchange is now increasingly being considered as an important tool for preparing students for study abroad as it allows them to experience intensive interaction with members of the target culture from the relative 'safety' of their own classroom. The European Commission's recent Green Paper on promoting the learning mobility of young people refers to "online exchange as a tool for preparing physical mobility or as a second-best alternative for those students and young people who are unable to engage in traditional mobility programmes" (2009, p. 154).

## RESEARCH HYPOTHESES

On the basis of the assumption that writing skill can be enhanced through peripheral teaching in cyber environments, the following hypotheses are formed:

1. There is a noticeable difference between Iranian EFL test-takers' performance across peripheral teaching method.
2. Knowledge gained through peripheral teaching remains longer in learners mind.

## METHODOLOGY

### *Participants*

The subjects participated in this study were 80 learners of English as foreign language who were chosen from 120 students studying English at Navid Language Institute in Dehdashat, Kohgiluyeh and Boyer Ahmad province, Iran. All the population of students attending the Institute was administered a Proficiency Test (Fowler and Coe, 1976). Those whose marks fell between +1 SD above and -1SD below the mean were selected as intermediate level. Then, they were randomly divided into two homogeneous groups known as one experimental and one control group. Each experimental and control group (A and B) consisted of 40 subjects, respectively.

### *Instruments*

The instruments used in this study to collect, estimate and analyze the data were a thirty-item test of Nelson English Language Proficiency Tests (Fowler and Coe, 1976) in addition to students' course books in language institute, Paragraph Writing. In fact, the afore-mentioned proficiency test was used to sieve the participants in terms of their proficiency levels. The rationale behind adopting this test for the purpose of the study was that it is one of the rare available standardized tests compatible with Iranian students to decide on the proficiency level. Two TV sets and a CD player were used as the educational technological devices to show the peripheral aspects of teaching in physical environment. To make the environment or the context of teaching in such a way that contribute to learners' core and peripheral teaching (Hofer, 1997). The cyber teaching representing an IBC constituted both on-line and off-line communication, live and corresponding through email with students. In order to compare the results obtained from the post-tests of the experimental and controls groups, a t-test was used to determine the potential differences between these two groups.

### *Procedure*

From a population of 120 students studying at Navid Language Institute in Dehdashat, Kohgiluyeh and Boyer-Ahmad province, Iran, 80 subjects were selected in terms of Nelson Language Proficiency Test (Fowler & Coe, 1976) as the subjects of the study. Those whose scores fell 1SD above and 1SD below the sample mean on a proficiency test were considered as the intermediate level. The rationale for choosing the intermediate level was that there weren't enough students at other proficiency levels in the aforementioned Institute. Then, the intermediate ones were randomly divided into two homogeneous groups, experimental and control groups (A & B). So A was assigned to experimental group and B to the control group. First, the proficiency test was administered to both experimental sub-groups considered as the pre-test.

In the experimental group A consisting of 40 subjects, peripheral teaching were done in cyber environment, internet. Teacher was frequently in an on-line communication with students. He taught writing skills, and students were required to write passages based on the given topics and sending them back to the teacher through e-mail. The teacher read and corrected them, but at this time, as peripheral teaching, he added some phrases at the bottom of their writings without any explanation about them.

## RESULTS AND DISCUSSION

In this section, the collected data is analyzed, using paired T-tests for all comparisons related to the effect of peripheral teaching methodology. The collected data was subjected to statistical analysis, descriptively and inferentially. To find out whether or not the differences between the subjects' means at this stage were statistically significant, the data were run through both paired and independent T-tests. To verify or nullify the stated hypotheses, the data obtained through Nelson language test (Fowler and Coe, 1976) as the homogeneity test and the post-test, tables 4.1 through table 4.3 all show different analytical procedures and phases. The early step used in analyzing data was to determine the homogeneity of the experimental and control groups regarding their levels of second language proficiency. So, the students' overall scores on Nelson language proficiency test were collected from their records. Table 4.1 shows the descriptive statistics, frequency, mean and standard deviation for each of the four groups in terms of Nelson language proficiency test. It shows that each of the four groups had approximately similar performance on Nelson language proficiency test, In effect, they show no apparent significant differences.

Table 4. 1: Sample Means and Standard Deviations for Homogeneity Test

Group	N	Maxi	Mini	Mean	Std. Deviation
Experimental Group (A)	40	16	5	11.67	2.20
Control Group (B)	40	16	3	10.80	2.60
Total	80	18	3	11.55	2.28

### Results of T-test for methodology use

A T-test was carried out to compare the experimental groups' mean scores of methodology use. Based on these results, the hypotheses of inequality of means were approved,  $p < 0.05$ . Tables 4.2 and 4.3 show the mean scores were higher for peripheral teaching in cyber environment. Therefore, learners use peripheral teaching and the second hypothesis was verified. And also these tables show that there is a significant difference between the experimental groups' means and the first hypothesis was verified.

Table 4.2: The result of paired samples T-test for comparing mean of pre-test and post-test in cyber experimental group.

test	mean	Standard deviation	T value	Degree of freedom	significant
Pre-test	11.51	2.69	4.56	39	.001
Post-test	13.88	2.35			

Table 4.3 shows the mean of post-test scores for cyber experimental group and control group. The mean of the post-test scores of the cyber experimental group was 13.88, while that of the control group was 12.05. The t-value for the post-tests scores between the cyber experimental group and its counter-part control group was 3.05. The degree of freedom was 78. The significant difference between the post-tests scores of the cyber experimental group and control group was at the significance level of .05. This means that a significant difference was found between the cyber experimental group and its counter-part control group at  $p < .05$ . This result indicates that the cyber experimental group's mean was significantly higher than the control group's mean scores. Based on these data, there was a significant difference between the cyber experimental group and its counter-part control group with core teaching methodology and first hypothesis was approved.

Table 4. 3: the result of independent T-test for comparing mean of post-test in cyber experimental group control group.

group	mean	Standard deviation	T value	Degree of freedom	significant
experimental	13.88	2.35	3.05	78	.003
Control	12.05	2.97			

## CONCLUSION

This study began with the assumption that peripheral teaching methodology could enhance the intermediate language learners' writing skills (Hofer, 1997). The instruction lasted for two months. In the course of this time, the researcher (teacher) employed the above-mentioned teaching methodologies and instructed the participants in the experimental groups how to use peripheral teaching in their writing skills. The participants in the control groups, on the other hand, did not receive any instruction on the use of these teaching methodology during their writing practice.

After the post-test, the results tables 4.2 and 4.3 indicated that the instruction of the peripheral teaching methodology did affect the intermediate language learners' writing skill. Namely, the writing ability of the experimental groups who had made use of peripheral teaching methodology surpassed that of the control groups in their groups' means.

The purpose of this study was to determine the effectiveness of systematic peripheral teaching methodology designed to assist students in writing skills. At the end of the course both the control and the experimental groups were administered the writing tests and the result of the T-tests were compared to find the effect of the peripheral teaching methodology. The results of the

study confirmed that the writing skills could be improved through peripheral teaching methodology (Tables 4.2 and 4.3).

The studies mentioned above revealed the fact that instruction of peripheral teaching methodology was pedagogically effective and precipitated the methodology use. If the teaching methodologies to enhance the writing skill are felt advantageous, it might be better to be limited to notifying intermediate language learners of peripheral teaching methodology which they have to be taught to make them better use writing skills.

### ABSTRACT

With the emergence of new computer technologies and computer-mediated language teaching, a host of research in recent years has been done on the effectiveness of Modular Object-Oriented Dynamic Learning Environment (MOODLE) in improving language skills of language learners. The aim of this study is to investigate the impact of explicit instruction of verbal constructions on compositions of EFL learners through MOODLE platform. The study attempted to examine the composition improvement by 84 students for the correct usage of structures: infinitive and participle constructions. The subjects were sampled from Islamic Azad University, Dezful, Iran from both girls and boys. Totally, 96 changes were traced and analyzed based on the degree to which students utilized teacher's revision. The resulting 96 changes showed that the participle comments were more influential on revisions than infinitive ones. The results of the study based on the given provisions may imply that language teachers should use more participle constructions than infinitive ones. Furthermore, the teacher's online revisions helped the students both learn in a relatively shorter period of time and reinforce their abilities and knowledge.

**KEYWORDS:** Verbal Constructions; English as a Foreign Language (EFL); Modular Object-Oriented Dynamic Learning Environment (MOODLE)

### INTRODUCTION

Explicit instruction involves directing student attention toward specific learning in a highly structured environment. The instruction is focused on producing specific learning outcomes. It is highly teacher-directed and effective for providing information or developing step-by-step skills. It also works well for introducing other teaching methods, or actively involving the learners in knowledge construction. Topics and contents are not only taught in a logical order but also are

broken down into small parts and taught individually. It involves explanation, demonstration and practice. Providing with guidance and structured frameworks to the learners is one of its crucial factors. Another important characteristic of explicit instruction involves modeling skills and behaviors and modeling thinking. This involves the teacher thinking out loud when working through problems and demonstrating processes for students. The attention of students is important and listening and observations are keys to success. Moreover, explicit instruction is useful for introducing topics and specific skills. It provides guided instruction in the basic understanding of required skills, which students can then build on through practice, collaboration, repetition, hands on activities and developmental play.

Plus, it begins with **setting the stage for learning**, follows by a clear explanation of what to do, by **modeling** of the process, and by multiple opportunities for **practice** until independence is attained. Explicit instruction moves systematically from extensive teacher input and little student responsibility initially to total student responsibility and minimal teacher involvement at the conclusion of the learning cycle. In addition to that, in order to achieve high rates of success during explicit instruction, several design and delivery factors must be considered. Briefly, some of the factors that increase level of success include teaching material that is not too difficult or advanced for students to learn through more minimally guided teaching approaches, clear presentations, dynamic modeling of skills and strategies, supported practice, active participation, careful monitoring of student responses, and immediate corrective feedback. All in all, explicit instruction is an instructional strategy used by teachers to meet the needs of their students and engage them in unambiguous, clearly articulated teaching.

## LITERATURE REVIEW

The teaching practice of explicit instruction has been available to classroom teachers since the late 1960s. The effective teaching practices research identified most of the components of explicit instruction as essential for positive student outcomes (Rosenshine & Stevens, 1986). Instruction (please see Archer & Hughes, 2011) should be overt, and students should have multiple opportunities to practice the strategy under quality feedback conditions before they are expected to use the strategy on their own. Ellis and Worthington (1994) voice their support for the fact that the students can become independent, self-regulated learners through instruction that is deliberately and carefully scaffolded. Kame'enui and Simmons (1990) also express that explicit instruction initially provides sufficient learning opportunities for students to get the verbal associations, concepts, rule relationships, and cognitive strategies being taught and later, during expanded instruction, it is used to help students apply knowledge.

Several recent studies and reviews in SLA research have shown that explicit second language instruction does make a difference in learners' acquisition of target language norms. Doughty (1991), for example, shows that attention to form, either via detailed analysis of structure or highlighting of target language structures in context, promotes acquisition of inter-language grammar (Doughty, 1991, p. 431). Ellis (1995) also argues that although much of the acquisition of language form is the result of implicit learning, explicit instruction particularly involving grammatical consciousness-raising is also conducive to second language acquisition. Lando (1998) found that explicit and intensive form-focused instruction encourages an increased and more accurate use of other features that are closely related to the targeted ones when they are combined with continuous meaning-focused practice of instructed features.

A structured, systematic, and effective methodology for teaching academic skills (Archer & Hughes, 2011), explicit instruction is one of the best tools available to educators to maximize students' academic growth. Rosenshine (1987) also describes it as a systematic method of teaching with emphasis on proceeding in small steps, checking for student understanding, and achieving active and successful participation by all students, specifically, when the instructed strategies are categorized in a simple schema that can be easily learned and remembered (Souvignier & Mokhlesgerami, 2006). In addition to that, the teacher's examples serve as the heart of the teaching experience since this is the only way we get the logical structures of verbal associations, concepts, rule relationships, and cognitive strategies by comparing and contrasting examples of them (Kame'enui & Simmons, 1990). Stevenson and Stigler (1992) also add that the more time is available for instruction the more teachers can teach, the more learners can be engaged in instruction, and the more they can learn, (specially Rosenshine & Stevens, 1986) when the students spend much of their time being directly taught by their teacher. Also, group instruction has been found to be the most effective and efficient approach to teaching basic skills, Paris (1986) asserts that students can learn about features of reading like declarative, procedural and conditional knowledge through direct instruction as well as by practice. Part of a teacher's job is to explicate strategies for reading so that students will perceive them as useful and sensible. Swanson, 1999; Swanson & Siegel, 2001 characterize explicit instruction by a series of supports or scaffolds, whereby the learners are guided through the learning process with clear statements about the purpose and rationale for learning the new skill, clear explanations and demonstrations of the instructional target, and supported practice with feedback until independent mastery has been achieved. Consistence with these findings, Mastropieri et al. (2003) identified a typical explicit instruction sequence that includes: (a) state the purpose, (b) provide instruction, (c) model, (d) provide guided practice, (e) give corrective feedback, (f) provide independent practice, and (g) deliver generalization practice. In a review of explicit instruction, during school-based instruction (Sterling-Turner, Watson, & Moore, 2002) suggest that direct training methods led to higher treatment integrity than indirect training methods.

### ***Moodle***

Nowadays the growth of technology has opened new possibilities for communication and information. The use of technology in classroom worldwide has changed the practices of teachers and students. Within many of these classrooms, the use of technological tools and resources supports not only students as they search for information, design products and publish results but also teachers for creating structure, providing advice and monitoring the progress. Researchers (e.g. Bransford, Brown, & Cocking, 2000) posit that a number of features of new technologies are consistent with principles of the science of learning and hold promise for improving education. They contend that new information and communications technologies (ICT) can bring exciting curricula based on real-world problems into the classroom, and provide scaffolds and tools to enhance learning.

The interactivity of technologies is cited as a key feature that enables students to receive feedback on their performance, test and reflect on their ideas, and revise their understanding (Roschelle, Pea, Hoadley, Gordin, & Means, 2000). Networked technology can enable teachers and students to build local and global communities that connect them with interested people and expand opportunities for learning. Indeed, one of the nowadays networked technologies is Moodle which has become a very popular among educators around the world as a tool for creating online

dynamic web sites for their students. It is a Course Management System (CMS), known as a Learning Management System (LMS) or a Virtual Learning Environment (VLE) and a “Free” web application that educators can use to create effective online learning sites (Moodle, 2013). Although Moodle can be used for many kinds of educational applications, it is based on socio-constructivist principles (Dougiamas, 1998; Dougiamas 2000) and most suited for an educational approach involving interaction amongst people rather than transmission of content. In spite of giving both teachers and trainers a powerful set of web-based tools for an array of activities, such as forum, messaging, quizzes, assignments, wikis, blogs, and databases (Cole & Foster, 2008), its positive impact of technology does not come automatically and it much depends on how teachers use ICT in their classes (Bransford, Brown, & Cocking, 2000).

### ***Verbal Constructions***

Since in this study the researcher wants to investigate the effect of explicit teaching of verbal constructions of participle”, and to + infinitives on the composition of EFL learners, he provides some information on these structures which are challenging and even problematic for the learners to grasp. First the definition of verbal; certain structures called verbal are derived from verbs but do not inflect for person and tense, nor combine with an auxiliary verb to form verb phrases. Verbals include “participles”, and “infinitives” (DeCpua, 2008). Participles are two types “-ing” and “-ed” which generally function as adjectives and sometimes as adverbs. They can indicate time and can be used in passive voice. Plus, the transitive verbs only can form “-ed” participles. Infinitives are the “to” + base verb which function as subject, object, adjective, adverb, and complement and can indicate time and can be used in passive voice, too.

### **RESEARCH QUESTIONS:**

This study seeks to investigate, compare and answer the following questions regarding these two types of structures on the compositions of EFL learners in the Moodle context:

1. Does the explicit instruction of infinitive construction in traditional way have any effect on the compositions of Iranian EFL learners?
2. Does the explicit instruction of participle construction in the Moodle context have any effect on the compositions of Iranian EFL learners?
3. Does the explicit instruction of participle construction in the Moodle context outperform the infinitive construction in traditional way?

### **METHODOLOGY**

#### ***Participants***

The study was conducted in Dezful, Iran with 84 (N=84) intermediate Iranian EFL learners at Dezful Islamic Azad University including 43 males (N=43) and 41 females (N=41) with age range of 19-28. Not only were the participants university EFL students and had passed two semesters in English translation course but also they had the experience of studying English in junior high school and high school. Additionally, in order to guarantee the learners' proficiency level, they also took a TOEFL proficiency test. Then the learners were randomly assigned to two groups of 43 and 41 learners in each group. It should be noted that these two groups were taught by the same instructor; yet, the only difference was the type of given feedback treatment to each group. For this study, the students were asked to write a paragraph between 100 to 120 words on

verbal constructions. The first group (N=41) were reminded to provide some infinitive phrases in their paragraphs and the second group (N=43) to provide participle phrases in Moodle context. The instructor then evaluated the students' drafts. The first group received overt correction on the infinitive and the second on the participle phrases.

### ***Instrument***

In this study, a multiple-choice test designed by the researcher was used with the purpose of collecting quantitative data. Since the test used in this study was not previously tested or validated, it was necessary to check its validity and reliability before administering it. In order to check the validity, the researcher consulted one of the members of the thesis committee and a test designer who analyzed it for its validity. After assuring its validity, the test was administered once and the data was put into SPSS. Cronbach's alpha was used to check the reliability. The result showed the reliability of the test. The pre-test with the reliability of 0.86 and the post test with 0.80 reliability. The test was also pilot tested on 64 intermediate university EFL learners of English translation course at Dezful Islamic Azad University. As a result of pilot testing, a few of the items were modified and deleted. The multiple choice test used as the pre-test was developed to assess students' general vocabulary, grammar, listening and reading abilities.

### ***Procedure***

In order to accomplish the objectives of this study and also increase its validity, the use of randomization, pretest/posttest administration and treatment was essential. The following steps were taken to carry out the study:

In this study effort was made to select the samples randomly. For the samples to be homogeneous the multiple choice test comprising of four parts (listening, vocabulary, grammar and reading) was taken from 110 Iranian EFL learners at Dezful Islamic Azad University and the students' answers were marked from 10 to 0 (best to worst). 84 students with the scores ranged between 2.5 and 4 out of 10 were chosen as the main participants of the study with the mean scores of 3.0654 and the standard deviation of 0.71138. After the homogeneity test determined the level of participants' language proficiency, attempts were made to assign the participants in the two groups randomly. The 84 students were assigned to two groups of 41 learners (N=41) in infinitive + "to" group and 43 learners (N=43) in participle group. The controlled group (N=41) were taught in traditional way on the subject of 'Free Time' using infinitive section of verbal constructions and the other group, the experimental group (N=43) were trained in Moodle platform on the subject of 'Sport' using participle section of verbal constructions.

Before starting explicit instruction of verbal constructions, the researcher assured himself that the participants of the second group were computer savvy. He invited the participants in internet cafe and in a session or two explained activities such as uploading files, chat, forum, messages, wiki, SCORM packages, quiz, lesson, online text and offline activities. He also provided them the opportunity on how to physically navigate his Moodle site and gain confidence in posting and responding to that. Despite of the given information and clarification, some of the participants encountered few problems in Moodle context. But it didn't take long that they became Moodle savvy and knowledgeable in this regard. Then, this procedure went on throughout the following teaching sessions he had with them. As their confidence and their understanding of the options

available on the site on how to log on, maneuver the site, chat, upload files, and posting responses grew, the researcher asked them to register themselves as new users in his Moodle website and based on the given instructions on personalizing their accounts, they uploaded their profile pictures and personal details. Then, the researcher officially opened his Moodle class to his second group of the participants on 10 February 2013.

As the course progressed, the teacher started teaching each verbal construction to the participants of each group in fourteen sessions of sixty minutes twice a week (i.e. Saturday and Monday for the 1<sup>st</sup> group and Sunday and Tuesday for the 2<sup>nd</sup> one). During these sessions, the teacher step-by-step explained the participle constructions to the second group via a host of activities including online submission of texts, collaborations in a wiki, chat appointment and forum discussion accompanied face-to-face classes. Acquiring all the necessary information and feedbacks on the participle construction during the first ten sessions, the participants were asked to write a paragraph of 100 to 120 words on the “sport” topic using participle phrases of verbal constructions and then to post it. While doing this activity, the learners received not only the appropriate feedback on their writings but also they had the opportunities to review and improve their paragraphs by viewing the other learners’ postings and feedbacks. In the meantime, they engaged themselves in chat and message modules in both intra- and inter-class connection to exchange comments and interact with their teacher and every registered friend on the system and that helped them reflect on their responses and engage them in higher-order thinking processes. In the last session or two, the teacher asked them to review and revise their drafts and finalize them. Then, their paragraphs were given to two raters for analyzing and assigning marks from best to worst (10 to 0). At the end of the term, the participants were also asked on voluntary interviews to express their views and attitudes towards the virtual mode of instruction.

### ***Statistical procedures***

After collecting the data (i.e. the scores given to the participants by the raters), the mean scores and the standard deviations of experimental and control group, the degree of differences between pre-test and post-tests for each group were calculated. Then three independent samples *t*-tests were conducted, one is run to show the homogeneity of control and experimental groups and the other two are conducted to indicate the effect of explicit instruction on learner’s written paragraphs to examine both on topics of *Free Time* and *Sport* and also to see whether explicit instruction had the same effect on each groups independent samples *t*-test were conducted. The mean scores of each group were also calculated independently to see whether each group was equally affected by the explicit instruction or not.

## **RESULTS**

The raw scores obtained from the pretest and posttest was analyzed through SPSS. The means, standard deviations and differences of means were computed for each group. Significance of difference between the mean scores of both the control and experimental groups were tested at .05level by applying independent sample *t*-test.

Table 1 reveals the descriptive statistics conducted to compare the mean scores of both control and experimental groups in pre-test and that shows the mean scores as 3.0610 and 3.0698 respectively. As the scores show, there is not any significant difference between the two groups and that proves the homogeneity between the control and experimental groups.

*Table 1: The descriptive statistics of pre-test in both control and experimental group*

Group	N	Minimum	Maximum	Mean	Std. Deviation
pre t-test Free Time	41	1.50	4.50	3.0610	.79996
pre t-test Sport	43	1.50	4.00	3.0698	.62280

Table 2 reveals the descriptive statistics conducted to compare the mean scores of control group in pre-test and post-test. The results indicate that the maximum average refers to the pre t-test Sport, this shows that the mean score of experimental group is higher than the control group.

*Table 2: The descriptive statistics of control group in pre-test and post-test*

Group	N	Minimum	Maximum	Mean	Std. Deviation
pre t-test Free Time	41	1.50	4.50	3.0610	.79996
Post t-test Free Time	41	3.00	6.00	4.4878	.72014
Valid N (listwise)	41				

Figure 1 shows clearly that the scores of post t-test Free Time are higher than the scores of pre t-test Free Time.

Figure 1: Patterns in pre t-test and post t-test Free Time

To find out whether there was a significant difference between pre-test and post-test in control group, an independent samples *t*-test was conducted. The results which are presented in table2 show that there is a significant statistical difference between pre-test Free Time and post-test Free Time. The significant levels are below the significant value  $p < 0.05$ . It is 0.00.

Table 3: The independent samples *t*-test of control group in pre-test and post-test

Group		Paired Differences					t	df	Sig. (2-tailed)
		Mean	Std. Deviation	Std. Error Mean	95% Confidence Interval of the Difference				
					Lower	Upper			
Pair 1	pre t-test Free Time - Post t-test Free Time	-1.42683	.98464	.15377	-1.73762	-1.11604	-9.279	40	.000

Table 4 reveals the descriptive statistics conducted to compare the mean scores of experimental group in pre-test and post-test. The results show that the maximum average refers to post t-test Sport with a mean of 5.965.

Table 4: The descriptive statistics of experimental group in pre-test and post-test

Group	N	Minimum	Maximum	Mean	Std. Deviation
pre t-test Sport	43	1.50	4.00	3.0698	.62280
Post t-test Sport	43	4.50	8.00	5.9651	.94740
Valid N (listwise)	43				

Figure 2 shows clearly that the scores of post t-test Sport are higher than the scores of pre t-test Sport.

Figure 2: Patterns in pre t-test and post t-test Free Time

To find out whether there was a significant difference between pre-test and post-test in experimental group, an independent samples *t*-test was conducted. The results which are presented in table5 show that there is a significant statistical difference between pre-test sport and post-test Sport. The significant levels are below the significant value  $p < 0.05$ . It is 0.00.

Table 5: The independent samples of *t*-test of experimental group in pre-test and post-test

Group	Paired Differences	t	df	Sig. (2-
-------	--------------------	---	----	----------

	Mean	Std. Deviation	Std. Error Mean	95% Confidence Interval of the Difference				tailed)
				Lower	Upper			
Pair 1 pre t-test Sport - Post t-test Sport	-2.89535	1.00332	.15300	-3.20412	-2.58657	-18.923	42	.000

And also the post *t*-test of both control and experimental groups is compared through an independent samples *t*-test. The mean scores of both are 4.4878 and 5.9651 respectively. This shows that the mean score of experimental group is higher than the control group. And mean score of experimental group (i.e. post t-test Sport) is the highest mean among the other groups.

Table 6: The descriptive statistics of both control and experimental group in pre-test and post-test

Group	N	Minimum	Maximum	Mean	Std. Deviation
pre t-test Free Time	41	1.50	4.50	3.0610	.79996
pre t-test Sport	43	1.50	4.00	3.0698	.62280
Post t-test Free Time	41	3.00	6.00	4.4878	.72014
Post t-test Sport	43	4.50	8.00	5.9651	.94740

Figure 3 shows clearly that the scores of post t-test Sport are the highest among the scores of other groups. This indicates the superiority of post t-test Sport over the other groups.

Figure3. Patterns in pre t-test and post t-test of both Free Time and Sport

## DISCUSSION

The effect of explicit instruction of verbal construction on the learner's compositions can be shown by resorting to both mean scores of the control and experimental group.

The first hypothesis of the study asks whether the explicit instruction of infinitive construction in traditional way has any effect on the compositions of Iranian EFL learners.

To see whether this hypothesis is retained or rejected, we must look at the mean scores obtained from the infinitive construction in traditional way (i.e. Free Time). We see that the participants' mean score in the post t-test is 4.48 (SD=.72) while the mean score of pre t-test is 3.06 (SD=.79). This shows that the explicit instruction in traditional way has effect on the learning of infinitive construction. So, it can be concluded that the explicit instruction in traditional way can help learners to learn infinitive construction better. The results of the independent samples *t*-test also show that there is a significant difference between these two groups as the significant level ( $p=.001$ ) is below the  $p$  value  $<0.05$ . So, our conclusion is retained and the beneficial effect of explicit instruction in traditional way is again confirmed. The programs, needless to say, that are based on explicit instruction have proven effective for enhancing reading comprehension (Ross, Smith, Casey, & Slavin, 1995; Simmons, Fuchs, Fuchs, Mathes, & Hodge, 1995).

The second hypothesis wants to know whether or not the explicit instruction of participle construction in the Moodle context has any effect on the compositions of Iranian EFL learners. To retain or reject this hypothesis, we have to resort to the mean scores obtained from the pre t-test and post t-test of participle instruction (i.e. Sport). The mean of post t-test score of Sport group is 5.96 (SD=.94) while the mean of pre t-test score is 3.06 (SD=.62). As in the case of Sport paragraph learners, we see that the mean score of the participants taught through the Moodle context is higher and it reveals the positive effect of the results of the explicit instruction in Moodle platform. The results of the samples *t*-test also show that the significant value ( $p=0.000$ ) is below the  $p\text{-value} < 0.05$  and prove that explicit teaching of participle construction in Moodle environment has had an effect on learners' paragraph writing.

The last hypothesis asks whether or not the explicit instruction of participle construction in the Moodle context outperforms the infinitive construction in traditional way. Again to retain or reject this hypothesis we have to resort to the mean scores obtained from both the mean of post t-tests of participle construction (i.e. Sport) and infinitive construction (i.e. Free Time). The mean of post t-test score of Sport group is 5.96 (SD=.94) while the mean of post t-test of Free Time is 4.48 (SD=.72). As in the case of Sport paragraph learners, we see that the mean score of the participants taught through the Moodle context is higher and it reveals the positive effect of the results of the explicit instruction in Moodle platform. The overall analyses of the data release a definite superiority of the explicit instruction of participle construction in Moodle context over the infinitive construction in traditional way. So, our conclusion is retained and the outperformance of explicit instruction in Moodle context to its traditional one is also confirmed. These findings are in consistence with Moodle's many features which help to enhance the teaching and provide the students with a powerful learning environment (Cole & Foster, 2007, P.5).

## CONCLUSION

This study reports a series of experiments regarding the effect of explicit instruction of verbal constructions on compositions of Iranian EFL learners in a Moodle context. The findings of the study are encouraging regarding the effect of explicit instruction of verbal construction on learners' paragraph writing. Therefore, we can conclude that providing the learners with explicit instruction in Moodle environment can effectively supply opportunities for learners to interact with instructors and fellow students, allowing learners to share ideas, build concepts based on existing knowledge, reflect on experiences and construct knowledge. Moodle provide collaborative tools like email, chat, discussion forums, virtual classrooms and reflective journaling features that assist student as they construct knowledge. Based on this conclusion, we suggest teachers of English using Moodle since it has more than 3,200 sites in more than 115 countries that help educators create online courses with a focus on interaction and collaborative interaction of content which is in a continual evolution. And, since the interest in Moodle is growing in the e-learning community with a user base of 83,008 registered and verified sites, serving 70,696,570 users in 7.5 million courses with 1.2 million teachers as a open source virtual learning environment, it's unwise to ignore its prominent role in today's learning community.

Furthermore, the researcher expects the teachers and educators to use Moodle as an awesome source of virtual learning, as its system is not only easier to use for both learning and teaching, but also it is more flexible to increase and develop its range of tools to meet needs of different groups in comparison to other online learning sites like Blackboard or WebCT. Moreover, the

other reason that the researcher places emphasis on using Moodle is the positive attitude that it will build towards virtual learning as it provides an exciting and interesting learning experience for the students and enables them to proceed at their own pace while having sufficient time to reflect on the learning materials.

### **LIMITATION OF THE STUDY**

This paper is far from complete as the study is still in progress. However, sticking to this level of analysis the researcher found out that lack of learners' computer literacy and access to equipment to perform tasks was a major obstacle in doing this project. The low quality of internet connectivity and low internet speed were also a more hindrance than a help in the study. The other serious limitation which the researcher encountered was the low level of few participants' responsibility to set aside regular time study and to accompany in the research process with a full motivation despite of receiving adequate knowledge and training. And although the researcher found many supporting and convincing evidences to proceed with his research, further attempts, preparations and trainings should be made to escape these limitations.

### **Acknowledgment**

We would like to thank the students of Dezful Islamic Azad university who participated in this study. In addition, our special thanks go to Mr. Seyyed Abdollah Shahrokni who provided us with the opportunity to host his personal Moodle website to carry out our research.

## About the Authors

**Hassan Soleimani** is an assistant professor of applied linguistics at Payame Noor University, Iran. Dr. Soleimani received his Ph. D. in applied linguistics from Isfahan University in 2008. He has authored several books the last one entitled *Non-parametric Statistics for Applied Linguistics Research* in 2010. He is the author of several articles and has presented some papers in international conferences. His special interests are SLA issues in general and research and statistics in particular. He is presently teaching CALL, EFL methodology, and EFL curriculum in PNU post graduate school.

**Behrouz Shirzadfar** is M.A. student in Teaching English as a Foreign Language from Payame Noor Tehran, Iran. His research interests include Computer Assisted Language Learning (CALL) and aspects of Second Language Acquisition (SLA).

## REPRESENTATION OF RACISM AND ETHNICITY IN AMERICAN BLACK SINGERS' TWEETS: A CRITICAL DISCOURSE ANALYSIS

### ABSTRACT

The typical media stereotypes American black singers as excessively racist and more ethnic than other singers. This study examines how three American black singers use twitter as an online social networking service to present their own personalities. The literature probes the spots of racism and ethnicity in the three singers' tweets. Fifteen tweets from each singer were collected, then coded, analyzed and described using critical discourse analysis. In addition, this study is a descriptive qualitative study on the representation of racism and ethnicity in American black singers' tweets involving (1) the themes of discourses that represent racism and ethnicity in American black singers' tweets, (2) the representation of racism and ethnicity in American black singers' tweet, (3) the meaning and values of American black singers' tweets. This study was conducted from September 2012 to May 2013. Based on the research findings, it was found that American black singers' tweets represent the maintenance of an existing group, and raising black people from the dominant of white class and the positions of power and stature in American society and they also have meaning and values of the concept of power to reflect the interests of the strength elite, online identity construction, and a place to counter the media stereotypes.

**KEY WORDS:** American Black Singers, Twitter, Tweet, Representation, Critical Discourse Analysis, Racism, Ethnicity, Power, Discourse

### INTRODUCTION

Twitter is a social networking service which has emerged as a new medium in spotlight through latest happenings, such as a suicide bomber hits north Nigeria Catholic church and the portrait of Obama win the election. Twitter users follow others or are followed. Unlike on most online social networking sites, such as Facebook or MySpace, the relationship of following and being followed requires no reciprocation. A user can follow any other user, and the user being followed need not follow back. (Kwak, Lee, Park & Moon, 2010).

Kwak, Lee, Park, and Moon (2010) also define that Twitter and its power have new information for sharing. Moreover, there are two supplies on Twitter as the followers and followings, the relation between followers and tweets, reciprocity, degrees of separation, and homophile. Besides, the rank user by the number of followers, PageRank, and the number of retweets and present quantitative comparison among them. The ranking by retweets pushes those with fewer than a million followers on top of those with more than a million followers. Through our trending topic analysis we show what categories trending topics are classified into, how long they last, and how many users participate.

A twitter user keeps a brief profile about oneself. The public profile includes the full name, the location, a web page, a short biography, and the number of tweets of the user. The people who follow the user and those that the user follows are also listed. (Kwak, Lee, Park & Moon, 2010).

In addition, tweet is a post or status update on [twitter](#), a social networking service. Because Twitter only allows messages of 140 characters or less, "tweet" is as much a play on the size of the message as it is on the audible similarity to Twitter. (Nations, 2013).

A tweet is a post on Twitter. Moreover, the act of writing a tweet is called tweeting or twittering. Tweets can be up to 140 characters long, including spaces, and can include URLs and hashtags. The 140-character limit comes from the 160-character limit required by the short message service. (Rouse, 2009).

Talking about ethnicity and racism of American black singers related to twitter as a social networking service is that extremely visible, but often lack appropriate sites for personal expression of ideas and personality, unlike other public figures. In the interviews, as well as in-stage displays of emotion are highly analyzed, but rarely do singers have an opportunity to share or present other non-professional aspects of their lives. If Bond's (2009) analysis is correct, Twitter provides an opportunity for American black singers to present a realistic representation of the self.

As Goffman (1959) contends, the self-presentation aspect of an individual is similar to a stage drama, so a fair amount of "production value" should be expected in the form of identity exaggeration. This statement is grounded in the research by Grasmuck, Martin, and Zhao (2009), in the claim that individuals tend to present a more socially desirable image of themselves online; it is vital to note that American black singers' tweets in on-line may be a hyperbole of their true self.

American Black singers have an opportunity to present themselves in the way they choose and can challenge main narratives of black ethnicity presented by journalists, and other media members by tweets. This study opens the door for further exploration into how American black singers can contribute to their own representation by the mainstream media. Before there can be research claiming singers use Twitter and other social media to undermine main paradigms, it is appropriate to first investigate the ways singers are currently using this medium. This study investigates and analyzes the ways in which select three American black singers use twitter to perform their personalities, as they relate to stereotypical ideas of black ethnicity. (Stefanone et al., 2010).

A CDA outline reverberates with Twitter dialogic conversations because these dialogues incline to be complete with scheming tendencies of writers (knowledgeable learners, educators) aimed at influencing the psychology and social behaviour of readers / communicants (peers) through normalizing discourses. However, Twitter's dialogic complexity in the flexibility those communicants often have with respect to where to post their messages, who to engage with, and the language to use during interactions. Moreover, Twitter and other social networking services like

Facebook or MySpace particularity is predicated on its distorting between private and public discourse through 'imagined audiences' and 'collision of contexts' (Boyd, 2011).

Moreover, Twitter, Facebook and MySpace are also grounded in the connectives framework of knowledge production that values connected networks, co-generation of knowledge by novices and experts and use of complex, adaptive systems for knowledge generation (Siemens, 2006). Moreover, the informal and unregulated conversations on twitter raise critical questions about the exercise of academic authority and democratic expression of views when academics are involved.

A Critical Discourse Analysis framework resonates with social networking services like Twitter dialogic conversations by "tweet" something from those the user follows to receive the message and its mechanism empowers users to spread information of their choice beyond the reach of the original tweet's followers. These dialogues tend to be replete with manipulative tendencies of writers (knowledgeable learners, educators) aimed at influencing the psychology and social behavior of readers / communicants (peers) through normalizing discourses. However, twitter's dialogic complexity deceits in the flexibility that the communicants often have with respect to where to post their messages, who to engage with, and the language to use during interactions.

In addition, the purpose of this study is to analyze the racism and ethnicity of American black singers' tweets, as they related to black ethnic group in the social dimension of the text, namely, the function of the participants involved in the messages. In this work the researcher will use the critical discourse analysis (CDA) – an analytic method chosen to explore the social processes that (re)produce and reflect knowledge and power relations through discourses (Fairclough, 2003), rather than exclusively on the specific grammatical and linguistic use of language (Galasinski 2008; Hodges et al. 2008). CDA explores the ways in which social structures and practices constitute how specific topics (such as sexual health) are discussed (or not discussed) (Chouliaraki and Fairclough, 1999). CDA positions social structures (such as ethnicity and the social ordering of men and women) as systems of social relations that do not produce equilibrium but that are instead 'characterized by dominance, exploitation, struggle, oppression and power (Johnstone 2008:28).

The power of dominant groups may be integrated in laws, rules, norms, habits, and even a quite general consensus, and thus take the form of what Gramsci called "hegemony" (Gramsci, 1971). Class domination, sexism, and racism are characteristic examples of such hegemony. Note also that power is not always exercised in obviously abusive acts of dominant group members, but may be enacted in the myriad of taken-for-granted actions of everyday life, as is typically the case in the many forms of everyday sexism or racism. Similarly, not all members of a powerful group are always more powerful than all members of dominated groups: power is only defined here for groups as a whole. (Essed, 1991).

## **LITERATURE REVIEW**

There are some studies which relevant with this reserch. They are related on the representation of black people in tweets. The studies used, among others, are, Rinkus's study, about an analysis of twitter usage by select black professional athletes presenting their online identities, as related to black hypermasculinity (2012). This study talks about the mainstream media stereotypes Black professional athletes as overly aggressive and more masculine than athletes of other ethnicities. In addition, it examines how three professional athletes use the micro-blogging service, Twitter, to present their own

identities through social media. The literature explores online identity formation, parasocial interaction, and masculinity in sports. Fifty tweets from each athlete were collected, then coded using critical discourse analysis, and deconstructed through impression management theory with a focus on the dramaturgical perspective. Results reveal that athletes portrayed more individualized identities when their sport was in the offseason, while athletes currently competing tweeted personal anecdotes less frequently.

Payne (2007) in his paper with title “How does the media portray black American”, he found that Many blacks seem to uphold their stereotypes. Many black rappers glamorize their lifestyle living only for material possessions, and bragging about being from the violent streets. Furthermore, many black reinforce other American’s view of them stereotypical by attacking white America whenever something goes wrong.

The power of dominant groups may be integrated in laws, rules, norms, habits, and even a quite general consensus, and thus take the form of what Gramsci called "hegemony" (Gramsci, 1971). Class domination, racism and ethnicity are characteristic examples of such hegemony. Note also that power is not always exercised in obviously abusive acts of dominant group members, but may be enacted in the myriad of taken-for-granted actions of everyday life, as is typically the case in the many forms of everyday racism. Similarly, not all members of a powerful group are always more powerful than all members of dominated groups: power is only defined here for groups as a whole. (Essed, 1991).

The relations between discourse and power are the specific forms of discourse, e.g. those of politics, the media, or science, is itself a power resource. Secondly, as suggested earlier, action is controlled by our minds. So, if we are able to influence people's minds, e.g. their knowledge or opinions, we indirectly may control (some of) their actions, as we know from persuasion and manipulation. (Van Dijk, 1993).

The process of data analysis in Critical Discourse Analysis is largely based on thematic analysis while also being highly situated in the context of text. (Phillips and Hardy, 2002). Moreover, Alvesson and Skoldberg (2009) describe a text is the object of study and the “ideation level” where the text is used as a means for exploring the underpinning ideas and beliefs of the participants. At both these levels, Alvesson and Skoldberg (2009) argue that the researcher should avoid seeking some form of ‘reality’ in terms of social relations, structures and hierarchies lying hidden within the text (a focus at what they describe as the social condition level).

## **FORMULATION OF THE STUDY**

Based on background of the study, this study tries to answer the following questions:

1. What are themes of discourses that represent racism and ethnicity in American black singers’ tweets?
2. What is the representation of racism and ethnicity in American black singers’ tweets?
3. What are the meaning and values of American black singers’ tweets?

## **RESEARCH OBJECTIVES**

The Objectives of the study are to analyze the themes of discourses that represent racism and ethnicity in American black singers’ tweets and then describe the representation of racism and ethnicity in American black singers’ tweets and the meaning and values of American Black Singers’ tweets.

## THEORETICAL OUTLINE

There are several theories used in this research. Some of them are based on Critical Discourse Analysis (CDA) perspectives. The theories used, among others, are, Rinkus (2012) and Van Dijk's theory on CDA, especially in Critical Discourse Analysis (1998). The theory of themes of tweets related to discourse is taken from Eriksson and Kovalainen (2008).

## METHOD AND TECHNIQUE

### *Method*

This study focuses specifically on how select American black singers; Trey Songz, Nasir Jones, and, Anthony Hamilton use on social networking service to broaden their social worlds and identities as viewed by the general public. Taking a critical approach, a discourse analysis was performed on postings from three American black singers, each with more than one thousand followers. Data was collected from a specific starting date, with fifteen tweets from each singer in consideration for the study. Critical Discourse analysis is a tool used to expose implicit meaning not explicit within discourse; "a critical discourse consists of groups of related statements that cohere to produce meanings and effects...a critical discourse produces the 'truth' about objects" that are spoken of (Eriksson & Kovalainen 2008:230). Because this study used critical discourse analysis as its method, deep analysis was required from a contextual viewpoint.

Eriksson and Kovalainen (2008) caution those using critical discourse analysis as a method to avoid "non-analysis" by expecting "exhaustive" quotations from empirical data to stand alone without explanation; each post was given ample attention. The data included fifteen tweets from each singer as listed in the sample. It is specific, and will not necessarily allow a high level of generalization to other singers. However, as these singers have been purposively selected specifically for their probability to "talk about" issues that would remove notions of ethnicity, a critical discourse analysis of individual postings aimed to reveal a personality presentation consistent with the research question (Eriksson & Kovalainen, 2008).

In addition, this research is using a qualitative research with a descriptive method. Berg (2001:6) mentioned the qualitative research as. "*Qualitative research properly seeks answer to questions by examining various social and the individuals who inhabit these settings.*" He (2001:7) then continued his statements with. "*Qualitative researchers, then, are most interested in how humans arrange themselves and their settings and how inhabitants of these settings make sense of their surroundings through symbols, rituals, social structures, social roles, and so forth.*"

## THE TECHNIQUE OF DATA COLLECTING

Each Tweet in the data set was read independently of the rest. Following this close reading, the researcher examined tweets from the American black singers separately and identified the themes of tweets that became present for each. By conducting a critical discourse analysis on the data, the themes of tweets were determined by exploring what the sample singers "talked about;" in which fields they entered into critical discourse analysis (Eriksson & Kovalainen, 2008). The themes of tweets were then compiled in a separate document, and given operational instructions for identification (as follows, alphabetically) from the table below.

Table 1: Themes of Tweets

Themes of Tweets	Explanation
Active Lifestyle	Any tweet indicating or referencing Exercise.
Declarative Statement	Any tweet with an “I” Statement, or statement professing a point or idea.
Event Attendance	Any time the singer attends or references attending a specific happening.
Expressing Excitement	Any tweet featuring multiple exclamation points, or words commonly used to express excitement.
Family & Friends	Any reference to family or friends. This includes pets, when referenced by name.
Humanitarian	Any tweet related to the interests of humankind.
Introspection	Any tweet related to the singers’ emotion, or self-examination.
Music	Any tweet referencing music or musical Artists of any kind.
Photoshare	Any time a singer Tweets a photo
Promotion	Any tweet referencing a specific brand or Product.
Question	Any tweet using a question mark, a rhetorical question, or asking followers for a response.
Request	Any time a singer asks his followers to “do.” something, including “retweet.”
Salutation	Any tweet using a greeting, or a valediction (Closing).
Spirituality	Any tweet referencing “god” or “prayer,” or anything related to religion or spirituality.
Sports	Any tweet related to “sport” of any kind.
Travel	Any tweet where the singer indicates he is intransit, outside of everyday routine.
World News	Any time a singer Tweets about something News worthy happening outside the US.

The process of data analysis in Critical Discourse Analysis is largely based on thematic analysis while also being highly situated in the context of text. (Phillips & Hardy, 2002). Moreover, Alvesson and Skoldberg (2009) describe a text is the object of study and the “ideation level” where the text is used as a means for exploring the underpinning ideas and beliefs of the participants. At both these levels, Alvesson and Skoldberg (2009) argue that the researcher should avoid seeking some form of ‘reality’ in terms of social relations, structures and hierarchies lying hidden within the text (a focus at what they describe as the social condition level).

However, tweets can be understood as systemic ways of groups of people talk about things together. Such repertoires a broadly based on the idea that there exists a range of language resources that a group or community draws on whose meaning is assumed to be commonly and unproblematically understood within that group. (Eriksson & Kovalainen, 2008).

In addition, Critical Discourse Analysis is particularly interested in the consistency and variance in language use (Alvesson & Skoldberg, 2009) and how such discursive devices can be used to ‘manage’, lead or influence discursive interactions. (Eriksson & Kovalainen, 2008).

By conducting a Critical Discourse Analysis on the data of tweets, themes of tweets were determined by exploring what the sample people “talked about.” (Eriksson & Kovalainen, 2008). Themes were

then compiled in a separate document, and given operational instructions for identification. They are (a) active lifestyle: any tweet indicating or referencing exercise, (b) declarative statement: any tweet with an “I” Statement, or statement professing a point or idea, (c) event attendance: any time people attends or references attending a specific happening, (d) expressing excitement: any tweet featuring multiple exclamation points, or words commonly used to express excitement, (e) family and friends: any reference to family or friends. This includes pets, when referenced by name, (f) humanitarian: any tweet related to the interests of humankind, (g) introspection: any tweet related to the peoples’ emotion, or self-examination, (h) music: any Tweet referencing music or musical artists of any kind, (i) photoshare: any time people tweets a photo, (j) promotion: any tweet referencing a specific brand or product, (k) question: any tweet using a question mark, a rhetorical question, or asking followers for a response, (l) request: any time people asks his followers to “do” something, including “retweet,” (m) salutation: any tweet using a greeting, or a valediction (closing), (n) spirituality: any tweet referencing “god” or “prayer,” or anything related to religion or spirituality, (o) sports: any tweet related to “sport” of any kind, (p) travel: any tweet where people indicates he is in transit, outside of everyday routine, and (q) world news: any time people tweets about something newsworthy happening outside the US. (Eriksson & Kovalainen, 2008).

## **DATA SOURCE**

The data was statistically collected by a Twitter account created specifically for the purpose of this research; this newly created account followed the Twitter handle of each singer in the sample, so accumulating data automatically and instantaneously for analysis. Twitter is a free service, therefore the study was cost-free commercially; man hours spent were the main expenditure. The researcher had a laptop with Internet access; there were no fences in terms of data collection, aside from any unexpected web-page maintenance or similar downtime.

The writers took this research within 8 months (September 2012 – May 2013), that have relations to the subject taken in this research. These samples include three American black singers Trey Songz, Nasir Jones, and, Anthony Hamilton on Twitter. However, these three American black singers have created a stereotypical identity of the black male singer as overly dominance, racist, and ethnic in their tweets (Billings et al. 2002; Enck-Wanzer 2009; Lavelle 2010; Mercurio; Filak 2010). Goffman (1959) argues that when “an actor takes on an established social role; he (sic) finds that a particular front has already been established for it”. Focusing on the presentation of self through on-line identity allowed for sample data collection at a low cost. Due to the ease of access, researchers concerned with identity formation are turning more to social networking services, such as Twitter and Facebook (Bond, 2009).

These three American black singers; Trey Songz, Nasir Jones, and Anthony Hamilton are the great singers and so impressive. So, the media has created a stereotypical identity of them as overly racist and ethnic (Billings et al. 2002; Enck-Wanzer 2009; Lavelle 2010; Mercurio; Filak 2010). In addition, Goffman (1959) argues that when “an actor takes on an established social role; he finds that a particular front has already been established for it”. Focusing on the presentation of self through on-line identity allowed for sample data collection at a low cost. Due to the ease of access, researchers concerned with identity formation are turning more to social networking services, such as Twitter and Facebook (Bond, 2009). The data was numerically compiled by a Twitter account created specifically for the purpose of this research; this newly created account followed the Twitter handles of each singer in the sample, thereby accumulating data automatically and instantaneously for analysis. Twitter is a free service, so

the study was cost-free commercially; man hours spent were the main expenses. The writers had a laptop with Internet access; there were no barriers in terms of data collection, aside from any unexpected web-page maintenance or similar downtime.

## **WEIGHT AND RELEVANCE**

The result of this study is expected to give contribution to the theory of Critical Discourse Analysis of racism and ethnicity of American black Singers in tweets. It also gives feedback to educators about the implementation of the themes of discourse that reflect racism and ethnicity of American black singers' tweets. This study is also expected to be useful for them as a reference to conduct further studies in Critical Discourse Analysis of racism and ethnicity in American Black Singers' tweets.

## **RESULTS AND DISCUSSION**

### ***Results***

This study focuses specifically on the representation of racism and ethnicity of American black singers' tweets in broadening their social worlds and identities as viewed by the general public. Taking a critical approach, a Critical Discourse Analysis was performed on tweets from three American black singers, each with more than two million followers. Data was collected from a specific starting date, with only fifteen tweets from each singer in consideration for the study. A Critical discourse analysis is a tool used to expose implicit meaning not explicit within discourse; "a Critical Discourse Analysis consists of groups of related statements that cohere to produce meanings and effects...a Critical Discourse Analysis produces the 'truth' about objects" that are spoken of (Eriksson & Kovalainen, 2008:230). Because this study used critical discourse analysis as its method, deep analysis was required from a contextual viewpoint. Twenty tweets from each singer was an appropriate amount to avoid becoming inundated with too much information, while still having substantial data for analysis. Eriksson and Kovalainen (2008) caution those using discourse analysis as a method to avoid "non-analysis" by expecting "exhaustive" quotations from empirical data to stand alone without explanation; each tweet was given ample attention. The data included all tweets made by singers listed in the sample, including any tweets deleted retroactively. "Retweets," when the singer posts the tweet of another user, were omitted. The sample is specific, and will not necessarily allow a high level of generalization to other singers. However, as these singers have been purposively selected specifically for their probability to "talk about" issues that would remove notions of ethnicity, a Critical Discourse Analysis of individual tweets aimed to reveal a personality presentation consistent with the research question (Eriksson & Kovalainen, 2008).

Though the study focused specifically on three American black singers, there are millions of other active Twitter users. Tweets outside of the data set provided a vocabulary database when understood meaning could not be derived from a specific unit of text. The characters of tweet are proposed for confronting when the coder was unable to decipher an implied abbreviation. Assuming "U R" is intended to read "you are" is not a complicated translation, however, converting more advanced Twitter "lingo" proved difficult. In cases as such, the coder consulted the Twitter lexicon. Using the Twitter search function allowed the coder to find tweets outside the data set using the same unknown abbreviation; where context clues then provided the appropriate definition for the unidentified term. If there was ever a question as to the meaning of an abbreviated word, the coder followed this process. Because Twitter has such a massive textual database, tweets within the data set needing interpretation had a high level of transferability to other Tweets in the Twitter universe.

After establishing the forms of Trey Songz, Nasir Jones, and Anthony Hamilton's tweets, the writers coded each tweet is maintained awareness of the time separating successive tweets which indicated a grouping in some cases. There was no limit on the amount of themes potentially present in any given tweet. For each tweet the writers established context through citation. This context allowed the researcher to make a more informed form choice when it was not explicitly clear what the singer was referencing. Tweets are presented verbatim from Twitter website and are followed by analysis from the researcher. They are presented literal from the twitter and followed by analysis from the writers. The following are examples of how each tweet was coded:

**A. *TREY SONGZ***

**1. 25<sup>th</sup> September, 2012: Obama**

Themes of Tweets: Declarative Statement, Expressing Excitement, and World News

Trey Songz expresses his support to President Obama for the president election in the USA. He supports Mr. President because of the same ethnic with him as the black people.
