# The 5-Step Emergency Shelter Method

Learn how to create a basic shelter in the wilderness using natural materials for survival.

## STEP 1

### Find a Suitable Location

Choose a flat, dry area away from hazards like falling branches and water sources to ensure safety and stability.

## STEP 2

### Gather Natural Materials

Collect branches, leaves, and other materials that will be used to construct the shelter, providing insulation and protection from elements.

## STEP 3

### Build the Shelter Frame

Construct a sturdy framework using larger branches to form the basic structure of the lean-to, supporting the roof and walls.

## STEP 4

### Insulate the Shelter

Layer leaves, smaller branches, and debris on the roof and sides to create insulation, trapping heat and keeping you warm.

## STEP 5

### Secure the Entrance

Create an entrance that can be closed off with materials, ensuring safety and warmth while inside the shelter.
