NEUROLOGICAL SUPPORT & REGULATION PROGRAM

A New Approach To Neurological Stability

Harbor's Structured Neurological Calibration Programs" are designed to support eligible neurodivergent patients experiencing severe emotional overload, sensory dysregulation, distress-response activation, and long-term functional instability.

Through clinically supervised neurological regulation procedures, Harbor helps patients pursue greater emotional consistency, reduced distress activation, and improved long-term adaptive functioning.

Our multidisciplinary care framework combines neurological oversight, sensory regulation support, and structured recovery planning within a calm and highly regulated clinical environment.

Post-Regulation Family Support

Families play an important role in supporting long-term neurological stabilization outcomes.

Harbor's post-regulation support framework assists caregivers in adapting to behavioral stabilization changes, reduced distress-response patterns, and evolving communication dynamics following treatment.

Our care teams provide structured guidance intended to support long-term consistency within the home environment.

Who May Qualify

Harbor's Structured Neurological Calibration Programs™ are available to individuals experiencing severe emotional overload, sensory dysregulation, or distress-response activation that interfere with daily functioning and long-term stability.

ELIGIBILITY CONSIDERATIONS

- Documented neurodivergent profile
- Evidence of significant functional impairment
- Commitment to structured treatment and post-regulation support

Eligibility is determined through clinical assessment and physician review.
