

Secure Logistics and Mobility

Safe, reliable movement of people, vehicles, equipment and materials

WHY TBS

As a Libya-based provider, TBS brings route knowledge, local networks and a practical understanding of the conditions that affect movement across the country. Clients move with better information and clearer planning. International clients need mobility support that is safe, well documented and reliable, delivered by people who understand both the environment and the standards the client expects.

SERVICE OVERVIEW

TBS supports the safe and reliable movement of people, vehicles, equipment and project materials across Libya. Moving safely in Libya takes route knowledge, trusted drivers, local coordination, access checks, communications and the ability to adapt quickly when conditions change. TBS plans and manages movements for airport arrivals, business meetings, project visits, technical inspections and field activity. TBS builds the service around the client's profile and requirement, combining transport coordination with security awareness and practical logistics support.

HOW WE DELIVER

Mobility support begins before the journey. TBS reviews the purpose of movement, locations, timings, route options, passenger profile, equipment needs and any access or coordination requirements. This allows practical journey plans built around the client's schedule. During movement, TBS coordinates drivers, vehicles, communications and local updates, and adjusts when timings, routes or conditions require it. The aim is to keep journeys controlled, efficient and professionally managed from arrival to destination.

WHAT THIS MEANS IN PRACTICE

- Airport meet-and-greet and arrival coordination
- Ground transport arranged through trusted local capability
- Route planning, journey management and movement monitoring
- Secure movement coordination for business, project and field activity
- Equipment and material movement supported through practical logistics control
- Communications maintained before, during and after movement
- Local checks and approvals handled ahead of each journey
- Drivers and vehicles selected to suit the task and conditions
- Contingency and alternative routing planned for delays or disruption
